I. FINDINGS

This section summarizes the existing traffic conditions, project traffic impacts, and the proposed mitigation measures. The City of Banning is the lead agency responsible for preparation of the traffic impact analysis, in accordance with the California Environmental Quality Act authorizing legislation.

A. Site Location and Study Area

The project site is located in the City of Banning with a small portion to be annexed from unincorporated County of Riverside. The majority of intersections are located in the City of Banning, except as noted below.

Based upon a 50 peak hour trip threshold, the study area includes the following intersections:

Beaumont Avenue/SR-79 (NS) at:
- 1st Street (EW) - #1‡
- Potrero Boulevard (EW) - #2‡
- California Avenue (EW) - #3‡

Michigan Avenue (NS) at:
- 1st Street (EW) - #4

Pennsylvania Avenue (NS) at:
- 1st Street (EW) - #5

Highland Springs Avenue (NS) at:
- 14th Street (EW) - #6†
- Oak Valley Parkway (EW) - #7†
- 8th Street/Wilson Street (EW) - #8†
- 6th Street/Ramsey Street (EW) - #9†
- I-10 Freeway WB Ramps (EW) - #10‡
- I-10 Freeway EB Ramps (EW) - #11‡
- 1st Street/Sun Lakes Boulevard (EW) - #12†

Highland Home Road (NS) at:
- 14th Street (EW) - #13
- Wilson Street (EW) - #14
- Ramsey Street (EW) - #15
- Sun Lakes Boulevard (EW) - #16

Lincoln Street (NS) at:

† City of Banning/Beaumont jurisdiction.

‡ California Department of Transportation jurisdiction.

Lincoln Street (NS) at:
- Westward Avenue (EW) - #17

Sunset Avenue (NS) at:
- Wilson Street (EW) - #18
- Ramsey Street (EW) - #19
- I-10 Freeway WB Ramps (EW) - #20‡
- I-10 Freeway EB Ramps (EW) - #21‡
- Lincoln Street (EW) - #22
- Westward Avenue (EW) - #23
- C Street (EW) - #24

A Street (NS) at:
- Westward Avenue (EW) - #25

22nd Street (NS) at:
- Ramsey Street (EW) - #26
- I-10 Freeway WB Ramps (EW) - #27‡
- I-10 Freeway EB Ramps (EW) - #28‡
- Lincoln Street (EW) - #29
- Westward Avenue (EW) - #30

8th Street (NS) at:
- Wilson Street (EW) - #31
- Ramsey Street (EW) - #32
- I-10 Freeway WB Ramps (EW) - #33‡
- I-10 Freeway EB Ramps (EW) - #34‡
- Lincoln Street (EW) - #35‡
- Westward Avenue (EW) - #36

San Gorgonio Avenue (NS) at:
- Wilson Street (EW) - #37
- Ramsey Street (EW) - #38
- Lincoln Street (EW) - #39‡
- Westward Avenue (EW) - #40‡
- Charles Street (EW) - #41‡
- Wesley Street (EW) - #42‡

San Gorgonio Avenue/SR-243 (NS) at:
- Old Idyllwild Road (EW) - #43‡

SR-243 (NS) at:
- C Street (EW) - #44‡

‡ California Department of Transportation jurisdiction.

B. Definition of Deficiency and Significant Impact

As required by the City of Banning, this report analyzes the traffic impacts of the proposed project in accordance with the Riverside County Transportation Department Traffic Impact Analysis Preparation Guide. The following definitions of deficiencies and significant impacts have been developed in accordance with the City of Banning requirements.

Definition of Deficiency

The definition of an intersection deficiency has been obtained from the City of Banning General Plan, which states that peak hour intersection operations of Level of Service D or better are generally acceptable. Therefore, any intersection operating at Level of Service E or F will be considered deficient. The City of Beaumont General Plan also utilizes the same Level of Service standards.

The California Department of Transportation endeavors to maintain a target Level of Service at the transition between Level of Service C and D (maximum 35 seconds of control delay). If an existing facility, or study area intersection for purposes of this analysis, operates at an unacceptable Level of Service, then the existing control delay should be maintained. The lead agency may consult with the California Department of Transportation to determine the appropriate target Level of Service if the maximum 35 seconds of control delay is not feasible.

Definition of Significant Impact

An impact is considered significant if the project-related traffic causes an intersection to move from an acceptable Level of Service to an unacceptable Level of Service. If a significant impact occurs, mitigation is required to bring the intersection back to an acceptable Level of Service, or to no-project conditions if the intersection is projected to operate an unacceptable Level of Service for no-project conditions.

C. Existing Traffic Conditions

1. The project site consists of 830.84 acres of currently undeveloped land and is generally located east of Sunset Avenue, south of Westward Avenue, and west of San Gorgonio Avenue/Old Idyllwild Road in the City of Banning.

2. Existing roadways in the vicinity of the project study area include Beaumont Avenue/SR-79, Michigan Avenue, Pennsylvania Avenue, Highland Springs Avenue, Highland Home Road, Sunset Avenue, 22nd Street, 8th Street, San Gorgonio Avenue, SR-243, Oak Valley Parkway, 8th Street, Wilson Street, 6th Street, Ramsey Street, 1st Street, Sun Lakes Boulevard, Lincoln Street, Westward Avenue, California Avenue, Charles Street, and Wesley Street. Regional access is provided by the I-10 Freeway.

3. Banning High School is situated on the southwest corner of the San Gorgonio Avenue and Westward Avenue intersection. When school lets out, students traverse north on San Bernardino through the Lincoln Street intersection creating traffic jams for an approximately 15 minute period in the afternoon (off-peak period). To reduce this

pedestrian conflict, it is recommended that crossing guards be positioned along San Gorgonio Avenue at the intersections of Lincoln Street and Westward Avenue.

4. The following study area intersections currently operate at unacceptable Levels of Service during the peak hours for existing traffic conditions:

   Beaumont Avenue/SR-79 (NS) at:
   California Avenue (EW) - #3

   8th Street (NS) at:
   I-10 Freeway EB Ramps (EW) - #34

5. Traffic signals appear to be currently warranted at the following study area intersections for existing traffic conditions:

   Beaumont Avenue/SR-79 (NS) at:
   California Avenue (EW) - #3

   Michigan Avenue (NS) at:
   1st Street (EW) - #4

   Pennsylvania Avenue (NS) at:
   1st Street (EW) - #5

   Sunset Avenue (NS) at:
   Wilson Street (EW) - #18

   8th Street (NS) at:
   I-10 Freeway WB Ramps (EW) - #33
   I-10 Freeway EB Ramps (EW) - #34

D. Traffic Impacts

1. The proposed development consists of 45 planning areas, including single-family detached residential, multi-family attached residential, senior adult housing (detached), neighborhood commercial, elementary school, and community park land uses.

2. For Opening Year (2017), the project site is projected to generate a total of approximately 3,307 daily vehicle trips, 538 of which will occur during the morning peak hour and 359 of which will occur during the evening peak hour.

3. For Interim Year (2019), the project site is projected to generate a total of approximately 6,725 daily vehicle trips, 807 of which will occur during the morning peak hour and 718 of which will occur during the evening peak hour.

4. For Interim Year (2022), the project site is projected to generate a total of approximately 10,952 daily vehicle trips, 1,140 of which will occur during the morning peak hour and 1,162 of which will occur during the evening peak hour.

5. For Interim Year (2025), the project site is projected to generate a total of approximately 25,296 daily vehicle trips, 1,747 of which will occur during the morning peak hour and 2,224 of which will occur during the evening peak hour.

6. For Interim Year (2029), the project site is projected to generate a total of approximately 30,832 daily vehicle trips, 2,177 of which will occur during the morning peak hour and 2,770 of which will occur during the evening peak hour.

7. For General Plan Buildout Year (2035) (project buildout), the project site is projected to generate a total of approximately 31,698 daily vehicle trips, 2,245 of which will occur during the morning peak hour and 2,861 of which will occur during the evening peak hour.

8. The study area intersections are projected to operate within acceptable Levels of Service during the peak hours for Existing Plus Project traffic conditions, except for the following study area intersections:

    Beaumont Avenue/SR-79 (NS) at:
        California Avenue (EW) - #3

    Sunset Avenue (NS) at:
        I-10 Freeway WB Ramps (EW) - #20
        I-10 Freeway EB Ramps (EW) - #21
        Westward Avenue (EW) - #23

    22nd Street (NS) at:
        Westward Avenue (EW) - #30

    8th Street (NS) at:
        I-10 Freeway WB Ramps (EW) - # 33
        I-10 Freeway EB Ramps (EW) - #34
        Lincoln Street (EW) - #35
        Westward Avenue (EW) - #36

9. The proposed project does not create a significant impact at the study area intersections for Existing Plus Project traffic conditions, with improvements.

10. Traffic signals are projected to be warranted at the following additional study area intersections for Existing Plus Project traffic conditions:

    Highland Home Road (NS) at:
        Ramsey Street (EW) - #15

Sunset Avenue (NS) at:
Lincoln Street (EW) - #22
Westward Avenue (EW) - #23

A Street (NS) at:
Westward Avenue (EW) - #25

22nd Street (NS) at:
I-10 Freeway WB Ramps (EW) - #27
I-10 Freeway EB Ramps (EW) - #28
Westward Avenue (EW) - #30

8th Street (NS) at:
Lincoln Street (EW) - #35
Westward Avenue (EW) - #36

11. The study area intersections are projected to operate within acceptable Levels of Service during the peak hours for Opening Year (2017) Without Project traffic conditions, except for the following study area intersection:

Beaumont Avenue/SR-79 (NS) at:
California Avenue (EW) - #3

8th Street (NS) at:
I-10 Freeway EB Ramps (EW) - #34

12. The study area intersections are projected to operate within acceptable Levels of Service during the peak hours for Opening Year (2017) With Project traffic conditions, except for the following study area intersections:

Beaumont Avenue/SR-79 (NS) at:
California Avenue (EW) - #3

8th Street (NS) at:
I-10 Freeway WB Ramps (EW) - # 33
I-10 Freeway EB Ramps (EW) - #34

13. The proposed project does not create a significant impact at the study area intersections for Opening Year (2017) With Project traffic conditions, with improvements.

14. Traffic signals are projected to be warranted at the following additional study area intersections for Opening Year (2017) With Project traffic conditions:

8th Street (NS) at:
Lincoln Street (EW) - #35
Westward Avenue (EW) - #36

15. The study area intersections are projected to operate within acceptable Levels of Service during the peak hours for Interim Year (2019) Without Project traffic conditions, except for the following study area intersection:

    Beaumont Avenue/SR-79 (NS) at:
        California Avenue (EW) - #3

    8th Street (NS) at:
        I-10 Freeway EB Ramps (EW) - #34

16. The study area intersections are projected to operate within acceptable Levels of Service during the peak hours for Interim Year (2019) With Project traffic conditions, except for the following study area intersections:

    Beaumont Avenue/SR-79 (NS) at:
        California Avenue (EW) - #3

    8th Street (NS) at:
        I-10 Freeway WB Ramps (EW) - # 33
        I-10 Freeway EB Ramps (EW) - #34
        Lincoln Street (EW) - #35

17. The proposed project does not create a significant impact at the study area intersections for Interim Year (2019) With Project traffic conditions, with improvements.

18. The study area intersections are projected to operate within acceptable Levels of Service during the peak hours for Interim Year (2022) Without Project traffic conditions, except for the following study area intersections:

    Beaumont Avenue/SR-79 (NS) at:
        California Avenue (EW) - #3

    8th Street (NS) at:
        I-10 Freeway EB Ramps (EW) - #34

19. The study area intersections are projected to operate within acceptable Levels of Service during the peak hours for Interim Year (2022) With Project traffic conditions, except for the following study area intersections:

    Beaumont Avenue/SR-79 (NS) at:
        California Avenue (EW) - #3

    Highland Home Road (NS) at:
        Ramsey Street (EW) - #15

8th Street (NS) at:
I-10 Freeway WB Ramps (EW) - # 33
I-10 Freeway EB Ramps (EW) - #34
Lincoln Street (EW) - #35
Westward Avenue (EW) - #36

20. The proposed project does not create a significant impact at the study area intersections for Interim Year (2022) With Project traffic conditions, with improvements.

21. Traffic signals are projected to be warranted at the following additional study area intersections for Interim Year (2022) With Project traffic conditions:

22nd Street (NS) at:
I-10 Freeway WB Ramps (EW) - #27
I-10 Freeway EB Ramps (EW) - #28

22. The study area intersections are projected to operate within acceptable Levels of Service during the peak hours for Interim Year (2025) Without Project traffic conditions, except for the following study area intersections:

Beaumont Avenue/SR-79 (NS) at:
California Avenue (EW) - #3

Highland Home Road (NS) at:
Ramsey Street (EW) - #15

8th Street (NS) at:
I-10 Freeway EB Ramps (EW) - #34

23. The study area intersections are projected to operate within acceptable Levels of Service during the peak hours for Interim Year (2025) With Project traffic conditions, except for the following study area intersections:

Beaumont Avenue/SR-79 (NS) at:
California Avenue (EW) - #3

Highland Home Road (NS) at:
Ramsey Street (EW) - #15

Sunset Avenue (NS) at:
Wilson Street (EW) - #18

22nd Street (NS) at:
Westward Avenue (EW) - #30

8th Street (NS) at:
I-10 Freeway WB Ramps (EW) - # 33

I-10 Freeway EB Ramps (EW) - #34
Lincoln Street (EW) - #35
Westward Avenue (EW) - #36

24. The proposed project does not create a significant impact at the study area intersections for Interim Year (2025) With Project traffic conditions, with improvements.

25. Traffic signals are projected to be warranted at the following additional study area intersections for Interim Year (2025) With Project traffic conditions:

Highland Home Road (NS) at:
Wilson Street (EW) - #14

Sunset Avenue (NS) at:
Lincoln Street (EW) - #22

22nd Street (NS) at:
Westward Avenue (EW) - #30

8th Street (NS) at:
Wilson Street (EW) - #31

26. The study area intersections are projected to operate within acceptable Levels of Service during the peak hours for Interim Year (2029) Without Project traffic conditions, except for the following study area intersections:

Beaumont Avenue/SR-79 (NS) at:
California Avenue (EW) - #3

Highland Home Road (NS) at:
Wilson Street (EW) - #14
Ramsey Street (EW) - #15

Sunset Avenue (NS) at:
Wilson Street (EW) - #18

8th Street (NS) at:
I-10 Freeway EB Ramps (EW) - #34

27. Traffic signals are projected to be warranted at the following additional study area intersections for Interim Year (2029) Without Project traffic conditions:

Highland Springs Avenue (NS) at:
14th Street (EW) - #6

28. The study area intersections are projected to operate within acceptable Levels of Service during the peak hours for Interim Year (2029) With Project traffic conditions, except for the following study area intersections:

Beaumont Avenue/SR-79 (NS) at:
California Avenue (EW) - #3

Pennsylvania Avenue (NS) at:
1st Street (EW) - #5

Highland Home Road (NS) at:
Wilson Street (EW) - #14
Ramsey Street (EW) - #15

Sunset Avenue (NS) at:
Wilson Street (EW) - #18
Lincoln Street (EW) - #22
Westward Avenue (EW) - #23

22nd Street (NS) at:
I-10 Freeway EB Ramps (EW) - #28
Westward Avenue (EW) - #30

8th Street (NS) at:
I-10 Freeway WB Ramps (EW) - # 33
I-10 Freeway EB Ramps (EW) - #34
Lincoln Street (EW) - #35
Westward Avenue (EW) - #36

29. The proposed project does not create a significant impact at the study area intersections for Interim Year (2029) With Project traffic conditions, with improvements.

30. Traffic signals are projected to be warranted at the following additional study area intersections for Interim Year (2029) With Project traffic conditions:

Highland Home Road (NS) at:
Ramsey Street (EW) - #15

Sunset Avenue (NS) at:
Westward Avenue (EW) - #23

A Street (NS) at:
Westward Avenue (EW) - #25

22nd Street (NS) at:
Lincoln Street (EW) - #29

31. The study area intersections are projected to operate within acceptable Levels of Service during the peak hours for General Plan Buildout Year (2035) Without Project traffic conditions, except for the following study area intersections:

Beaumont Avenue/SR-79 (NS) at:
California Avenue (EW) - #3

Highland Home Road (NS) at:
Wilson Street (EW) - #14
Ramsey Street (EW) - #15

Sunset Avenue (NS) at:
Wilson Street (EW) - #18

8th Street (NS) at:
I-10 Freeway EB Ramps (EW) - #34

32. Traffic signals are projected to be warranted at the following additional study area intersections for General Plan Buildout Year (2035) Without Project traffic conditions:

Beaumont Avenue/SR-79 (NS) at:
Potrero Boulevard (EW) - #2

Highland Home Road (NS) at:
Sun Lakes Boulevard (EW) - #16

33. The study area intersections are projected to operate within acceptable Levels of Service during the peak hours for General Plan Buildout Year (2035) With Project traffic conditions, except for the following study area intersections:

Beaumont Avenue/SR-79 (NS) at:
California Avenue (EW) - #3

Pennsylvania Avenue (NS) at:
1st Street (EW) - #5

Highland Home Road (NS) at:
Wilson Street (EW) - #14
Ramsey Street (EW) - #15

Sunset Avenue (NS) at:
Wilson Street (EW) - #18
Lincoln Street (EW) - #22
Westward Avenue (EW) - #23

22nd Street (NS) at:
Westward Avenue (EW) - #30

8th Street (NS) at:
I-10 Freeway WB Ramps (EW) - # 33
I-10 Freeway EB Ramps (EW) - #34
Lincoln Street (EW) - #35

34. The proposed project does not create a significant impact at the study area intersections for General Plan Buildout Year (2035) With Project traffic conditions, with improvements.

E. Mitigation Measures

The following measures are recommended to mitigate the impact of the project on traffic circulation:

On-Site

1. Site-specific circulation and access recommendations are depicted on Figures 112 to 117.

2. Construct Sunset Avenue from the north project boundary to the south project boundary at its ultimate half-section width including landscaping and parkway improvements in conjunction with development (Secondary Highway; see Figure 8).

3. Construct Rancho San Gorgonio Parkway north of A Street at 22nd Street to Westward Avenue at its ultimate half-section width including landscaping and parkway improvements in conjunction with development (116 foot right-of-way; see Figure 111).

4. Construct Rancho San Gorgonio Parkway south of Westward Avenue at 8th Street along the project boundary at its ultimate cross-section width including landscaping and parkway improvements in conjunction with development (146 foot right-of-way; see Figure 111).

5. Construct Westward Avenue along the project boundaries at its ultimate half-section width including landscaping and parkway improvements in conjunction with development (Collector Highway; see Figure 8). Construction of Westward Avenue should be coordinated with other land owners' so that improvements are done simultaneously along Westward Avenue from Sunset Avenue to San Gorgonio Avenue. This will alleviate Westward Avenue from being partially improved sporadically along the project's property boundaries.

6. Construct Victory Avenue from Rancho San Gorgonio Parkway to Lovell Street at its ultimate half-section width including landscaping and parkway improvements in conjunction with development (Local Street).

7. Construct Old Idyllwild Road from C Street to the south project boundary at its ultimate half-section width including landscaping and parkway improvements in conjunction with development.

8. Obtain the necessary right-of-way to construct C Street from the east project boundary to SR-243. C Street should intersect SR-243 at a right angle and adequate sight distance should be provided. Engineering design standards and safety features shall be maintained including traffic signalization and high speed signage as identified by the City of Banning Transportation Department staff.

9. Sight distance at project accesses shall comply with standard California Department of Transportation and City of Banning sight distance standards. The final grading, landscaping, and street improvement plans shall demonstrate that sight distance standards are met. Such plans must be reviewed by the City and approved as consistent with this measure prior to issue of grading permits.

10. Separate on-site traffic signing and striping should be implemented in conjunction with detailed construction plans for the project.

Off-Site

1. As is the case for any roadway design, the City of Banning should periodically review traffic operations in the vicinity of the project once the project is constructed to assure that the traffic operations are satisfactory.

2. Participate in the phased construction of off-site traffic signals through payment of traffic signal mitigation fees. The traffic signals within the study area at buildout should specifically include an interconnect of the traffic signals to function in a coordinated system.

3. Table 33 shows a summary of the required off-site improvements. Recommended improvements to the study area network are consistent with the City of Banning, City of Beaumont, and County of Riverside General Plan Circulation Elements and roadway cross-section widths.

4. The following improvements are identified as City of Banning TUMF improvements within the roadway network:

    - 8th Street from Wilson Street to the I-10 Freeway to 2 lanes
    - Sunset Avenue I-10 Freeway interchange and railroad crossing
    - Sun Lakes Boulevard/Westward Avenue from Highland Home Road to Westward Avenue to 4 lanes
    - Highland Home Road from north of 14th Street to Wilson Avenue to 4 lanes and from Wilson Street to Sun Lakes Boulevard to 6 lanes including the I-10 Freeway interchange
    - Potrero Boulevard west of SR-79 to SR-79 to 4 lanes

5. The following improvements are identified as City of Banning Capital Improvement Project improvements within the roadway network:

    - Sun Lakes Boulevard/Westward Avenue from Highland Home Road to Sunset Street
    - Sunset Avenue Grade Separation
    - Ramsey Street from 8th Street east to Hargrave Street
    - Lincoln Street from San Gorgonio Avenue east to Hargrave Street
    - 8th Street from Lincoln Street to Westward Avenue

II. PROJECT DESCRIPTION

This section discusses the project location and proposed development. Figure 1 shows the project location map and Figure 2 illustrates the project conceptual land use plan. For purposes of this traffic analysis, the conceptual land use plan has been divided into traffic analysis zones 1 through 10.

A. Location

The project site consists of 830.84 acres of currently undeveloped land and is generally located east of Sunset Avenue, south of Westward Avenue, and west of San Gorgonio Avenue/Old Idyllwild Road in the City of Banning. It should be noted that the project is partially within the jurisdiction of the County of Riverside and coordination with the County is required for annexation purposes.

B. Proposed Development

The proposed development consists of 42 planning areas (see Figure 2). The project site is proposed to be developed with the following land uses:

Land Use	Quantity	Units[1]
Single-Family Detached Residential	1,449	DU
Multi-Family Attached Residential (Apartments)	931	DU
Senior Adult Housing (Detached)	754	DU
Neighborhood Commercial[2]	101.604	TSF
Elementary School	800	ST
Community Park	25.0	AC

C. Phasing

For purposes of evaluating the traffic impacts at different stages of development, the project has been divided into six phases. Phase 1 is anticipated to be complete by Year 2017. Phase 2 is anticipated to be complete by Year 2019. Phase 3 is anticipated to be complete by Year 2022. Phase 4 is anticipated to be complete by 2025. Phase 5 is anticipated to be complete by 2029. The project buildout, or phase 6, is anticipated to be complete by Year 2035. The phasing utilized in this traffic impact analysis is consistent with the phasing shown in the Specific Plan.

[1] DU = Dwelling Units; TSF = Thousand Square Feet; ST = Students; AC = Acres

[2] The neighborhood commercial has an overlay option that includes 168 apartment dwelling units. 168 apartment dwelling units generates 1,117 daily vehicle trips with 86 trips in the morning peak hour and 104 in the evening peak hour. The 101,604 square foot neighborhood commercial shopping center generates 6,656 daily vehicle trips with 158 trips in the morning peak hour and 400 in the evening peak hour (including pass-by trip reductions). As such, the neighborhood commercial would generate more vehicle trips. Therefore, the neighborhood commercial option has been analyzed to provide a maximum likely scenario.

Figure 1
Project Location Map

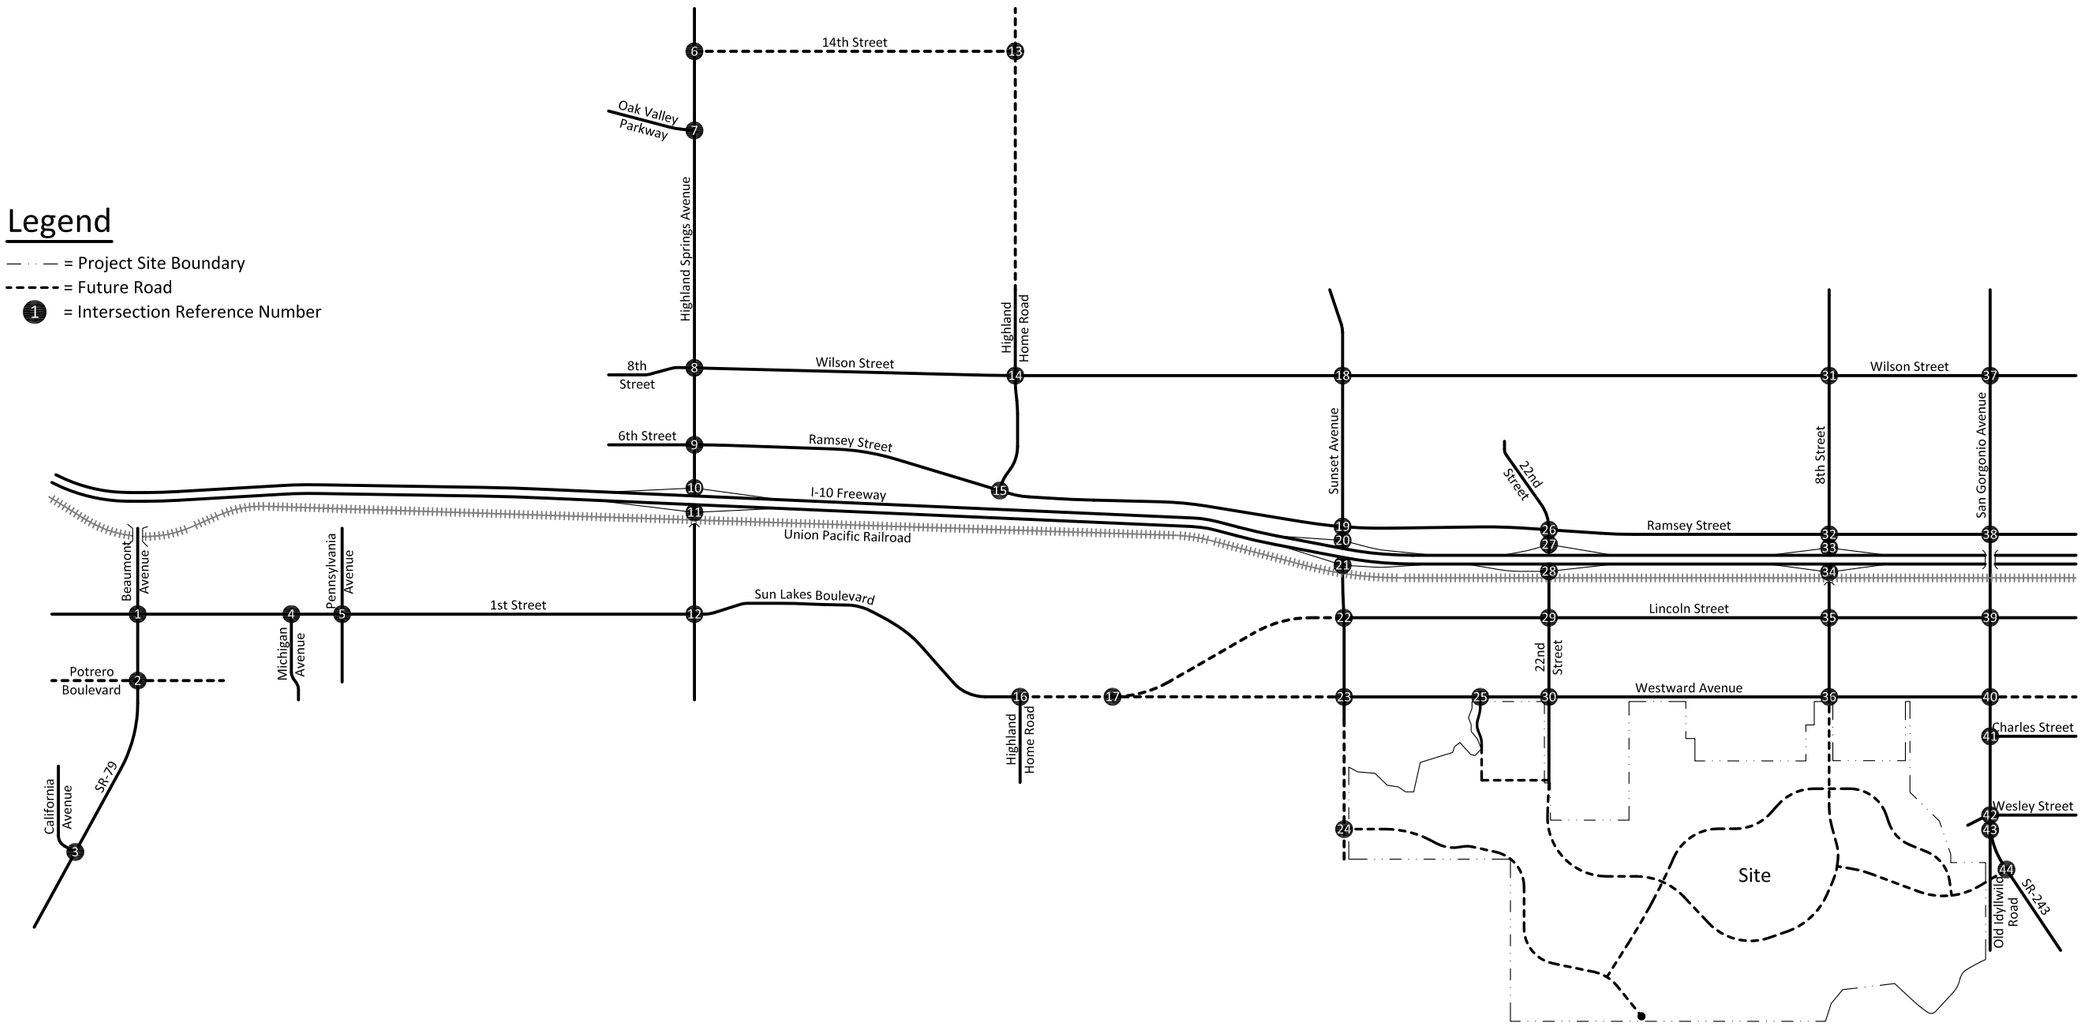

Figure 2
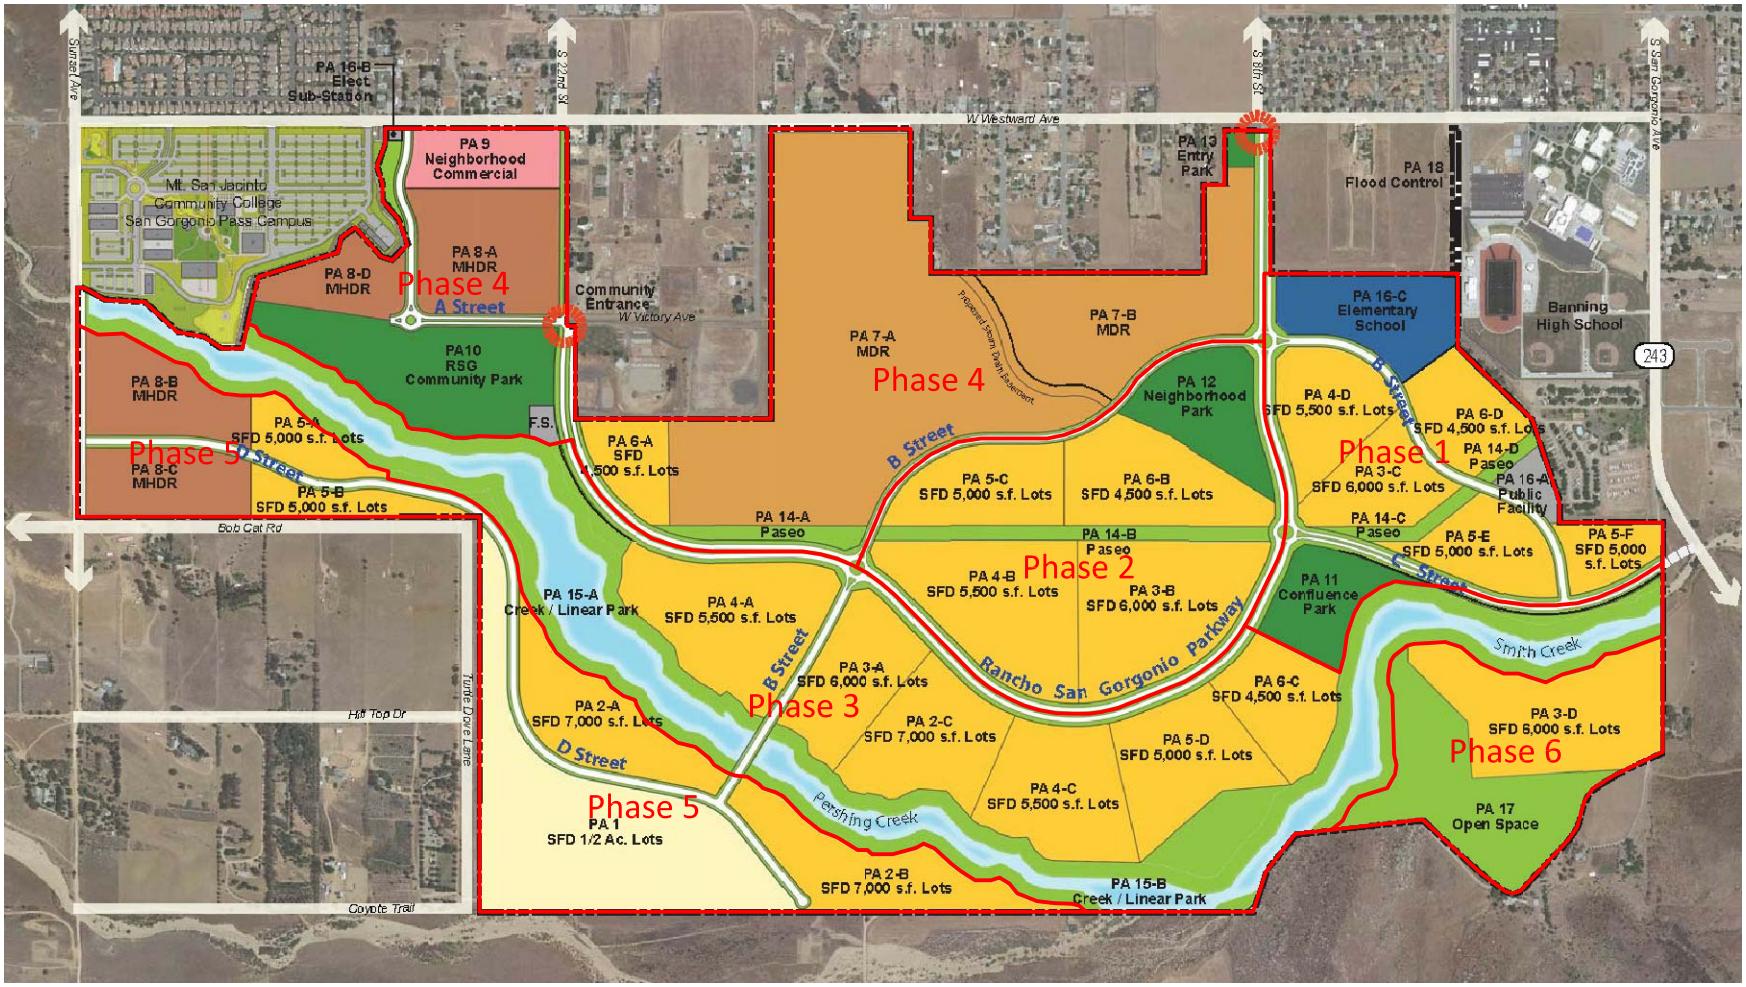
Site Plan



III. EXISTING TRAFFIC CONDITIONS

The traffic conditions as they exist today are discussed below and illustrated on Figures 3 to 12.

A. Surrounding Street System

Existing roadways in the vicinity of the project study area include Beaumont Avenue/SR-79, Michigan Avenue, Pennsylvania Avenue, Highland Springs Avenue, Highland Home Road, Sunset Avenue, 22nd Street, 8th Street, San Gorgonio Avenue, SR-243, Oak Valley Parkway, 8th Street, Wilson Street, 6th Street, Ramsey Street, 1st Street, Sun Lakes Boulevard, Lincoln Street, Westward Avenue, California Avenue, Charles Street, and Wesley Street. Regional access is provided by the I-10 Freeway.

Beaumont Avenue/SR-79: This north-south four lane undivided to divided roadway is classified as an Expressway A (184 or 220 foot right-of-way) on the City of Beaumont General Plan Circulation Element. It currently carries approximately 25,700 to 31,000 vehicles per day in the study area.

Michigan Avenue: This north-south two lane undivided roadway is classified as a Major Highway (100 foot right-of-way) on the City of Beaumont General Plan Circulation Element. It currently carries approximately 3,300 vehicles per day in the study area.

Pennsylvania Avenue: This north-south two lane undivided to divided roadway is classified as a Major Highway (100 foot right-of-way) on the City of Beaumont General Plan Circulation Element. It currently carries approximately 8,400 vehicles per day in the study area.

Highland Springs Avenue: This north-south two lane undivided to six lane divided roadway is classified as a Major/Arterial Highway (100 or 110 foot right-of-way) on the City of Banning General Plan Circulation Element. The roadway is classified as an Arterial (100 foot right-of-way) on the City of Banning General Plan Circulation Element. It currently carries approximately 6,100 to 29,200 vehicles per day in the study area.

Highland Home Road: This north-south two lane undivided to four lane divided roadway is classified as a Major/Arterial Highway (100 to 110 foot right-of-way) on the City of Banning General Plan Circulation Element. It currently carries approximately 200 to 1,700 vehicles per day in the study area.

Sunset Avenue: This north-south two lane undivided to four lane divided roadway is classified as a Collector Highway (66 foot right-of-way) north of Wilson Street, a Major Highway (100 foot right-of-way) between Wilson Street and the I-10 Freeway, and a Secondary Highway (88 foot right-of-way) south of the I-10 Freeway on the City of Banning General Plan Circulation Element. It currently carries approximately 400 to 10,500 vehicles per day in the study area.

22nd Street: This north-south two lane undivided to four lane divided roadway is classified as a Collector Highway (66 foot right-of-way) north of Ramsey Street and as a Secondary

22nd Street: This north-south two lane undivided to four lane divided roadway is classified as a Collector Highway (66 foot right-of-way) north of Ramsey Street and as a Secondary Highway (88 foot right-of-way) south of Ramsey Street on the City of Banning General Plan Circulation Element. It currently carries approximately 100 to 8,900 vehicles per day in the study area.

8th Street: This north-south two lane undivided roadway is classified as a Collector Highway (66 foot right-of-way) north of Wilson Street, as a Secondary Highway (88 foot right-of-way) between Wilson Street and Ramsey Street, and as a Major/Arterial Highway (100 to 110 foot right-of-way) south of Ramsey Street on the City of Banning General Plan Circulation Element. It currently carries approximately 2,100 to 13,100 vehicles per day in the study area.

San Gorgonio Avenue/SR-243: This north-south two to three lane undivided roadway is classified as a Collector Highway (66 foot right-of-way) north of Wilson Street. as a Secondary Highway (88 foot right-of-way) between Wilson Street and Lincoln Street, and as a Major/Arterial Highway (100 to 110 foot right-of-way) south of Lincoln Street on the City of Banning General Plan Circulation Element. It currently carries approximately 1,800 to 3,800 vehicles per day in the study area.

Oak Valley Parkway: This east-west four lane divided roadway is classified as a Major Highway (100 foot right-of-way) on the City of Beaumont General Plan Circulation Element. It currently carries approximately 5,000 vehicles per day in the study area.

8th Street: This east-west four lane divided roadway is classified as a Major Highway (100 foot right-of-way) on the City of Beaumont General Plan Circulation Element. It currently carries approximately 3,300 vehicles per day in the study area.

Wilson Street: This east-west two lane undivided to four lane divided roadway is classified as a Major/Arterial Highway (100 to 110 foot right-of-way) on the City of Banning General Plan Circulation Element. It currently carries approximately 3,400 to 9,200 vehicles per day in the study area.

6th Street: This east-west five lane divided roadway is classified as an Arterial Highway (110 foot right-of-way) on the City of Beaumont General Plan Circulation Element. It currently carries approximately 12,700 vehicles per day in the study area.

Ramsey Street: This east-west two lane undivided to four lane divided roadway is classified as a Major/Arterial Highway (100 to 110 foot right-of-way) on the City of Banning General Plan Circulation Element. It currently carries approximately 5,600 to 13,500 vehicles per day in the study area.

1st Street: This east-west two to four lane divided roadway is classified as a Major Highway (100 foot right-of-way) east of Michigan Avenue and as a Secondary Highway (88 foot right-of-way) west of Michigan Avenue on the City of Beaumont General Plan Circulation Element. It currently carries approximately 5,000 to 11,800 vehicles per day in the study area.

Sun Lakes Boulevard: This east-west four lane divided roadway is classified as a Major/Arterial Highway (100 to 110 foot right-of-way) on the City of Banning General Plan Circulation Element. It currently carries approximately 400 to 6,000 vehicles per day in the study area.

Lincoln Street: This east-west two lane undivided roadway is classified as a Major/Arterial Highway (100 to 110 foot right-of-way) on the City of Banning General Plan Circulation Element. It currently carries approximately 1,800 to 4,700 vehicles per day in the study area.

Westward Avenue: This east-west two lane undivided roadway is classified as a Collector Highway (66 foot right-of-way) on the City of Banning General Plan Circulation Element. It currently carries approximately 700 to 2,000 vehicles per day in the study area.

California Avenue: This east-west two lane undivided roadway is classified as a Secondary Highway (88 foot right-of-way) on the City of Beaumont General Plan Circulation Element. It currently carries approximately 3,700 vehicles per day in the study area.

Charles Street: This east-west two lane undivided roadway is not classified on the City of Banning General Plan Circulation Element. It currently carries approximately 600 vehicles per day in the study area.

Wesley Street: This east-west two lane undivided roadway is classified as a Collector Highway (66 foot right-of-way) on the City of Banning General Plan Circulation Element. It currently carries approximately 100 to 300 vehicles per day in the study area.

B. Existing Travel Lanes and Intersection Controls

Figure 3 identifies the existing roadway conditions for study area roadways. The number of through lanes for existing roadways, existing intersection controls, and the intersection lane geometry is identified on Figure 3.

C. Existing Average Daily Traffic Volumes

Figure 4 depicts the existing average daily traffic volumes. Existing average daily traffic volumes have been obtained from the Traffic Volumes on California State Highways (latest available; 2013) by the California Department of Transportation and factored from peak hour counts (see Appendix B) made for Kunzman Associates, Inc. in December 2012/February 2013/January 2014 using the following formula for each intersection leg:

PM Peak Hour (Approach Volume + Exit Volume) x 12 = Leg Volume

This is a conservative estimate and may over estimate the average daily traffic volumes.

With the Sunset Avenue/I-10 Freeway interchange under construction at the time of the analysis, the City of Banning Transportation Department staff requested that the traffic counts utilized in the February 28, 2014 traffic impact analysis be utilized for this report.

D. Existing Intersection Delay

The technique used to assess the capacity needs of an intersection is known as the Intersection Delay Method (see Appendix E). To calculate delay, the volume of traffic using the intersection is compared with the capacity of the intersection.

The existing delay and Level of Service for intersections in the vicinity of the project are shown in Table 1. Existing delay is based upon manual peak hour intersection turning movement counts obtained by Kunzman Associates, Inc. in December 2012/February 2013/January 2014 (see Figures 5 and 6). Traffic count worksheets are provided in Appendix B.

There are two peak hours in a weekday. The morning peak hour is between 7:00 AM and 9:00 AM, and the evening peak hour is between 4:00 PM and 6:00 PM. The actual peak hour within the two hour interval is the four consecutive 15 minute periods with the highest total volume when all movements are added together. Thus, the evening peak hour at one intersection may be 4:45 PM to 5:45 PM if those four consecutive 15 minute periods have the highest combined volume.

The study area intersections were selected based on the 50 peak hour project trip contribution test as outlined in the Riverside County Transportation Department Traffic Impact Analysis Preparation Guide.

The following study area intersections currently operate at unacceptable Levels of Service during the peak hours for existing traffic conditions:

Beaumont Avenue/SR-79 (NS) at:
California Avenue (EW) - #3

8th Street (NS) at:
I-10 Freeway EB Ramps (EW) - #34

Existing delay worksheets are provided in Appendix E.

E. Existing Traffic Signal Warrant Analysis

Traffic signals appear to be currently warranted at the following study area intersections for existing traffic conditions (see Appendix F):

Beaumont Avenue/SR-79 (NS) at:
California Avenue (EW) - #3

Michigan Avenue (NS) at:
1st Street (EW) - #4

Pennsylvania Avenue (NS) at:
1st Street (EW) - #5

Sunset Avenue (NS) at:
- Wilson Street (EW) - #18
- I-10 Freeway WB Ramps (EW) - #20
- I-10 Freeway EB Ramps (EW) - #21

8th Street (NS) at:
- I-10 Freeway WB Ramps (EW) - #33
- I-10 Freeway EB Ramps (EW) - #34

The unsignalized intersections have been evaluated for traffic signals using the California Department of Transportation Warrant 3 Peak Hour traffic signal warrant analysis, as specified in the California Manual on Uniform Traffic Control Devices (2014 Edition).

F. Relevant Circulation Plans

Figure 7 shows the current City of Banning General Plan Circulation Element. Both existing and future roadways are included in the Circulation Element of the General Plan and are graphically depicted on Figure 7. This figure shows the nature and extent of arterial highways that are needed to adequately serve the ultimate development depicted by the land use element of the General Plan. The City of Banning General Plan roadway cross-sections are illustrated on Figure 8.

It should be noted that although the City of Banning General Plan Circulation Element shows a future Highland Home Road connection from Ramsey Street to Sun Lakes Boulevard with a future interchange (later changed to an overpass/underpass) at the I-10 Freeway, the City of Banning Transportation Department staff has advised that this connection will not occur. As a result, the Riverside Traffic Analysis Model (RivTAM) was refined eliminating this roadway while redistributing traffic projected to utilize this connection in the future to the surrounding roadway network.

The City of Beaumont General Plan Circulation Element and General Plan roadway cross-sections are illustrated on Figures 9 and 10, respectively. The County of Riverside Pass Area Circulation Plan and General Plan roadway cross-sections are illustrated on Figures 11 and 12, respectively.

1. General Plan Amendment

It should be noted that the proposed project requires a City of Banning General Plan Amendment to remove Porter Road extending through the project site including the County of Riverside in this process as part of the project site is located within the County. Porter Road is shown as an east-west Secondary Highway on the City of Banning General Plan Circulation Element (see Figure 7). The analysis presented in this report has assumed that Porter Road would not extend through the project and the intersection improvements recommended for General Plan Buildout Year (2035) With Project traffic conditions ensure that any subsequent impacts are mitigated.

It should be noted that according to Resolution No. 2008-16, the City Council for the City of Banning approved General Plan Amendment No, 07-2503 (January 22, 2008) to

delete Porter Road between Sunset Avenue and 22nd Street from the General Plan system. The Resolution notes that "the development occurring in the area will use an alternative route, Bobcat Road, for east west access between 22nd Street and Sunset Avenue that is equivalent to and serves the same purpose as the portion of roadway that is being deleted."

It should be noted that one of the purposes of the traffic impact analysis is to determine the mitigation necessary for Westward Avenue and other east-west connections with the removal of Bobcat Road.

2. Planned Improvements

The following improvements are identified as TUMF improvements within the roadway network:

- 8th Street from Wilson Street to the I-10 Freeway to 2 lanes
- Sunset Avenue I-10 Freeway interchange and railroad crossing
- Sun Lakes Boulevard/Westward Avenue from Highland Home Road to Westward Avenue to 4 lanes
- Highland Home Road from north of 14th Street to Wilson Avenue to 4 lanes and from Wilson Street to Sun Lakes Boulevard to 6 lanes including the I-10 Freeway interchange
- Potrero Boulevard west of SR-79 to SR-79 to 4 lanes

The following improvements are identified as City of Banning Capital Improvement Project improvements within the roadway network:

- Sun Lakes Boulevard/Westward Avenue from Highland Home Road to Sunset Street
- Sunset Avenue Grade Separation
- Ramsey Street from 8th Street east to Hargrave Street
- Lincoln Street from San Gorgonio Avenue east to Hargrave Street

G. Transit Service

The City of Banning Pass Transit Routes 5 and 6 currently serve most of the study area including Highland Springs Avenue, Sunset Avenue, Ramsey Street, Lincoln Street, Westward Avenue, and San Gorgonio Avenue. The Pass Transit Route 1 services trips to and from the Cabazon Outlet Malls with multiple stops within the City of Banning.

[1] When a right turn is designated, the lane can either be striped or unstriped. To function as a right turn lane there must be sufficient width for right turning vehicles to travel outside the through lanes.

L = Left; T = Through; R = Right; d = De Facto Turn Lane; > = Right Turn Overlap; >> = Free Right Turn

[2] Delay and level of service calculated using the following analysis software: Traffix, Version 7.9.0215 (2008). Per the Highway Capacity Manual, overall average intersection delay and level of service are shown for intersections with traffic signal or all way stop control. For intersections with cross street stop control, the delay and level of service for the worst individual movement (or movements sharing a single lane) are shown.

[3] TS = Traffic Signal; CSS = Cross Street Stop; AWS = All Way Stop

[4] 99.9-F = Delay High, Intersection Unstable, Level of Service F

IV. PROJECT TRAFFIC

The proposed development consists of 45 planning areas, including single-family detached residential, multi-family attached residential, senior adult housing (detached), neighborhood commercial, elementary school, and community park land uses.

A. Trip Generation

The trips generated by the project are determined by multiplying an appropriate trip generation rate by the quantity of land use. Trip generation rates are predicated on the assumption that energy costs, the availability of roadway capacity, the availability of vehicles to drive, and life styles remain similar to what are known today. A major change in these variables may affect trip generation rates.

Trip generation rates were determined for daily traffic, morning peak hour inbound and outbound traffic, and evening peak hour inbound and outbound traffic for the proposed land uses. By multiplying the trip generation rates by the land use quantities, the project-generated traffic volumes are determined. Table 2 exhibits the trip generation rates. The trip generation rates are from the Institute of Transportation Engineers, Trip Generation Manual, 9th Edition, 2012 and from San Diego Association of Governments, Traffic Generators, April 2002 (for the community park land use only). Tables 3 to 8 exhibit the project peak hour and daily traffic volumes for Phases 1 to 6, respectively.

For Opening Year (2017), the project site is projected to generate a total of approximately 3,307 daily vehicle trips, 538 of which will occur during the morning peak hour and 359 of which will occur during the evening peak hour.

For Interim Year (2019), the project site is projected to generate a total of approximately 6,725 daily vehicle trips, 807 of which will occur during the morning peak hour and 718 of which will occur during the evening peak hour.

For Interim Year (2022), the project site is projected to generate a total of approximately 10,952 daily vehicle trips, 1,140 of which will occur during the morning peak hour and 1,162 of which will occur during the evening peak hour.

For Interim Year (2025), the project site is projected to generate a total of approximately 25,296 daily vehicle trips, 1,747 of which will occur during the morning peak hour and 2,224 of which will occur during the evening peak hour.

For Interim Year (2029), the project site is projected to generate a total of approximately 30,832 daily vehicle trips, 2,177 of which will occur during the morning peak hour and 2,770 of which will occur during the evening peak hour.

For General Plan Buildout Year (2035) (project buildout), the project site is projected to generate a total of approximately 31,698 daily vehicle trips, 2,245 of which will occur during the morning peak hour and 2,861 of which will occur during the evening peak hour.

Trip Generation Notes

As with most neighborhood shopping centers, a significant percentage of the shopping center trips can reasonably be expected to come from pass-by trips; trips that "pass by" while travelling from an origin to a destination other than the shopping center and would already be on the roadway system. Based on the Institute of Transportation Engineers, Trip Generation Handbook, 2nd Edition, 2004, a 34% pass-by trip reduction has been applied to the shopping center land use in Planning Area 9.

As previously noted, the neighborhood commercial (Planning Area 9) has an overlay option of 168 apartment dwelling units. Below is a table which shows a trip generation comparison between the land uses:

Land Use	Quantity	Morning Peak Hour			Evening Peak Hour			Daily
		Inbound	Outbound	Total	Inbound	Outbound	Total	
Apartments	168 DU	17	69	86	67	37	104	1,117
Neighborhood Commercial	101.604 TSF	98	60	158	192	208	400	6,656
Difference		+81	-9	+72	+125	+171	+296	+5,539

Since the neighborhood commercial option generates more daily, morning peak hour, and evening peak hour trips (even though the apartments land use generates 9 more outbound trips during the morning peak hour) it has been analyzed to provide a maximum likely scenario.

The Specific Plan dwelling unit count of 3,385 dwelling units includes the elementary school planning area (Planning Area 16-C) being developed as residential in lieu of the school. The trip generation difference is shown below:

Land Use	Quantity	Morning Peak Hour			Evening Peak Hour			Daily
		Inbound	Outbound	Total	Inbound	Outbound	Total	
Single-Family Detached Residential	83 DU	16	46	62	52	31	83	790
Elementary School	800 ST	200	160	360	56	64	120	1,032
Difference		+184	+114	+298	+4	+33	+37	+242

Since the elementary school option generates more daily, morning peak hour, and evening peak hour trips it has been analyzed to provide a maximum likely scenario.

The neighborhood park and open space land uses would generate nominal trips on weekdays and are anticipated to remain internal to the Specific Plan. The Rancho San Gorgonio Community Park (Planning Area 10) will be programmed by the City of Banning for community events which will generate trips from outside the Specific Plan and has been analyzed as such. The public facility (Planning Area 16) consists of a proposed electrical switching station, or similar use, which would not generate trips on a regular daily basis.

The unspecified future development (Planning Area 18) consists of a flood control channel that is not anticipated to generate any trips.

Phasing

The project is proposed to be completed in six phases. Phase 1 includes Planning Areas 3-C, 4-D, 5-E, 5-F, 6-D, 11, 13, 14-C, 14-D, 16-A, 16-C, 15-B (eastern portion), and 18. Phase 2 includes Planning Areas 3-B, 4-B, 5-C, 6-B, 12, and 14-B. Phase 3 includes Planning Areas 2-C, 3-A, 4-A, 4-C, 5-D, 6-C, 15-A, and 15-B (western portion). Phase 4 includes Planning Areas 6-A, 7-A, 7-B, 8-A, 8-D, 9, 10, 14-A, and 16-B. Phase 5 includes Planning Areas 1, 2-A, 2-B, 5-A, 5-B, 8-B, and 8-C. Phase 6 includes Planning Areas 3-D and 17.

B. Trip Distribution

For purposes of this traffic analysis, the site plan has been divided into traffic analysis zones 1 through 10 (see Figure 13). Figures 14 through 49 contain the directional distributions of the project traffic for the proposed project land uses.

The trip distributions of the project traffic were based on the select zone evening peak period trip distribution from the Riverside Traffic Analysis Model (RivTAM) (see Appendix D). Historically, traffic impact analyses in the County of Riverside have been prepared in this manner with the theory being that the morning peak hour select zone trip distribution percentages would be the same as the evening peak hour select zone, except the inbound and outbound trips being reversed. For instance, a vehicle likely travels the same route from work to home in the evening peak hour as travelled in the morning peak hour. The assignment of inbound versus outbound trips is accounted for in the project trip generation.

The socio-economic data inputs to the Riverside Traffic Analysis Model are representative of the proposed project development intensity and land uses. That is, the Year 2035 Riverside Traffic Analysis Model was run with the proposed project land uses in the project traffic analysis zones. The proposed project development was divided into nine zones for the purposes of modeling the most likely paths vehicles will take traversing within the proposed development to the external roadway network, and vice-versa, based on the planning area locations.

The trip distributions were then refined from Buildout Year (2035) to Existing Plus Project traffic conditions based on what roadway improvements are anticipated to be built for each analysis year. The City of Banning staff provided information pertaining to the anticipated roadway improvements. Trip distribution redistribution from the Buildout Year (2035) trip distribution based on the select zone trip distribution percentages was derived. City of Banning Transportation Department staff reviewed the trip distributions for each analysis year and refined as necessary. The outcome of which are the trip distributions utilized throughout this analysis.

The trip generation and distributions were utilized to determine the study area intersections. Scoping discussions with the City of Banning and County of Riverside in conjunction with their respective traffic impact analysis guidelines determined the intersections to be analyzed. The study area intersections were determined based on both

jurisdictions input. Site plan changes occurred between the first draft of the traffic impact analysis and the current iteration. These changes included losses and increases to the number of dwelling units within some planning areas as well as residential land use changes. The commercial retail portion of the project was reduced in scope. To remain consistent with all previous drafts of the traffic impact analysis, the City of Banning determined that the study area intersections that were initially analyzed shall remain as such.

The trip distributions allocate substantially more than 50 peak hour trips on SR-79 south towards the City of San Jacinto. Since the nearest intersection beyond the study area intersections would be over 5 miles from the project site, the County of Riverside and City of Banning Transportation Department staffs determined that the study area intersections should be within a 5 mile radius of the project site, with no analysis exceeding the 5 mile radius, which is consistent with the County of Riverside traffic impact analysis guidelines.

C. Trip Assignment

Based on the identified trip generation and distributions, project average daily traffic volumes have been calculated for existing plus project, Opening Year (2017), Interim Year (2019), Interim Year (2022), Interim Year (2025) Interim Year (2029) and General Plan Buildout Year (2035) conditions and are shown on Figures 50 through 56, respectively. The project morning and evening peak hour intersection turning movement volumes expected for existing plus project conditions are shown on Figures 57 and 58, respectively. The Opening Year (2017) project morning and evening peak hour intersection turning movement volumes expected are shown on Figures 59 and 60, respectively. The Interim Year (2019) project morning and evening peak hour intersection turning movement volumes expected are shown on Figures 61 and 62, respectively. The Interim Year (2022) project morning and evening peak hour intersection turning movement volumes expected are shown on Figures 63 and 64, respectively. The Interim Year (2025) project morning and evening peak hour intersection turning movement volumes expected are shown on Figures 65 and 66, respectively. The Interim Year (2029) project morning and evening peak hour intersection turning movement volumes expected are shown on Figures 67 and 68, respectively. The General Plan Buildout Year (2035) project morning and evening peak hour intersection turning movement volumes expected are shown on Figures 69 and 70, respectively.

D. Modal Split

The traffic reducing potential of public transit has not been considered in this report. Essentially the traffic projections are conservative in that public transit might be able to reduce the traffic volumes.

Table 2

V. EXISTING PLUS PROJECT CONDITIONS

A. Method of Projection

To assess Existing Plus Project traffic conditions, project traffic is combined with existing traffic. Figure 71 shows the average daily traffic volumes that can be expected for Existing Plus Project traffic conditions.

B. Capacity and Level of Service Analysis

The technique used to assess the capacity needs of an intersection is known as the Intersection Delay Method as prescribed by the Highway Capacity Manual (see Appendix E). To calculate delay, the volume of traffic using the intersection is compared with the capacity of the intersection.

The Existing Plus Project delay and Level of Service for the study area roadway network are shown in Table 9. Table 9 shows delay values based on geometrics at the study area intersections, without and with improvements. Existing Plus Project morning, and evening peak hour intersection turning movement volumes are shown on Figures 72 and 73, respectively.

As shown in Table 9, the study area intersections are projected to operate within acceptable Levels of Service during the peak hours for Existing Plus Project traffic conditions, except for the following study area intersections:

Beaumont Avenue/SR-79 (NS) at:
- California Avenue (EW) - #3

Sunset Avenue (NS) at:
- I-10 Freeway WB Ramps (EW) - #20
- I-10 Freeway EB Ramps (EW) - #21

22nd Street (NS) at:
- Westward Avenue (EW) - #30

8th Street (NS) at:
- I-10 Freeway WB Ramps (EW) - # 33
- I-10 Freeway EB Ramps (EW) - #34
- Lincoln Street (EW) - #35
- Westward Avenue (EW) - #36

As shown in Table 10, the proposed project does not create a significant impact at the study area intersections for Existing Plus Project traffic conditions, with improvements. Existing Plus Project delay worksheets are provided in Appendix E.

C. Existing Plus Project Traffic Signal Warrant Analysis

Traffic signals are projected to be warranted at the following additional study area intersections for Existing Plus Project traffic conditions (see Appendix F):

Highland Home Road (NS) at:
Ramsey Street (EW) - #15

Sunset Avenue (NS) at:
Lincoln Street (EW) - #22
Westward Avenue (EW) - #23

A Street (NS) at:
Westward Avenue (EW) - #25

22nd Street (NS) at:
I-10 Freeway WB Ramps (EW) - #27
I-10 Freeway EB Ramps (EW) - #28
Westward Avenue (EW) - #30

8th Street (NS) at:
Lincoln Street (EW) - #35
Westward Avenue (EW) - #36

The unsignalized intersections have been evaluated for traffic signals using the California Department of Transportation Warrant 3 Peak Hour traffic signal warrant analysis, as specified in the California Manual on Uniform Traffic Control Devices (2014 Edition).

[1] When a right turn is designated, the lane can either be striped or unstriped. To function as a right turn lane there must be sufficient width for right turning vehicles to travel outside the through lanes.

L = Left; T = Through; R = Right; d = De Facto Turn Lane; > = Right Turn Overlap; >> = Free Right Turn; **BOLD** = Improvement

[2] Delay and level of service calculated using the following analysis software: Traffix, Version 7.9.0215 (2008). Per the Highway Capacity Manual, overall average intersection delay and level of service are shown for intersections with traffic signal or all way stop control. For intersections with cross street stop control, the delay and level of service for the worst individual movement (or movements sharing a single lane) are shown.

[3] TS = Traffic Signal; CSS = Cross Street Stop; AWS = All Way Stop

[4] 99.9-F = Delay High, Intersection Unstable, Level of Service F

[1] When a right turn is designated, the lane can either be striped or unstriped. To function as a right turn lane there must be sufficient width for right turning vehicles to travel outside the throug lanes.

L = Left; T = Through; R = Right; d = De Facto Turn Lane; > = Right Turn Overlap; >> = Free Right Turn;**BOLD** = Improvement

[2] Delay and level of service calculated using the following analysis software: Traffix, Version 7.9.0215 (2008). Per the Highway Capacity Manual, overall average intersection delay and level of service are shown for intersections with traffic signal or all way stop control. For intersections with cross street stop control, the delay and level of service for the worst individual movement (or movements sharing a single lane) are shown.

[3] TS = Traffic Signal; CSS = Cross Street Stop; AWS = All Way Stop

[4] 99.9-F = Delay High, Intersection Unstable, Level of Service F

VI. OPENING YEAR (2017) TRAFFIC CONDITIONS

To assess Year 2017 traffic conditions, existing traffic is combined with ambient and other development growth from the Riverside Traffic Analysis Model and the project traffic. Figures 60 to 65 illustrate the Year 2021 traffic conditions.

A. Method of Projection

Based upon discussions with City of Banning staff, the average daily traffic volume forecasts have been determined using the growth increment approach[3] on the Riverside Traffic Analysis Model (RivTAM) Year 2007 and Year 2035 average daily traffic volume forecasts (see Appendix C). This difference defines the growth in traffic over the 28 year period. The incremental growth in average daily traffic volume has been factored to reflect the forecast growth between Year 2014 and Year 2035. For this purpose, linear growth between the Year 2007 base condition and the forecast Year 2035 condition was assumed. Since the increment between Year 2014 and Year 2035 is 21 years of the 28 year time frame, a factor of 0.75 (i.e., 21/28) was used.

The Year 2035 daily and peak hour directional roadway segment volume forecasts have been determined using the growth increment approach on the Riverside Traffic Analysis Model Year 2007 and Year 2035 peak hour volumes. The growth increment calculation worksheets are shown in Appendix C. Current peak hour intersection approach/departure data is a necessary input to this approach. The existing traffic count data serves as the starting point for the refinement process. The initial turning movement proportions are estimated based upon the relationship of each approach leg's forecast traffic volume to the other legs forecast volumes at the intersection. The initial estimate of turning movement proportions is then entered into a spreadsheet program consistent with the National Cooperative Highway Research Program Report 255. A linear programming algorithm is used to calculate individual turning movements that match the known directional roadway segment volumes computed in the previous step. This program computes a likely set of intersection turning movements from intersection approach counts and the initial turning proportions from each approach leg.

The Year 2035 Riverside Traffic Analysis Model (see Appendix D) was run with the proposed project land uses in the project traffic analysis zones. The Riverside Traffic Analysis Model utilizes socio-economic data based on the proposed project land uses and quantities for its analysis. Therefore, to analyze the level of service for Year 2035 with full buildout of the project traffic, it was necessary to manually add the entire project buildout trip generation project traffic to the Year 2035 traffic volumes developed by the model.

[3] This methodology is an accepted procedure for traffic model forecast refinement and smoothing based upon the National Cooperative Highway Research Program (NCHRP Report 255). A linear programming algorithm was used to calculate individual turning movements and the traffic model output was checked for reasonableness and factored up to a minimum of 10% growth as part of the refinement process. The minimum growth includes any additional growth that is not accounted for in the future forecasts. These forecasts were also checked for flow conservation, reasonable growth, and reasonable diversion between parallel routes (i.e., Wilson Street, Ramsey Street, I-10 Freeway, Sun Lakes Boulevard, and Westward Avenue). This methodology is consistent with previous traffic studies conducted in the area by other traffic engineering firms.

The Year 2035 Riverside Traffic Analysis Model was run with the proposed I-10 Bypass Project and without the proposed I-10 Bypass Project. According to the I-10 Bypass Preliminary Engineering and Environmental Services Traffic Operational Analysis Revised Final Report, prepared by Kimley-Horn & Associates, Inc. (October 31, 2013). The opening year for the I-10 Bypass is 2022. Therefore, future forecast volumes before 2022 were analyzed using the Year 2035 Riverside Traffic Analysis Model without the I-10 Bypass and future forecast volumes after 2022 were analyzed using the Year 2035 Riverside Traffic Analysis Model with the I-10 Bypass. Information pertaining to the I-10 Bypass Project can be found at http://rcprojects.org/i10bypass/. According to discussions with the City of Banning Transportation Department staff, County of Riverside Transportation Department staff, and LSA Associates, the RivTAM model was run with Alternative 1 (and similar alternatives) as the most likely scenario.

Quality control checks and forecast adjustments were performed as necessary to ensure that all future traffic volume forecasts reflect a minimum of 10% growth over existing traffic volumes. The result of this traffic forecasting procedure is a series of traffic volumes suitable for traffic operations analysis.

The Year 2017 traffic projections have been interpolated between Year 2035 traffic volumes and existing traffic volumes utilizing a portion of the growth increment.

The technique used to assess the capacity needs of an intersection is known as the Intersection Delay Method (see Appendix E) based on the Highway Capacity Manual – Transportation Research Board Special Report 209. To calculate delay, the volume of traffic using the intersection is compared with the capacity of the intersection. Signalized intersections are considered deficient (Level of Service F) if the overall intersection critical volume to capacity ratio equals or exceeds 1.0, even if the level of service defined by the delay value is below the defined Level of Service standard. The volume to capacity ratio is defined as the critical volumes divided by the intersection capacity. A volume to capacity ratio greater than 1.0 implies that the traffic volume demand is greater than the capacity of the intersection and as a result traffic may begin to queue during the analyzed peak hour.

Per City of Banning traffic study guidelines, all analysis factors and procedures have been obtained from the Riverside County Transportation Department Traffic Impact Analysis Preparation Guide.

The Level of Service analysis for signalized intersections has been performed using optimized signal timing. This analysis has included an assumed lost time of four seconds per phase. Signal timing optimization has considered pedestrian safety and signal coordination requirements. Appropriate time for pedestrian crossings have also been considered in the signalized intersection analysis. All Highway Capacity Manual Level of Service calculations have accounted for a minimum pedestrian walking time of seven seconds.

The peak hour traffic volumes have been adjusted to peak 15 minute volumes for analysis purposes using the existing observed peak 15 minute to peak hour factors for all scenarios analyzed. In accordance with the Riverside County Transportation Department Traffic Impact Analysis Preparation Guide, the Year 2035 peak hour factor has been adjusted

upwards to 1.00. This is to account for the effects of congestion on peak spreading. Peak spreading refers to the tendency of traffic to spread more evenly across time as congestion increases.

The Sunset Avenue Grade Separation Project is currently under construction in the project area. Since the project started construction after existing traffic counts were conducted, the existing traffic counts reflect traffic patterns once the project is completed. The project is anticipated to be completed prior to Opening Year (2017). The future analysis in this report reflects the completion of the Sunset Avenue Grade Separation Project. The intersection geometrics for this project can be found at http://rcprojects.org/sunsetave/.

B. Opening Year (2017) Without Project Average Daily Traffic Volumes

The average daily traffic volumes for Opening Year (2017) Without Project traffic conditions have been determined and are shown on Figure 74.

C. Opening Year (2017) With Project Average Daily Traffic Volumes

The average daily traffic volumes for Opening Year (2017) With Project traffic conditions have been determined and are shown on Figure 75.

D. Opening Year (2017) Without Project Average Intersection Delay and Level of Service

The technique used to assess the capacity needs of an intersection is known as the Intersection Delay Method (see Appendix E). To calculate delay, the volume of traffic using the intersection is compared with the capacity of the intersection.

The delay and Level of Service for Opening Year (2017) Without Project traffic conditions have been calculated and are shown in Table 11. Opening Year (2017) Without Project morning and evening peak hour intersection turning movement volumes are shown on Figures 76 and 77, respectively.

As shown in Table 9, the study area intersections are projected to operate within acceptable Levels of Service during the peak hours for Opening Year (2017) Without Project traffic conditions, except for the following study area intersection:

Beaumont Avenue/SR-79 (NS) at:
California Avenue (EW) - #3

8th Street (NS) at:
I-10 Freeway EB Ramps (EW) - #34

Opening Year (2017) Without Project delay worksheets are provided in Appendix E.

E. Opening Year (2017) With Project Intersection Delay and Level of Service

The technique used to assess the capacity needs of an intersection is known as the Intersection Delay Method (see Appendix E). To calculate delay, the volume of traffic using the intersection is compared with the capacity of the intersection.

The delay and Level of Service for Opening Year (2017) With Project traffic conditions have been calculated and are shown in Table 12. Opening Year (2017) With Project morning and evening peak hour intersection turning movement volumes are shown on Figures 78 and 79, respectively.

As shown in Table 12, the study area intersections are projected to operate within acceptable Levels of Service during the peak hours for Opening Year (2017) With Project traffic conditions, except for the following study area intersections:

Beaumont Avenue/SR-79 (NS) at:
- California Avenue (EW) - #3

8th Street (NS) at:
- I-10 Freeway WB Ramps (EW) - #33
- I-10 Freeway EB Ramps (EW) - #34

As shown in Table 13, the proposed project does not create a significant impact at the study area intersections for Opening Year (2017) With Project traffic conditions, with improvements. Opening Year (2017) With Project delay worksheets are provided in Appendix E.

F. Opening Year (2017) With Project Traffic Signal Warrant Analysis

Traffic signals are projected to be warranted at the following additional study area intersections for Opening Year (2017) With Project traffic conditions (see Appendix F):

8th Street (NS) at:
- Lincoln Street (EW) - #35
- Westward Avenue (EW) - #36

The unsignalized intersections have been evaluated for traffic signals using the California Department of Transportation Warrant 3 Peak Hour traffic signal warrant analysis, as specified in the California Manual on Uniform Traffic Control Devices (2014 Edition).

[1] When a right turn is designated, the lane can either be striped or unstriped. To function as a right turn lane there must be sufficient width for right turning vehicles to travel outside the through lanes.

L = Left; T = Through; R = Right; d = De Facto Turn Lane; > = Right Turn Overlap; >> = Free Right Turn; **BOLD** = Improvement

[2] Delay and level of service calculated using the following analysis software: Traffix, Version 7.9.0215 (2008). Per the Highway Capacity Manual, overall average intersection delay and level of service are shown for intersections with traffic signal or all way stop control. For intersections with cross street stop control, the delay and level of service for the worst individual movement (or movements sharing a single lane) are shown.

[3] TS = Traffic Signal; CSS = Cross Street Stop; AWS = All Way Stop

[4] 99.9-F = Delay High, Intersection Unstable, Level of Service F

VII. INTERIM YEAR (2019) TRAFFIC CONDITIONS

To assess Year 2019 traffic conditions, existing traffic is combined with ambient and other development growth from the Riverside Traffic Analysis Model and the project traffic. Figures 80 to 85 illustrate the Year 2019 traffic conditions.

A. Method of Projection

As described in Section V.I and based upon discussions with City of Banning staff, the average daily traffic volume forecasts have been determined using the growth increment approach on the Riverside Traffic Analysis Model Year 2007 and Year 2035 average daily traffic volume forecasts (see Appendix D). This difference defines the growth in traffic over the 28 year period. The incremental growth in average daily traffic volume has been factored to reflect the forecast growth between Year 2014 and Year 2035. For this purpose, linear growth between the Year 2007 base condition and the forecast Year 2035 condition was assumed. Since the increment between Year 2014 and Year 2035 is 21 years of the 28 year time frame, a factor of 0.75 (i.e., 21/28) was used.

The Year 2019 traffic projections have been interpolated between Year 2035 traffic volumes and existing traffic volumes utilizing a portion of the growth increment (see Section V.I).

The Sunset Avenue Grade Separation Project is currently under construction in the project area. Since the project started construction after existing traffic counts were conducted, the existing traffic counts reflect traffic patterns once the project is completed. The project is anticipated to be completed prior to Opening Year (2017). The future analysis in this report reflects the completion of the Sunset Avenue Grade Separation Project. The intersection geometrics for this project can be found at http://rcprojects.org/sunsetave/.

B. Interim Year (2019) Without Project Average Daily Traffic Volumes

The average daily traffic volumes for Interim Year (2019) Without Project traffic conditions have been determined and are shown on Figure 80.

C. Interim Year (2019) With Project Average Daily Traffic Volumes

The average daily traffic volumes for Interim Year (2019) With Project traffic conditions have been determined and are shown on Figure 81.

D. Interim Year (2019) Without Project Average Intersection Delay and Level of Service

The technique used to assess the capacity needs of an intersection is known as the Intersection Delay Method (see Appendix E). To calculate delay, the volume of traffic using the intersection is compared with the capacity of the intersection.

The delay and Level of Service for Interim Year (2019) Without Project traffic conditions have been calculated and are shown in Table 14. Interim Year (2019) Without Project

morning and evening peak hour intersection turning movement volumes are shown on Figures 82 and 83, respectively.

As shown in Table 14, the study area intersections are projected to operate within acceptable Levels of Service during the peak hours for Interim Year (2019) Without Project traffic conditions, except for the following study area intersections:

Beaumont Avenue/SR-79 (NS) at:
California Avenue (EW) - #3

8th Street (NS) at:
I-10 Freeway EB Ramps (EW) - #34

Interim Year (2019) Without Project delay worksheets are provided in Appendix E.

E. <u>Interim Year (2019) With Project Intersection Delay and Level of Service</u>

The technique used to assess the capacity needs of an intersection is known as the Intersection Delay Method (see Appendix E). To calculate delay, the volume of traffic using the intersection is compared with the capacity of the intersection.

The delay and Level of Service for Interim Year (2019) With Project traffic conditions have been calculated and are shown in Table 15. Interim Year (2019) With Project morning and evening peak hour intersection turning movement volumes are shown on Figures 84 and 85, respectively.

As shown in Table 15, the study area intersections are projected to operate within acceptable Levels of Service during the peak hours for Interim Year (2019) With Project traffic conditions, except for the following study area intersections:

Beaumont Avenue/SR-79 (NS) at:
California Avenue (EW) - #3

8th Street (NS) at:
I-10 Freeway WB Ramps (EW) - #33
I-10 Freeway EB Ramps (EW) - #34
Lincoln Street (EW) - #35

As shown in Table 16, the proposed project does not create a significant impact at the study area intersections for Interim Year (2019) With Project traffic conditions, with improvements. Interim Year (2019) With Project delay worksheets are provided in Appendix E.

VIII. INTERIM YEAR (2022) TRAFFIC CONDITIONS

To assess Year 2022 traffic conditions, existing traffic is combined with ambient and other development growth from the Riverside Traffic Analysis Model and the project traffic. Figures 86 to 91 illustrate the Year 2022 traffic conditions.

A. Method of Projection

As described in Section V.I and based upon discussions with City of Banning staff, the average daily traffic volume forecasts have been determined using the growth increment approach on the Riverside Traffic Analysis Model Year 2007 and Year 2035 average daily traffic volume forecasts (see Appendix D). This difference defines the growth in traffic over the 28 year period. The incremental growth in average daily traffic volume has been factored to reflect the forecast growth between Year 2014 and Year 2035. For this purpose, linear growth between the Year 2007 base condition and the forecast Year 2035 condition was assumed. Since the increment between Year 2014 and Year 2035 is 21 years of the 28 year time frame, a factor of 0.75 (i.e., 21/28) was used.

The Year 2022 traffic projections have been interpolated between Year 2035 traffic volumes and existing traffic volumes utilizing a portion of the growth increment (see Section V.I).

The Sunset Avenue Grade Separation Project is currently under construction in the project area. Since the project started construction after existing traffic counts were conducted, the existing traffic counts reflect traffic patterns once the project is completed. The project is anticipated to be completed prior to Opening Year (2017). The future analysis in this report reflects the completion of the Sunset Avenue Grade Separation Project. The intersection geometrics for this project can be found at http://rcprojects.org/sunsetave/.

B. Interim Year (2022) Without Project Average Daily Traffic Volumes

The average daily traffic volumes for Interim Year (2022) Without Project traffic conditions have been determined and are shown on Figure 86.

C. Interim Year (2022) With Project Average Daily Traffic Volumes

The average daily traffic volumes for Interim Year (2022) With Project traffic conditions have been determined and are shown on Figure 87.

D. Interim Year (2022) Without Project Average Intersection Delay and Level of Service

The technique used to assess the capacity needs of an intersection is known as the Intersection Delay Method (see Appendix E). To calculate delay, the volume of traffic using the intersection is compared with the capacity of the intersection.

The delay and Level of Service for Interim Year (2022) Without Project traffic conditions have been calculated and are shown in Table 17. Interim Year (2022) Without Project

morning and evening peak hour intersection turning movement volumes are shown on Figures 88 and 89, respectively.

As shown in Table 17, the study area intersections are projected to operate within acceptable Levels of Service during the peak hours for Interim Year (2022) Without Project traffic conditions, except for the following study area intersections:

Beaumont Avenue/SR-79 (NS) at:
California Avenue (EW) - #3

8th Street (NS) at:
I-10 Freeway EB Ramps (EW) - #34

Interim Year (2022) Without Project delay worksheets are provided in Appendix E.

E. <u>Interim Year (2022) With Project Intersection Delay and Level of Service</u>

The technique used to assess the capacity needs of an intersection is known as the Intersection Delay Method (see Appendix E). To calculate delay, the volume of traffic using the intersection is compared with the capacity of the intersection.

The delay and Level of Service for Interim Year (2022) With Project traffic conditions have been calculated and are shown in Table 18. Interim Year (2022) With Project morning and evening peak hour intersection turning movement volumes are shown on Figures 90 and 91, respectively.

As shown in Table 18, the study area intersections are projected to operate within acceptable Levels of Service during the peak hours for Interim Year (2022) With Project traffic conditions, except for the following study area intersections:

Beaumont Avenue/SR-79 (NS) at:
California Avenue (EW) - #3

Highland Home Road (NS) at:
Ramsey Street (EW) - #15

8th Street (NS) at:
I-10 Freeway WB Ramps (EW) - #33
I-10 Freeway EB Ramps (EW) - #34
Lincoln Street (EW) - #35
Westward Avenue (EW) - #36

As shown in Table 19, the proposed project does not create a significant impact at the study area intersections for Interim Year (2022) With Project traffic conditions, with improvements. Interim Year (2022) With Project delay worksheets are provided in Appendix E.

F. Interim Year (2022) With Project Traffic Signal Warrant Analysis

Traffic signals are projected to be warranted at the following additional study area intersections for Interim Year (2022) With Project traffic conditions (see Appendix F):

22nd Street (NS) at:
- I-10 Freeway WB Ramps (EW) - #27
- I-10 Freeway EB Ramps (EW) - #28

The unsignalized intersections have been evaluated for traffic signals using the California Department of Transportation Warrant 3 Peak Hour traffic signal warrant analysis, as specified in the California Manual on Uniform Traffic Control Devices (2014 Edition).

It should be noted that although the intersection of Highland Home Road at Ramsey Street is not warranted for a traffic signal for Interim Year (2022) traffic conditions, it is warranted for a traffic signal for Interim Year (2029) With Project and is thus the recommended mitigation measure to bring the intersection from an unacceptable level of service to an acceptable level of service.

[1] When a right turn is designated, the lane can either be striped or unstriped. To function as a right turn lane there must be sufficient width for right turning vehicles to travel outside the thro lanes.

L = Left; T = Through; R = Right; d = De Facto Turn Lane; > = Right Turn Overlap; >> = Free Right Turn; **BOLD** = Improvement

[2] Delay and level of service calculated using the following analysis software: Traffix, Version 7.9.0215 (2008). Per the Highway Capacity Manual, overall average intersection delay and level of service are shown for intersections with traffic signal or all way stop control. For intersections with cross street stop control, the delay and level of service for the worst individual movemen (or movements sharing a single lane) are shown.

[3] TS = Traffic Signal; CSS = Cross Street Stop; AWS = All Way Stop

[4] 99.9-F = Delay High, Intersection Unstable, Level of Service F

IX. INTERIM YEAR (2025) TRAFFIC CONDITIONS

To assess Year 2025 traffic conditions, existing traffic is combined with ambient and other development growth from the Riverside Traffic Analysis Model and the project traffic. Figures 92 to 97 illustrate the Year 2025 traffic conditions.

A. Method of Projection

As described in Section V.I and based upon discussions with City of Banning staff, the average daily traffic volume forecasts have been determined using the growth increment approach on the Riverside Traffic Analysis Model Year 2007 and Year 2035 average daily traffic volume forecasts (see Appendix D). This difference defines the growth in traffic over the 28 year period. The incremental growth in average daily traffic volume has been factored to reflect the forecast growth between Year 2014 and Year 2035. For this purpose, linear growth between the Year 2007 base condition and the forecast Year 2035 condition was assumed. Since the increment between Year 2014 and Year 2035 is 21 years of the 28 year time frame, a factor of 0.75 (i.e., 21/28) was used.

The Year 2025 traffic projections have been interpolated between Year 2035 traffic volumes and existing traffic volumes utilizing a portion of the growth increment (see Section V.I).

The Sunset Avenue Grade Separation Project is currently under construction in the project area. Since the project started construction after existing traffic counts were conducted, the existing traffic counts reflect traffic patterns once the project is completed. The project is anticipated to be completed prior to Opening Year (2017). The future analysis in this report reflects the completion of the Sunset Avenue Grade Separation Project. The intersection geometrics for this project can be found at http://rcprojects.org/sunsetave/.

B. Interim Year (2025) Without Project Average Daily Traffic Volumes

The average daily traffic volumes for Interim Year (2025) Without Project traffic conditions have been determined and are shown on Figure 92.

C. Interim Year (2025) With Project Average Daily Traffic Volumes

The average daily traffic volumes for Interim Year (2025) With Project traffic conditions have been determined and are shown on Figure 93.

D. Interim Year (2025) Without Project Average Intersection Delay and Level of Service

The technique used to assess the capacity needs of an intersection is known as the Intersection Delay Method (see Appendix E). To calculate delay, the volume of traffic using the intersection is compared with the capacity of the intersection.

The delay and Level of Service for Interim Year (2025) Without Project traffic conditions have been calculated and are shown in Table 20. Interim Year (2025) Without Project

morning and evening peak hour intersection turning movement volumes are shown on Figures 94 and 95, respectively.

As shown in Table 20, the study area intersections are projected to operate within acceptable Levels of Service during the peak hours for Interim Year (2025) Without Project traffic conditions, except for the following study area intersections:

Beaumont Avenue/SR-79 (NS) at:
California Avenue (EW) - #3

Highland Home Road (NS) at:
Ramsey Street (EW) - #15

8th Street (NS) at:
I-10 Freeway EB Ramps (EW) - #34

Interim Year (2025) Without Project delay worksheets are provided in Appendix E.

E. Interim Year (2025) With Project Intersection Delay and Level of Service

The technique used to assess the capacity needs of an intersection is known as the Intersection Delay Method (see Appendix E). To calculate delay, the volume of traffic using the intersection is compared with the capacity of the intersection.

The delay and Level of Service for Interim Year (2025) With Project traffic conditions have been calculated and are shown in Table 21. Interim Year (2025) With Project morning and evening peak hour intersection turning movement volumes are shown on Figures 97 and 98, respectively.

As shown in Table 21, the study area intersections are projected to operate within acceptable Levels of Service during the peak hours for Interim Year (2025) With Project traffic conditions, except for the following study area intersections:

Beaumont Avenue/SR-79 (NS) at:
California Avenue (EW) - #3

Highland Home Road (NS) at:
Ramsey Street (EW) - #15

Sunset Avenue (NS) at:
Wilson Street (EW) - #18

22nd Street (NS) at:
Westward Avenue (EW) - #30

8th Street (NS) at:
I-10 Freeway WB Ramps (EW) - # 33
I-10 Freeway EB Ramps (EW) - #34

Lincoln Street (EW) - #35
Westward Avenue (EW) - #36

As shown in Table 22, the proposed project does not create a significant impact at the study area intersections for Interim Year (2025) With Project traffic conditions, with improvements. Interim Year (2025) With Project delay worksheets are provided in Appendix E.

F. Interim Year (2025) With Project Traffic Signal Warrant Analysis

Traffic signals are projected to be warranted at the following additional study area intersections for Interim Year (2025) With Project traffic conditions (see Appendix F):

Highland Home Road (NS) at:
Wilson Street (EW) - #14

Sunset Avenue (NS) at:
Lincoln Street (EW) - #22

22nd Street (NS) at:
Westward Avenue (EW) - #30

8th Street (NS) at:
Wilson Street (EW) - #31

The unsignalized intersections have been evaluated for traffic signals using the California Department of Transportation Warrant 3 Peak Hour traffic signal warrant analysis, as specified in the California Manual on Uniform Traffic Control Devices (2014 Edition).

X. INTERIM YEAR (2029) TRAFFIC CONDITIONS

To assess Year 2029 traffic conditions, existing traffic is combined with ambient and other development growth from the Riverside Traffic Analysis Model and the project traffic. Figures 98 to 103 illustrate the Year 2029 traffic conditions.

A. Method of Projection

As described in Section V.I and based upon discussions with City of Banning staff, the average daily traffic volume forecasts have been determined using the growth increment approach on the Riverside Traffic Analysis Model Year 2007 and Year 2035 average daily traffic volume forecasts (see Appendix D). This difference defines the growth in traffic over the 28 year period. The incremental growth in average daily traffic volume has been factored to reflect the forecast growth between Year 2014 and Year 2035. For this purpose, linear growth between the Year 2007 base condition and the forecast Year 2035 condition was assumed. Since the increment between Year 2014 and Year 2035 is 21 years of the 28 year time frame, a factor of 0.75 (i.e., 21/28) was used.

The Year 2029 traffic projections have been interpolated between Year 2035 traffic volumes and existing traffic volumes utilizing a portion of the growth increment (see Section V.I).

The Sunset Avenue Grade Separation Project is currently under construction in the project area. Since the project started construction after existing traffic counts were conducted, the existing traffic counts reflect traffic patterns once the project is completed. The project is anticipated to be completed prior to Opening Year (2017). The future analysis in this report reflects the completion of the Sunset Avenue Grade Separation Project. The intersection geometrics for this project can be found at http://rcprojects.org/sunsetave/.

B. Interim Year (2029) Without Project Average Daily Traffic Volumes

The average daily traffic volumes for Interim Year (2029) Without Project traffic conditions have been determined and are shown on Figure 98.

C. Interim Year (2029) With Project Average Daily Traffic Volumes

The average daily traffic volumes for Interim Year (2029) With Project traffic conditions have been determined and are shown on Figure 99.

D. Interim Year (2029) Without Project Average Intersection Delay and Level of Service

The technique used to assess the capacity needs of an intersection is known as the Intersection Delay Method (see Appendix E). To calculate delay, the volume of traffic using the intersection is compared with the capacity of the intersection.

The delay and Level of Service for Interim Year (2029) Without Project traffic conditions have been calculated and are shown in Table 23. Interim Year (2029) Without Project

morning and evening peak hour intersection turning movement volumes are shown on Figures 100 and 101, respectively.

As shown in Table 23, the study area intersections are projected to operate within acceptable Levels of Service during the peak hours for Interim Year (2029) Without Project traffic conditions, except for the following study area intersections:

Beaumont Avenue/SR-79 (NS) at:
California Avenue (EW) - #3

Highland Home Road (NS) at:
Wilson Street (EW) - #14
Ramsey Street (EW) - #15

Sunset Avenue (NS) at:
Wilson Street (EW) - #18

8th Street (NS) at:
I-10 Freeway EB Ramps (EW) - #34

Interim Year (2029) Without Project delay worksheets are provided in Appendix E.

E. Interim Year (2029) Without Project Traffic Signal Warrant Analysis

Traffic signals are projected to be warranted at the following additional study area intersections for Interim Year (2029) Without Project traffic conditions (see Appendix F):

Highland Springs Avenue (NS) at:
14th Street (EW) - #6

Highland Home Road (NS) at:
Wilson Street (EW) - #14

The unsignalized intersections have been evaluated for traffic signals using the California Department of Transportation Warrant 3 Peak Hour traffic signal warrant analysis, as specified in the California Manual on Uniform Traffic Control Devices (2014 Edition).

F. Interim Year (2029) With Project Intersection Delay and Level of Service

The technique used to assess the capacity needs of an intersection is known as the Intersection Delay Method (see Appendix E). To calculate delay, the volume of traffic using the intersection is compared with the capacity of the intersection.

The delay and Level of Service for Interim Year (2029) With Project traffic conditions have been calculated and are shown in Table 24. Interim Year (2029) With Project morning and evening peak hour intersection turning movement volumes are shown on Figures 102 and 103, respectively.

As shown in Table 24, the study area intersections are projected to operate within acceptable Levels of Service during the peak hours for Interim Year (2029) With Project traffic conditions, except for the following study area intersections:

Beaumont Avenue/SR-79 (NS) at:
California Avenue (EW) - #3

Pennsylvania Avenue (NS) at:
1st Street (EW) - #5

Highland Home Road (NS) at:
Wilson Street (EW) - #14
Ramsey Street (EW) - #15

Sunset Avenue (NS) at:
Wilson Street (EW) - #18
Lincoln Street (EW) - #22
Westward Avenue (EW) - #23

22nd Street (NS) at:
I-10 Freeway EB Ramps (EW) - #28
Westward Avenue (EW) - #30

8th Street (NS) at:
I-10 Freeway WB Ramps (EW) - # 33
I-10 Freeway EB Ramps (EW) - #34
Lincoln Street (EW) - #35
Westward Avenue (EW) - #36

As shown in Table 25, the proposed project does not create a significant impact at the study area intersections for Interim Year (2029) With Project traffic conditions, with improvements. Interim Year (2029) With Project delay worksheets are provided in Appendix E.

G. Interim Year (2029) With Project Traffic Signal Warrant Analysis

Traffic signals are projected to be warranted at the following additional study area intersections for Interim Year (2022) Without Project traffic conditions (see Appendix F):

Highland Home Road (NS) at:
Ramsey Street (EW) - #15

Sunset Avenue (NS) at:
Westward Avenue (EW) - #23

A Street (NS) at:
Westward Avenue (EW) - #25

22nd Street (NS) at:

Lincoln Street (EW) - #29

The unsignalized intersections have been evaluated for traffic signals using the California Department of Transportation Warrant 3 Peak Hour traffic signal warrant analysis, as specified in the California Manual on Uniform Traffic Control Devices (2014 Edition).

XI. GENERAL PLAN BUILDOUT YEAR (2035) TRAFFIC CONDITIONS

To assess Year 2035 traffic conditions, existing traffic is combined with ambient and other development growth from the Riverside Traffic Analysis Model and the project traffic. Figures 104 to 109 illustrate the Year 2035 traffic conditions.

A. Method of Projection

As described in Section V.I and based upon discussions with City of Banning staff, the average daily traffic volume forecasts have been determined using the growth increment approach on the Riverside Traffic Analysis Model Year 2007 and Year 2035 average daily traffic volume forecasts (see Appendix D). This difference defines the growth in traffic over the 28 year period. The incremental growth in average daily traffic volume has been factored to reflect the forecast growth between Year 2014 and Year 2035. For this purpose, linear growth between the Year 2007 base condition and the forecast Year 2035 condition was assumed. Since the increment between Year 2014 and Year 2035 is 21 years of the 28 year time frame, a factor of 0.75 (i.e., 21/28) was used.

The Sunset Avenue Grade Separation Project is currently under construction in the project area. Since the project started construction after existing traffic counts were conducted, the existing traffic counts reflect traffic patterns once the project is completed. The project is anticipated to be completed prior to Opening Year (2017). The future analysis in this report reflects the completion of the Sunset Avenue Grade Separation Project. The intersection geometrics for this project can be found at http://rcprojects.org/sunsetave/.

B. General Plan Buildout Year (2035) Without Project Average Daily Traffic Volumes

The average daily traffic volumes for General Plan Buildout Year (2035) Without Project traffic conditions have been determined and are shown on Figure 104.

C. General Plan Buildout Year (2035) With Project Average Daily Traffic Volumes

The average daily traffic volumes for General Plan Buildout Year (2035) With Project traffic conditions have been determined and are shown on Figure 105.

D. General Plan Buildout Year (2035) Without Project Average Intersection Delay and Level of Service

The technique used to assess the capacity needs of an intersection is known as the Intersection Delay Method (see Appendix E). To calculate delay, the volume of traffic using the intersection is compared with the capacity of the intersection.

The delay and Level of Service for General Plan Buildout Year (2035) Without Project traffic conditions have been calculated and are shown in Table 26. General Plan Buildout Year (2035) Without Project morning and evening peak hour intersection turning movement volumes are shown on Figures 106 and 107, respectively.

As shown in Table 26, the study area intersections are projected to operate within acceptable Levels of Service during the peak hours for General Plan Buildout Year (2035) Without Project traffic conditions, except for the following study area intersections:

Beaumont Avenue/SR-79 (NS) at:
California Avenue (EW) - #3

Highland Home Road (NS) at:
Wilson Street (EW) - #14
Ramsey Street (EW) - #15

Sunset Avenue (NS) at:
Wilson Street (EW) - #18

8th Street (NS) at:
I-10 Freeway EB Ramps (EW) - #34

General Plan Buildout Year (2035) Without Project delay worksheets are provided in Appendix E.

E. General Plan Buildout Year (2035) Without Project Traffic Signal Warrant Analysis

Traffic signals are projected to be warranted at the following additional study area intersections for General Plan Buildout Year (2035) Without Project traffic conditions (see Appendix F):

Beaumont Avenue/SR-79 (NS) at:
Potrero Boulevard (EW) - #2

Highland Home Road (NS) at:
Sun Lakes Boulevard (EW) - #16

The unsignalized intersections have been evaluated for traffic signals using the California Department of Transportation Warrant 3 Peak Hour traffic signal warrant analysis, as specified in the California Manual on Uniform Traffic Control Devices (2014 Edition).

F. General Plan Buildout Year (2035) With Project Intersection Delay and Level of Service

The technique used to assess the capacity needs of an intersection is known as the Intersection Delay Method (see Appendix E). To calculate delay, the volume of traffic using the intersection is compared with the capacity of the intersection.

The delay and Level of Service for General Plan Buildout Year (2035) With Project traffic conditions have been calculated and are shown in Table 27. Interim Year (2029) With Project morning and evening peak hour intersection turning movement volumes are shown on Figures 108 and 109, respectively.

As shown in Table 27, the study area intersections are projected to operate within acceptable Levels of Service during the peak hours for General Plan Buildout Year (2035) With Project traffic conditions, except for the following study area intersections:

Beaumont Avenue/SR-79 (NS) at:
- California Avenue (EW) - #3

Pennsylvania Avenue (NS) at:
- 1st Street (EW) - #5

Highland Home Road (NS) at:
- Wilson Street (EW) - #14
- Ramsey Street (EW) - #15

Sunset Avenue (NS) at:
- Wilson Street (EW) - #18
- Lincoln Street (EW) - #22
- Westward Avenue (EW) - #23

22nd Street (NS) at:
- Westward Avenue (EW) - #30

8th Street (NS) at:
- I-10 Freeway WB Ramps (EW) - # 33
- I-10 Freeway EB Ramps (EW) - #34
- Lincoln Street (EW) - #35

As shown in Table 28, the proposed project does not create a significant impact at the study area intersections for General Plan Buildout Year (2035) With Project traffic conditions, with improvements. General Plan Buildout Year (2035) With Project delay worksheets are provided in Appendix E.

G. Queuing Analysis

A left turn pocket queuing analysis has been conducted at the I-10 Freeway and Sunset Avenue, 22nd Street, and 8th Street freeway interchanges at the request of the California Department of Transportation.

The SimTraffic simulation model has the capability to simulate a wide variety of traffic controls, including a network with traffic signals operating on different cycle lengths or operating under fully-actuated conditions. The SimTraffic simulation model allows for a direct evaluation of traffic conditions operating under varying cycle lengths and traffic control. Each vehicle in the traffic system is individually tracked through the simulation model and comprehensive operational measures of effectiveness are collected on every vehicle during each 0.1-second of the simulation. The variation of each vehicle's behavior is simulated in a manner reflecting real world operations.

To provide a conservative estimate, 95th percentile lengths were used to calculate required storage lengths. The ultimate scenario (Buildout Year (2035) With Project traffic conditions) was used to calculate required storage lengths.

Table 29 summarizes results of the queuing analyses conducted at the study area intersections. The values represent the 95th percentile queue lengths and the turn bay length. It is recommended that the ultimate turn bay length exceed the projected queue length, where possible. SimTraffic queuing reports are located in Appendix G.

The storage lengths of several turning movements are projected to be overloaded during Buildout Year (2035) With Project traffic conditions. While the storage lengths may be overloaded, the intersections will still be projected to function adequately as shown in the intersection analysis. A more detailed explanation of traffic conditions at intersections with overloaded queues along with any necessary mitigation is given below.

1. Sunset Avenue (NS) at I-10 Freeway EB Ramps (EW) - #21

   The evening peak hour queue exceeds the turning bay length for the eastbound off-ramp. This queue spillback will be between six and seven vehicle lengths. The recommended mitigation measure so that the queue does not exceed the turning bay length is an additional lane for the off-ramp.

2. 8th Street (NS) at I-10 Freeway WB Ramps (EW) - #33

   The evening peak hour queue exceeds the turning bay length for the northbound left turn lane. This queue spillback will be approximately three vehicle lengths. There is no opportunity to extend storage lengths at this intersection approach at this time. The recommended mitigation measure so that the queue does not exceed the turning bay length is an additional northbound left turn lane.

3. 8th Street (NS) at I-10 Freeway EB Ramps (EW) - #34

   The evening peak hour queue exceeds the turning bay length for the southbound left turn lane. This queue spillback will be approximately one vehicle length. There is no opportunity to extend storage lengths at this intersection approach at this time. The recommended mitigation measure so that the queue does not exceed the turning bay length is an additional southbound left turn lane.

H. Freeway Mainline Analysis

At the request of the California Department of Transportation a freeway mainline analysis has been conducted for the I-10 Freeway. Table 30 presents the analysis for the Buildout Year (2035) With Project morning and evening peak hours traffic conditions. A total of 5 freeway segments were analyzed. General use lanes have an assumed capacity of 2,300 vehicles per hour, while High Occupancy Vehicle lanes have an assumed capacity of 1,600 vehicles per hour. Annual average daily traffic volumes, K% (percentage of the AADT in both directions during the peak hour), and D% (percentage of traffic in the peak direction during the peak hour) were given by the California Department of Transportation. The

freeway peak hour volume forecasts have been developed using the peak period Riverside Traffic Analysis Model. The freeway mainline segment volume to capacity ratios have been calculated, along with the resulting Levels of Service. The eastbound and westbound I-10 Freeway are expected to experience peak hour deficiencies.

The improvements needed to provide Level of Service E or better operations during the peak hours of traffic have been determined. High occupancy vehicle lanes were used, if possible, to provide Level of Service E or better. Otherwise, a general use lane was added. The freeway mainline segment volume to capacity ratios have been recalculated, along with the resulting Levels of Service. Table 31 summarizes the required freeway mainline improvements and the resulting Levels of Service for the morning and evening peak hours.

I. Freeway Merge/Diverge/Weaving Analysis

A ramp junction is an area of competing traffic demands. Entering on-ramp vehicles merge into the adjacent traffic lane competing for space with upstream freeway traffic combining into one stream. In a merge area, individual on-ramp vehicles attempt to find gaps in the adjacent freeway lane traffic stream. The action of individual merging vehicles entering the traffic stream introduces turbulence to traffic flow in the vicinity of the ramp gore area. Approaching freeway vehicles move toward the left to avoid this turbulence, or create gaps for entering vehicles. Exiting off-ramp vehicles diverge from upstream traffic separating into two streams. Exiting vehicles must occupy the lane adjacent to the freeway stream or the off-ramp. This has a redistributing effect on other freeway vehicles, as they move left to avoid the turbulence of the immediate diverge area.

Ramps have a limited storage capacity. If capacity is exceeded at the merge point, local congestion and queuing occurs, which may ultimately spill back onto the roadway network. The same is true for diverging vehicles. If capacity is exceeded at the diverge point, queuing can back onto the freeway mainline. Both queuing scenarios should be avoided.

Freeway weaving occurs when vehicular movements cross each other's path. Vehicles entering onto the freeway must change lanes prior to reaching the next interchanges off-ramp while vehicles wishing to exit the freeway must change lanes to exit the freeway using the freeway off-ramp. These two movements conflict with each other and gaps must be found so that the desired lane changes can be made.

The freeway ramp merge/diverge/weaving analysis was conducted using the Transportation Research Board, 2010 Highway Capacity Manual, 2010 methodology merge/diverge density using the HCS+ software, Version 6.65. The analysis is based on the typical weekday AM and PM peak hour traffic volumes.

Levels of Service in a merge influence area, diverge influence area, or weaving influence area are defined in terms of density for all cases of stable operation, Level of Service A through Level of Service E. Level of Service F exists when the demand exceeds the capacity of the on-ramp or off-ramp. The Transportation Research Board, 2010 Highway Capacity Manual states that Level of Service F is unacceptable because congestion is likely to occur, therefore Level of Service E should not be exceeded. The California Department of Transportation has defined Level of Service D as the maximum acceptable Level of Service.

Level of Service A:

Unrestricted operations. Density is low enough to permit smooth merging/diverging, with virtually no turbulence in the traffic stream. Level of Service A represents a density of passenger cars per mile per lane of less than or equal to 10. The California Department of Transportation has defined Level of Service A as an acceptable Level of Service.

Level of Service B:

Merging/diverging maneuvers become noticeable to through drivers and minimum turbulence occurs. Level of Service B represents a density of passenger cars per mile per lane of greater than 10 to 20. The California Department of Transportation has defined Level of Service B as an acceptable Level of Service.

Level of Service C:

Speed within the influence area begins to decline as turbulence levels become noticeable. Both ramp and freeway vehicles begin to adjust their speed to accomplish smooth transitions. Level of Service C represents a density of passenger cars per mile per lane of greater than 20 to 28. The California Department of Transportation has defined Level of Service C as an acceptable Level of Service.

Level of Service D:

Turbulence levels in the influence area become intrusive and virtually all vehicles slow to accommodate merging/diverging. Some ramp queues may form at heavily used on-ramps, but freeway operations remain stable. Level of Service D represents a density of passenger cars per mile per lane of greater than 28 to 35. The California Department of Transportation has defined Level of Service D as the maximum acceptable Level of Service.

Level of Service E:

Conditions approaching capacity. Speeds reduce significantly and turbulence is felt by virtually all drivers. Flow levels approach capacity and small changes in demand or disruptions within the traffic stream can cause both ramp and freeway queues to form. Level of Service E represents a density of passenger cars per mile per lane of greater 35. The California Department of Transportation has defined Level of Service E as an unacceptable Level of Service.

Level of Service F:

Demand exceeds the capacity of the on-ramp or off-ramp. The California Department of Transportation has defined Level of Service E as an unacceptable Level of Service.

Table 32 summarizes results of the merge/diverge/weaving analyses conducted at the Sunset Avenue/I-10 Freeway interchange, the 22nd Street/I-10 Freeway interchange, and

the 8th Street/I-10 Freeway interchange. Merge/diverge analysis worksheets are provided in Appendix H.

For Year 2035 With Project traffic conditions, the study area merge/diverge/weaving areas are projected to operate at Level of Service B or better during the peak hours.

[1] When a right turn is designated, the lane can either be striped or unstriped. To function as a right turn lane there must be sufficient width for right turning vehicles to travel outside the throu lanes.

L = Left; T = Through; R = Right; d = De Facto Turn Lane; > = Right Turn Overlap; >> = Free Right Turn; **BOLD** = Improvement

[2] Delay and level of service calculated using the following analysis software: Traffix, Version 7.9.0215 (2008). Per the Highway Capacity Manual, overall average intersection delay and level of service are shown for intersections with traffic signal or all way stop control. For intersections with cross street stop control, the delay and level of service for the worst individual movement (or movements sharing a single lane) are shown.

[3] TS = Traffic Signal; CSS = Cross Street Stop; AWS = All Way Stop

[4] 99.9-F = Delay High, Intersection Unstable, Level of Service F

[1] When a right turn is designated, the lane can either be striped or unstriped. To function as a right turn lane there must be sufficient width for right turning vehicles to travel outside the through lanes.

L = Left; T = Through; R = Right; d = De Facto Turn Lane; > = Right Turn Overlap; >> = Free Right Turn**BOLD** = Improvement

[2] Delay and level of service calculated using the following analysis software: Traffix, Version 7.9.0215 (2008). Per the Highway Capacity Manual, overall average intersection delay and level of service are shown for intersections with traffic signal or all way stop control. For intersections with cross street stop control, the delay and level of service for the worst individual movement (or movements sharing a single lane) are shown.

[3] TS = Traffic Signal; CSS = Cross Street Stop; AWS = All Way Stop

[4] 99.9-F = Delay High, Intersection Unstable, Level of Service F

XII. PROJECT MITIGATION

A. Required Improvements

Improvements that will eliminate all anticipated roadway operational deficiencies throughout the study area have been identified for Buildout Year (2035) traffic conditions. The improvements were determined through the operations analysis of Sections V to IX.

Off-site improvements are shown in the delay and Level of Service tables in previous sections. Table 33 shows a summary of the required off-site improvements. The recommended mitigation measures conform with the roadway classifications for the City of Banning and City of Beaumont General Plan Circulation Elements. They were also analyzed for feasibility and determined to be feasible while meeting these right-of-way requirements.

Intersection improvements which are included within the City of Banning, City of Beaumont, and County of Riverside Nexus Fee Programs are noted as such in Table 33. The recommended mitigation measures are identified for each intersection by improvement. Each analysis scenario when each mitigation measure is required is noted. Each improvement is then broken down by whether or not it is a program improvement or not, with the fair share percentage (see Table 33) given if the improvement is not a program improvement. The funding sources identified are as follows with data provided by City of Banning staff:

- Western Riverside Council of Governments Transportation Uniform Mitigation Fee Nexus Study 2015 Update Final Report, August 17, 2015
- City of Banning Development Impact Fee Study, June 9, 2006
- City of Banning Resolution No. 2006-75, August 8, 2006
- City of Banning Resolution No. 2015-24 (Five-Year Measure "A" Capital Improvement Plan for Fiscal Years 2015/2016 - 2019/2020), April 14, 2015
- Development Agreement between City of Banning and Pardee Homes, April 24, 2012
- City of Beaumont Resolution No. 2010-04, March 16, 2010
- Table B "Right-of-Way Determination for Study Area Intersections" prepared by LSA Associates, August 18, 2015 as part of a current City of Banning Fee Program Project

B. Project Contribution and Fair Share Percentages

The project fair share percentages have also been calculated for Buildout Year (2035) improvement locations. The project percentage has been based on the proportion of project peak hour traffic contributed to the improvement location relative to the total new peak hour Buildout Year (2035) traffic volume.

Table 34 presents a summary of project fair share percentages at the Buildout Year (2035) intersection improvement locations. The intersection fair share percentages are typically based on the higher of the morning and evening peak hour traffic volumes. Table 34

based on the higher of the morning and evening peak hour traffic volumes. Table 34 identifies the morning and evening peak hour fair share percentages for each study area intersection requiring mitigation for Buildout Year (2035) traffic conditions.

As mitigation for the potential traffic impacts, the proposed project shall contribute through an adopted traffic impact fee program in addition to any fair share contributions shown within the traffic study which is not covered within this fee program.

C. TUMF and DIF Programs

The City of Banning has a Development Impact Fee Program (DIF) which collects fees from new development with the purpose of funding transportation improvements such as roadway widening, new roadways, intersection improvements, traffic signalization, etc. for the purpose of mitigating future growth within the city as specified in the City of Banning Circulation Element. Table 35 identifies the fees by category. These dollar cost estimates are from the City of Banning Development Impact Fee Study, June 9, 2006 provided to Kunzman Associates, Inc. by the City of Banning staff. As shown in Table 27, the City of Banning Development Impact Fee is $15,815,898. It should be noted that this doesn't include the dollar cost estimates for the 800 student elementary school (service category) since the square footage is not yet known.

The County of Riverside has a Transportation Mitigation Uniform Fee (TUMF) administered by the Western Regional Council of Governments which collects fees from new development with the purpose of funding transportation improvements such as roadway widening, new roadways, intersection improvements, traffic signalization, etc. for the purpose of mitigating future growth through 2035. Table 35 identifies the fees by category. These dollar cost estimates are from the Western Riverside Council of Governments Transportation Uniform Mitigation Fee Nexus Study 2015 Update Final Report, August 17, 2015. As shown in Table 35, the Transportation Mitigation Uniform Fee is $29,254,196. It should be noted that this doesn't include the dollar cost estimates for the 800 student elementary school (service category) since the square footage is not yet known.

The combined City of Banning Development Impact Fee Program and County of Riverside Transportation Mitigation Uniform Fee (TUMF) administered by the Western Regional Council of Governments is $45,070,094. It should be noted that this doesn't include the dollar cost estimates for the 800 student elementary school (service category) since the square footage is not yet known.

The rates utilized in calculating these fees are from the City of Banning Development Impact Fee Study, June 9, 2006 provided to Kunzman Associates, Inc. by the City of Banning staff and the Western Riverside Council of Governments Transportation Uniform Mitigation Fee Nexus Study 2015 Update Final Report, August 17, 2015. The fees should be monitored and updated for any potential future changes to either program.

Note: The 800 student Elementary School falls under the Services category. However, the square footage is not yet known.

XIII. RECOMMENDATIONS

A. Site Access

The proposed project will have access to one point on Sunset Avenue, three points on Westward Avenue, and one point on SR-243. Adequate emergency access is assured because there is more than one way of reaching any point within the site.

B. Roadway Improvements

1. On- Site

Site-specific circulation and access recommendations are depicted on Figures 112 to 117.

Construct Sunset Avenue from the north project boundary to the south project boundary at its ultimate half-section width including landscaping and parkway improvements in conjunction with development (Secondary Highway; see Figure 8).

Construct Rancho San Gorgonio Parkway north of A Street at 22nd Street to Westward Avenue at its ultimate half-section width including landscaping and parkway improvements in conjunction with development (116 foot right-of-way; see Figure 111).

Construct Rancho San Gorgonio Parkway south of Westward Avenue at 8th Street along the project boundary at its ultimate cross-section width including landscaping and parkway improvements in conjunction with development (146 foot right-of-way; see Figure 111).

Construct Westward Avenue along the project boundaries at its ultimate half-section width including landscaping and parkway improvements in conjunction with development (Collector Highway; see Figure 8). Construction of Westward Avenue should be coordinated with other land owners' so that improvements are done simultaneously along Westward Avenue from Sunset Avenue to San Gorgonio Avenue. This will alleviate Westward Avenue from being partially improved sporadically along the project's property boundaries.

Construct Victory Avenue from Rancho San Gorgonio Parkway to Lovell Street at its ultimate half-section width including landscaping and parkway improvements in conjunction with development (Local Street).

Construct Old Idyllwild Road from C Street to the south project boundary at its ultimate half-section width including landscaping and parkway improvements in conjunction with development.

Obtain the necessary right-of-way to construct C Street from the east project boundary to SR-243. C Street should intersect SR-243 at a right angle and adequate sight

Obtain the necessary right-of-way to construct C Street from the east project boundary to SR-243. C Street should intersect SR-243 at a right angle and adequate sight distance should be provided. Engineering design standards and safety features shall be maintained including traffic signalization and high speed signage as identified by the City of Banning Transportation Department staff.

Sight distance at project accesses shall comply with standard California Department of Transportation and City of Banning sight distance standards. The final grading, landscaping, and street improvement plans shall demonstrate that sight distance standards are met. Such plans must be reviewed by the City and approved as consistent with this measure prior to issue of grading permits.

Separate on-site traffic signing and striping should be implemented in conjunction with detailed construction plans for the project.

2. Off-Site

As is the case for any roadway design, the City of Banning should periodically review traffic operations in the vicinity of the project once the project is constructed to assure that the traffic operations are satisfactory.

Participate in the phased construction of off-site traffic signals through payment of traffic signal mitigation fees. The traffic signals within the study area at buildout should specifically include an interconnect of the traffic signals to function in a coordinated system.

Off-site improvements are shown in the delay and Level of Service tables in previous sections. Table 33 shows a summary of the required off-site improvements. The recommended mitigation measures conform with the roadway classifications for the City of Banning and City of Beaumont General Plan Circulation Elements.

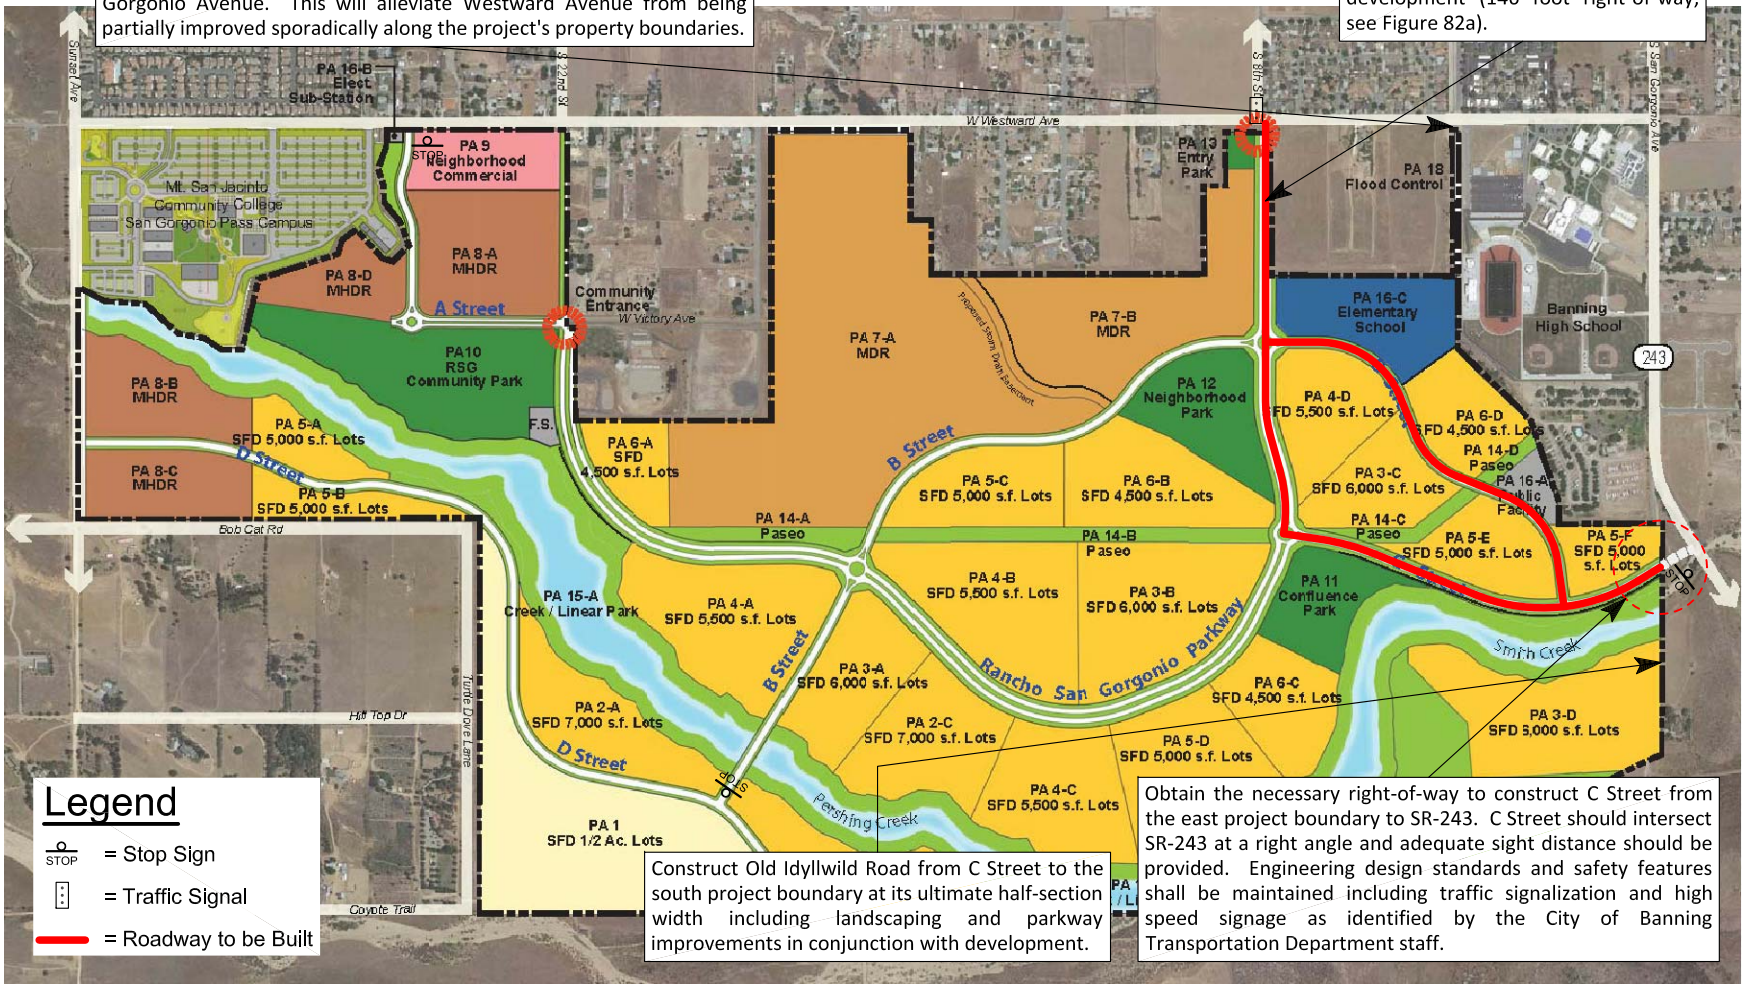
Figure 112
Circulation Recommendations - Opening Year (2017)

Construct Westward Avenue along the project boundaries at its ultimate half-section width including landscaping and parkway improvements in conjunction with development (Collector Highway; see Figure 8). Construction of Westward Avenue should be coordinated with other land owners' so that improvements are done simultaneously along Westward Avenue from Sunset Avenue to San Gorgonio Avenue. This will alleviate Westward Avenue from being partially improved sporadically along the project's property boundaries.

Construct Rancho San Gorgonio Parkway south of Westward Avenue at 8th Street along the project boundary at its ultimate cross-section width including landscaping and parkway improvements in conjunction with development (146 foot right-of-way; see Figure 82a).



Construct Old Idyllwild Road from C Street to the south project boundary at its ultimate half-section width including landscaping and parkway improvements in conjunction with development.

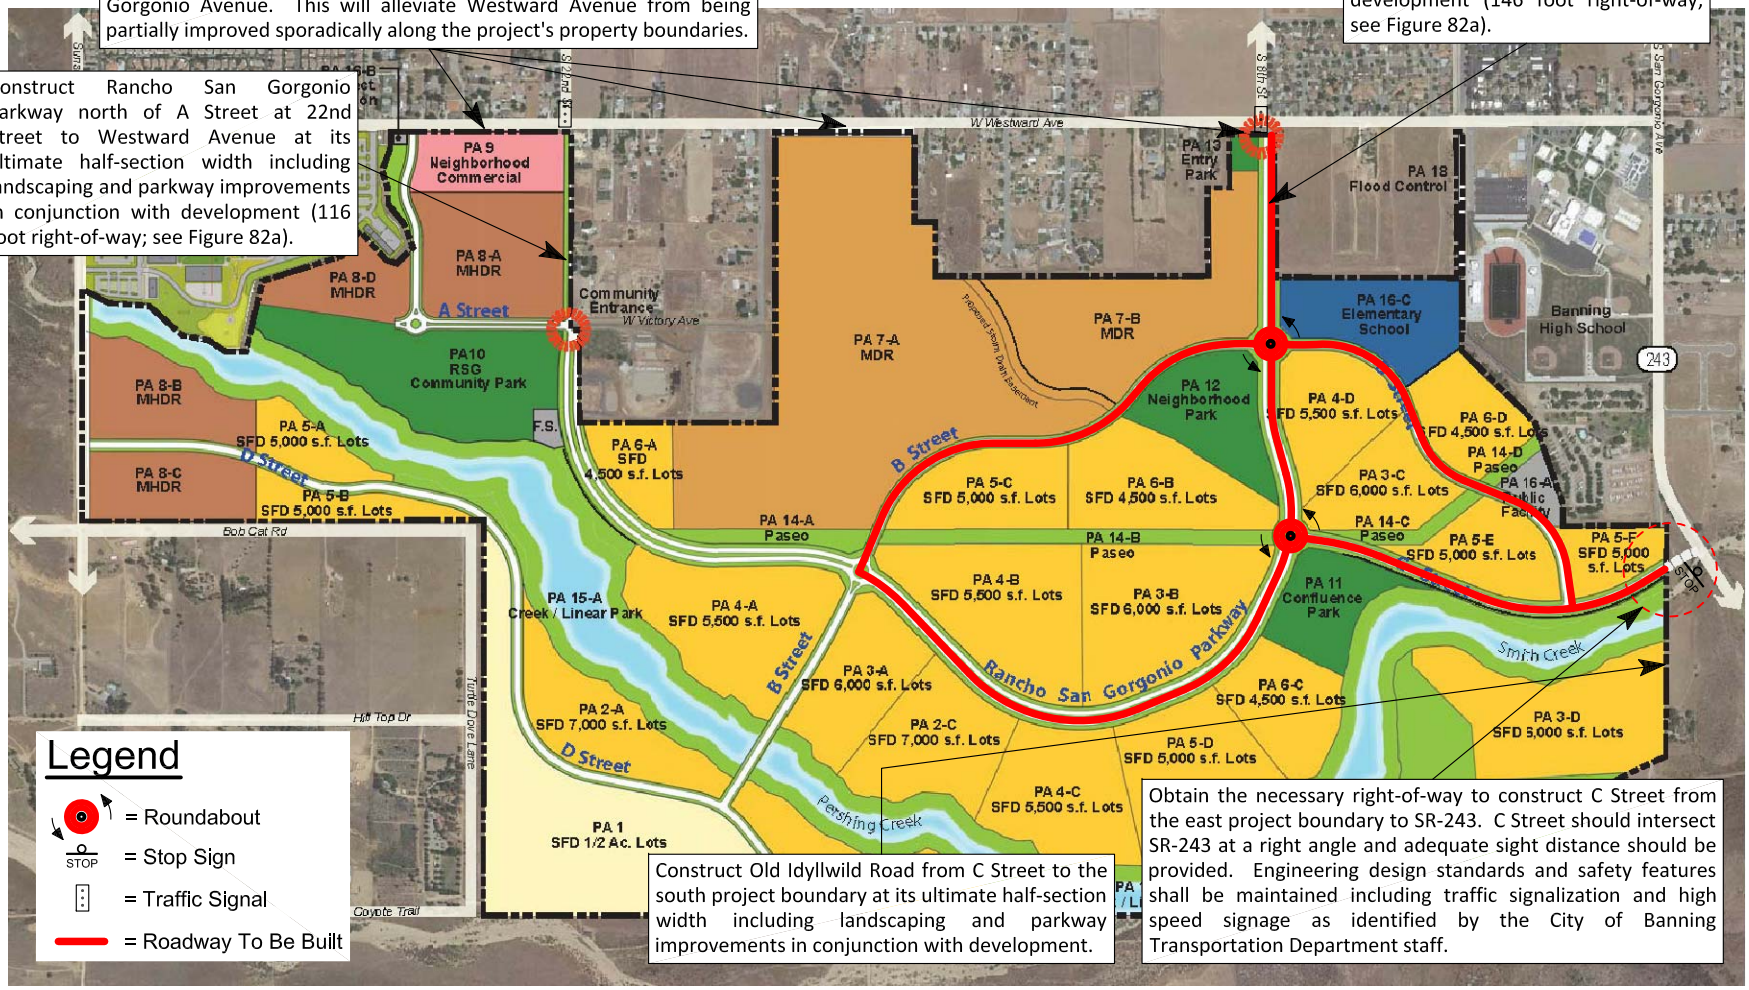
Obtain the necessary right-of-way to construct C Street from the east project boundary to SR-243. C Street should intersect SR-243 at a right angle and adequate sight distance should be provided. Engineering design standards and safety features shall be maintained including traffic signalization and high speed signage as identified by the City of Banning Transportation Department staff.

Figure 113
Circulation Recommendations - Interim Year (2019)

Construct Westward Avenue along the project boundaries at its ultimate half-section width including landscaping and parkway improvements in conjunction with development (Collector Highway; see Figure 8). Construction of Westward Avenue should be coordinated with other land owners' so that improvements are done simultaneously along Westward Avenue from Sunset Avenue to San Gorgonio Avenue. This will alleviate Westward Avenue from being partially improved sporadically along the project's property boundaries.

Construct Rancho San Gorgonio Parkway south of Westward Avenue at 8th Street along the project boundary at its ultimate cross-section width including landscaping and parkway improvements in conjunction with development (146 foot right-of-way; see Figure 82a).

Construct Rancho San Gorgonio Parkway north of A Street at 22nd Street to Westward Avenue at its ultimate half-section width including landscaping and parkway improvements in conjunction with development (116 foot right-of-way; see Figure 82a).



Construct Old Idyllwild Road from C Street to the south project boundary at its ultimate half-section width including landscaping and parkway improvements in conjunction with development.

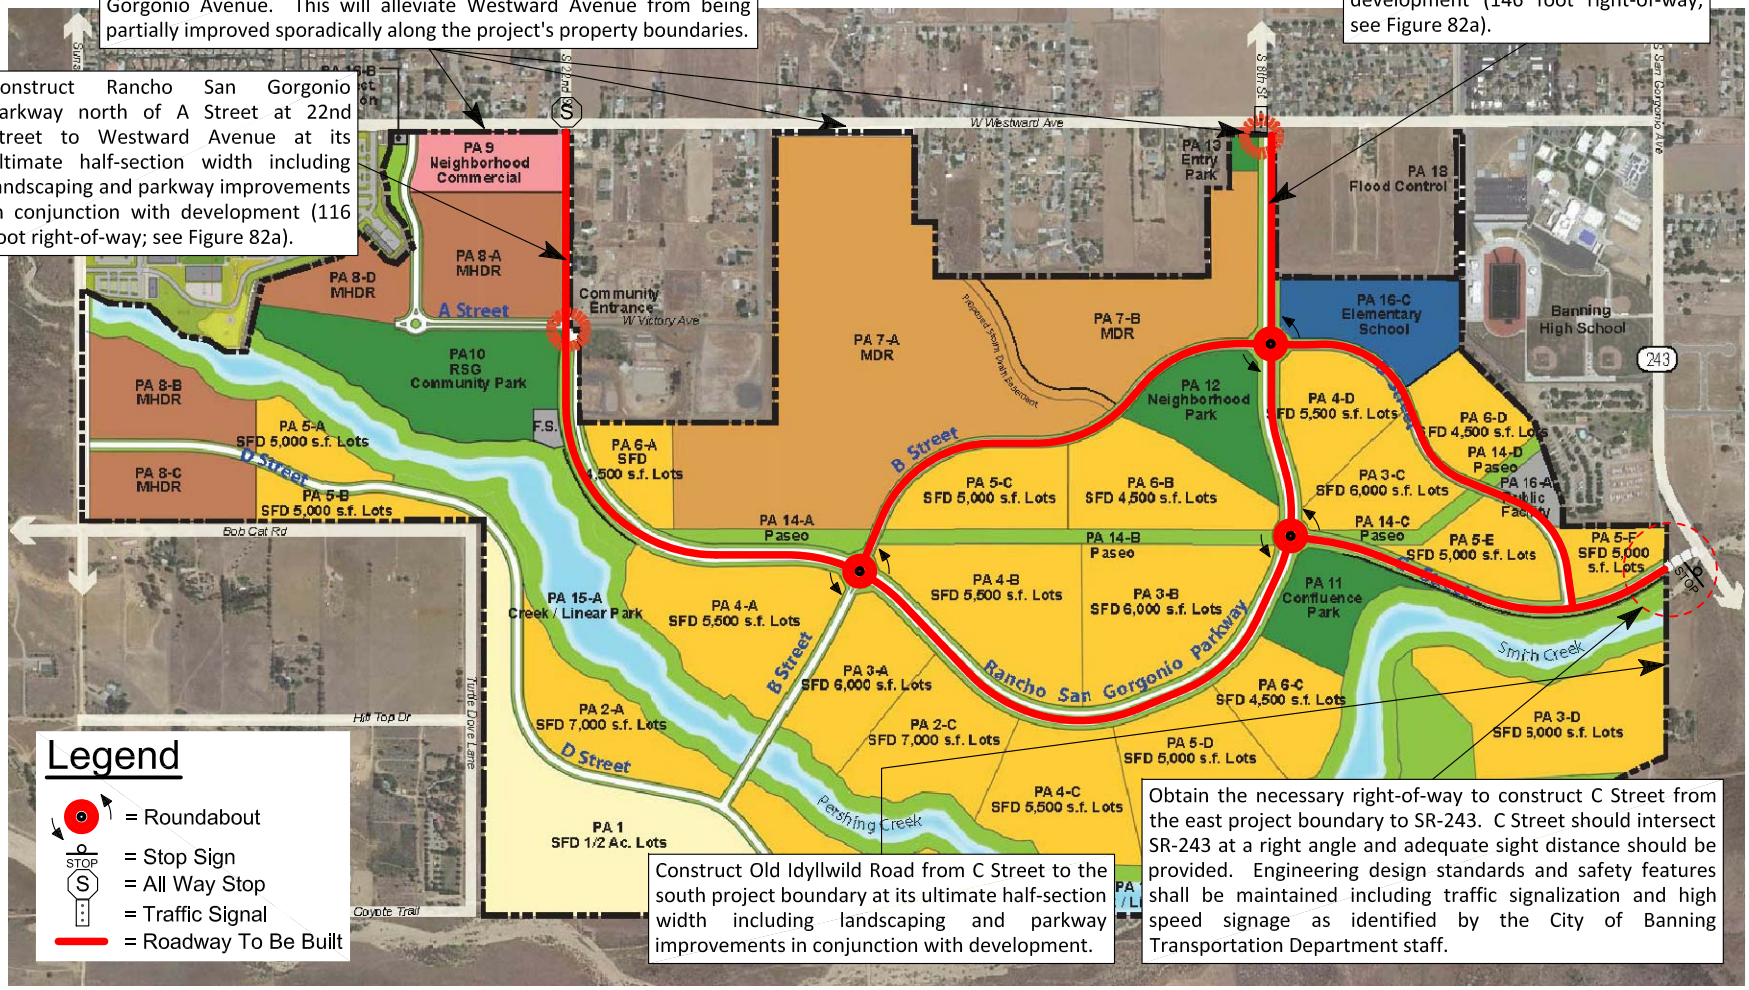
Obtain the necessary right-of-way to construct C Street from the east project boundary to SR-243. C Street should intersect SR-243 at a right angle and adequate sight distance should be provided. Engineering design standards and safety features shall be maintained including traffic signalization and high speed signage as identified by the City of Banning Transportation Department staff.

Figure 114
Circulation Recommendations - Interim Year (2022)

Construct Westward Avenue along the project boundaries at its ultimate half-section width including landscaping and parkway improvements in conjunction with development (Collector Highway; see Figure 8). Construction of Westward Avenue should be coordinated with other land owners' so that improvements are done simultaneously along Westward Avenue from Sunset Avenue to San Gorgonio Avenue. This will alleviate Westward Avenue from being partially improved sporadically along the project's property boundaries.

Construct Rancho San Gorgonio Parkway south of Westward Avenue at 8th Street along the project boundary at its ultimate cross-section width including landscaping and parkway improvements in conjunction with development (146 foot right-of-way; see Figure 82a).

Construct Rancho San Gorgonio Parkway north of A Street at 22nd Street to Westward Avenue at its ultimate half-section width including landscaping and parkway improvements in conjunction with development (116 foot right-of-way; see Figure 82a).



Construct Old Idyllwild Road from C Street to the south project boundary at its ultimate half-section width including landscaping and parkway improvements in conjunction with development.

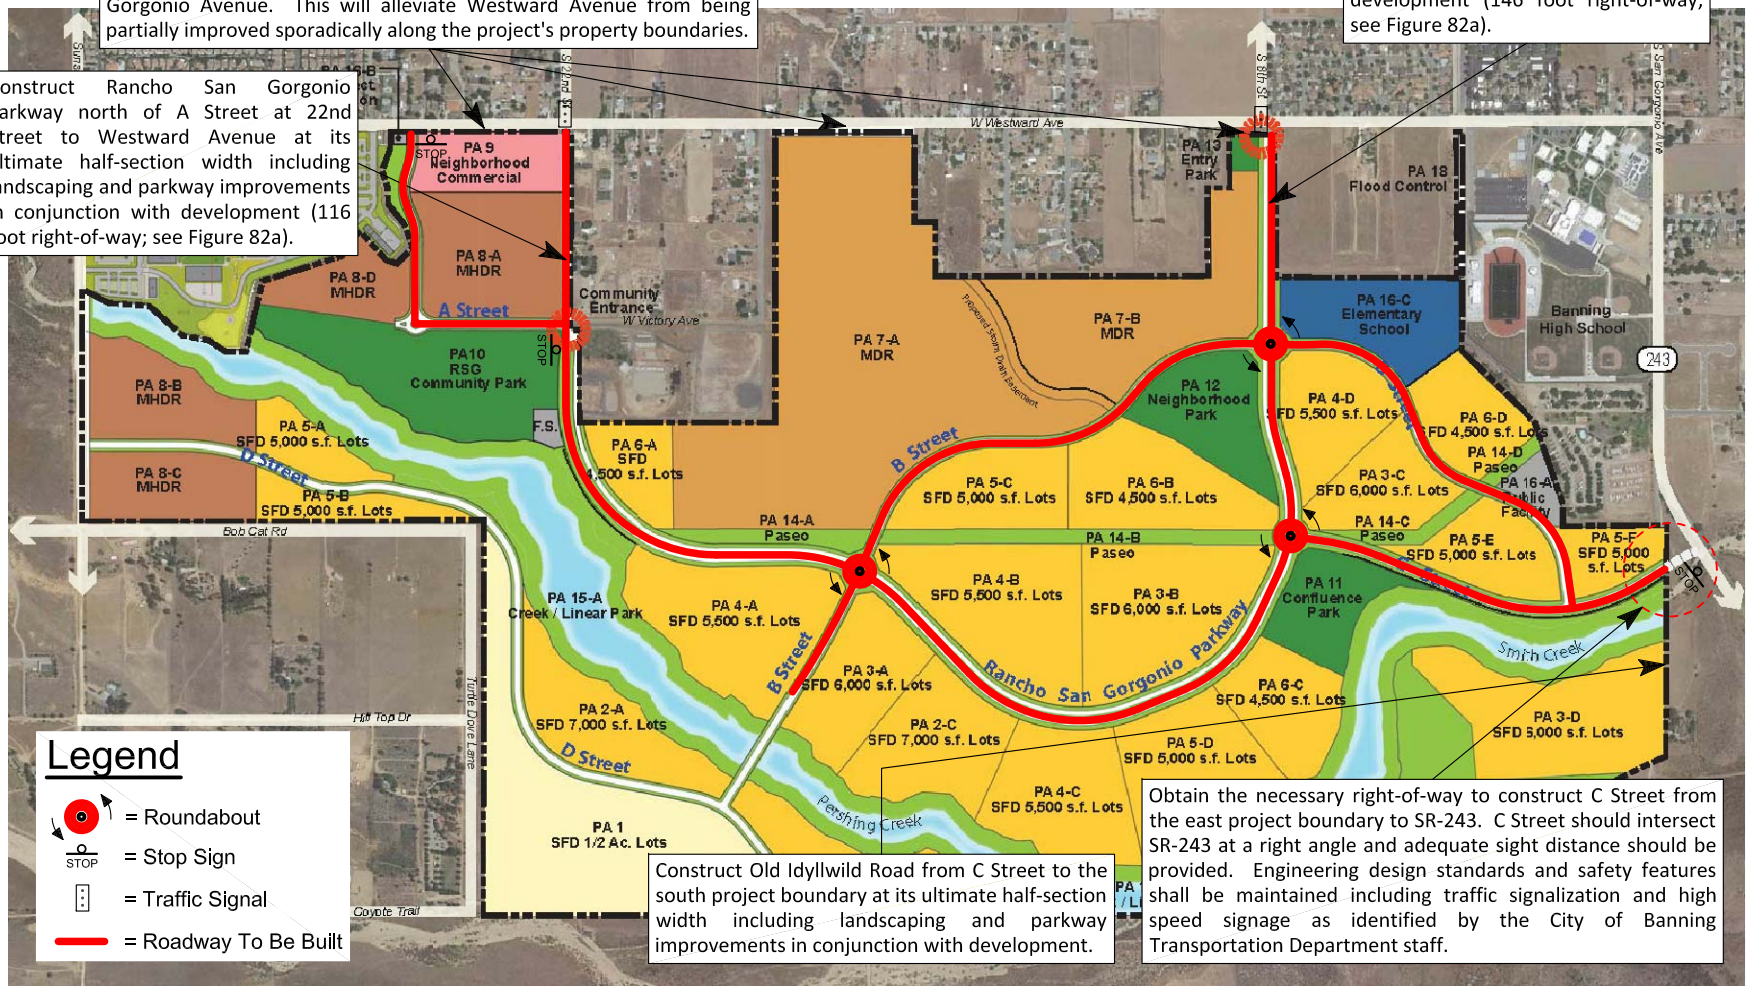
Obtain the necessary right-of-way to construct C Street from the east project boundary to SR-243. C Street should intersect SR-243 at a right angle and adequate sight distance should be provided. Engineering design standards and safety features shall be maintained including traffic signalization and high speed signage as identified by the City of Banning Transportation Department staff.

Figure 115
Circulation Recommendations - Interim Year (2025)

Construct Westward Avenue along the project boundaries at its ultimate half-section width including landscaping and parkway improvements in conjunction with development (Collector Highway; see Figure 8). Construction of Westward Avenue should be coordinated with other land owners' so that improvements are done simultaneously along Westward Avenue from Sunset Avenue to San Gorgonio Avenue. This will alleviate Westward Avenue from being partially improved sporadically along the project's property boundaries.

Construct Rancho San Gorgonio Parkway south of Westward Avenue at 8th Street along the project boundary at its ultimate cross-section width including landscaping and parkway improvements in conjunction with development (146 foot right-of-way; see Figure 82a).

Construct Rancho San Gorgonio Parkway north of A Street at 22nd Street to Westward Avenue at its ultimate half-section width including landscaping and parkway improvements in conjunction with development (116 foot right-of-way; see Figure 82a).



Construct Old Idyllwild Road from C Street to the south project boundary at its ultimate half-section width including landscaping and parkway improvements in conjunction with development.

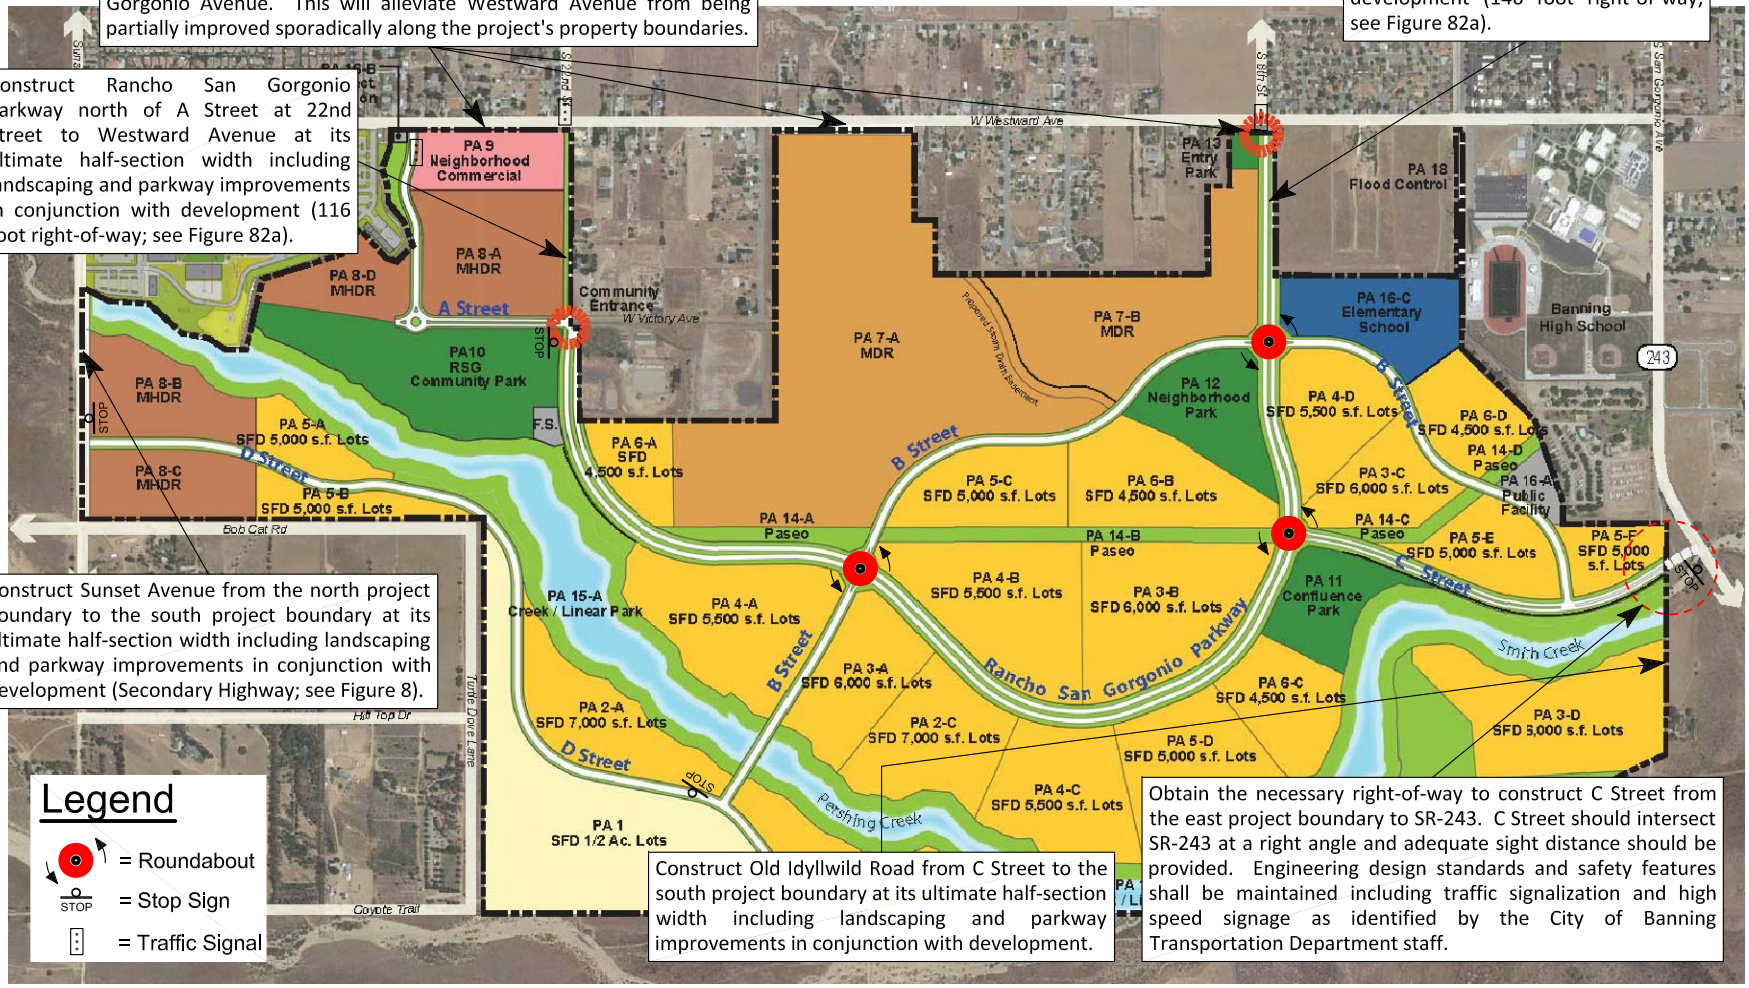
Obtain the necessary right-of-way to construct C Street from the east project boundary to SR-243. C Street should intersect SR-243 at a right angle and adequate sight distance should be provided. Engineering design standards and safety features shall be maintained including traffic signalization and high speed signage as identified by the City of Banning Transportation Department staff.

Figure 116
Circulation Recommendations - Interim Year (2029)

Construct Westward Avenue along the project boundaries at its ultimate half-section width including landscaping and parkway improvements in conjunction with development (Collector Highway; see Figure 8). Construction of Westward Avenue should be coordinated with other land owners' so that improvements are done simultaneously along Westward Avenue from Sunset Avenue to San Gorgonio Avenue. This will alleviate Westward Avenue from being partially improved sporadically along the project's property boundaries.

Construct Rancho San Gorgonio Parkway south of Westward Avenue at 8th Street along the project boundary at its ultimate cross-section width including landscaping and parkway improvements in conjunction with development (146 foot right-of-way; see Figure 82a).

Construct Rancho San Gorgonio Parkway north of A Street at 22nd Street to Westward Avenue at its ultimate half-section width including landscaping and parkway improvements in conjunction with development (116 foot right-of-way; see Figure 82a).



Construct Sunset Avenue from the north project boundary to the south project boundary at its ultimate half-section width including landscaping and parkway improvements in conjunction with development (Secondary Highway; see Figure 8).

Construct Old Idyllwild Road from C Street to the south project boundary at its ultimate half-section width including landscaping and parkway improvements in conjunction with development.

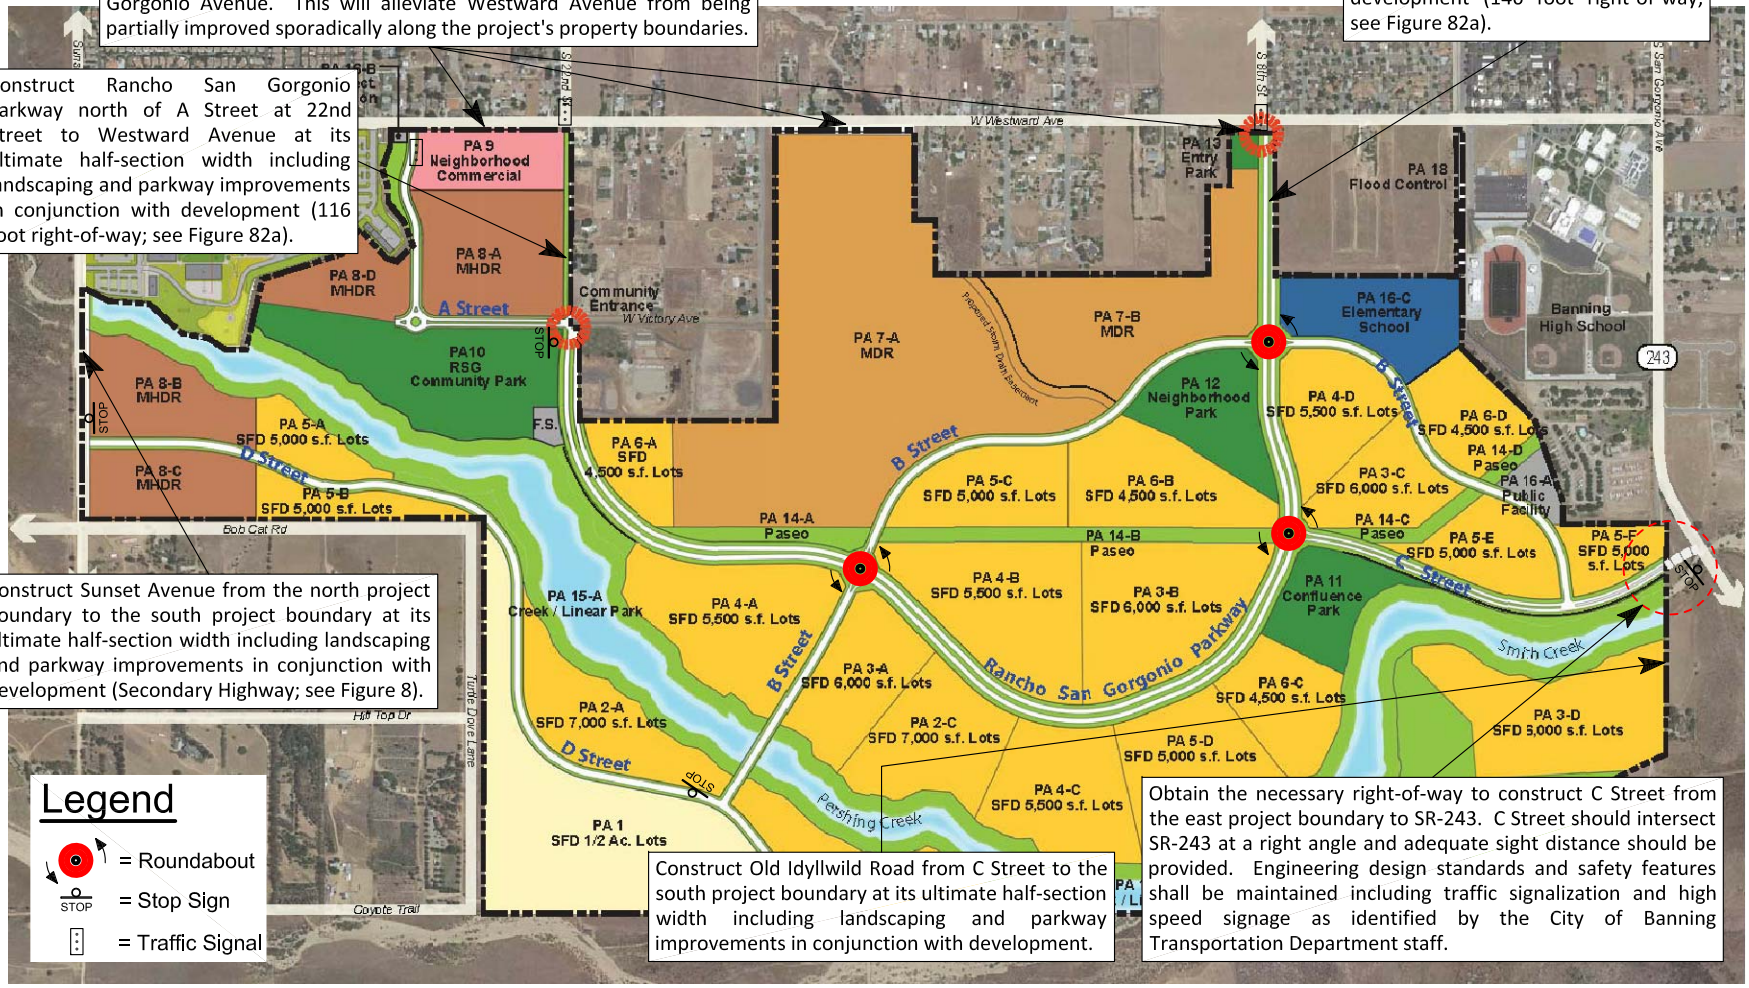
Obtain the necessary right-of-way to construct C Street from the east project boundary to SR-243. C Street should intersect SR-243 at a right angle and adequate sight distance should be provided. Engineering design standards and safety features shall be maintained including traffic signalization and high speed signage as identified by the City of Banning Transportation Department staff.

Figure 117
Circulation Recommendations - General Plan Buildout Year (2035)

Construct Westward Avenue along the project boundaries at its ultimate half-section width including landscaping and parkway improvements in conjunction with development (Collector Highway; see Figure 8). Construction of Westward Avenue should be coordinated with other land owners' so that improvements are done simultaneously along Westward Avenue from Sunset Avenue to San Gorgonio Avenue. This will alleviate Westward Avenue from being partially improved sporadically along the project's property boundaries.

Construct Rancho San Gorgonio Parkway south of Westward Avenue at 8th Street along the project boundary at its ultimate cross-section width including landscaping and parkway improvements in conjunction with development (146 foot right-of-way; see Figure 82a).

Construct Rancho San Gorgonio Parkway north of A Street at 22nd Street to Westward Avenue at its ultimate half-section width including landscaping and parkway improvements in conjunction with development (116 foot right-of-way; see Figure 82a).



Construct Sunset Avenue from the north project boundary to the south project boundary at its ultimate half-section width including landscaping and parkway improvements in conjunction with development (Secondary Highway; see Figure 8).

Construct Old Idyllwild Road from C Street to the south project boundary at its ultimate half-section width including landscaping and parkway improvements in conjunction with development.

Obtain the necessary right-of-way to construct C Street from the east project boundary to SR-243. C Street should intersect SR-243 at a right angle and adequate sight distance should be provided. Engineering design standards and safety features shall be maintained including traffic signalization and high speed signage as identified by the City of Banning Transportation Department staff.

APPENDIX A

Glossary of Transportation Terms

GLOSSARY OF TRANSPORTATION TERMS

COMMON ABBREVIATIONS

AC:	Acres
ADT:	Average Daily Traffic
Caltrans:	California Department of Transportation
DU:	Dwelling Unit
ICU:	Intersection Capacity Utilization
LOS:	Level of Service
TSF:	Thousand Square Feet
V/C:	Volume/Capacity
VMT:	Vehicle Miles Traveled

TERMS

AVERAGE DAILY TRAFFIC: The total volume during a year divided by the number of days in a year. Usually only weekdays are included.

BANDWIDTH: The number of seconds of green time available for through traffic in a signal progression.

BOTTLENECK: A constriction along a travelway that limits the amount of traffic that can proceed downstream from its location.

CAPACITY: The maximum number of vehicles that can be reasonably expected to pass over a given section of a lane or a roadway in a given time period.

CHANNELIZATION: The separation or regulation of conflicting traffic movements into definite paths of travel by the use of pavement markings, raised islands, or other suitable means to facilitate the safe and orderly movements of both vehicles and pedestrians.

CLEARANCE INTERVAL: Nearly same as yellow time. If there is an all red interval after the end of a yellow, then that is also added into the clearance interval.

CORDON: An imaginary line around an area across which vehicles, persons, or other items are counted (in and out).

CYCLE LENGTH: The time period in seconds required for one complete signal cycle.

CUL-DE-SAC STREET: A local street open at one end only, and with special provisions for turning around.

DAILY CAPACITY: The daily volume of traffic that will result in a volume during the peak hour equal to the capacity of the roadway.

DELAY: The time consumed while traffic is impeded in its movement by some element over which it has no control, usually expressed in seconds per vehicle.

DEMAND RESPONSIVE SIGNAL: Same as traffic-actuated signal.

DENSITY: The number of vehicles occupying in a unit length of the through traffic lanes of a roadway at any given instant. Usually expressed in vehicles per mile.

DETECTOR: A device that responds to a physical stimulus and transmits a resulting impulse to the signal controller.

DESIGN SPEED: A speed selected for purposes of design. Features of a highway, such as curvature, superelevation, and sight distance (upon which the safe operation of vehicles is dependent) are correlated to design speed.

DIRECTIONAL SPLIT: The percent of traffic in the peak direction at any point in time.

DIVERSION: The rerouting of peak hour traffic to avoid congestion.

FORCED FLOW: Opposite of free flow.

FREE FLOW: Volumes are well below capacity. Vehicles can maneuver freely and travel is unimpeded by other traffic.

GAP: Time or distance between successive vehicles in a traffic stream, rear bumper to front bumper.

HEADWAY: Time or distance spacing between successive vehicles in a traffic stream, front bumper to front bumper.

INTERCONNECTED SIGNAL SYSTEM: A number of intersections that are connected to achieve signal progression.

LEVEL OF SERVICE: A qualitative measure of a number of factors, which include speed and travel time, traffic interruptions, freedom to maneuver, safety, driving comfort and convenience, and operating costs.

LOOP DETECTOR: A vehicle detector consisting of a loop of wire embedded in the roadway, energized by alternating current and producing an output circuit closure when passed over by a vehicle.

MINIMUM ACCEPTABLE GAP: Smallest time headway between successive vehicles in a traffic stream into which another vehicle is willing and able to cross or merge.

MULTI-MODAL: More than one mode; such as automobile, bus transit, rail rapid transit, and bicycle transportation modes.

OFFSET: The time interval in seconds between the beginning of green at one intersection and the beginning of green at an adjacent intersection.

PLATOON: A closely grouped component of traffic that is composed of several vehicles moving, or standing ready to move, with clear spaces ahead and behind.

ORIGIN-DESTINATION SURVEY: A survey to determine the point of origin and the point of destination for a given vehicle trip.

PASSENGER CAR EQUIVALENTS (PCE): One car is one Passenger Car Equivalent. A truck is equal to 2 or 3 Passenger Car Equivalents in that a truck requires longer to start, goes slower, and accelerates slower. Loaded trucks have a higher Passenger Car Equivalent than empty trucks.

PEAK HOUR: The 60 consecutive minutes with the highest number of vehicles.

PRETIMED SIGNAL: A type of traffic signal that directs traffic to stop and go on a predetermined time schedule without regard to traffic conditions. Also, fixed time signal.

PROGRESSION: A term used to describe the progressive movement of traffic through several signalized intersections.

SCREEN-LINE: An imaginary line or physical feature across which all trips are counted, normally to verify the validity of mathematical traffic models.

SIGNAL CYCLE: The time period in seconds required for one complete sequence of signal indications.

SIGNAL PHASE: The part of the signal cycle allocated to one or more traffic movements.

STARTING DELAY: The delay experienced in initiating the movement of queued traffic from a stop to an average running speed through a signalized intersection.

TRAFFIC-ACTUATED SIGNAL: A type of traffic signal that directs traffic to stop and go in accordance with the demands of traffic, as registered by the actuation of detectors.

TRIP: The movement of a person or vehicle from one location (origin) to another (destination). For example, from home to store to home is two trips, not one.

TRIP-END: One end of a trip at either the origin or destination; i.e. each trip has two trip-ends. A trip-end occurs when a person, object, or message is transferred to or from a vehicle.

TRIP GENERATION RATE: The quantity of trips produced and/or attracted by a specific land use stated in terms of units such as per dwelling, per acre, and per 1,000 square feet of floor space.

TRUCK: A vehicle having dual tires on one or more axles, or having more than two axles.

UNBALANCED FLOW: Heavier traffic flow in one direction than the other. On a daily basis, most facilities have balanced flow. During the peak hours, flow is seldom balanced in an urban area.

VEHICLE MILES OF TRAVEL: A measure of the amount of usage of a section of highway, obtained by multiplying the average daily traffic by length of facility in miles.

APPENDIX E

Explanation and Calculation of Intersection Delay

EXPLANATION AND CALCULATION OF INTERSECTION LEVEL OF SERVICE USING DELAY METHODOLOGY

The levels of service at the unsignalized and signalized intersections are calculated using the delay methodology in the Highway Capacity Manual. This methodology views an intersection as consisting of several lane groups. A lane group is a set of lanes serving a movement. If there are two northbound left turn lanes, then the lane group serving the northbound left turn movement has two lanes. Similarly, there may be three lanes in the lane group serving the northbound through movement, one lane in the lane group serving the northbound right turn movement, and so forth. It is also possible for one lane to serve two lane groups. A shared lane might result in there being 1.5 lanes in the northbound left turn lane group and 2.5 lanes in the northbound through lane group.

For each lane group, there is a capacity. That capacity is calculated by multiplying the number of lanes in the lane group times a theoretical maximum lane capacity per lane time's 12 adjustment factors.

Each of the 12 adjustment factors has a value of approximately 1.00. A value less than 1.00 is generally assigned when a less than desirable condition occurs.

The 12 adjustment factors are as follows:

1. Peak hour factor (to account for peaking within the peak hour)
2. Lane utilization factor (to account for not all lanes loading equally)
3. Lane width
4. Percent of heavy trucks
5. Approach grade
6. Parking
7. Bus stops at intersections
8. Area type (CBD or other)
9. Right turns

10. Left turns

11. Pedestrian activity

12. Signal progression

The maximum theoretical lane capacity and the 12 adjustment factors for it are all unknowns for which approximate estimates have been recommended in the Highway Capacity Manual. For the most part, the recommended values are not based on statistical analysis but rather on educated estimates. However, it is possible to use the delay method and get reasonable results as will be discussed below.

Once the lane group volume is known and the lane group capacity is known, a volume to capacity ratio can be calculated for the lane group.

With a volume to capacity ratio calculated, average delay per vehicle in a lane group can be estimated. The average delay per vehicle in a lane group is calculated using a complex formula provided by the Highway Capacity Manual, which can be simplified and described as follows:

Delay per vehicle in a lane group is a function of the following:

1. Cycle length

2. Amount of red time faced by a lane group

3. Amount of yellow time for that lane group

4. The volume to capacity ratio of the lane group

The average delay per vehicle for each lane group is calculated, and eventually an overall average delay for all vehicles entering the intersection is calculated. This average delay per vehicle is then used to judge Level of Service. The Level of Services are defined in the table that follows this discussion.

Experience has shown that when a maximum lane capacity of 1,900 vehicles per hour is used (as recommended in the Highway Capacity Manual), little or no yellow time penalty is used, and none of the 12 penalty factors are applied, calculated delay is realistic. The delay calculation for instance assumes that yellow time is totally unused. Yet experience shows that most of the yellow time is used.

An idiosyncrasy of the delay methodology is that it is possible to add traffic to an intersection and reduce the average total delay per vehicle. If the average total delay is 30 seconds per vehicle for all vehicles traveling through an intersection, and traffic is added to a movement that has an average total delay of 15 seconds per vehicle, then the overall average total delay is reduced.

The delay calculation for a lane group is based on a concept that the delay is a function of the amount of unused capacity available. As the volume approaches capacity and there is no more unused capacity available, then the delay rapidly increases. Delay is not proportional to volume, but rather increases rapidly as the unused capacity approaches zero.

Because delay is not linearly related to volumes, the delay does not reflect how close an intersection is to overloading. If an intersection is operating at Level of Service C and has an average total delay of 18 seconds per vehicle, you know very little as to what percent the traffic can increase before Level of Service E is reached.

LEVEL OF SERVICE DESCRIPTION[1]

Level of Service	Description	Average Total Delay Per Vehicle (Seconds)	
		Signalized	Unsignalized
A	Level of Service A occurs when progression is extremely favorable and most vehicles arrive during the green phase. Most vehicles do not stop at all. Short cycle lengths may also contribute to low delay.	0 to 10.00	0 to 10.00
B	Level of Service B generally occurs with good progression and/or short cycle lengths. More vehicles stop than for Level of Service A, causing higher levels of average total delay.	10.01 to 20.00	10.01 to 15.00
C	Level of Service C generally results when there is fair progression and/or longer cycle lengths. Individual cycle failures may begin to appear in this level. The number of vehicles stopping is significant at this level, although many still pass through the intersection without stopping.	20.01 to 35.00	15.01 to 25.00
D	Level of Service D generally results in noticeable congestion. Longer delays may result from some combination of unfavorable progression, long cycle lengths, or high volume to capacity ratios. Many vehicles stop, and the proportion of vehicles not stopping declines. Individual cycle failures are noticeable.	35.01 to 55.00	25.01 to 35.00
E	Level of Service E is considered to be the limit of acceptable delay. These high delay values generally indicate poor progression, long cycle lengths, and high volume to capacity ratios. Individual cycle failures are frequent occurrences.	55.01 to 80.00	35.01 to 50.00
F	Level of Service F is considered to be unacceptable to most drivers. This condition often occurs with oversaturation, i.e., when arrival flow rates exceed the capacity of the intersection. It may also occur at high volume to capacity ratios below 1.00 with many individual cycle failures. Poor progression and long cycle lengths may also be major contributing causes to such delay levels.	80.01 and up	50.01 and up
