ENVIRONMENTAL CHECKLIST FORM

1. Project title: Banning Distribution Center
(GPA 17-2501; ZC 17-3501; DR 16-7002; ENV 16-1503)

2. Lead agency name and address:
City of Banning
99 E. Ramsey Street
Banning, CA 92220
(951) 922-3130

3. Contact person email address and phone number:
Patty Nevins, Community Development Director
pnevins@ci.banning.ca.us
(951) 922-3131

4. Project location: No address has been assigned to the property. It is north and east of the Banning Airport, south of the Union Pacific Railroad line and Interstate 10, Banning, CA 92220 **(See Figure 1 – Project Vicinity)**

- APN: 532-110-006, 532-130-001, and 532-130-002
- Tentative Parcel Map 34335

5. Project sponsor's name and address:
Banning Industrial, LP
17842 Mitchell North, Suite 100
Irvine, Ca. 92614
(949) 474-2000

6. General plan designation: Existing - Airport Industrial (AI) and Public Facilities – Airport (PF-A)
Proposed: Airport Industrial (AI)

7. Zoning: Existing: AI, PF-A.
Proposed: AI

8. Project Description:

The proposed Banning Distribution Center (herein after "proposed Project or Project") consists of three parcels, which are currently undeveloped and vacant. The proposed Project entitlements include a General Plan Amendment and Zone Change. The three parcels are part of a previously approved single tentative parcel map (TPM 34335). TPM 34335 was set to expire in 2017; it was extended until October 22, 2018 at the November 14, 2017 City Council meeting.

General Plan Land Use and Zoning designations at the site are both AI and PF-A (**See Figure 2 – General Plan Land Use Designation)**. Concurrent to the preparation of the Initial Study, a General Plan Amendment (GPA) and Zone Change (ZC) are being submitted to the City of Banning, changing the land use and zoning of PF-A to AI on a portion of the subject site. The site plan submittal dated November 17, 2017 for the proposed Project shows parking and a detention basin on the area presently designated as PF-A (**Figure 5 – Site Plan**).

The Project site is relatively flat, consists of approximately 63.9 acres, and is located to the north and east of, and directly adjacent to, the Banning Airport in the City of Banning, California (**Figure 3 – Project Site**, **Figure 4 – USGS Map**). South of the airport, land use is zoned Industrial (I) and Very Low Density Residential (VLDR). To the west of the airport at the extension of John Street, land use is zoned Airport Industrial and Industrial. Land uses include a plastic fabrication business, a small multi-tenant industrial park, automotive repair and scattered residential uses. Interstate Highway 10 and a Union Pacific Railroad line are located to the north of the site and the Morongo Indian Reservation is located directly east of the site.

The proposed Project involves development of a non-refrigerated high-cube warehouse building and offsite improvements with 990,000 square feet of warehouse space; 10,000 square feet of office space; 321 truck and trailer parking spaces; 166 automobile parking spaces, eight Americans with Disabilities (ADA) parking spaces and 205 loading docks that will have lighting pursuant to Chapter 17.12.170 of the City of Banning's Zoning Ordinance (**Figure 5 – Site Plan**). An existing rail line is located to the north of the Project site parallel to Interstate 10 and in the future if a specific user is identified, a rail spur could be constructed to serve the Project site. However, at this time, no rail spur is being proposed or analyzed as part of this Project.

Given the proximity to the Banning Airport, the Project is located within the Banning Municipal Airport overlay zones B1, B2, and D. The Project requires Airport Land Use Commission (ALUC) review, which occurred in March 2017. Airport Overlay Zone B1 is the "Inner Approach/Departure Zone". Objects taller than 35 feet within this zone require an airspace review and an aviation easement dedication. Per ALUC's development review, proposed buildings and associated structures on this site cannot be taller than 47 feet above ground level, or a maximum elevation of 2,208 feet above mean sea level. The proposed building is 46.6' high for a maximum elevation of 2,191 feet above mean sea level.

The offsite improvements involved in the Project include paving and improving of John Street, a dirt fire access road, sewer and water lines. The proposed Project offsite roadways include a 5,688 linear foot extension of John Street from the Project's west property line to Lincoln Street and a 3,871 linear foot dirt emergency fire access roadway at the southwestern corner of the property, which will cross the Ramsey Street Wash onto Banning Airport property.

The offsite utility improvements include extensions of water and sewer lines in order to connect to existing facilities located in Charles Street for sewer and the intersection of S. Hathaway Street and E. Barbour Street for water. As shown in **Figure 3**, the location to the south and west of the proposed lift station is labeled "Wet Utility." The exact location of the water and sewer lines has

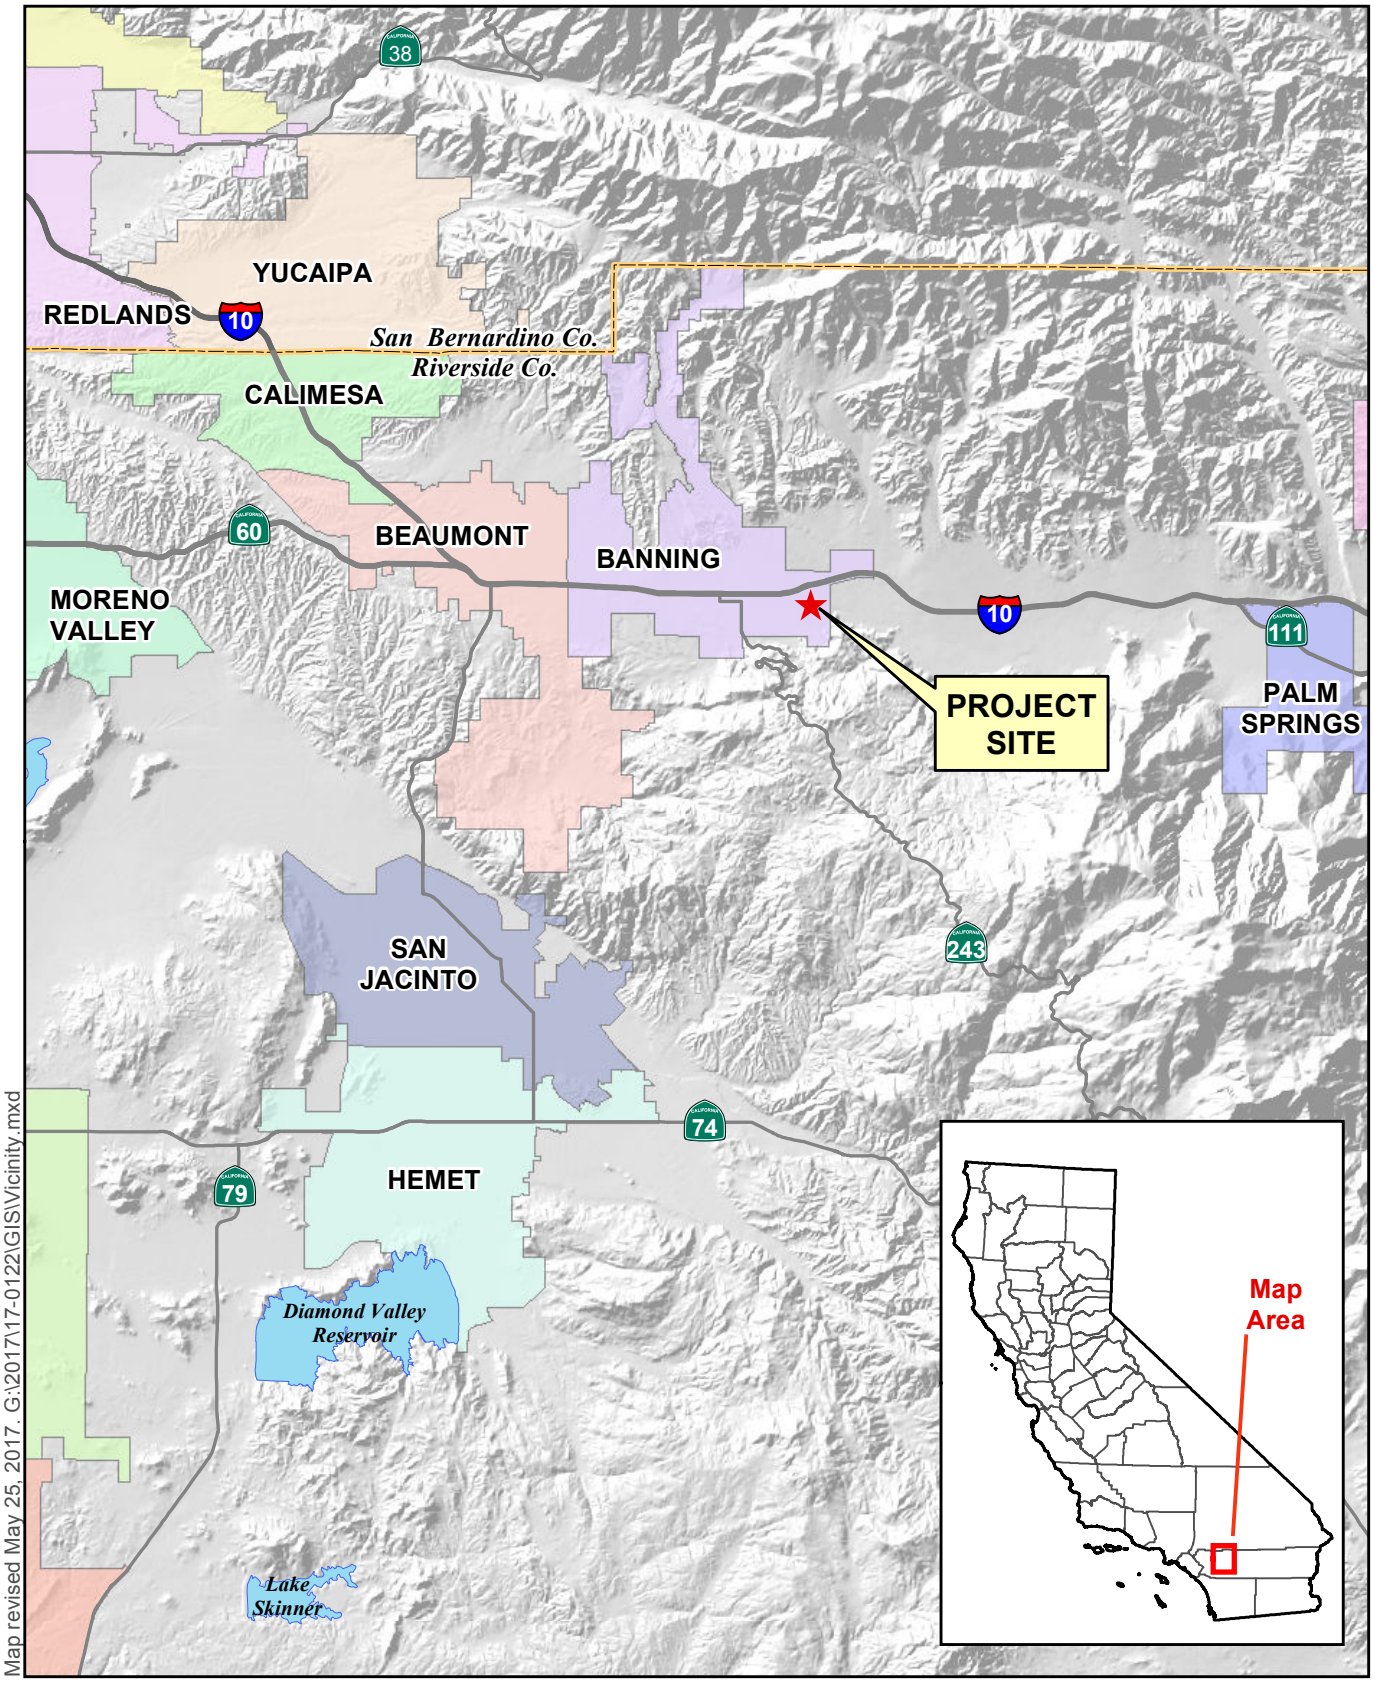
not been determined. However, it was determined that the area labeled Wet Utility will be the general location of these lines.

There will be two detention basins located on the southern portion of the Project site, just north of the Ramsey Street Wash. The Project includes construction of 5,968 linear feet of sewer line and the construction of an approximately 0.146 acre lift station. The lift station is approximately 0.4 miles from the southern edge of the Project. The Project requires construction of an offsite water line 9,350 linear feet in length to connect to existing lines at the intersection of S. Hathaway Street and E. Barbour Street. Approximately 4,714 linear feet of the water line extension will extend north on Hathaway and then east on the extension of John Street. The remaining 4,636 linear feet will be east and south of the Project site, terminating at the intersection of Scott Street and W. Westward Avenue. The point of connection for the water is at the intersection of W Westward Avenue and Scott Street; for the sewer line is in Charles Street, at the entrance to the City of Banning's Water Reclamation Facility (**Figure 6 – Utilities & Access**).

9. Surrounding land uses and setting:

The area directly to the south and west of the proposed Project consists of the Banning Municipal Airport facility, a city-owned facility zoned as Public Facilities (PF-A) consisting of approximately 295 acres. The property to the east of the Project is owned by the Morongo Band of Mission Indians, is currently vacant and is located outside the City's sphere of influence. The Union Pacific Railroad (Railroad) and Interstate 10 (I-10) are located north of the Project site.

10. Other public agencies whose approval is required (e.g., permits, financing approval, or participation agreement):



- Riverside County Airport Land Use Commission
- US Army Corps of Engineers, Clean Water Act Section 404 Permit
- Regional Water Quality Control Board, Colorado Region, Clean Water Act Section 401 Water Quality Certification
- California Department of Fish and Wildlife, a Fish and Game Code Section 1602 Streambed Alteration Agreement

11. Have California Native American tribes traditionally and culturally affiliated with the project area requested consultation pursuant to Public Resources Code section 21080.3.1? If so, has consultation begun?

As part of the EIR process, the City of Banning has conducted AB 52 and SB 18 consultations, including contacting the appropriate tribes and meeting with tribes that have requested consultation.

Note: Conducting consultation early in the CEQA process allows tribal governments, lead agencies, and Project proponents to discuss the level of environmental review, identify and address potential adverse impacts to tribal cultural resources, and reduce the potential for delay and conflict in the environmental review process. (See Public Resources Code section 21083.3.2.) Information may also be available from the California Native American Heritage Commission's Sacred Lands File per

Public Resources Code section 5097.96 and the California Historical Resources Information System administered by the California Office of Historic Preservation. Please also note that Public Resources Code section 21082.3(c) contains provisions specific to confidentiality.

ENVIRONMENTAL FACTORS POTENTIALLY AFFECTED:

The environmental factors checked below would be potentially affected by this project, involving at least one impact that is a "Potentially Significant Impact" as indicated by the checklist on the following pages:

☐ Aesthetics	☐ Agriculture and Forestry Resources	☒ Air Quality
☒ Biological Resources	☒ Cultural Resources	☐ Geology/Soils
☒ Greenhouse Gas Emissions	☐ Hazards & Hazardous Materials	☒ Hydrology/Water Quality
☐ Land Use/Planning	☐ Mineral Resources	☒ Noise
☐ Population/Housing	☐ Public Services	☐ Recreation
☒ Transportation/Traffic	☒ Tribal/Cultural Resources	☒ Utilities/Service Systems
☒ Mandatory Findings of Significance		

DETERMINATION: (To be completed by the Lead Agency)

On the basis of this initial evaluation:

☐ I find that the proposed project COULD NOT have a significant effect on the environment, and a NEGATIVE DECLARATION will be prepared.

☐ I find that although the proposed project could have a significant effect on the environment, there will not be a significant effect in this case because the mitigation measures described on an attached sheet have been added to the project. A MITIGATED NEGATIVE DECLARATION will be prepared.

☒ I find that the proposed project MAY have a significant effect on the environment, and an ENVIRONMENTAL IMPACT REPORT is required.

☐ I find that the proposed project MAY have a "potentially significant impact" or "potentially significant unless mitigated" impact on the environment, but at least one effect 1) has been adequately analyzed in an earlier document pursuant to applicable legal standards, and 2) has been addressed by mitigation measures based on the earlier analysis as described on attached sheets. An ENVIRONMENTAL IMPACT REPORT is required, but it must analyze only the effects that remain to be addressed.

☐ I find that although the proposed project could have a significant effect on the environment, because all potentially significant effects (a) have been analyzed adequately in an earlier EIR or NEGATIVE DECLARATION pursuant to applicable standards, and (b) have been avoided or mitigated pursuant to that earlier EIR or NEGATIVE DECLARATION, including revisions or mitigation measures that are imposed upon the proposed project.

Printed Name

EVALUATION OF ENVIRONMENTAL IMPACTS:

1) A brief explanation is required for all answers except "No Impact" answers that are adequately supported by the information sources a lead agency cites in the parentheses following each question. A "No Impact" answer is adequately supported if the referenced information sources show that the impact simply does not apply to projects like the one involved *(e.g., the project falls outside a fault rupture zone)*. A "No Impact" answer should be explained where it is based on project-specific factors as well as general standards *(e.g., the project will not expose sensitive receptors to pollutants, based on a project-specific screening analysis)*.

2) All answers must take account of the whole action involved, including off-site as well as on-site, cumulative as well as project-level, indirect as well as direct, and construction as well as operational impacts.

3) Once the lead agency has determined that a particular physical impact may occur, then the checklist answers must indicate whether the impact is potentially significant, less than significant with mitigation, or less than significant. "Potentially Significant Impact" is appropriate if there is substantial evidence that an effect may be significant. If there are one or more "Potentially Significant Impact" entries when the determination is made, an EIR is required.

4) "Negative Declaration: Less Than Significant With Mitigation Incorporated" applies where the incorporation of mitigation measures has reduced an effect from "Potentially Significant Impact" to a "Less Than Significant Impact." The lead agency must describe the mitigation measures, and briefly explain how they reduce the effect to a less than significant level (mitigation measures from Section XVII, "Earlier Analyses," may be cross-referenced).

5) Earlier analyses may be used where, pursuant to the tiering, program EIR, or other CEQA process, an effect has been adequately analyzed in an earlier EIR or negative declaration. Section 15063(c)(3)(D). Earlier analyses are discussed below:

    a. **Earlier Analysis Used.** Identify and state where they are available for review.
    b. **Impacts Adequately Addressed.** Identify which effects from the above checklist were within the scope of and adequately analyzed in an earlier document pursuant to applicable legal standards, and state whether such effects were addressed by mitigation measures based on the earlier analysis.
    c. **Mitigation Measures.** For effects that are "Less than Significant with Mitigation Measures Incorporated," describe the mitigation measure which were incorporated or refined from the earlier document and the extent to which they address site-specific conditions for the project.

6) Lead agencies are encouraged to incorporate into the checklist references to information sources for potential impacts *(e.g., general plans, zoning ordinances)*. Reference to a previously prepared or outside document should, where appropriate, include a reference to the page or pages where the statement is substantiated. A source list should be attached and other sources used or individuals contacted should be cited in the discussion.

7) Supporting Information Sources: A source list should be attached, and other sources used or individuals contacted should be cited in the discussion.

8) The explanation of each issue should identify:

    a. the significance criteria or threshold, if any, used to evaluate each question; and
    b. the mitigation measure identified, if any, to reduce the impact to less than significant.

ENVIRONMENTAL FACTORS: ENVIRONMENTAL CHECKLIST	*Potentially Significant Impact*	*Less Than Significant with Mitigation Incorporated*	*Less Than Significant Impact*	*No Impact*
I. AESTHETICS. Would the project:				
a. Have a substantial adverse effect on a scenic vista?	☐	☐	☒	☐
b. Substantially damage scenic resources, including, but not limited to, trees, rock outcroppings, and historic buildings within a state scenic highway?	☐	☐	☒	☐
c. Substantially degrade the existing visual character or quality of the site and its surroundings?	☐	☐	☒	☐
d. Create a new source of substantial light or glare which would adversely affect day or nighttime views in the area?	☐	☐	☒	☐

Aesthetics Discussion:

a) Would the project have a substantial adverse effect on a scenic vista?

The City of Banning (City) defines visual resources as those physical features that enhance the City's aesthetic and scenic character. The majority of the City is located within the narrow east-west trending valley of the San Gorgonio Pass, which is dominated by the San Bernardino Mountains along the northern end of the valley and the San Jacinto Mountains along the southern end of the valley (GP DEIR, p. III-189). These mountain ranges present impressive viewsheds and dramatic scenery, including frequently snow-covered mountain peaks and ranges with rugged slopes.

The Project proposes improvements to a currently vacant site to include a one story (46'- 6"height) warehouse, landscaping and two detention basins. Structures proposed at the site will have a relatively low profile and will not substantially alter views of the San Bernardino or San Jacinto Mountains. Additionally, the Project site is located in an area that is generally surrounded by developed or disturbed land and does not constitute a scenic vista. The closest sensitive receptor in proximity to the proposed on-site building is a house of worship located approximately 1.27 miles to the west of the Project site. There are several sensitive receptors located adjacent to the off-site improvements including residences directly adjacent to the off-site water line along Hathaway Street and residences located directly across Lincoln Street at the terminus of the extension of John Street at Lincoln Avenue as well as along Hargrave Street. There are existing industrial buildings between the sensitive receptors and the proposed Project. Therefore, any impacts related to scenic vistas will be **less than significant. This issue will not be addressed in the forthcoming EIR.**

Sources: GP DEIR, Project Design Plans

b) Would the project substantially damage scenic resources, including, but not limited to, trees, rock outcroppings, and historic buildings within a state scenic highway?

A portion of State Highway 243 is designated as a state scenic highway where it occurs in the City's southern Sphere of Influence. The City's General Plan (GP) Draft Environmental Impact Report (DEIR) determined, however, that development pursuant to the City's GP would have a limited impact to viewsheds along this

corridor (GP DEIR, p. III-190). The proposed Project site is located approximately one and one-half miles to the northeast of this section of State Highway 243, and thus will not affect a designated scenic highway.

Additionally, the Project site is currently vacant and does not contain any significant trees, rock outcroppings, or historic buildings. Therefore, impacts to scenic resources will be **less than significant. This issue will not be addressed in the forthcoming EIR.**

Source: GP DEIR

c) Would the project substantially degrade the existing visual character or quality of the site and its surroundings?

The Project site is currently vacant, relatively flat land. The Project is adjacent to other commercial and industrial uses, including the airport to the south and west, the Railroad and I-10 to the north, vacant land north of I-10, and vacant land to the east owned by the Morongo Band of Mission Indians. South of the airport, land use is zoned Industrial and Very Low Density Residential. To the west of the airport at the extension of John Street, land use is zoned Airport Industrial and Industrial. Existing land uses include a plastic fabrication business, a small multi-tenant industrial park, automotive repair and a single family residential unit. The industrial uses in this general area are typically single story, stucco and wood buildings with asphalt roofs. The proposed Project building is a modern industrial design, including concrete tilt-up wall construction with metal cap and window glazing. Therefore, the Project will not substantially degrade the quality of the site and its surroundings. Impacts in this regard will be **less than significant. This issue will not be addressed in the forthcoming EIR.**

Source: Project Description; General Plan

d) Would the project create a new source of substantial light or glare which would adversely affect day or nighttime views in the area?

During Project construction, nighttime lighting may be used within construction staging areas to provide security for construction equipment only. Nighttime lighting will not be needed to support construction since construction hours will comply with the City of Banning's Municipal Code Section 8.44.090 that requires construction activity be between the hours of 7:00 AM and 6:00 PM. Due to the distance of approximately 560 feet laterally between the construction area and motorists on adjacent roadways, such security lights may cause a significant impact in the form of glare to motorists. Lighting for the Project and construction will comply with the City's Municipal Code Section 17.12.170(D) that requires light shielding not spill beyond the boundaries of the site, reducing any anticipated glare to motorists.

The proposed Project will not introduce substantial new daytime glare to the area because it will consist of a concrete-walled building with few windows. As shown on **Figure 5**, the areas in the Project building with office space are on the southwest and southeast sides, facing away from the freeway; these are the only locations on the building that would have glazed windows. The proposed Project will introduce new sources of nighttime light and glare into the area from improved street lighting and additional security lighting at the Project site. However, all lighting at the Project site will be designed pursuant to Section 17.12.170 of the City's Municipal Code, which includes requirements for industrial lighting, including shielded exterior lights that point downward and away from adjoining properties (Zoning Ord. § 9106.03(11)). Therefore, measures to be incorporated into the Project design will avoid the creation of substantial light and glare, and any residual impacts will be **less than significant. This issue will not be addressed in the forthcoming EIR.**

Source: Project Description; City of Banning Zoning Chapter 17

ENVIRONMENTAL FACTORS:	*Potentially Significant Impact*	*Less Than Significant with Mitigation Incorporated*	*Less Than Significant Impact*	*No Impact*
II. AGRICULTURAL and FORESTRY RESOURCES. In determining whether impacts to agricultural resources are significant environmental effects, lead agencies may refer to the California Agricultural Land Evaluation and Site Assessment Model (1997) prepared by the California Department of Conservation as an optional model to use in assessing impacts on agriculture and farmland. In determining whether impacts to forest resources, including timberland, are significant environmental effects, lead agencies may refer to information compiled by the California Department of Forestry and Fire Protection regarding the state's inventory of forest land, including the Forest and Range Assessment project and the Forest Legacy Assessment project; and forest carbon measurement methodology provided in Forest Protocols adopted by the California Air Resources Board. Would the project:				
a. Convert Prime Farmland, Unique Farmland, or Farmland of Statewide Importance (Farmland), as shown on the maps prepared pursuant to the Farmland Mapping and Monitoring Program of the California Resources Agency, to non-agricultural use?	☐	☐	☐	☒
b. Conflict with existing zoning for agricultural use, or a Williamson Act contract?	☐	☐	☐	☒
c. Conflict with existing zoning for, or cause rezoning of, forest land (as defined in Public Resources Code section 12220(g)), timberland (as defined by Public Resources Code section 4526), or timberland zoned Timberland Production (as defined by Government Code section 51104(g))?	☐	☐	☐	☒
d. Involve other changes in the existing environment which, due to their location or nature, could result in conversion of Farmland, to non-agricultural use or conversion of forest land to non-forest use?	☐	☐	☐	☒

Agricultural Resources Discussion:

a) Convert Prime Farmland, Unique Farmland, or Farmland of Statewide Importance (Farmland), as shown on the maps prepared pursuant to the Farmland Mapping and Monitoring Program of the California Resources Agency, to non-agricultural use?

The proposed Project is not located within areas of Prime Farmland, Unique Farmland, or Farmland of Statewide Importance. According to the California Department of Conservation *California Important Farmland Finder*, the agriculture designation surrounding the Project site is Grazing Land. Urban and Built-Up Land designations within the Project area are associated with the runway and the I-10 corridor. In addition, neither the project site, nor the surrounding area, is zoned for agricultural use by the City of Banning. Therefore the proposed Project will have **no impact** in terms of converting any Prime Farmland, Unique Farmland, or Farmland of Statewide Importance. **This issue will not be addressed in the forthcoming EIR.**

Source: DOC

b) Conflict with existing zoning for agricultural use, or a Williamson Act contract?

As of 2004, there were three Williamson Act contracts in effect over approximately 3,500 acres within the City's General Plan planning area. These include lands located in the City limits near the Banning Bench, in the northwest portion of the planning area between Highland Springs Avenue and Highland Home Road, and in the City's southerly sphere of influence south of Westward Avenue (GP, p. IV-22). These lands are being phased out due to urbanization, although residential land uses that allow for agricultural and ranching activities are provided for under the proposed GP (GP DEIR, p. III-11).

The proposed Project is not located within or adjacent to a Williamson Act contract and is separated from the Williamson Act lands south of Westward Avenue by development, including residential and public parks. The land uses within the City of Banning for ranch/agriculture are located in the southwestern portion of the City, approximately 3.7 miles west of the Project site. The land uses surrounding the Project site are not zoned ranch/agricultural. Therefore, the proposed Project will have **no impact. This issue will not be addressed in the forthcoming EIR.**

Source: GP; GP DEIR; DOC WA

c) Conflict with existing zoning for, or cause rezoning of, forest land (as defined in Public Resources Code section 12220(g)), timberland (as defined by Public Resources Code section 4526), or timberland zoned Timberland Production (as defined by Government Code section 51104(g))?

The proposed Project site is within the City of Banning which does not have a zoning designation for forest land, timberland, or timberland zoned Timberland Production within City limits. In addition, no lands that would qualify as timberland exist within the City limits. Therefore, there will be **no impact**. **This issue will not be addressed in the forthcoming EIR.**

Source: GP DEIR

d) Involve other changes in the existing environment which, due to their location or nature, could result in conversion of Farmland, to non-agricultural use or conversion of forest land to non-forest use?

The proposed Project involves constructing a high-cube warehouse. The Project site is surrounded by lands classified as Urban and Built-Up Land by the California Department of Conservation and is not planned for future agricultural use in the City's General Plan. According to the California Department of Conservation *California Important Farmland Finder*, the agriculture designation surrounding the Project site is Grazing Land. Additionally, the City's GP does not identify any forest land uses within the City's limits. Therefore, **no impacts** are anticipated related to the conversion of Farmland to non-agricultural use or conversion of forest land to non-forest use**. This issue will not be addressed in the forthcoming EIR.**

Source: DOC; GP DEIR

ENVIRONMENTAL FACTORS:	*Potentially Significant Impact*	*Less Than Significant with Mitigation Incorporated*	*Less Than Significant Impact*	*No Impact*
III. AIR QUALITY. Where available, the significance criteria established by the applicable air quality management or air pollution control district may be relied upon to make the following determinations. Would the project:				
a. Conflict with or obstruct implementation of the applicable air quality plan?	☒	☐	☐	☐
b. Violate any air quality standard or contribute substantially to an existing or projected air quality violation?	☒	☐	☐	☐
c. Result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable federal or state ambient air quality standard (including releasing emissions which exceed quantitative thresholds for ozone precursors)?	☒	☐	☐	☐
d. Expose sensitive receptors to substantial pollutant concentrations?	☒	☐	☐	☐
e. Create objectionable odors affecting a substantial number of people?	☒	☐	☐	☐

Air Quality Discussion:

a) Conflict with or obstruct implementation of the applicable air quality plan?

The City of Banning and the San Gorgonio Pass are located in the South Coast Air Basin (Basin)**,** which is a non-attainment area for ozone, $PM_{2.5}$ and PM_{10}. The South Coast Air Quality Management District (SCAQMD) is responsible for preparation and enforcement of the Air Quality Management Plan (AQMP) for the Basin. The AQMD sets forth a comprehensive program designed to bring the Basin into compliance with all federal and state air quality standards. The AQMP's control measures and related emission reduction estimates are based upon emissions projections for a future development scenario derived from land use, population, and employment characteristics consistent with local General Plans, and are compiled in consultation with local governments.

According to the City's GP Land Use Map and Zoning Ordinance, the proposed Project has a land use and zoning designation of Airport Industrial and Public Facilities-Airport. The proposed Project involves the construction of a high-cube warehouse consistent with the City's AI designation which overlays the majority of the site, including the building footprint. The proposed Project entitlement requests include a General Plan Amendment and Zone Change altering the land use to AI from PF-A. At present, the proposed Project conflicts with the existing land use plan on a portion of the site. Therefore, the proposed Project could be considered to have a **potentially significant impact relative to the implementation of the AQMP. This topic will be addressed further in the forthcoming EIR.**

Source: GP DEIR; 2016 AQMP

b) Violate any air quality standard or contribute substantially to an existing or projected air quality violation?

Air quality impacts can be described in a short- and long-term perspective. Short-term impacts occur during site preparation and Project construction consisting of fugitive dust and other particulate matter, as well as exhaust emissions generated by construction-related vehicles. Long-term air quality impacts occur once the Project is in operation, and are primarily related to vehicular traffic generation.

The Project's short-term and long-term emissions will be evaluated and compliance with SCAQMD regional significance thresholds will be discussed in the forthcoming Environmental Impact Report (EIR). It is not possible at this time to determine the severity of Project-related air quality impacts; however, the proposed Project may result in a **potentially significant impact. This topic will be addressed further in the forthcoming EIR.**

c) Result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable federal or state ambient air quality standard (including releasing emissions which exceed quantitative thresholds for ozone precursors)?

The portion of the Basin within which the proposed Project site is located is designated as a non-attainment area for nitrogen dioxide (NO_2) under state standards, and for ozone, particulate matter less than 10 microns in diameter (PM_{10}), and particulate matter less than 2.5 microns in diameter ($PM_{2.5}$) under both state and federal standards (SCAQMD 2013, p. 2-7). The SCAQMD considers the thresholds for project-specific impacts and cumulative impacts to be the same. The Project's air pollutant emissions will be estimated and the severity of Project-related air quality impacts will be addressed in the forthcoming EIR. The proposed Project may result in a cumulatively considerable net impact to air quality, which would be a **potentially significant impact**. **This topic will be addressed further in the forthcoming EIR.**

d) Expose sensitive receptors to substantial pollutant concentrations?

The forthcoming air quality analysis will include a localized significance thresholds (LST) analysis as recommended, but not required, by the SCAQMD. LSTs are applicable to nitrogen oxides (NO_x), carbon monoxide (CO), PM_{10}, and $PM_{2.5}$ and represent the maximum emissions from a project that will not cause or contribute to an exceedance of the most stringent applicable federal or state ambient air quality standard on sensitive receptors (SCAQMD 2008). Sensitive receptors include residential uses, school playgrounds, childcare facilities, athletic facilities, hospitals, retirement homes, and convalescent homes (CARB 2005, p. 2-1). The closest sensitive receptor is a house of worship located approximately 1.27 miles to the west of the Project site. There are several sensitive receptors located adjacent to the off-site improvements including residences directly adjacent to the off-site water line along Hathaway Street and residences located directly across Lincoln Street at the terminus of the extension of John Street at Lincoln Avenue. The forthcoming air quality analysis will estimate the severity of Project-related air quality impacts to sensitive receptors and there may be a **potentially significant impact**. **This topic will be addressed further in the forthcoming EIR.**

e) Create objectionable odors affecting a substantial number of people?

It is anticipated that the major potential sources of odor from the proposed Project would be from short – term construction-related activities, particularly from construction equipment exhaust and asphalt applications. As has been noted, the closest sensitive receptors to the Project site itself are approximately 1.27 miles away. There are, however, sensitive receptors located within 100 feet of the proposed off-site road improvements, where odors from construction equipment and asphalt laying would be noticeable.

Impacts to these receptors may be potentially significant. Therefore, this topic **will be further addressed in the forthcoming EIR**.

Additionally, the California Air Resources Board (CARB) has developed an Air Quality and Land Use Handbook to evaluate common sources of odor complaints, including: sewage treatment plants, landfills, recycling facilities, and petroleum refineries (CARB 2005, p. 2-2). The Project proposes to operate as a warehouse, which is not included on CARB's list of facilities that are known to be prone to generate odors. Further, odor intensity decreases as distance from the source increases because it allows fresh air to mix with the odors. Therefore, odor-related impacts from these sources are considered to be **less than significant. This issue will not be addressed in the forthcoming EIR.**

ENVIRONMENTAL FACTORS:	*Potentially Significant Impact*	*Less Than Significant with Mitigation Incorporated*	*Less Than Significant Impact*	*No Impact*
IV. BIOLOGICAL RESOURCES. Would the project:				
a. Have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Game or U.S. Fish and Wildlife Service?	☒	☐	☐	☐
b. Have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations, or by the California Department of Fish and Game or U.S. Fish and Wildlife Service?	☒	☐	☐	☐
c. Have a substantial adverse effect on federally protected wetlands as defined by Section 404 of the Clean Water Act (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means?	☒	☐	☐	☐
d. Interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites?	☒	☐	☐	☐
e. Conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance?	☒	☐	☐	☐
f. Conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan?	☒	☐	☐	☐

Biological Resource Discussion:

a) Have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Wildlife or U.S. Fish and Wildlife Service?

The Project site and associated off-site improvement areas are currently vacant undeveloped land and have the potential to support species that might be listed as candidate, sensitive or special status. The City of Banning is a Permittee to the Western Riverside County Multiple Species Habitat Conservation Plan (MSHCP) which was developed in order for the local jurisdictions to have Take Authorization for covered, listed, and sensitive species as long as the terms and conditions of the MSHCP are met. Local projects from Permittees are required to determine if a project site has the potential for covered species under the MSHCP. As long as a project is consistent with the MSHCP, then Taking any covered sensitive or listed species would be authorized by compliance with the MSHCP. However, a variety of other special-status species that are not covered under the MSHCP could occur on the site or along the off-site linear alignments.

The Project site and associated off-site improvement areas are located within the Pass Area Plan of the MSHCP but are not located within a Criteria Area which would dictate certain specific requirements. The site is, however, located within an MSHCP-designated Special Linkage Area. The MSHCP indicates that the Project site is located within the designated Section 6.1.3 Narrow Endemic Plant Species Survey Area (NEPSSA) for Marvin's onion (*Allium marvinii*) and many-stemmed dudleya (*Dudleya multicaulis*), but it does not require Section 6.3.2 Critical Area Species surveys for plants or sensitive amphibian surveys. The Project area, including off-site improvement areas lay within the Section 6.3.2 MSHCP survey area for Burrowing Owl, which is a protected avian species of special concern. Proposed off-site improvement areas are not within the Section 6.3.2 MSHCP survey area for the Los Angeles Pocket Mouse, a mammalian species of special concern. Because the Project site is within the NEPSSA Burrowing Owl Survey Area, is located in a Special Linkage Area, and could support special-status species that are not covered under the MSHCP, Project development could have a **potentially significant impact. These topics will, therefore, be further addressed in the forthcoming EIR.**

Source: MSHCP

b) Have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations, or by the California Department of Fish and Wildlife or U.S. Fish and Wildlife Service?

The Project site has drainages on- and off-site that are potentially subject to regulations from California Department of Fish and Wildlife and US Fish and Wildlife Service. On a preliminary basis, the proposed Project could result in **potentially significant impacts** to riparian habitat or other sensitive natural communities. **This topic will be further addressed in the EIR.**

c) Have a substantial adverse effect on federally protected wetlands as defined by Section 404 of the Clean Water Act (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means?

The Project site has drainages on- and off-site that are potentially subject to Section 404 of the Clean Water Act. **This issue is, therefore, considered potentially significant and will be further addressed in the forthcoming EIR**.

d) Interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites?

As has been noted, the Project site, both on and offsite improvements, lies within a designated MSHCP Special Linkage Area, which are areas designed to preserve movement of wildlife and participate in surveys for special species covered under the MSHCP (GP DEIR, VI-1). This issue is considered **potentially significant and will be further addressed in the forthcoming EIR.**

Source: GP – DEIR; MSHCP

e) Conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance?

Prior to removal of any trees in excess of 50 years of age, the City of Banning Municipal Code Section 17.32.060 requires preparation of a tree removal and replacement plan, unless removal is required to protect public health and safety. The MSHCP does not identify any trees on the Project site or within the offsite improvements in excess of 50 years of age; however, a tree report will be prepared that identifies any trees that could be over 50 years old and a landscape plan will be prepared that identifies the trees to be planted on the Project site. Consequently, impacts are considered **potentially significant and will be addressed in the forthcoming EIR.**

Source: BMC; GE

f) Conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan?

As has been noted, the proposed Project site is within the boundaries of the MSHCP for Western Riverside County. As described in Threshold IV.a) above, the Project's consistency with the MSHCP could be a **potentially significant impact and will be further addressed in the forthcoming EIR.**

ENVIRONMENTAL FACTORS:	*Potentially Significant Impact*	*Less Than Significant with Mitigation Incorporated*	*Less Than Significant Impact*	*No Impact*
V. CULTURAL RESOURCES. Would the project:				
a. Cause a substantial adverse change in the significance of a historical resource as defined in §15064.5?	☒	☐	☐	☐
b. Cause a substantial adverse change in the significance of an archeological resource pursuant to §15064.5?	☒	☐	☐	☐
c. Directly or indirectly destroy a unique paleontological resource or site or unique geologic feature?	☒	☐	☐	☐
d. Disturb any human remains, including those interred outside of formal cemeteries?	☒	☐	☐	☐

Cultural Resource Discussion:

a) Cause a substantial adverse change in the significance of a historical resource as defined in §15064.5?

The Project site is being evaluated to determine if any historical resources exist in the Project area that could be considered a **potentially significant impact**. **This topic will be addressed in the forthcoming EIR.**

b) Cause a substantial adverse change in the significance of an archeological resource pursuant to §15064.5?

The Project site is being evaluated to determine if any archaeological resources exist in the Project area that could be *considered* a **potentially significant impact**. **This topic will be addressed in the forthcoming EIR.**

c) Directly or indirectly destroy a unique paleontological resource or site or unique geologic feature?

According to the Riverside County GIS database, the proposed Project is located within paleontological sensitivity areas of low potential. During construction, paleontological resources could, however, be unexpectedly encountered. The Project site is being evaluated to determine if any unique paleontological resources exist in the Project area which would be considered a **potentially significant impact**. **This will be further addressed in the forthcoming EIR.**

Source: RCLIS

d) Disturb any human remains, including those interred outside of formal cemeteries?

The proposed Project site is not located on any known cemetery. Should any human remains be found, it could be considered a **potentially significant impact**. **The forthcoming EIR will discuss this topic** and identify procedures required should human remains be found.

ENVIRONMENTAL FACTORS:	*Potentially Significant Impact*	*Less Than Significant with Mitigation Incorporated*	*Less Than Significant Impact*	*No Impact*
VI. GEOLOGY AND SOILS. Would the project:				
a. Expose people or structures to potential substantial adverse effects, including the risk of loss, injury, or death involving:				
i. Rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map issued by the State Geologist for the area or based on other substantial evidence of a known fault? Refer to Division of Mines and Geology Special Publication 42.	☐	☐	☒	☐
ii. Strong seismic ground shaking?	☐	☐	☒	☐
iii. Seismic-related ground failure, including liquefaction?	☐	☐	☒	☐
iv. Landslides or mudflows?	☐	☐	☒	☐
b. Result in substantial changes in topography, unstable soil	☐	☐	☒	☐

ENVIRONMENTAL FACTORS:	*Potentially Significant Impact*	*Less Than Significant with Mitigation Incorporated*	*Less Than Significant Impact*	*No Impact*
conditions from excavation, grading or fill, or soil erosion or the loss of topsoil?				
c. Be located on a geologic unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on- or off-site landslide, lateral spreading, subsidence, liquefaction or collapse?	☐	☐	☒	☐
d. Be located on expansive soil, as defined in Table 18-1-B of the Uniform Building Code (1994), creating substantial risks to life or property?	☐	☐	☒	☐
e. Have soils incapable of adequately supporting the use of septic tanks or alternative waste water disposal systems where sewers are not available for the disposal of waste water?	☐	☐	☐	☒

Geology and Soils Discussion:

a) Expose people or structures to potential substantial adverse effects, including the risk of loss, injury, or death involving:

i) Rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map issued by the State Geologist for the area or based on other substantial evidence of a known fault? Refer to Division of Mines and Geology Special Publication 42.

The Banning area is located between the North American and Pacific tectonic plates and in proximity to the San Andreas Fault Zone and other regional faults (GP, p. V-10). The closest Alquist-Priolo Earthquake Fault Hazard Zone is the San Gorgonio Pass fault zone that is located along the San Andreas Fault Zone which is approximately 1.3 miles to the north of the Project site (GEO p. 13, Riverside County Land Information System). There are no other known faults within or immediately adjacent to the Project site that could rupture during an earthquake (GP Exhibit V-3, GP DEIR Exhibit III-13).

The proposed Project involves constructing a warehouse building, roads, a sewer lift station, water and sewer lines, and landscaping at the currently vacant site. None of these proposed facilities are anticipated to expose a large number of people or structures to substantial seismic risk from a known earthquake fault. For a warehouse this size based on industry research conducted by the National Association for Industrial and Office Parks (NAIOP), it is estimated that there would be approximately one worker employed for every 2,000 square feet of space. For this Project, that would be approximately 500 workers employed at the site, depending on the type of use the building will ultimately operate. Not all employees would, however, be anticipated to be on-site at any given time. The proposed Project will be developed pursuant to the most recent versions of the Uniform Building Code and the California Building Code which require seismic safety standards applicable to all development in California (GP DEIR, p. III-74). Compliance with existing building code and seismic safety requirements will reduce potential impacts from fault rupture to the extent feasible, and thus are considered **less than significant. This issue will not be addressed further in the forthcoming EIR.**

Source: GEO; GP Exhibit V-3 – Faults and Fault Zones; GP DEIR Exhibit III-13 – Faults and Fault Zones; RCLIS

ii) Strong seismic ground shaking?

Due to its physical and geologic location, the Banning area is susceptible to potentially intense seismic ground shaking, typical of much of California, which could affect the safety and welfare of the general community. The effects of ground motion on structures are difficult to predict, dependent on the intensity of the earthquake, the distance from the epicenter to the site, the composition of soils and bedrock, building design, and other physical criteria (GP DEIR, p. III-74). As has been noted, the San Andreas Fault Zone, which is located approximately 1.3 miles from the Project site, could cause severe seismic shaking. The Maximum Credible Earthquake (MCE) is used to determine the largest earthquake that a fault is estimated to be able to generate. In the Banning sphere of influence, the MCE from the San Andreas Fault could generate a magnitude 7.8 earthquake (GP, p. V-11). Based on these factors, ground shaking may cause no, little, or major structural damage or destruction. In general, however, peak ground accelerations and seismic intensity values decrease with increasing distance from the causative fault.

The proposed Project involves construction of a warehouse structure and other infrastructure (roads, water, and sewer). Similar to other areas in the City of Banning and nearby vicinity, employees and visitors to the site may be exposed to risk of loss, injury, or death involving strong seismic ground shaking. Compliance with existing building code and seismic safety requirements will reduce potential impacts from ground shaking to the extent feasible, and thus are considered **less than significant. This issue will not be addressed further in the forthcoming EIR**.

Source: GP DEIR

iii) Seismic-related ground failure, including liquefaction?

Liquefaction commonly occurs in loose, saturated, sandy sediments that are subject to ground vibrations greater than 0.2 peak ground acceleration (g). When liquefaction occurs, the sediments involved have a substantial loss of shear strength and behave like a liquid or semi-viscous substance and can result in structural distress or failure due to ground settlement, a loss of load-bearing capacity in foundation soils, and the buoyant rise of buried structures.

A geotechnical investigation and report, which describes on-site soils and groundwater conditions, was conducted in June 2005 by Geotechnics Incorporated (GEO) and updated in June 2016 by Southern California Soil & Testing, Inc. (SCST). The investigation found that the Project site is underlain by Quaternary-age alluvium shed from the adjacent San Jacinto Mountains. The alluvium is generally composed of poorly graded sand with silt and gravel and poorly graded gravel with silt and sand containing various amounts of gravel and fragments of granite and gneissic rock. Site surveys and exploratory borings did not reveal any groundwater on-site. The geotechnical study conducted on the Project site noted that the site is not underlain by potentially liquefiable soils (GEO, p. 14).

According to the City's GP, the Project site is located in an area with moderate liquefaction susceptibility (GP Exhibit V-4, GP DEIR Exhibit III-14). The Project will be designed in compliance with the Uniform Building Code and the California Building Code. Adherence to all applicable federal and state codes and regulations will ensure that potential impacts to people and structures from seismic related ground

failure, including liquefaction, will be **less than significant. This issue will not be addressed further in the forthcoming EIR.**

Source: GEO; GP Exhibit V-4 – Liquefaction Susceptibility; GP DEIR Exhibit III-14 – Liquefaction Susceptibility; USDA

iv) Landslides or mudflows?

Landslides have become significant hazards as development within the City reaches higher elevations on the hill slopes. Rock falls, rockslides, and to a lesser degree, large landslides are likely to occur in areas of high relief, such as along steep canyon walls in the southern Banning Bench area, and along the portions of the natural slopes facing the southern edge of the City (GP, p. V-6).

The proposed Project site is not located adjacent to any areas with low, moderate, or high risk of seismically induced settlement and slope instability and no known landslides have occurred in the Project vicinity (GP Exhibit V-2; GP DEIR Exhibit III-15). On-site and surrounding topography is relatively flat. The Project will be designed in compliance with the Uniform Building Code and California Building Code. Adherence to all applicable federal and state codes and regulations will ensure that potential impacts to people and structures from landslides or mudflows, however minimal, will be **less than significant. This issue will not be addressed further in the forthcoming EIR.**

Source: GP Exhibit V-2 – Seismically Induced Settlement and Slope Instability; GP DEIR Exhibit III-15 – Seismically Induced Settlement and Slope Instability

b) Result in substantial changes in topography, unstable soil conditions from excavation, grading or fill, or soil erosion or the loss of topsoil?

Once operational, the majority of the Project site will be paved and developed with a warehouse facility and supporting infrastructure. Potential short-term and long-term erosional impacts associated with construction and operation of the proposed Project will be minimized through compliance with standard erosional control practices and requirements of a National Pollutant Discharge Elimination System (NPDES) General Construction Permit issued by the State Water Resources Control Board (SWRCB) for construction projects. As required, the Project will incorporate Best Management Practices to minimize potential runoff and erosion. Impacts are consequently considered **less than significant. This issue will not be further addressed in the forthcoming EIR.**

Source: Project Description; GP DEIR

c) Be located on a geologic unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on- or off-site landslide, lateral spreading, subsidence, liquefaction or collapse?

Impacts related to landslides are addressed in Threshold VI.a.iv) above; impacts related to liquefaction are addressed in Threshold VI.a.iii) above. The following analysis addresses impacts related to unstable soils, as a result of lateral spreading, subsidence, or collapse.

Lateral spreading refers to the lateral movement of gently to steeply sloping saturated soil deposits caused by earthquake-induced liquefaction. As discussed in Threshold VI.a.iii), the site is located within an area with moderate potential for liquefaction. A geotechnical investigation and report was conducted in June 2005 by Geotechnics Incorporated (GEO) at the proposed Project site and updated in June 2016 by Southern

California Soil & Testing, Inc. (SCST). The GEO site survey noted the Project site is not located within an area previously known for significant geological hazards nor was there evidence of active faulting, landslides, liquefiable soils or collapsible soils (GEO, p. 9). The Project will be designed in compliance with the Uniform Building Code and California Building Code. With adherence to all applicable federal and state codes and regulations, **impacts related to the potential for lateral spreading are considered less than significant. This issue will not be further addressed in the EIR.**

Subsidence in the Banning area is closely associated with groundwater levels. In particular, the alluvial sediments within the groundwater basins from which the City's water is withdrawn are subject to subsidence if rapid groundwater extraction occurs in response to increased water demands as a result of population growth or prolonged drought (GP DEIR, p. III-69). Structures sensitive to slight changes in elevation, such as canals, sewers and drainage improvements are generally sensitive to the effects of subsidence and may be damaged if significant subsidence occurs.

A substantial portion of the City's valley and canyon areas are underlain by potentially compressible and/or collapsible soils consisting of young sediments with low density that will settle under the added weight of fill embankments or buildings (GP DEIR, p. III-81).

The updated GEO report noted the Project site is in the same general physical condition as when it was originally investigated. The investigation provided recommendations for design of site improvements and structure including removal of the top 12 inches of subgrade, moisture conditioning to near optimum moisture content, and compaction to at least 95% relative compaction. These recommendations are standard design measures and will be incorporated in Project construction. Recommendations of the geotechnical consultant will be incorporated in the Project's Conditions of Approval. Through compliance with these standard measures as well as compliance with the Uniform Building Code and California Building Code, **potential impacts related to unstable soils will be less than significant. This issue will not be addressed further in the forthcoming EIR.**

Source: GEO; GP DEIR; SCST

d) Be located on expansive soil, as defined in Table 18-1-B of the Uniform Building Code (1994), creating substantial risks to life or property?

Expansive soils are those that contain significant amounts of clay with a high shrink (dry) and swell (wet) potential. The upward pressures induced by the swelling of expansive soils under moist conditions can have harmful effects upon structures. In Banning, expansive soils are primarily associated with areas underlain by older fan deposits containing argillic (clay-rich) soil profiles, which are in the moderately expansive range. The low-lying areas of the City are underlain by alluvial fan sediments that are composed primarily of granular soils with expansion potential ranging from very low to moderately low (GP DEIR, p. III-69). According to the Geotechnical report, the Project site consists of poorly graded sand with silt and gravel (SP-SM) and poorly graded gravel with silt and sand with gravel and cobble sized sediment (GP-GM) which are granular soils. As noted above in Threshold IV.d.), recommendations from the geotechnical consultant will be used in the building design as well as the most recent versions of the Uniform Building Code and the California Building Code. Potential impacts associated with expansive soils are consequently considered to be **less than significant and no mitigation is required. This issue will not be addressed further in the forthcoming EIR.**

Source: GP DEIR; GEO

e) Have soils incapable of adequately supporting the use of septic tanks or alternative waste water disposal systems where sewers are not available for the disposal of waste water?

The proposed Project will not contain septic tanks or alternative wastewater disposal systems. The Project will require a sewer line that will tie into the existing sewer infrastructure. Therefore, there will be **no impact** in this regard. **This issue will not be addressed further in the forthcoming EIR.**

Source: Project Description

ENVIRONMENTAL FACTORS:	*Potentially Significant Impact*	*Less Than Significant with Mitigation Incorporated*	*Less Than Significant Impact*	*No Impact*
VII. GREENHOUSE GAS EMISSIONS. Would the project:				
a. Generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment?	☒	☐	☐	☐
b. Conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of greenhouse gases?	☒	☐	☐	☐

Greenhouse Gas Emissions Discussion:

a) Generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment?

The forthcoming EIR will address greenhouse gas emissions (GHG) from construction and operation of the proposed Project. This issue is considered **potentially significant and will be further investigated and discussed in the forthcoming EIR.**

b) Conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of greenhouse gases?

The City of Banning participated in the development of the Western Riverside Council of Governments (WRCOG) Subregional Climate Action Plan (CAP). The Project will be analyzed to determine if there are any conflicts with applicable plans or policies that could create a **potentially significant impact**. **Compliance with the CAP will be discussed in the forthcoming EIR.**

Source: WRCOG CAP

ENVIRONMENTAL FACTORS:	*Potentially Significant Impact*	*Less Than Significant with Mitigation Incorporated*	*Less Than Significant Impact*	*No Impact*
VIII. HAZARDS AND HAZARDOUS MATERIALS. Would the project:				
a. Create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials?	☐	☐	☒	☐
b. Create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment?	☐	☐	☒	☐
c. Emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school?	☐	☐	☒	☐

e. For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project result in a safety hazard for people residing or working in the project area?	☐	☐	☒	☐
f. For a project within the vicinity of a private airstrip, would the project result in a safety hazard for people residing or working in the project area?	☐	☐	☐	☒
g. Impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan?	☐	☐	☒	☐
h. Expose people or structures to a significant risk of loss, injury or death involving wildland fires, including where wildlands are adjacent to urbanized areas or where residences are intermixed?	☐	☐	☒	☐

Hazards and Hazardous Materials Discussion:

a) Create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials?

The routine transportation of hazardous materials can result in accidental spills, leaks, toxic releases, fire, or explosions Construction of the proposed Project may involve short term transportation and storage of hazardous materials, such as fuels for construction equipment. The proposed Project involves developing a warehouse, access road, secondary fire access road and a water and sewer lift station at the currently vacant site, none of which involve uses that would generate a significant long -term routine hazard to the public.

Nonetheless, any amount of hazardous substances used during Project construction and operation will be subject to federal and state regulations for the safe handling and transportation of hazardous materials. Hazardous material transport, storage and response to upsets or accidents are primarily subject to federal regulation by the United States Department of Transportation (DOT) Office of Hazardous Materials Safety in accordance with Title 49 of the Code of Federal Regulations (CFR). California regulations applicable to hazardous material transport, storage and response to upsets or accidents are codified in Title 13 (Motor Vehicles), Title 8 (Cal/OSHA), Title 22 (Management of Hazardous Waste), Title 26 (Toxics) of the California Code of Regulations (CCR), and the Chapter 6.95 of the Health and Safety Code (Hazardous Materials Release Response Plans and Inventory).

Compliance with all applicable federal and state laws related to the transportation, use, storage and response to upsets or accidents that involve hazardous materials would reduce the possibility and potential severity of upsets and accidents during construction related activities. As noted previously, the long term operation of the proposed facility is not expected to involve the routine use, transport or disposal of hazardous materials. Consequently, impacts from such activities are anticipated to be **less than significant**. **This issue will not be addressed further in the forthcoming EIR.**

Source: CHSC; CCR; CFR

b) Create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment?

As noted in Threshold VIII.a), above, the Project may involve the use of small amounts of hazardous materials during construction activities but must comply with all applicable federal and state laws pertaining to the transport, use, disposal, handling, and storage of hazardous materials, including but not limited to Title 49 of the Code of Federal Regulations and Title 13, (motor vehicles) Title 8 (Cal/OSHA), Title 22 (Health and Safety Code), Title 26 (Toxics) of the California Code of Regulations, and Chapter 6.95 of the Health and Safety Code (Hazardous Materials Release Response Plans and Inventory), which impose strict regulations for the safe transportation and use of hazardous materials. Compliance with all applicable federal and state laws related to the transportation, use and storage of hazardous materials would reduce the possibility and potential severity of any accidents. As has been noted, the Project is not expected to result in the long term use of significant amounts of hazardous materials that would create a hazard to the public or environment. Consequently, potential impacts from upset and accident conditions involving release of hazardous substances are considered **less than significant. This issue will not be addressed further in the forthcoming EIR.**

Source: CHSC; CCR; CFR

c) Emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school?

The proposed Project is approximately one mile to the south of Hoffer Elementary School which is located on the north side of Interstate 10. However, as discussed in Threshold VIII.a), neither construction of the off-site improvements including the sewer lift station and water and sewer lines nor operation of the Project site is anticipated to require routine use or storage of hazardous materials, substances, or their disposal. Any incidental hazardous materials, substances, or waste that might be transported to, or generated at, the Project site will be handled in compliance with all applicable local, state and federal regulations. The Project site, as noted, is also more than one quarter mile from the nearest school. Consequently, any potential

impacts to existing schools from hazardous substances are considered **less than significant. This issue will not be addressed further in the forthcoming EIR.**

Source: GE

d) Be located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, would it create a significant hazard to the public or the environment?

HEI Corporation (HEI) conducted a Phase 1 Environmental Site Assessment for the Project site in April 2017. The Phase 1 assessment found that there is no evidence of recognized environmental conditions at the Project site and there is no evidence of recent activity observed.

To the south of the Project site, Banning Airport is listed in the California Department of Toxic Substances Control (DTSC) EnviroStor Database as a Formally Used Defense Site (FUDS) which was used by the military for training programs in 1943. The EnviroStor posting regarding the airport does not indicate any soil or groundwater impacts occurred.

Beyond the airport, the closest listed hazardous materials site that could have affected the site is the California Department of Transportation Banning Maintenance Station located approximately one-half mile to the west of the Project Site (HEI). The site is listed as a Leaking Underground Storage Tank (LUST) and Landfill and/or Sold Waste (SWF/LF) designation. As of August 30, 1995, the site was given a LUST status of "Completed – Case Closed." The site is currently a limited volume transfer station that handles dead animals; inert, landscape and metal debris; mixed municipal trash; and used tires.

In relation to the Project off-site improvements, the DTSC EnviroStor Database lists the closest hazardous materials site as the Banning Rifle Range located approximately 500 feet to the south of the proposed lift station (WEBB). It was a FUDS site used by the military as a small arms firing range during World War II between 1942 and 1944. As of September 2012, the site is listed as inactive.

Because the proposed Project site is not on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5, and there are not any listed sites adjacent to the Project site, the Project will not create a significant hazard to the public or the environment. Consequently, related impacts are considered **less than significant. This issue will not be addressed further in the forthcoming EIR.**

Source: HEI; EnviroStor Database

e) For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project result in a safety hazard for people residing or working in the project area?

The Banning Municipal Airport is located adjacent to the Project site as well as being located in close proximity to the offsite utilities. The offsite utilities will be underground, and the sewer lift station will be no taller than 10 feet. Land use designations within the City General Plan are designed to accommodate for continued safe operation of the Banning Municipal Airport (GP DEIR, p. III-62). The Project lies within Zone B1, B2, and D of the Banning Municipal Airport Land Use Compatibility Plan. Thus, project review by the Riverside County Airport Land Use Commission (ALUC1) is required. Objects taller than 35 feet within Zone B1 are subject to an airspace review. ALUC reviewed this Project at its February 9, 2017 meeting (ALUC2,

Appendix D), and determined that structures should not exceed a height of 47 feet above ground level. The proposed Project consists of a high cube warehouse that will be no taller than 46.6 feet above ground level. The Project is consistent with the ALUC plan for The Banning Municipal Airport, and therefore would not pose a safety hazard. Consequently, potential airport safety impacts are considered **less than significant. This issue will not be addressed further in the forthcoming EIR.**

Source: ALUC1; ALUC2; GE; GP DEIR; Project Description

f) For a project within the vicinity of a private airstrip, would the project result in a safety hazard for people residing or working in the project area?

The proposed Project and associated off-site features are not located within the vicinity of a private airstrip (Google Earth). As such, the Project will have **no impact** related to exposure of people residing or working in the Project area to safety hazards. **This issue will not be addressed in the forthcoming EIR.**

Source: GE

g) Impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan?

The Riverside County Operational Area (OA) Emergency Operations Plan (EOP) which was adopted in 2006 and updated in 2012, addresses the planned response to extraordinary emergency situations associated with natural disasters, technological incidents, and national security emergencies in or affecting Riverside County (EOP, p. 1-1), including the City of Banning.

According to the City's GP, evacuation routes have not been formally established throughout the City, although depending on the location and extent of the emergency, major surface streets could be utilized to route traffic through the City (GP, p. VI-45). Access to the proposed Project site will be available from John Street, which is proposed to be improved as part of the Project and will run east-west and directly north of the Project site. John Street is not designated as a Major Local Roadway in the City's GP and would not be expected to be a major evacuation route in the event of an emergency since it terminates at the Project site. While the proposed Project site is located adjacent to I-10, the location of the Project's roadway improvements are not expected to impact the use of I-10 as an evacuation route as the roadway improvements do not include changes to I-10 or access to I-10 from the Project site (GP, Exhibit III-4).

Because the development of the Project will not affect any major streets that are most suited for evacuation routes for a large population, and because it would contribute to the improvement of John Street, interference with an adopted emergency response plan or emergency evacuation plan for the City is considered a less **than significant impact and no mitigation is required**. **This issue will not be addressed further in the forthcoming EIR.**

Source: EOP; GP – PSF

h) Expose people or structures to a significant risk of loss, injury or death involving wildland fires, including where wildlands are adjacent to urbanized areas or where residences are intermixed?

The proposed Project and off-site features are located within the City's High Fire Hazard Zone, within which topographic changes are minimal and hardscape (concrete, asphalt, and structures) and landscaping vegetation predominate (GP, Exhibit V-10). The risk of wildfires being triggered during construction is

considered limited due to required adherence to standard fire-prevention measures such as protection of any sparking equipment and prohibition of the use of such equipment during high winds. In addition, neither construction of buildings or offsite improvements are anticipated to involve any unique characteristics that would create a significant risk from wildfires. The Project site will be designed according to the 2001 California Fire Code with City amendments and regularly maintained (e.g. brush management) to reduce fire hazards. (GP, p. V-70).

The City contracts with the Riverside County Fire Department for fire services; in turn, the County contracts with CAL FIRE. The City's Fire Marshal is authorized and directed to enforce the provisions of the Fire Code throughout the City. As part of these responsibilities, the Fire Marshal reviews plans for new construction and additions, coordinates with the City for disaster preparedness programs, and manages the City's weed abatement program. Consequently, with compliance to the California Fire Code and required approval of site plans by the Fire Marshal, exposure of people or structures to a significant risk of loss, injury, or death involving wildland fires is considered a **less than significant impact. This issue will not be addressed further in the forthcoming EIR.**

Hydrology and Water Quality Discussion:

a) Violate any water quality standards or waste discharge requirements?

Activities associated with the construction of the proposed Project including the offsite utilities may threaten water quality standards through the release of pollutants (e.g., oil from equipment) and sediment off-site. However, the Project is required to prepare a Storm Water Pollution Prevention Plan (SWPPP) pursuant to the statewide General Construction Permit (NPDES General Permit No. CAS000002, Waste Discharge Requirements, Order No. 2009-0009-DWQ, adopted September 2, 2009 and effective as of July 2, 2010) issued by the State Water Resources Control Board (SWRCB) for construction projects. The SWPPP must be prepared by a Qualified SWPPP Developer and implemented on-site by a Qualified SWPPP Practitioner and is also subject to review (before and during construction) by the Colorado River Basin Regional Water Quality Control Board (RWQCB). The SWPPP must describe erosion and sediment control measures (best management practices or "BMPs") to minimize the discharge of polluted stormwater runoff to the maximum extent practicable. In addition, the SWPPP will outline a visual monitoring program and a chemical monitoring program for "non-visible" pollutants to be implemented if there is a failure of BMPs. Termination of general construction permit coverage is possible only after 70% of the site is deemed stable and proven as such to the state (RWQCB).

Development of the proposed Project would add impervious surfaces to the site through improvements to John Street, parking lots, sidewalks and drive aisles. In addition, operation of the proposed Project would introduce potential sources of water pollution including vehicles, trucks, and personnel. By increasing the percentage of impervious surfaces on the site, more surface runoff would be generated that collects and transports pollutants into receiving waterbodies during rainfall events.

As a co-permittee to the Municipal Separate Storm Sewer System permit ('MS4', Colorado River Basin RWQCB Order No. R7-2013-0011, NPDES No. CAS617002), Banning is required to regulate the discharges of urban runoff as they enter the City's MS4 facilities (i.e., storm drains) in order to prevent the degradation of water quality in receiving waters, pursuant to the Whitewater River MS4 Stormwater Water Management Plan (SWMP). One method of regulation in the SWMP is the requirement of a Water Quality Management Plan (WQMP) for all Priority Development Projects to treat post-construction stormwater runoff in perpetuity. The Project applicant would be required to develop a WQMP for review and approval by the City of Banning that outlines how stormwater runoff generated within the plant will be treated prior to release from the site (or infiltrated). The WQMP must also detail whether hydro modification conditions of concern

exist, how source control practices can be implemented, and identify responsible entities for ongoing maintenance and funding.

Currently, the preliminary WQMP provides two infiltration basins on the southern area of the Project site that comply with the City of Banning's stormwater requirements and WQMP Guidance Document by infiltrating a volume equivalent to a 100-year, 3-hour storm event. Due to the proximity of the site next to the Banning Airport, the basins will be completely infiltrated within 48 hours. In addition, the Project building footprint and parking areas include avoidance of the Ramsey Street Wash along the southern border of the property, which will ensure existing natural drainage patterns remain. The proposed Project incorporates site design, source controls and treatment control BMPs to address storm water runoff. Thus, through BMPs, in addition to compliance with existing regulations, the proposed Project will not violate water quality standards or waste discharge requirements. Consequently, impacts pertaining to compliance with water quality and waste discharge standards are considered **less than significant**. **This issue will not be addressed further in the forthcoming EIR.**

Source: Project Description; P-WQMP, MS4 Permit, WQMP Guidance Document, SWRCB

b) Substantially deplete groundwater supplies or interfere substantially with groundwater recharge such that there would be a net deficit in aquifer volume or a lowering of the local groundwater table level (e.g., the production rate of pre-existing nearby wells would drop to a level which would not support existing land uses or planned uses for which permits have been granted)?

A Water Supply Assessment that is required pursuant to Senate Bill 610 will be prepared by the Project water supplier and will be summarized in the forthcoming EIR. See Checklist Item XVIII (d) for specific information on water supply impacts.

The City of Banning overlies the westerly half of the San Gorgonio Pass Groundwater Sub-basin and obtains all of its water supply from local groundwater sources. The City of Banning will be the water supplier for the Project. The San Gorgonio Pass Groundwater Sub-basin includes five hydraulically-connected groundwater "storage units", which constitute the City of Banning groundwater resource area: the Banning Storage Unit, the Banning Bench Storage Unit, the Banning Canyon Storage Unit, the Cabazon Storage Unit, and the Beaumont Storage Unit. Groundwater recharge to the Banning area is obtained from precipitation infiltrating into the ground within the surface water catchments and particularly in the canyons north of the City. An additional source of recharge is subsurface inflow (i.e. underflow) from storage unit to storage unit, infiltration of Whitewater River diversions in the Banning Canyon, and from infiltration of treated wastewater into the Cabazon Storage Unit.

The proposed Project overlies the Cabazon Storage Unit, which encompasses approximately 17,215 acres. The Project does not include construction of a groundwater well. Noting the high rates of infiltration documented onsite, storm water runoff collected on-site within the proposed infiltration basins would provide a point of periodic recharge to the Cabazon Storage Unit. Notably in 2011, this storage unit experienced a positive change in storage as a result of the recharge basins located at the City's wastewater treatment plant (WWTP). Accordingly, the City plans to increase groundwater production in the future. Through the avoidance of Ramsey Street Wash along the southern border of the Project site and providing onsite storm water infiltration basins, development of the Project site will not substantially interfere with groundwater recharge. Consequently, impacts related to depletion of groundwater are considered **less than significant, and will not be addressed further in the EIR.**

Sources: Project Description; UWMP; P-WQMP, Geotechnical Report

c) Substantially alter the existing drainage pattern of the site or area, including through the alteration of a watercourse or wetland, in a manner which would result in substantial erosion or siltation on- or off-site?

There are existing drainage features on the Project site. Because impacts have not been fully evaluated, the Project may have a **potentially significant impact** related to alteration of existing drainage patterns. **The forthcoming EIR will analyze this issue.**

Source: Project Description

d) Substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, or substantially increase the rate or amount of surface runoff in a manner which would result in flooding on or off site?

There are existing drainage features on the Project site. Because impacts have not been fully evaluated, the Project may have a **potentially significant impact** related to altering drainage. The forthcoming EIR will analyze this issue.

Source: Project Description

e) Create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff?

The Project includes building storm water facilities to the south of the proposed warehouse location which could have **potentially significant impacts** on storm water drainage systems. **This topic will be addressed further in the forthcoming EIR.**

Source: Project Description

f) Otherwise substantially degrade water quality?

The proposed Project's degradation of water quality has not been fully investigated. Consequently, there could be **potentially significant water quality impacts**. **The forthcoming EIR will address this issue.**
Source: Project Description

g) Place housing within a 100-year flood hazard area as mapped on a federal Flood Hazard Boundary or Flood Insurance Rate Map or other flood hazard delineation map?

The southern portion of the proposed Project is located in Zone A, which is the 100-year flood hazard area. The proposed Project involves construction of a warehouse and does not include construction of any housing. Therefore, **no impact** will occur in this regard. **This issue will not be addressed in the forthcoming EIR.**

Source: Project Description

h) Place within a 100-year flood hazard area structures which would impede or redirect flood flows?

As shown on FEMA Panel No. 06065C0836G and No. 06065C0837G, the proposed Project is located within Zone A and Zone X. While Zone X is an area outside of the Special Flood Hazard Area with minimal flood hazard and higher than the elevation of the 0.2-percent-annual-chance floodplain, Zone A is within a 100-year flood hazard area that is subject to inundation by the 1% annual chance flood. Since the site is within the Special Flood Hazard Area, there could be **potentially significant impacts related to flooding. The forthcoming EIR will address this issue.**

Source: FEMA

i) Expose people or structures to a significant risk of loss, injury or death involving flooding, including flooding as a result of the failure of a levee or dam?

As shown on FEMA Panel No. 06065C0836G and No. 06065C0837G, the proposed Project does not have any identified levees or dams within the Project boundary, nor does the city have any identified dams within or next to its jurisdiction. Therefore, the Project is not expected to expose people or structures to a significant risk of loss, injury or death involving flooding, including flooding as a result of the failure of a levee or dam. According to the County of Riverside's General Plan, the Project area is not within a dam failure inundation zone (GP-RIV, Figure S-10). Potential impacts from dam or levee failure will be **less than significant and no related mitigation measures are required. This issue will not be addressed further in the forthcoming EIR. Other potential flood hazards will be addressed in the EIR, however, as described in preceding Checklist items IX(h) and (i).**

Source: FEMA; GP-RIV

j) Inundation by seiche, tsunami or mudflow?

Seiches are seismically-induced oscillation or sloshing of water contained in enclosed bodies of water including lakes, ponds, reservoirs, and swimming pools. This hazard is dependent upon the frequency of seismic waves, distance and direction from the epicenter, and site-specific design criteria of the enclosed body of water. Swimming pools and other small bodies of water are likely to incur minor damages in the event of seismically induced seiches. However, seiching could result in the failure of larger bodies of water, including water tanks, retention basins, recharge basins and other water storage structures, and could result in the inundation of land and structures downslope. There are no such bodies of water in the immediate Project vicinity (Google Earth). **Potential impacts related to inundation by seiche, are therefore, considered to be less than significant.**

Tsunamis are large waves that occur in coastal areas. The City of Banning is not located in a coastal area, thus **no impacts due to tsunamis will occur.**

As discussed previously in Threshold VI.a.iv, strong ground motions can result in landslides, rock slides and rock falls, particularly where saturated ground conditions exist. During an earthquake, groundwater conditions have an influence in the development of seismically induced slope failures, as well as landslides and mudflows. The proposed Project site is not located adjacent to any areas with low, moderate, or high risk of seismically induced settlement and slope instability and no known landslides have occurred in the Project vicinity (GP Exhibit V-2; GP DEIR Exhibit III-15).

Impacts related to inundation by mudflow are, therefore, considered less than significant and no mitigation measures are required. This issue will not be addressed further in the forthcoming EIR.

Source: GP Exhibit V-2 – Seismically Induced Settlement and Slope Instability; GP DEIR Exhibit III-15 – Seismically Induced Settlement and Slope Instability; GE

ENVIRONMENTAL FACTORS:	*Potentially Significant Impact*	*Less Than Significant with Mitigation Incorporated*	*Less Than Significant Impact*	*No Impact*
X. LAND USE PLANNING. Would the project:				
a. Physically divide an established community?	☐	☐	☐	☒
b. Conflict with any applicable land use plan, policy, or regulation of an agency with jurisdiction over the project (including, but not limited to the general plan, specific plan, local coastal program, or zoning ordinance) adopted for the purpose of avoiding or mitigating an environmental effect?	☐	☐	☒	☐
c. Conflict with any applicable habitat conservation plan or natural community conservation plan?	☒	☐	☐	☐

Land Use and Planning Discussion:

a) Physically divide an established community?

There are no established communities surrounding the Project site. The Project is surrounded by land designated for Public Facility – Airport to the south and west, and General Commercial to the north (GP, Exhibit III-2). The proposed Project involves developing a warehouse, which is consistent with the surrounding zoning and land use designations. The Change of Zone requested for the Project is to provide a consistent zoning designation on the entire site. As has been noted previously, the site is presently split between two zone classifications (AI and PF-A). The Change of Zone will not create any impacts to an established community. Potential impacts related to this issue are, therefore, considered **to have no impact. This issue will not be addressed further in the forthcoming EIR.**

Source: Project Description; GP - CD

b) Conflict with any applicable land use plan, policy, or regulation of an agency with jurisdiction over the project (including, but not limited to the general plan, specific plan, local coastal program, or zoning ordinance) adopted for the purpose of avoiding or mitigating an environmental effect?

According to the City's GP Land Use Map and Zoning Ordinance, the proposed Project site is designated as Airport Industrial (AI) and Public Facilities – Airport (PF-A). The latter allows airport-related and transportation-related functions such as machining, manufacturing, warehousing, flight schools, restaurants and office uses (GP, p.III-8). Concurrent with the environmental assessment of the proposed Project and other entitlement actions, a General Plan Amendment (GPA) and Change of Zone (ZC) are proposed, changing the land use and zoning of PF-A existing on a portion of the site to AI. The site plan for the proposed Project shows parking and a detention basin on the portion of the site currently designated PF-A. The parking and detention basins might be considered consistent with the PF-A zone, but do not represent public facilities associated with the airport. The proposed Zone Change will eliminate this discrepancy. Warehousing and related office uses are consistent with the AI Zone and land use designation, thus no conflict with plans or policies exists on that portion of the site. Potential impacts related to conflicts with

land use plans, policies, or regulations adopted for the purpose of avoiding or mitigating an environmental effect are consequently considered **less than significant and no mitigation measures are required. This issue will not be addressed further in the forthcoming EIR.**

Source: Project Description; GP - CD

c) Conflict with any applicable habitat conservation plan or natural community conservation plan?

As previously described in Threshold IV.f), the Project is located within the Western Riverside County MSHCP – The Pass Area Plan and within an MSHCP special linkage area. Because impacts to the MSHCP have not been fully investigated, the Project may have **a potentially significant impact** related to maintaining consistency with conservation plans. **This potential impact will be addressed in the Biological Resources section of the forthcoming EIR.**

ENVIRONMENTAL FACTORS:	*Potentially Significant Impact*	*Less Than Significant with Mitigation Incorporated*	*Less Than Significant Impact*	*No Impact*
XI. MINERAL RESOURCES. Would the project:				
a. Result in the loss of availability of a known mineral resource that would be of value to the region and the residents of the state?	☐	☐	☒	☐
b. Result in the loss of availability of a locally-important mineral resource recovery site delineated on a local general plan, specific plan, or other land use plan?	☐	☐	☐	☒

Mineral Resources Discussion:

a) Result in the loss of availability of a known mineral resource that would be of value to the region and the residents of the state?

Sand and gravel, collectively referred to as aggregate, is the primary mineral resource that is actively being developed in the eastern portion of the City. Weathering, erosion, and other geological processes have deposited materials from the surrounding mountains and hills, forming an alluvial fan with significant deposits of these mineral resources. The Surface Mining and Reclamation Act (SMARA) was developed to assure the preservation of mineral resources while concurrently addressing the need for protecting the environment. Under the purview of SMARA, the State of California Department of Conservation, Division of Mines and Geology, has identified regionally significant mineral deposits in an effort to conserve and develop them as well as to anticipate regional aggregate production needs.

The proposed Project site is located within Mineral Resource Zone 2 (GP, Exhibit IV-8), which means the Project site is located within an area that contains mineral deposits. The significance of these deposits cannot, however, be evaluated from available data. Due to being adjacent to the airport, it is unlikely that a mining operation would be practical at the Project site.

Further, the City has designated specific areas as Industrial-Mineral Resources land use in the City's GP to allow for surface mining operations on lands considered to have significant potential for mineral resources

(GP DEIR, Table I-3). The Project site is not within one of these zones, and is not identified for development of mineral resource mining by either the City or the State. Consequently, the proposed Project will not result in the loss of availability of a known mineral resource that would be of value to the region and residents of the state. Potential impacts to known mineral resources are thus considered **less than significant. This issue will not be addressed further in the forthcoming EIR.**

Source: GP Exhibit IV-8 – Mineral Resource Zones; GP DEIR Table I-3 – City of Banning Draft General Plan Proposed Land Use Designations

b) Result in the loss of availability of a locally-important mineral resource recovery site delineated on a local general plan, specific plan or other land use plan?

According to the General Plan, an area of Mineral Resource Zone 2 (MRZ-2) is located in the eastern portion of the City, totaling approximately 6.5 acres of land. An MRZ-2 area contains significant mineral deposits that are present or that there is a high likelihood for them to exist. The eastern portion of the City lies along the alluvial fan of the San Gorgonio River southeast of the Banning Bench, north and south of Interstate 10 (GP, Exhibit IV-8). As of 2004, the Banning Quarry, operated by Robertson's Ready Mix, was the only aggregate producer within the MRZ-2 designated area of the City.

The proposed Project is not located within or adjacent to the Banning Quarry or any other locally-important mineral resource recovery site delineated on a local general plan, specific plan, or other land use plan. Further, as described in Threshold XI.a above, the proposed Project is not designated Industrial-Mineral Resources land use in the City's GP. Consequently, **no impact** to a locally important mineral resource recovery site **is** anticipated. **This issue will not be addressed further in the forthcoming EIR.**

Sources: GP Exhibit IV-8 – Mineral Resource Zones; GP DEIR Table I-3 – City of Banning Draft General Plan Proposed Land Use Designations; ZONING

expose people residing or working in the project area to excessive noise levels?				
f. For a project within the vicinity of a private airstrip, would the project expose people residing or working in the project area to excessive noise levels?	☐	☐	☐	☒

Noise Discussion:

a) Exposure of persons to or generation of noise levels in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies?

Construction and operation of the proposed Project will introduce new noise sources to the Project vicinity. The closest sensitive receptors to the proposed Project site are the scattered residences and a house of worship located approximately 1.27 miles from the site and residences located adjacent to the off-site improvements. The proposed Project will also result in the exposure of construction workers and employees to noise generated by the nearby Banning Municipal Airport. A Noise Study will be prepared to specifically quantify potential noise impacts on nearby sensitive receptors as well as construction workers and employees. The Project may have a **potentially significant impact** related to exposure of residents, employees and construction workers to noise. Consequently, **this topic will be addressed further in the forthcoming EIR.**

b) Exposure of persons to or generation of excessive groundborne vibration or groundborne noise levels?

Construction equipment and activities such as vibratory compactors or rollers, pile drivers and pavement breakers have the potential to generate ground-borne vibration. In general, demolition of structures preceding construction and pile driving generate the highest levels of vibration. The proposed Project site is currently vacant and does not necessitate demolition of any existing structures. In addition, according to correspondence with the construction manager, no pile driving is required to construct the proposed facilities (Personal Correspondence, Bob Harding). Heavy trucks that may be utilized during construction can also generate ground-borne vibrations which vary in intensity depending on vehicle type, weight and pavement conditions.

Construction-related truck traffic will be routed directly onto Lincoln and Hargrave Street to I-10 on and off ramps, thereby minimizing the amount of truck traffic having to utilize other City roadways and potentially affecting other land uses. Other than the typical construction equipment and methods needed to construct the Project components, no significant groundborne vibration or ground borne noise is anticipated. No sensitive noise receptors are located within the Project area, and the closest sensitive receptors in the surrounding area (residential land use and house of worship) are approximately 1.27 miles away. Should future use of the rail spur be proposed, additional environmental assessment, including noise analysis, would be required.

Project construction methods are not anticipated to involve any significant sources of groundborne vibration or groundborne noise beyond those that would normally be associated with construction activities. Any noise generated during construction must adhere to the Banning Municipal Code, thus potential

impacts relating to exposure and generation of excessive groundborne vibration or groundborne noise levels are considered **less than significant and no mitigation measures are required**. **This issue will not be addressed further in the forthcoming EIR.**

Source: BMC

c) A substantial permanent increase in ambient noise levels in the project vicinity above levels existing without the project?

The proposed Project has the potential to result in a substantial permanent increase in ambient noise levels due to an increase in truck and vehicular traffic to the Project area. A Noise Study will be prepared as part of the EIR analysis. Because noise impacts have not been investigated, the Project may have a **potentially significant impact** related to a permanent increase to ambient noise. **This topic will be addressed further in the forthcoming EIR.**

d) A substantial temporary or periodic increase in ambient noise levels in the project vicinity above levels existing without the project?

The proposed Project has the potential to create a substantial or periodic increase in ambient noise levels. A Noise Study will be prepared to evaluate noise-related impacts due to implementation of the proposed Project. T**hese impacts could be potentially significant. This topic will be addressed in the forthcoming EIR**.

e) For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project expose people residing or working in the project area to excessive noise levels?

The Banning Municipal Airport is located adjacent to the Project site on the west. Land use designations within the Project vicinity have been made to accommodate the continued safe operation of the Banning Municipal Airport (GP DEIR, p. III-62). Nonetheless, the Project is located within Zones B1, B2, and D of the Banning Municipal Airport Land Use Compatibility Plan and is required to be reviewed by the Riverside County Airport Land Use Commission (ALUC). The airport has approximately 12,000 operations per year predominately by small, single engine piston aircraft. Due to the relatively small noise footprint generated by this type of aircraft, the associated average annual community noise equivalent level (CNEL) noise contours for the Banning Airport generally stay within the airport property, limiting people exposed to excessive aircraft noise to the airport property. The proposed Project is beyond the 65 CNEL noise contour, which is the standard noise metric used to determine if people would be exposed to excessive noise. The ALUC reviewed the Project in March 2017 (ALUC2) and found the proposed land use consistent with ALUC policies, including noise exposure. Potential impacts to construction workers and employees at the Project site from exposure to excessive airport noise levels are likely to be less than significant as previously noted. **Nonetheless, this potential concern will be evaluated in the Noise Study to be prepared and will be discussed in the EIR.**

Source: GP Exhibit V-7 – Airport Noise Contours at Buildout; GP DEIR Exhibit III-27 – Airport Noise Contours at Buildout; ALUC2

f) For a project within the vicinity of a private airstrip, would the project expose people residing or working in the project area to excessive noise levels?

The proposed Project is not located within the vicinity of a private airstrip, and as such there will be **no impact** on people residing or working in the Project area due to excessive noise levels from this type of facility. **This issue will not be addressed further in the forthcoming EIR.**

Source: ALUC1

ENVIRONMENTAL FACTORS:	*Potentially Significant Impact*	*Less Than Significant with Mitigation Incorporated*	*Less Than Significant Impact*	*No Impact*
XIII. POPULATION AND HOUSING. Would the project:				
a. Induce substantial population growth in an area, either directly (for example, by proposing new homes and businesses) or indirectly (for example, through extension of roads or other infrastructure)?	☐	☐	☐	☒
b. Displace substantial numbers of existing housing, necessitating the construction of replacement housing elsewhere?	☐	☐	☐	☒
c. Displace substantial numbers of people, necessitating the construction of replacement housing elsewhere?	☐	☐	☐	☒

Population and Housing Discussion:

a) Induce substantial population growth in an area, either directly (for example, by proposing new homes and businesses) or indirectly (for example, through extension of roads or other infrastructure)?

The proposed Project involves extension of an existing road and construction of a warehouse. It does not propose new homes. Per a discussion with the industrial Project general contractor to determine the number of workers required for a project this size as well as commuting behavior of construction workers (Personal Communications, Bob Harding2), construction projects of this size typically require between 20 and 150 workers per day at the site, depending on the phase of construction and take approximately 10 – 18 months to complete. Due to the limited duration of construction, local population growth related to construction jobs is not expected. Construction projects in the Inland Empire typically use staff within 50 miles of a project site. Construction workers are expected to commute from the City of Banning as well as from communities as far west as Corona and as far east as Palm Springs.

Furthermore, according to the Southern California Association of Governments (SCAG Profile of the City of Banning), in 2015 approximately 6.1% of the jobs in the City were in wholesale activities. The SCAG report also indicates that over 38% of people living in Banning currently commute over 30 minutes to work in other cities. Introducing additional wholesale jobs to the City could retain employees within the City instead of commuting, thereby minimizing impacts to the environment. For a warehouse this size based on industry research conducted by the National Association for Industrial and Office Parks (NAIOP), it is estimated that there would be approximately one worker employed for every 2,000 square feet of space. For this Project, that would be approximately 500 workers employed at the site, depending on the type of use the building will ultimately operate. Only a portion of total employees would, however, be anticipated to be new residents attracted to Banning specifically by the Project. Consequently, the Project is anticipated to have **a less than significant impact** related to direct or indirect creation of population growth. **This issue will not be addressed further in the forthcoming EIR.**

Source: Project Description

b) Displace substantial numbers of existing housing, necessitating the construction of replacement housing elsewhere?

The proposed Project site is currently vacant and there is no existing housing at the Project site. The proposed warehouse will not displace any existing housing; consequently **no impacts** related to housing displacement are anticipated**. This issue will not be addressed further in the forthcoming EIR.**

Source: Project Description

c) Displace substantial numbers of people, necessitating the construction of replacement housing elsewhere?

The proposed Project site is currently vacant and does not contain any existing housing. Development of a warehouse will not displace substantial numbers of people, necessitating the construction of replacement housing elsewhere. Consequently, **no impact** to housing is anticipated as a result of the proposed Project. This issue will not be addressed further in the forthcoming EIR.

Source: Project Description

ENVIRONMENTAL FACTORS:	*Potentially Significant Impact*	*Less Than Significant with Mitigation Incorporated*	*Less Than Significant Impact*	*No Impact*
XIV. PUBLIC SERVICES. Would the project:				
a. Would the project result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, need for new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times or other performance objectives for any of the public services:				
i. Fire protection?	☐	☐	☒	☐
ii. Police protection?	☐	☐	☒	☐
iii. Schools?	☐	☐	☐	☒
iv. Parks?	☐	☐	☐	☒
v. Other public facilities?	☐	☐	☐	☒

Public Service Discussion:

a) ***Would the project result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, need for new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times or other performance objectives for any of the public services?***

i. Fire protection?

Fire protection services are provided to the City of Banning through a contractual agreement with the Riverside County Fire Department, which in turn contracts with the California Department of Forestry CAL FIRE. The contract provides various fire related services, including emergency medical services, fire prevention, disaster preparedness, fire safety inspections, hazardous materials business plan programs and plan reviews. When an emergency call is received, the station that is physically closest to the emergency will respond, even if the emergency is located outside the station's official "jurisdiction" (GP-PSF, p. VI-35.)

Fire Station No. 89, located at 172 North Murray, is approximately 1.7 miles to the northwest of the Project site and would likely provide emergency response services to the Project site. The Riverside County Fire Department is rated as Class 4 by the Insurance Service Office (ISO), a private company, which rates fire departments throughout the country based on a scale of 1 to 10, with Class 1 being the highest possible score. The City aims for a ratio of above 0.70 fire personnel per 1,000 residents, which would be 58 firefighters at General Plan buildout (GP DEIR, p. III-202). The City of Banning's contract for fire support services with the County includes a Regional Fire Protection Program with other surrounding cities wherein each of the cities (Beaumont, Calimesa, Cabazon) has access to the services provided by the County to the participating jurisdictions.

The Project proposes to extend John Street to the east and develop a warehouse. This use is consistent with the City's existing land use designation for the site. The Project will not cause a significant increase in population triggering the need for additional fire facilities or impacts to acceptable service ratios, response times, or performance objectives. The Project will be designed to meet Banning Municipal Code 8.16.010, which applies the 2016 California Fire code to building and equipment design features. The proposed Project is a warehouse being built on speculation, therefore there is no identified user at this time. The anticipated uses for the building include standard high-cube warehousing, which typically includes household products and is not being designed to store hazardous materials. No hazardous or highly volatile substances are anticipated to be stored on-site per Threshold VIII(a) and (c); however, should the site store hazardous materials, the Project will comply with state and federal regulations pertaining to hazardous materials storage. The Banning Fire Department will conduct pre-occupancy and periodic inspections after occupancy to ensure compliance with all fire and hazardous materials regulations.

Interviews with the industrial Project general contractor were (Personal Communications, Bob Harding) conducted to determine the number of workers required for a project this size. Construction projects of this size typically require between 20 and 150 workers per day at the site, depending on the phase of construction and take approximately 10 – 18 months to complete. Due to the limited duration of construction, population growth from construction jobs is not expected. For a warehouse this size based on industry research conducted by the National Association for Industrial and Office Parks (NAIOP), it is

estimated that there would be approximately one long term worker employed for every 2,000 square feet of space. For this Project, that would be approximately 500 workers employed at the site, depending on the type of use the building will ultimately operate. Only a portion of total employees would, however, be anticipated to be new residents attracted to Banning specifically by the Project. The Project is consistent with the type and intensity of development envisioned by the General Plan in the Project area. The developer will also be required to pay Fire Impact fees to address potential impacts to fire protection services.

Therefore, impacts related to fire protection will be **less than significant** and no mitigation measures are required**. This issue will not be addressed further in the forthcoming EIR.**

Source: GP – PSF; GP DEIR

ii. Police protection?

Police protection services within City limits are provided by the Banning Police Department (GP, p. VI-32). The Banning Police Department has 35 sworn officers and maintains a ratio of 1.4 sworn officers for every 1,000 residents (GP DEIR, p. III-200). The City's police station is located at 125 East Ramsey Street, approximately 1.7 miles northwest of the Project site. The police response time for high-priority calls is between three and seven minutes with the City (GP-PSF, p. VI-33). The developer will pay the associated police impact fees.

The Project proposes to extend John Street to the east and develop a warehouse; this use is consistent with the City's existing land use designation for the site. The Project site will be fully fenced on all four sides with eight foot chain link fencing. An entry gate, including a guard house, will be installed near the Project entrance at the terminus of John Street and a gate on the northeast side of the building. The Project is not anticipated to cause a significant increase in population triggering the need for additional police services. An interview with the industrial project general contractor was conducted (Personal Communications, Bob Harding) to determine the number of construction workers required for a project this size. Projects of this size typically require between 20 and 150 workers per day at the site, depending on the phase of construction and take approximately 10 – 18 months to complete. Due to the limited duration of construction, population growth from construction jobs is not expected.

For a warehouse this size, based on industry research conducted by the National Association for Industrial and Office Parks (NAIOP), it is estimated that there would be approximately one long-term worker employed for every 2,000 square feet of space. For this Project, that would be approximately 500 long–term workers employed at the site, depending on the type of use the building will ultimately operate. Only a portion of total employees would, however, be anticipated to be new residents attracted to Banning specifically by the Project. The Project is consistent with the type and intensity of development envisioned by the General Plan in the Project area. The developer will also be required to pay Police Facilities impact fees. Consequently, impacts related to police protection will be **less than significant** and no mitigation measures are required**. This issue will not be addressed further in the forthcoming EIR.**

Source: GP – PSF; GP DEIR

iii. Schools?

The majority of the City is served by the Banning Unified School District, with a small area in the western portion of the City served by the Beaumont Unified School District (GP, pp. VI-24 – VI-25). The proposed Project involves extending John Street to the east and developing a warehouse and will not cause an increase in population that would require additional school facilities. According to the SCAG profile of the City, between 2000 thru 2016, school enrollment decreased by 4.6 percent for elementary (grades K-6), 10.7 percent for grades 7-9, and showed an increase of 1.3 percent for grades 10-12.

As has been noted in preceding sections, limited local population growth is expected as a direct result of the proposed Project. The Banning Union School District (BUSD) will determine school impact fees the developer will be required to pay to address potential impacts to school facilities. The District's fee schedule is based on square footage and the type of development involved. With payment of impact fees, **no impact** related to school services or facilities is anticipated. **This issue will not be addressed further in the forthcoming EIR.**

Source: GP – PSF; GP DEIR; SCAG

iv. Parks?

Parks and recreation services within the City of Banning are provided by the City Community Services Department. The closest City park to the Project (Lions Park) is approximately five mile away. The Riverside County Regional Park and Open Space District also provides recreational facilities and services at County owned parks facilities. As has been noted previously, the proposed Project is a warehouse that will not cause a substantial increase in local population. Consequently, no need to provide additional park service is anticipated. The Project will pay parkland associated development impact fees. With payment of impact fees, **no impact** related to park services or facilities is anticipated. **This issue will not be addressed further in the forthcoming EIR**.

Source: GP – Community Development; GP DEIR

vi. Other public facilities?

Other public facilities in the City include one U.S. Post Office, the Banning Municipal Airport, San Gorgonio Memorial Hospital, and a number of public utility facilities operated by the City Public Works Department. As has been noted previously, the proposed Project is a warehouse that will not cause a substantial increase in local population No construction of additional public facilities will be required. The Project will also pay associated general City facility development impact fees. Therefore, since no additional public facilities are anticipated, there will be **no impact** to public facilities. **This issue will not be addressed further in the forthcoming EIR.**

Source: GP – PSF

ENVIRONMENTAL FACTORS:	*Potentially Significant Impact*	*Less Than Significant with Mitigation Incorporated*	*Less Than Significant Impact*	*No Impact*
XV. RECREATION.				
a. Would the project increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated?	☐	☐	☐	☒
b. Does the project include recreational facilities or require the construction or expansion of recreational facilities which might have an adverse physical effect on the environment?	☐	☐	☐	☒

Recreation Discussion:

a) Would the project increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated?

The closest City park to the Project, Lions Park, is approximately a five mile drive; the closest regional park is Bogart Park located in Cherry Valley, approximately a 13 mile drive from the Project site. The proposed Project involves the development of a warehouse and will not cause a substantial increase in the local population, as described in preceding sections. Consequently, no increase in the use of existing neighborhood and regional parks or other recreational facilities is anticipated. The Project will pay parkland associated development impact fees. With payment of impact fees, **no impact** related to parks or other recreational facilities is anticipated. **This issue will not be addressed further in the forthcoming EIR**.

Source: Project Description

b) Does the project include recreational facilities or require the construction or expansion of recreational facilities which might have an adverse physical effect on the environment?

The Project does not include new public recreational facilities or require the construction or expansion of recreational facilities. As described in the preceding sections (Section XIII – Population and Housing, and Section XIV-iv, Parks), the proposed Project will not cause a significant increase in local population, and no need for additional park facilities is anticipated. The Project must also pay parkland related impact fees. Consequently, there will be **no impact** in this regard. **This issue will not be addressed in the forthcoming EIR.**

Source: Project Description

ENVIRONMENTAL FACTORS:	*Potentially Significant Impact*	*Less Than Significant with Mitigation Incorporated*	*Less Than Significant Impact*	*No Impact*

ENVIRONMENTAL FACTORS:	*Potentially Significant Impact*	*Less Than Significant with Mitigation Incorporated*	*Less Than Significant Impact*	*No Impact*
XVI. TRANSPORTATION/TRAFFIC. Would the project:				
a. Conflict with an applicable plan, ordinance, or policy establishing measures of effectiveness for the performance of the circulation system, taking into account all modes of transportation including mass transit and non-motorized travel and relevant components of the circulation system, including but not limited to intersections, streets, highways and freeways, pedestrian and bicycle paths, and mass transit?	☒	☐	☐	☐
b. Conflict with applicable congestion management program, including, but not limited to level of service standards and travel demand measures, or other standards established by the county congestion management agency for designated roads or highways?	☒	☐	☐	☐
c. Result in a change in air traffic patterns, including either an increase in traffic levels or a change in location that results in substantial safety risks?	☐	☐	☒	☐
d. Substantially increase hazards due to a design feature (e.g., sharp curves or dangerous intersections) or incompatible uses (e.g., farm equipment)?	☐	☐	☒	☐
e. Result in inadequate emergency access?	☐	☐	☒	☐
f. Conflict with adopted policies, plans, or programs supporting alternative transportation (e.g., bus turnouts, bicycle racks)?	☐	☐	☐	☒

Transportation and Traffic Discussion:

a) Conflict with an applicable plan, ordinance, or policy establishing measures of effectiveness for the performance of the circulation system, taking into account all modes of transportation including mass transit and non-motorized travel and relevant components of the circulation system, including but not limited to intersections, streets, highways and freeways, pedestrian and bicycle paths, and mass transit?

A Traffic Impact Analysis will be prepared and potential impacts relative to compliance with adopted plans and policies analyzed as part of the EIR. Short-term, construction-related and long-term, operationally generated traffic will occur with the Project. The Project may have a **potentially significant impact** related to the effectiveness of the circulation system. **This topic will be addressed further in the forthcoming EIR**.

b) Conflict with applicable congestion management program, including, but not limited to level of service standards and travel demand measures, or other standards established by the county congestion management agency for designated roads or highways?

Each county in California is required to develop a Congestion Management Program (CMP) that analyzes the links between land use, transportation and air quality. The Riverside County Transportation Commission

(RCTC) is the County of Riverside's Congestion Management Agency. The RCTC prepares and periodically updates the County's CMP to meet federal Congestion Management System guidelines and state CMP legislation. According to the RCTC CMP, within Banning's sphere of influence, I-10 is the only roadway that is part of the CMP. The Project may have a **potentially significant impact** related to travel demand, level of service standards and other CMP provisions. **This topic will be addressed in the forthcoming EIR.**

Source: RCTC CMP

c) Result in change in air traffic patterns, including either an increase in traffic levels or a change in location that results in substantial safety risks?

The Banning Municipal Airport is located immediately adjacent to the south and west of the Project site. The Project's use as a distribution center is consistent with the allowable land uses within the Zones B1, B2 and D of the Airport Land Use Compatibility Plan and as reviewed in the ALUC's Development Review of the Project in March 2017 (ALUC). A General Plan Amendment and Zone Change is in process for the Project's southern portion of the parcels that are zoned PF-A to be zoned AI. The Project is not anticipated to use Banning Municipal Airport for the movement of goods as the airport does not have the required infrastructure. The operation of the proposed Project is anticipated to use airports in the Inland Empire that have existing cargo operations for the movement of goods; however, the utilization of these airports is not anticipated to cause in increase in total operations or cause other adverse impacts. Therefore, implementation of the Project will have a **less than significant** and no mitigation measures are required related to air traffic patterns. **This issue will not be addressed in the forthcoming EIR.**

Source: ALUC2; GE; Project Description

d) Substantially increase hazards due to a design feature (e.g., sharp curves or dangerous intersections) or incompatible uses (e.g., farm equipment)?

The proposed Project does not propose any design features that would increase traffic hazards. The Project would, however, introduce truck traffic onto existing streets and at freeway ramps, and does include the expansion of John Street. These impacts may be **potentially significant**. **The forthcoming EIR will discuss these issues** related to a potential increase in traffic hazards.

Source: Project Description

e) Result in inadequate emergency access?

Access to the Project site will be provided from the John Street extension and a secondary fire access road south and west of the Project site. As Threshold VIII (g) notes, John Street would not be designated as a Major Local Roadway and would not be expected to be a major evacuation route in the event of an emergency. The traffic analysis will, however, evaluate potential impacts of increased truck and vehicular traffic to emergency access and evacuation routes. These impacts may be **potentially significant**. **This issue will be addressed in the forthcoming EIR.**

Source: BMC

f) Conflict with adopted policies, plans, or programs supporting alternative transportation (e.g., bus turnouts, bicycle racks)?

The GP identifies that sidewalks, bike lanes, off-street trails and golf cart routes are especially important along major roadways in the community. In May 2002, the Banning City Council approved the final Pass Area Transit Plan. The Transit Plan establishes the Pass Transit System, which consists of two independent transit systems, the Banning Municipal Transit System and the Beaumont Municipal Transit System. Regional bus service is provided by the Riverside Transit Agency (RTA), which provides services to Hemet/San Jacinto (Route 31), Moreno Valley (Route 35), and Calimesa/Redlands (Route 36). There are no bus stops or bike lanes proposed as part of this Project. The closest bus route to the Project is the City of Beaumont Transit System Route 2 that goes to Beaumont, Morongo Casino and the Cabazon Outlet Malls. The bus stop for this route is located at the intersection of East Ramsey Street and Hargrave Street, approximately 1.4 miles north of the Project site on the north side of I-10.

The proposed Project involves development of a warehouse that will not conflict with any adopted policies, plans, or programs supporting alternative transportation. Therefore, **no impact** will occur. **This issue will not be addressed in the forthcoming EIR.**

Source: GP – CD

ENVIRONMENTAL FACTORS:	*Potentially Significant Impact*	*Less Than Significant with Mitigation Incorporated*	*Less Than Significant Impact*	*No Impact*
XVII. TRIBAL CULTURAL RESOURCES. Would the project:				
a. Would the project cause a substantial adverse change in the significance of a tribal cultural resources, defined in Public Resources Code Section 21074 as either a site, feature, place, cultural landscape that is geographically defined in terms of the size and scope of the landscape, sacred place, or object with cultural value to a California Native American tribe, and that is:				
a. Listed or eligible for listing in the California Register of Historical Resources, or in a local register of historical resources as defined in Public Resources Code section 5020.1(k), or	☒	☐	☐	☐
b. A resource determined by the lead agency, in its discretion and supported by substantial evidence, to be significant pursuant to criteria set forth in subdivision (c) of Public Resources Code Section 5024.1. In applying the criteria set forth in subdivision (c) of Public Resource Code Section 5024.1, the lead agency shall consider the significance of the resource to a California Native American tribe.	☒	☐	☐	☐

Tribal Cultural Resources Discussion:

a) Listed or eligible for listing in the California Register of Historical Resources, or in a local register of historical resources as defined in Public Resources Code section 5020.1(k)?

As discussed previously in *Threshold 5a (Cultural Resources)* there are no listed historic resources or any eligible for listing at the Project site and the site is currently vacant. Nonetheless, it is possible that previously undiscovered historical resources may be encountered at the Project site. A site-specific cultural resources investigation will be conducted at the Project site. Thus, impacts to tribal resources are considered **potentially significant** and **this topic will be addressed in the forthcoming EIR.**

Source: AE

b) A resource determined by the lead agency, in its discretion and supported by substantial evidence, to be significant pursuant to criteria set forth in subdivision (c) of Public Resources Code Section 5024.1. In applying the criteria set forth in subdivision (c) of Public Resource Code Section 5024.1, the lead agency shall consider the significance of the resource to a California Native American tribe.

Assembly Bill 52 (AB 52), signed into law in 2014, amended CEQA and established new requirements for tribal notification and consultation. AB 52 applies to all projects for which a notice of preparation or notice of intent to adopt a negative declaration/mitigated negative declaration is issued after July 1, 2015. AB 52 also broadly defines a new resource category of tribal cultural resources and established a more robust process for meaningful consultation that includes:

- prescribed notification and response timelines;
- consultation on alternatives, resource identification, significance determinations, impact evaluation, and mitigation measures; and
- documentation of all consultation efforts to support CEQA findings.

AB 52 notification was initiated for this Project as required for a Notice of Preparation and EIR.

Senate Bill (SB) 18 requires local agencies to consult with tribes prior to making certain planning decisions and to provide notice to tribes at certain key points in the planning process, thereby providing tribes an opportunity to participate in local land use decisions at an early planning stage. SB 18 notification was initiated for this Project as required for a General Plan Amendment and associated Change of Zone.

In accordance with SB 18 and AB 52, the City sent letters of Notice to all Native American tribes on the recommended NAHC (Native American Historic Commission) distribution list, advising of the General Plan Amendment, Zone Change and EIR. Tribal consultations will be held as requested. Since AB 52 and SB 18 consultation is currently in progress by the Lead Agency, the Project may have a **potentially significant impact** related to tribal notification and consultation; **the forthcoming EIR will analyze this issue.**

ENVIRONMENTAL FACTORS:	*Potentially Significant Impact*	*Less Than Significant with Mitigation Incorporated*	*Less Than Significant Impact*	*No Impact*
XVIII. UTILITIES AND SERVICE SYSTEMS. Would the project:				
a. Exceed wastewater treatment requirements of the applicable Regional Water Quality Control Board?	☐	☐	☒	☐

ENVIRONMENTAL FACTORS:	*Potentially Significant Impact*	*Less Than Significant with Mitigation Incorporated*	*Less Than Significant Impact*	*No Impact*
b. Require or result in the construction of new water or wastewater treatment or facilities or expansion of existing facilities, the construction of which could cause significant environmental effects?	☒	☐	☐	☐
c. Require or result in the construction of new storm water drainage facilities or expansion of existing facilities, the construction of which could cause significant environmental effects?	☒	☐	☐	☐
d. Have sufficient water supplies available to serve the project from existing entitlements and resources, or are new or expanded entitlements needed?	☒	☐	☐	☐
e. Result in a determination by the wastewater treatment provider which serves or may serve the project that it has adequate capacity to serve the project's projected demand in addition to the provider's existing commitments?	☒	☐	☐	☐
f. Be served by a landfill with sufficient permitted capacity to accommodate the project's solid waste disposal needs?	☐	☐	☒	☐
g. Comply with federal, state, and local statutes and regulations related to solid waste?	☐	☐	☒	☐

Utilities and Service Systems Discussion:

a) Exceed wastewater treatment requirements of the applicable Regional Water Quality Control Board?

Project construction will be required to comply with the provisions of the SWRCB Construction general permit to ensure all wastewater treatment requirements are met. Wastewater produced at the Project site will likely be transported to the City of Banning Wastewater Reclamation Plant, located at 2242 East Charles Street. The City's GP contains policies and programs intended to reduce impacts to water resources to less than significant levels and assure the continued implementation of federal, state, local and all other applicable pollution control standards (GP DEIR, p. III-110). Thus, compliance with the GP would also constitute compliance with wastewater treatment requirements of the RWQCB and impacts will be **less than significant. This topic will not be further discussed in the EIR.**

Source: Project Description; SWRCB; GP DEIR

b) Require or result in the construction or relocation of new water or wastewater treatment or transmission facilities or expansion of existing facilities, the construction of which could cause significant environmental effects?

The City of Banning Public Works – Wastewater Division provides sanitary wastewater services to the City of Banning, including the Project site. Buildout according to the City's GP is anticipated to occur gradually over the life of the GP and the City will monitor growth trends to assure that wastewater services are adequate (GP DEIR, p. III-210). The Project will provide approximately 6,000 linear feet of sewer line and an associated lift station. In addition, the Project will be required to contribute development impact fees for projected

future needs of the City wastewater collection and treatment system. Because impacts have not been fully investigated the Project may have a **potentially significant impact** related to new wastewater facilities, including a sewer line and lift station. **This topic will be addressed further in the forthcoming EIR.**

Source: Project Description; GP DEIR

c) Require or result in the construction of new stormwater drainage facilities or expansion of existing facilities, the construction of which could cause significant environmental effects?

As noted in Threshold XVI.b) the Project includes construction of storm drain facilities to accommodate existing and proposed stormwater flows. Potential impacts of these facilities have not been fully investigated, therefore the Project could have a **potentially significant impact**. **This issue will be analyzed in the forthcoming EIR.**

Source: Project Description

d) Have sufficient water supplies available to serve the project from existing entitlements and resources, or are new or expanded entitlements needed?

City Public Works and Utilities provides domestic water services to the City of Banning and unincorporated County of Riverside lands located southwesterly of the City limits. The City owns and operates wells, reservoirs, and a distribution line system to deliver domestic water within their service area.

The Project requires construction of an offsite water line 9,350 linear feet in length to connect to existing lines at the intersection of S. Hathaway Street and E. Barbour Street. Approximately 4,714 linear feet of the water line extension will extend north on Hathaway and then east on the extension of John Street. The remaining 4,636 linear feet will be east and south of the Project site, terminating at the intersection of Scott Street and W. Westward Avenue. Impacts have not been fully quantified relating to water supplies. The Project could have a **potentially significant impact** in this regard. **This issue will be analyzed in the forthcoming EIR.**

Source: Project Description; GP DEIR; UWMP

e) Result in a determination by the wastewater treatment provider which serves or may serve the project that it has adequate capacity to serve the project's projected demand in addition to the provider's existing commitments?

The City of Banning Public Works – Wastewater Division provides sanitary wastewater services to the City of Banning, including the Project site. Buildout according to the City's GP is anticipated to occur gradually over the life of the GP and the City will monitor growth trends to assure that wastewater services are adequate (GP DEIR, p. III-210).

The Project includes offsite improvements, including an approximately 6,000 linear foot sewer line and lift station. In addition, the Project will be required to contribute development impact fees for projected future needs of the City wastewater collection and treatment system. Impacts have not been fully investigated related to wastewater services. The Project could have a **potentially significant impact**. **This issue will, therefore, be analyzed in the forthcoming EIR.**

Source: Project Description; GP DEIR

f) Be served by a landfill with sufficient permitted capacity to accommodate the project's solid waste disposal needs?

Solid waste collection and disposal services are provided by Waste Management Inland Empire and trash collected from the City is disposed at the Lamb Canyon Sanitary Landfill, El Sobrante Landfill, and the Badlands Landfill. According to CalRecycle databases, the El Sobrante Landfill has a remaining capacity of 145,530,000 tons and is anticipated to cease operation in 2045. Similarly, the Badlands Sanitary Landfill had a remaining capacity of 15,748,799 cubic yards as of January 2015 and is anticipated to operate through January 2022 (CalRecycle).

Warehouse solid waste generation rates are approximately 13.82 pounds/day per employee (CalRecycle). Using the industry standard CalRecycle estimated solid waste generation rates, a warehouse the size of this Project would generate approximately 13.82 pounds of waste per day, per employee. This Project assumes approximately 500 total employees, although only a portion would likely be on-site at any given time. At worst case, assuming all 500 employees to be on-site each day, 6,910 pounds of waste could be generated each day (4.07 cubic yards) (ENG).

The proposed Project is consistent with the anticipated land uses analyzed by the City's General Plan and the Project is not anticipated to generate what would be considered a significant amount of waste. Proposed land uses envisioned in the City's GP are not anticipated to produce unusually high quantities of waste; however, in order to ensure the safe and cost effective disposal of the City's solid waste, monitoring of waste management by City departments is necessary (GP DEIR, p. III-212). Landfills that would most likely receive solid wastes generated by the Project have available capacity. The Project's solid waste disposal needs and potential impacts are consequently considered to be **less than significant and no mitigation measures are required. This issue will not be addressed in the forthcoming EIR.**

Source: CAL-R; ENG

g) Comply with federal, state, and local statutes and regulations related to solid waste?

The collection and disposal of solid waste would conform to applicable federal, State, and local plans and regulations, including AB 939 (Integrated Waste Management Act, 1989) that local jurisdictions divert at least 50% of all solid waste generated by January 1, 2000 (GP DEIR, p. III-211). AB 341 (Mandatory Recycling), adopted in 2011, increases this recycling goal to 75% of solid waste generated should be reduced, recycled or composted by the year 2020. The proposed Project will be required to adhere to all federal, State and local regulations related to solid waste during construction and operation.

The City's GP Public Services and Facilities policies include the following that will be applied to this Project:

- Policy 7 – The City shall continue to confer and coordinate with its solid waste service franchisee to maintain and, if possible, exceed the provisions of AB 939 by expanding recycling programs that divert valuable resources from the waste stream and returning these materials to productive use.

- Policy 8 – the City shall support, and to the greatest extent practical, shall encourage commercial and industrial businesses to reduce and limit the amount of packaging and potential waste associated with produce sale and production.

In consideration of the foregoing factors, the proposed Project is considered to have a **less than significant impact** in terms of complying with federal, state, and local statutes and regulations related to solid waste. **This issue will not be addressed further in the forthcoming EIR.**

Source: GP DEIR

ENVIRONMENTAL FACTORS:	*Potentially Significant Impact*	*Less Than Significant with Mitigation Incorporated*	*Less Than Significant Impact*	*No Impact*
XVIV. MANDATORY FINDINGS OF SIGNIFICANCE.				
a. Does the project have the potential to degrade the quality of the environment, substantially reduce the habitat of a fish or wildlife species, cause a fish or wildlife population to drop below self-sustaining levels, threaten to eliminate a plant or animal community, reduce the number or restrict the range of a rare or an endangered plant or animal or eliminate important examples of the major periods of California history or prehistory?	☒	☐	☐	☐
b. Does the project have impacts that are individually limited, but cumulatively considerable? ("Cumulatively considerable" means that the incremental effects of a project are considerable when viewed in connection with the effects of past projects, the effects of other current projects, and the effects of probable future projects)?	☒	☐	☐	☐
c. Does the project have environmental effects which will cause substantial adverse effects on human beings, either directly or indirectly?	☒	☐	☐	☐

Mandatory Findings of Significance Discussion:

a) Does the project have the potential to degrade the quality of the environment, substantially reduce the habitat of a fish or wildlife species, cause a fish or wildlife population to drop below self-sustaining levels, threaten to eliminate a plant or animal community, reduce the number or restrict the range of a rare or an endangered plant or animal or eliminate important examples of the major periods of California history or prehistory?

MSHCP Section 6.3.2 requires burrowing owl and Los Angeles pocket mouse surveys to determine the presence or absence of this species at the Project site and areas associated with off-site features, along with appropriate mitigation measures to reduce impacts to this species. The proposed Project is also required to pay MSHCP impact fees to contribute to regional habitat protection for multiple species. There are no known historic or archaeological resources at the Project site or in areas associated with the construction of off-site features. Compliance with standard procedures identified in this assessment will ensure that any impacts to human remains that may be uncovered during Project construction will be less than significant. It is still possible, however, that there may be previously unidentified cultural resources at the Project site. Because there may be potentially significant impacts to burrowing owls and unknown cultural resources at

the proposed Project site, these topics will be addressed in the forthcoming EIR and appropriate mitigation measures identified to reduce impacts to a less than significant level.

b) Does the project have impacts that are individually limited, but cumulatively considerable? ("Cumulatively considerable" means that the incremental effects of a project are considerable when viewed in connection with the effects of past projects, the effects of other current projects, and the effects of probable future projects)?

The proposed Project will be developed in conformance with the Airport Industrial land use designation in the city's General Plan. The Project may, however, result in several cumulatively considerable impacts, including air quality, noise, and traffic generation. Project-specific studies will be prepared in these topical areas to assess the proposed Project's contribution to potentially significant cumulative impacts. Because there may be potentially significant cumulative impacts, this topics will be addressed in the forthcoming EIR and appropriate mitigation measures identified to reduce impacts to a less than significant level.

c) Does the project have environmental effects which will cause substantial adverse effects on human beings, either directly or indirectly?

The Project proposes construction and operation of a warehouse building, which will attract additional traffic to the area. This may contribute to an exceedance of SCAQMD thresholds for air quality and pose a threat to human health. Likewise, noise impacts associated with construction and operation of the proposed Project will be assessed to determine the potential for nuisance noises to be generated at the Project site. Project-related impacts have not been fully evaluated and the Project may have a potentially significant impact to human health. These topics will be addressed in the forthcoming EIR and appropriate mitigation measures identified to reduce impacts to a less than significant level.

EARLIER ANALYSES

Earlier analysis may be used where, pursuant to the tiering, program EIR, or other CEQA process, an effect has been adequately analyzed in an earlier EIR or negative declaration as per California Code of Regulations, Section 1503 (c) (3) (D).

Earlier Analysis Used, if any:

None

Notice of Preparation

January 22, 2018

To: Reviewing Agencies

Re: Banning Distribution Center
SCH# 2018011032

Attached for your review and comment is the Notice of Preparation (NOP) for the Banning Distribution Center draft Environmental Impact Report (EIR).

Responsible agencies must transmit their comments on the scope and content of the NOP, focusing on specific information related to their own statutory responsibility, within 30 days of receipt of the NOP from the Lead Agency. This is a courtesy notice provided by the State Clearinghouse with a reminder for you to comment in a timely manner. We encourage other agencies to also respond to this notice and express their concerns early in the environmental review process.

Please direct your comments to:

Patty Nevins
City of Banning
99 E. Ramsey Street
Banning, CA 92220-0998

with a copy to the State Clearinghouse in the Office of Planning and Research. Please refer to the SCH number noted above in all correspondence concerning this project.

If you have any questions about the environmental document review process, please call the State Clearinghouse at (916) 445-0613.

Sincerely,

Scott Morgan
Director, State Clearinghouse

RE: SCH# 2018011032; Banning Distribution Project, City of Banning; Riverside County, California

Dear Ms. Nevins:

The Native American Heritage Commission has received the Notice of Preparation (NOP) for Draft Environmental Impact Report for the project referenced above. The California Environmental Quality Act (CEQA) (Pub. Resources Code § 21000 et seq.), specifically Public Resources Code section 21084.1, states that a project that may cause a substantial adverse change in the significance of an historical resource is a project that may have a significant effect on the environment. (Pub. Resources Code § 21084.1; Cal. Code Regs., tit.14, § 15064.5 (b) (CEQA Guidelines Section 15064.5 (b)). If there is substantial evidence, in light of the whole record before a lead agency, that a project may have a significant effect on the environment, an environmental impact report (EIR) shall be prepared. (Pub. Resources Code § 21080 (d); Cal. Code Regs., tit. 14, § 15064 subd. (a)(1) (CEQA Guidelines § 15064 (a)(1)). In order to determine whether a project will cause a substantial adverse change in the significance of a historical resource, a lead agency will need to determine whether there are historical resources with the area of project effect (APE).

CEQA was amended significantly in 2014. Assembly Bill 52 (Gatto, Chapter 532, Statutes of 2014) (AB 52) amended CEQA to create a **separate category of cultural resources**, "tribal cultural resources" (Pub. Resources Code § 21074) and provides that a project with an effect that may cause a substantial adverse change in the significance of a tribal cultural resource is a project that may have a significant effect on the environment (Pub. Resources Code § 21084.2). Please reference California Natural Resources Agency (2016) "Final Text for tribal cultural resources update to Appendix G: Environmental Checklist Form," http://resources.ca.gov/ceqa/docs/ab52/Clean-final-AB-52-App-G-text-Submitted.pdf. Public agencies shall, when feasible, avoid damaging effects to any tribal cultural resource. (Pub. Resources Code § 21084.3 (a)). **AB 52 applies to any project for which a notice of preparation or a notice of negative declaration or mitigated negative declaration is filed on or after July 1, 2015.** If your project involves the adoption of or amendment to a general plan or a specific plan, or the designation or proposed designation of open space, on or after March 1, 2005, it may also be subject to Senate Bill 18 (Burton, Chapter 905, Statutes of 2004) (SB 18). **Both SB 18 and AB 52 have tribal consultation requirements**. If your project is also subject to the federal National Environmental Policy Act (42 U.S.C. § 4321 et seq.) (NEPA), the tribal consultation requirements of Section 106 of the National Historic Preservation Act of 1966 (154 U.S.C. 300101, 36 C.F.R. § 800 et seq.) may also apply.

The NAHC recommends **lead agencies consult with all California Native American tribes** that are traditionally and culturally affiliated with the geographic area of your proposed project as early as possible in order to avoid inadvertent discoveries of Native American human remains and best protect tribal cultural resources. Below is a brief summary of portions of AB 52 and SB 18 as well as the NAHC's recommendations for conducting cultural resources assessments. **Consult your legal counsel about compliance with AB 52 and SB 18 as well as compliance with any other applicable laws**.

AB 52

AB 52 has added to CEQA the additional requirements listed below, along with many other requirements:

1. Fourteen Day Period to Provide Notice of Completion of an Application/Decision to Undertake a Project: Within fourteen (14) days of determining that an application for a project is complete or of a decision by a public agency to undertake a project, a **lead agency** shall provide formal notification to a designated contact of, or tribal representative of, traditionally and culturally affiliated California Native American tribes that have requested notice, to be accomplished by at least one written notice that includes:
    a. A brief description of the project.
    b. The lead agency contact information.
    c. Notification that the California Native American tribe has 30 days to request consultation. (Pub. Resources Code § 21080.3.1 (d)).
    d. A "California Native American tribe" is defined as a Native American tribe located in California that is on the contact list maintained by the NAHC for the purposes of Chapter 905 of Statutes of 2004 (SB 18). (Pub. Resources Code § 21073).

2. Begin Consultation Within 30 Days of Receiving a Tribe's Request for Consultation and Before Releasing a Negative Declaration, Mitigated Negative Declaration, or Environmental Impact Report: A **lead agency** shall begin the consultation process within 30 days of receiving a request for consultation from a California Native American tribe that is traditionally and culturally affiliated with the geographic area of the proposed project. (Pub. Resources Code § 21080.3.1, subds. (d) and (e)) and prior to the release of a negative declaration, mitigated negative declaration or environmental impact report. (Pub. Resources Code § 21080.3.1(b)).
    a. For purposes of AB 52, "consultation shall have the same meaning as provided in Gov. Code § 65352.4 (SB 18). (Pub. Resources Code § 21080.3.1 (b)).

3. Mandatory Topics of Consultation If Requested by a Tribe: The following topics of consultation, if a tribe requests to discuss them, are mandatory topics of consultation:
    a. Alternatives to the project.
    b. Recommended mitigation measures.
    c. Significant effects. (Pub. Resources Code § 21080.3.2 (a)).

4. Discretionary Topics of Consultation: The following topics are discretionary topics of consultation:
    a. Type of environmental review necessary.
    b. Significance of the tribal cultural resources.
    c. Significance of the project's impacts on tribal cultural resources.
    d. If necessary, project alternatives or appropriate measures for preservation or mitigation that the tribe may recommend to the lead agency. (Pub. Resources Code § 21080.3.2 (a)).

5. Confidentiality of Information Submitted by a Tribe During the Environmental Review Process: With some exceptions, any information, including but not limited to, the location, description, and use of tribal cultural resources submitted by a California Native American tribe during the environmental review process shall not be included in the environmental document or otherwise disclosed by the lead agency or any other public agency to the public, consistent with Government Code sections 6254 (r) and 6254.10. Any information submitted by a California Native American tribe during the consultation or environmental review process shall be published in a confidential appendix to the environmental document unless the tribe that provided the information consents, in writing, to the disclosure of some or all of the information to the public. (Pub. Resources Code § 21082.3 (c)(1)).

6. Discussion of Impacts to Tribal Cultural Resources in the Environmental Document: If a project may have a significant impact on a tribal cultural resource, the lead agency's environmental document shall discuss both of the following:
    a. Whether the proposed project has a significant impact on an identified tribal cultural resource.
    b. Whether feasible alternatives or mitigation measures, including those measures that may be agreed to pursuant to Public Resources Code section 21082.3, subdivision (a), avoid or substantially lessen the impact on the identified tribal cultural resource. (Pub. Resources Code § 21082.3 (b)).

7. Conclusion of Consultation: Consultation with a tribe shall be considered concluded when either of the following occurs:
    a. The parties agree to measures to mitigate or avoid a significant effect, if a significant effect exists, on a tribal cultural resource; or
    b. A party, acting in good faith and after reasonable effort, concludes that mutual agreement cannot be reached. (Pub. Resources Code § 21080.3.2 (b)).

8. Recommending Mitigation Measures Agreed Upon in Consultation in the Environmental Document: Any mitigation measures agreed upon in the consultation conducted pursuant to Public Resources Code section 21080.3.2 shall be recommended for inclusion in the environmental document and in an adopted mitigation monitoring and reporting program, if determined to avoid or lessen the impact pursuant to Public Resources Code section 21082.3, subdivision (b), paragraph 2, and shall be fully enforceable. (Pub. Resources Code § 21082.3 (a)).

9. Required Consideration of Feasible Mitigation: If mitigation measures recommended by the staff of the lead agency as a result of the consultation process are not included in the environmental document or if there are no agreed upon mitigation measures at the conclusion of consultation, or if consultation does not occur, and if substantial evidence demonstrates that a project will cause a significant effect to a tribal cultural resource, the lead agency shall consider feasible mitigation pursuant to Public Resources Code section 21084.3 (b). (Pub. Resources Code § 21082.3 (e)).

10. Examples of Mitigation Measures That, If Feasible, May Be Considered to Avoid or Minimize Significant Adverse Impacts to Tribal Cultural Resources:
    a. Avoidance and preservation of the resources in place, including, but not limited to:
        i. Planning and construction to avoid the resources and protect the cultural and natural context.
        ii. Planning greenspace, parks, or other open space, to incorporate the resources with culturally appropriate protection and management criteria.
    b. Treating the resource with culturally appropriate dignity, taking into account the tribal cultural values and meaning of the resource, including, but not limited to, the following:
        i. Protecting the cultural character and integrity of the resource.
        ii. Protecting the traditional use of the resource.
        iii. Protecting the confidentiality of the resource.
    c. Permanent conservation easements or other interests in real property, with culturally appropriate management criteria for the purposes of preserving or utilizing the resources or places.
    d. Protecting the resource. (Pub. Resource Code § 21084.3 (b)).
    e. Please note that a federally recognized California Native American tribe or a nonfederally recognized California Native American tribe that is on the contact list maintained by the NAHC to protect a California prehistoric, archaeological, cultural, spiritual, or ceremonial place may acquire and hold conservation easements if the conservation easement is voluntarily conveyed. (Civ. Code § 815.3 (c)).
    f. Please note that it is the policy of the state that Native American remains and associated grave artifacts shall be repatriated. (Pub. Resources Code § 5097.991).

11. Prerequisites for Certifying an Environmental Impact Report or Adopting a Mitigated Negative Declaration or Negative Declaration with a Significant Impact on an Identified Tribal Cultural Resource: An environmental impact report may not be certified, nor may a mitigated negative declaration or a negative declaration be adopted unless one of the following occurs:
    a. The consultation process between the tribes and the lead agency has occurred as provided in Public Resources Code sections 21080.3.1 and 21080.3.2 and concluded pursuant to Public Resources Code section 21080.3.2.
    b. The tribe that requested consultation failed to provide comments to the lead agency or otherwise failed to engage in the consultation process.
    c. The lead agency provided notice of the project to the tribe in compliance with Public Resources Code section 21080.3.1 (d) and the tribe failed to request consultation within 30 days. (Pub. Resources Code § 21082.3 (d)).

    This process should be documented in the Cultural Resources section of your environmental document.

The NAHC's PowerPoint presentation titled, "Tribal Consultation Under AB 52: Requirements and Best Practices" may be found online at: http://nahc.ca.gov/wp-content/uploads/2015/10/AB52TribalConsultation_CalEPAPDF.pdf

SB 18

SB 18 applies to local governments and requires **local governments** to contact, provide notice to, refer plans to, and consult with tribes prior to the adoption or amendment of a general plan or a specific plan, or the designation of open space. (Gov. Code § 65352.3). Local governments should consult the Governor's Office of Planning and Research's "Tribal Consultation Guidelines," which can be found online at: https://www.opr.ca.gov/docs/09_14_05_Updated_Guidelines_922.pdf

Some of SB 18's provisions include:

1. Tribal Consultation: If a local government considers a proposal to adopt or amend a general plan or a specific plan, or to designate open space it is required to contact the appropriate tribes identified by the NAHC by requesting a "Tribal Consultation List." If a tribe, once contacted, requests consultation the local government must consult with the tribe on the plan proposal. **A tribe has 90 days from the date of receipt of notification to request consultation unless a shorter timeframe has been agreed to by the tribe.** (Gov. Code § 65352.3 (a)(2)).
2. No Statutory Time Limit on SB 18 Tribal Consultation. There is no statutory time limit on SB 18 tribal consultation.
3. Confidentiality: Consistent with the guidelines developed and adopted by the Office of Planning and Research pursuant to Gov. Code section 65040.2, the city or county shall protect the confidentiality of the information concerning the specific identity, location, character, and use of places, features and objects described in Public Resources Code sections 5097.9 and 5097.993 that are within the city's or county's jurisdiction. (Gov. Code § 65352.3 (b)).
4. Conclusion of SB 18 Tribal Consultation: Consultation should be concluded at the point in which:
    a. The parties to the consultation come to a mutual agreement concerning the appropriate measures for preservation or mitigation; or
    b. Either the local government or the tribe, acting in good faith and after reasonable effort, concludes that mutual agreement cannot be reached concerning the appropriate measures of preservation or mitigation. (Tribal Consultation Guidelines, Governor's Office of Planning and Research (2005) at p. 18).

Agencies should be aware that neither AB 52 nor SB 18 precludes agencies from initiating tribal consultation with tribes that are traditionally and culturally affiliated with their jurisdictions before the timeframes provided in AB 52 and SB 18. For that reason, we urge you to continue to request Native American Tribal Contact Lists and "Sacred Lands File" searches from the NAHC. The request forms can be found online at: http://nahc.ca.gov/resources/forms/

NAHC Recommendations for Cultural Resources Assessments

To adequately assess the existence and significance of tribal cultural resources and plan for avoidance, preservation in place, or barring both, mitigation of project-related impacts to tribal cultural resources, the NAHC recommends the following actions:

1. Contact the appropriate regional California Historical Research Information System (CHRIS) Center (http://ohp.parks.ca.gov/?page_id=1068) for an archaeological records search. The records search will determine:
    a. If part or all of the APE has been previously surveyed for cultural resources.
    b. If any known cultural resources have been already been recorded on or adjacent to the APE.
    c. If the probability is low, moderate, or high that cultural resources are located in the APE.
    d. If a survey is required to determine whether previously unrecorded cultural resources are present.

2. If an archaeological inventory survey is required, the final stage is the preparation of a professional report detailing the findings and recommendations of the records search and field survey.
    a. The final report containing site forms, site significance, and mitigation measures should be submitted immediately to the planning department. All information regarding site locations, Native American human remains, and associated funerary objects should be in a separate confidential addendum and not be made available for public disclosure.

b. The final written report should be submitted within 3 months after work has been completed to the appropriate regional CHRIS center.

3. Contact the NAHC for:
   a. A Sacred Lands File search. Remember that tribes do not always record their sacred sites in the Sacred Lands File, nor are they required to do so. A Sacred Lands File search is not a substitute for consultation with tribes that are traditionally and culturally affiliated with the geographic area of the project's APE.
   b. A Native American Tribal Consultation List of appropriate tribes for consultation concerning the project site and to assist in planning for avoidance, preservation in place, or, failing both, mitigation measures.

4. Remember that the lack of surface evidence of archaeological resources (including tribal cultural resources) does not preclude their subsurface existence.
   a. Lead agencies should include in their mitigation and monitoring reporting program plan provisions for the identification and evaluation of inadvertently discovered archaeological resources per Cal. Code Regs., tit. 14, section 15064.5(f) (CEQA Guidelines section 15064.5(f)). In areas of identified archaeological sensitivity, a certified archaeologist and a culturally affiliated Native American with knowledge of cultural resources should monitor all ground-disturbing activities.
   b. Lead agencies should include in their mitigation and monitoring reporting program plans provisions for the disposition of recovered cultural items that are not burial associated in consultation with culturally affiliated Native Americans.
   c. Lead agencies should include in their mitigation and monitoring reporting program plans provisions for the treatment and disposition of inadvertently discovered Native American human remains. Health and Safety Code section 7050.5, Public Resources Code section 5097.98, and Cal. Code Regs., tit. 14, section 15064.5, subdivisions (d) and (e) (CEQA Guidelines section 15064.5, subds. (d) and (e)) address the processes to be followed in the event of an inadvertent discovery of any Native American human remains and associated grave goods in a location other than a dedicated cemetery.

Please contact me if you need any additional information at gayle.totton@nahc.ca.gov.

Sincerely,

Gayle Totton, M.A., PhD.

Re: CEQA and Land Use Notice Request for the Banning Distribution Center, SCH2018011032

Dear Ms. Nevins and Ms. De La Fuente,

I am writing on behalf of the Laborers International Union of North America, Local Union 1184 and its members living in Riverside County and/or the City of Banning ("LiUNA"), regarding the Banning Distribution Center (aka SCH2018011032, GPA 17-2501, ZC 17-3501, DR 16-7002, and ENV 16-150), including all actions related or referring to the proposed development of a 990,000 sf high-cube warehouse building located on 63.9 acres to the north and east of, and directly adjacent to, the Banning Airport on Parcel Numbers 532-110-006, 532-130-001, and 532-130-002 in the City of Banning ("Project").

We hereby request that the City of Banning ("City") send by electronic mail, if possible or U.S. Mail to our firm at the address below notice of any and all actions or hearings related to activities undertaken, authorized, approved, permitted, licensed, or certified by the City and any of its subdivisions, and/or supported, in whole or in part, through contracts, grants, subsidies, loans or other forms of assistance from the City including, but not limited to the following:

- Notice of any public hearing in connection with the Project as required by California Planning and Zoning Law pursuant to Government Code Section 65091.

- Any and all notices prepared for the Project pursuant to the California Environmental Quality Act ("CEQA"), including, but not limited to:

    - Notices of any public hearing held pursuant to CEQA.

- Notices of determination that an Environmental Impact Report ("EIR") is required for a project, prepared pursuant to Public Resources Code Section 21080.4.
- Notices of any scoping meeting held pursuant to Public Resources Code Section 21083.9.
- Notices of preparation of an EIR or a negative declaration for a project, prepared pursuant to Public Resources Code Section 21092.
- Notices of availability of an EIR or a negative declaration for a project, prepared pursuant to Public Resources Code Section 21152 and Section 15087 of Title 14 of the California Code of Regulations.
- Notices of approval and/or determination to carry out a project, prepared pursuant to Public Resources Code Section 21152 or any other provision of law.
- Notices of approval or certification of any EIR or negative declaration, prepared pursuant to Public Resources Code Section 21152 or any other provision of law.
- Notices of determination that a project is exempt from CEQA, prepared pursuant to Public Resources Code section 21152 or any other provision of law.
- Notice of any Final EIR prepared pursuant to CEQA.
- Notice of determination, prepared pursuant to Public Resources Code Section 21108 or Section 21152.

Please note that we are requesting notices of CEQA actions and notices of any public hearings to be held under any provision of Title 7 of the California Government Code governing California Planning and Zoning Law. **This request is filed pursuant to Public Resources Code Sections 21092.2 and 21167(f), and Government Code Section 65092**, which requires agencies to mail such notices to any person who has filed a written request for them with the clerk of the agency's governing body.

Please send notice by electronic mail, if possible or U.S. Mail to:

Notice of Preparation of a Draft Environmental Impact Report for the Banning Distribution Center (GPA 17-2501, ZC 17-3501)

The South Coast Air Quality Management District (SCAQMD) staff appreciates the opportunity to comment on the above-mentioned document. SCAQMD staff's comments are recommendations regarding the analysis of potential air quality impacts from the Proposed Project that should be included in the Draft Environmental Impact Report (EIR). Please send SCAQMD a copy of the Draft EIR upon its completion. Note that copies of the Draft EIR that are submitted to the State Clearinghouse are not forwarded to SCAQMD. Please forward a copy of the Draft EIR directly to SCAQMD at the address shown in the letterhead. **In addition, please send with the Draft EIR all appendices or technical documents related to the air quality, health risk, and greenhouse gas analyses and electronic versions of all air quality modeling and health risk assessment files[1]. These include emission calculation spreadsheets and modeling input and output files (not PDF files). Without all files and supporting documentation, SCAQMD staff will be unable to complete our review of the air quality analyses in a timely manner. Any delays in providing all supporting documentation will require additional time for review beyond the end of the comment period.**

Air Quality Analysis

SCAQMD adopted its California Environmental Quality Act (CEQA) Air Quality Handbook in 1993 to assist other public agencies with the preparation of air quality analyses. SCAQMD recommends that the Lead Agency use this Handbook as guidance when preparing its air quality analysis. Copies of the Handbook are available from SCAQMD's Subscription Services Department by calling (909) 396-3720. More guidance developed since this Handbook is also available on SCAQMD's website at: http://www.aqmd.gov/home/regulations/ceqa/air-quality-analysis-handbook/ceqa-air-quality-handbook-(1993). SCAQMD staff also recommends that the Lead Agency use the CalEEMod land use emissions software. This software has recently been updated to incorporate up-to-date state and locally approved emission factors and methodologies for estimating pollutant emissions from typical land use development. CalEEMod is the only software model maintained by the California Air Pollution Control Officers Association (CAPCOA) and replaces the now outdated URBEMIS. This model is available free of charge at: www.caleemod.com.

SCAQMD has also developed both regional and localized significance thresholds. SCAQMD staff requests that the Lead Agency quantify criteria pollutant emissions and compare the results to SCAQMD's CEQA regional pollutant emissions significance thresholds to determine air quality impacts.

[1] Pursuant to the CEQA Guidelines Section 15174, the information contained in an EIR shall include summarized technical data, maps, plot plans, diagrams, and similar relevant information sufficient to permit full assessment of significant environmental impacts by reviewing agencies and members of the public. Placement of highly technical and specialized analysis and data in the body of an EIR should be avoided through inclusion of supporting information and analyses as appendices to the main body of the EIR. Appendices to the EIR may be prepared in volumes separate from the basic EIR document, but shall be readily available for public examination and shall be submitted to all clearinghouses which assist in public review.

SCAQMD's CEQA regional pollutant emissions significance thresholds can be found here: http://www.aqmd.gov/docs/default-source/ceqa/handbook/scaqmd-air-quality-significance-thresholds.pdf. In addition to analyzing regional air quality impacts, SCAQMD staff recommends calculating localized air quality impacts and comparing the results to localized significance thresholds (LSTs). LSTs can be used in addition to the recommended regional significance thresholds as a second indication of air quality impacts when preparing a CEQA document. Therefore, when preparing the air quality analysis for the Proposed Project, it is recommended that the Lead Agency perform a localized analysis by either using the LSTs developed by SCAQMD staff or performing dispersion modeling as necessary. Guidance for performing a localized air quality analysis can be found at: http://www.aqmd.gov/home/regulations/ceqa/air-quality-analysis-handbook/localized-significance-thresholds.

The Lead Agency should identify any potential adverse air quality impacts that could occur from all phases of the Proposed Project and all air pollutant sources related to the Proposed Project. Air quality impacts from both construction (including demolition, if any) and operations should be calculated. Construction-related air quality impacts typically include, but are not limited to, emissions from the use of heavy-duty equipment from grading, earth-loading/unloading, paving, architectural coatings, off-road mobile sources (e.g., heavy-duty construction equipment) and on-road mobile sources (e.g., construction worker vehicle trips, material transport trips). Operation-related air quality impacts may include, but are not limited to, emissions from stationary sources (e.g., boilers), area sources (e.g., solvents and coatings), and vehicular trips (e.g., on- and off-road tailpipe emissions and entrained dust). Air quality impacts from indirect sources, such as sources that generate or attract vehicular trips, should be included in the analysis.

In the event that the Proposed Project generates or attracts vehicular trips, especially heavy-duty diesel-fueled vehicles, it is recommended that the Lead Agency perform a mobile source health risk assessment. Guidance for performing a mobile source health risk assessment ("*Health Risk Assessment Guidance for Analyzing Cancer Risk from Mobile Source Diesel Idling Emissions for CEQA Air Quality Analysis*") can be found at: http://www.aqmd.gov/home/regulations/ceqa/air-quality-analysis-handbook/mobile-source-toxics-analysis. An analysis of all toxic air contaminant impacts due to the use of equipment potentially generating such air pollutants should also be included.

In addition, guidance on siting incompatible land uses (such as placing homes near freeways) can be found in the California Air Resources Board's *Air Quality and Land Use Handbook: A Community Health Perspective*, which can be found at: http://www.arb.ca.gov/ch/handbook.pdf. CARB's Land Use Handbook is a general reference guide for evaluating and reducing air pollution impacts associated with new projects that go through the land use decision-making process. Guidance[2] on strategies to reduce air pollution exposure near high-volume roadways can be found at: https://www.arb.ca.gov/ch/rd_technical_advisory_final.PDF.

SCAQMD Staff's Recommendation for Truck Trip Rates for High Cube Warehouse Projects

SCAQMD staff recommends the use of truck trip rates from the Institute of Transportation Engineers (ITE) for high cube warehouse projects located in SCAQMD (i.e. 1.68 average daily vehicle trips per 1,000 square feet and 0.64 average daily truck trips per 1,000 square feet). Consistent with CEQA Guidelines, the Draft EIR for the Proposed Project may use a non-default trip rate if there is substantial evidence supporting another rate is more appropriate for the air quality analysis.

[2] In April 2017, CARB published a technical advisory, *Strategies to Reduce Air Pollution Exposure Near High-Volume Roadways: Technical Advisory*, to supplement CARB's Air Quality and Land Use Handbook: A Community Health Perspective. This technical advisory is intended to provide information on strategies to reduce exposures to traffic emissions near high-volume roadways to assist land use planning and decision-making in order to protect public health and promote equity and environmental justice. The technical advisory is available at: https://www.arb.ca.gov/ch/landuse.htm.

For high cube warehouse projects, SCAQMD staff has been working on a Warehouse Truck Trip Study to better quantify trip rates associated with local warehouse and distribution projects, as truck emission represent more than 90 percent of air quality impacts from these projects. Details regarding this study can be found online here: http://www.aqmd.gov/home/regulations/ceqa/air-quality-analysis-handbook/high-cube-warehouse.

Mitigation Measures

In the event that the Proposed Project generates significant adverse air quality impacts, CEQA requires that all feasible mitigation measures that go beyond what is required by law be utilized during project construction and operation to minimize these impacts. Pursuant to CEQA Guidelines Section 15126.4 (a)(1)(D), any impacts resulting from mitigation measures must also be discussed. Several resources are available to assist the Lead Agency with identifying potential mitigation measures for the Proposed Project, including:

- Chapter 11 of SCAQMD's CEQA Air Quality Handbook
- SCAQMD's CEQA web pages available here: http://www.aqmd.gov/home/regulations/ceqa/air-quality-analysis-handbook/mitigation-measures-and-control-efficiencies
- SCAQMD's Rule 403 – Fugitive Dust, and the Implementation Handbook for controlling construction-related emissions and Rule 1403 – Asbestos Emissions from Demolition/Renovation Activities
- SCAQMD's Mitigation Monitoring and Reporting Plan (MMRP) for the 2016 Air Quality Management Plan (2016 AQMP) available here (starting on page 86): http://www.aqmd.gov/docs/default-source/Agendas/Governing-Board/2017/2017-mar3-035.pdf
- CAPCOA's *Quantifying Greenhouse Gas Mitigation Measures* available here: http://www.capcoa.org/wp-content/uploads/2010/11/CAPCOA-Quantification-Report-9-14-Final.pdf

Additional mitigation measures for operational air quality impacts from mobile sources that the Lead Agency should consider in the Draft EIR may include the following:

- Require the use of 2010 and newer haul trucks (e.g., material delivery trucks and soil import/export). In the event that that 2010 model year or newer diesel haul trucks cannot be obtained, provide documentation as information becomes available and use trucks that meet EPA 2007 model year NOx emissions requirements[3], at a minimum. Additionally, consider other measures such as incentives, phase-in schedules for clean trucks, etc.
- Have truck routes clearly marked with trailblazer signs, so that trucks will not enter residential areas.
- Limit the daily number of trucks allowed at the Proposed Project to levels analyzed in the CEQA document. If higher daily truck volumes are anticipated to visit the site, the Lead Agency should commit to re-evaluating the Proposed Project through CEQA prior to allowing this land use or higher activity level.
- Provide electric vehicle (EV) Charging Stations (see the discussion below regarding EV charging stations).
- Should the Proposed Project generate significant regional emissions, the Lead Agency should require mitigation that requires accelerated phase-in for non-diesel powered trucks. For example, natural gas trucks, including Class 8 HHD trucks, are commercially available today. Natural gas trucks can provide a substantial reduction in health risks, and may be more financially feasible

[3] Based on a review of the California Air Resources Board's diesel truck regulations, 2010 model year diesel haul trucks should have already been available and can be obtained in a successful manner for the project construction California Air Resources Board. March 2016. Available at: http://www.truckload.org/tca/files/ccLibraryFiles/Filename/000000003422/California-Clean-Truck-and-Trailer-Update.pdf (See slide #23).

today due to reduced fuel costs compared to diesel. In the Final CEQA document, the Lead Agency should require a phase-in schedule for these cleaner operating trucks to reduce any significant adverse air quality impacts. SCAQMD staff is available to discuss the availability of current and upcoming truck technologies and incentive programs with the Lead Agency.

- Trucks that can operate at least partially on electricity have the ability to substantially reduce the significant NOx impacts from this project. Further, trucks that run at least partially on electricity are projected to become available during the life of the project as discussed in the 2016-2040 Regional Transportation Plan/Sustainable Communities Strategy (2016-2040 RTP/SCS)[4]. It is important to make this electrical infrastructure available when the project is built so that it is ready when this technology becomes commercially available. The cost of installing electrical charging equipment onsite is significantly cheaper if completed when the project is built compared to retrofitting an existing building. Therefore, SCAQMD staff recommends the Lead Agency require the Proposed Project and other plan areas that allow truck parking to be constructed with the appropriate infrastructure to facilitate sufficient electric charging for trucks to plug-in. Similar to the City of Los Angeles requirements for all new projects, SCAQMD staff recommends that the Lead Agency require at least 5% of all vehicle parking spaces (including for trucks) include EV charging stations[5]. Further, electrical hookups should be provided at the onsite truck stop for truckers to plug in any onboard auxiliary equipment. At a minimum, electrical panels should appropriately sized to allow for future expanded use.
- Design the industrial building such that entrances and exits are such that trucks are not traversing past neighbors or other sensitive receptors.
- Design the industrial building such that any check-in point for trucks is well inside the Proposed Project site to ensure that there are no trucks queuing outside of the facility.
- Design the industrial building to ensure that truck traffic within the Proposed Project site is located away from the property line(s) closest to its residential or sensitive receptor neighbors.
- Restrict overnight parking in residential areas.
- Establish overnight parking within the industrial building where trucks can rest overnight.
- Establish area(s) within the Proposed Project site for repair needs.
- Develop, adopt and enforce truck routes both in and out of city, and in and out of facilities.
- Create a buffer zone of at least 300 meters (roughly 1,000 feet), which can be office space, employee parking, greenbelt, etc. between the Proposed Project and sensitive receptors.

Additional mitigation measures for operational air quality impacts from other area sources that the Lead Agency should consider in the Draft EIR may include the following:

- Maximize use of solar energy including solar panels; installing the maximum possible number of solar energy arrays on the building roofs and/or on the Project site to generate solar energy for the facility.
- Maximize the planting of trees in landscaping and parking lots.
- Use light colored paving and roofing materials.
- Utilize only Energy Star heating, cooling, and lighting devices, and appliances.
- Install light colored "cool" roofs and cool pavements.
- Require use of electric or alternatively fueled sweepers with HEPA filters.
- Use of water-based or low VOC cleaning products.

Alternatives

In the event that the Proposed Project generates significant adverse air quality impacts, CEQA requires the consideration and discussion of alternatives to the project or its location which are capable of avoiding or substantially lessening any of the significant effects of the project. The discussion of a reasonable range of potentially feasible alternatives, including a "no project" alternative, is intended to foster informed decision-making and public participation. Pursuant to CEQA Guidelines Section 15126.6(d), the Draft EIR shall include sufficient information about each alternative to allow meaningful evaluation, analysis, and comparison with the Proposed Project.

Permits

In the event that the Proposed Project requires a permit from SCAQMD, SCAQMD should be identified as Responsible Agency for the Proposed Project. For more information on permits, please visit SCAQMD webpage at: http://www.aqmd.gov/home/permits. Questions on permits can be directed to SCAQMD's Engineering and Permitting staff at (909) 396-3385.

Data Sources

SCAQMD rules and relevant air quality reports and data are available by calling SCAQMD's Public Information Center at (909) 396-2039. Much of the information available through the Public Information Center is also available at SCAQMD's webpage at: http://www.aqmd.gov.

SCAQMD staff is available to work with the Lead Agency to ensure that project air quality impacts are accurately evaluated and any significant impacts are mitigated where feasible. If you have any questions regarding this letter, please contact me at lsun@aqmd.gov or call me at (909) 396-3308.

Sincerely,

Lijin Sun

Good morning Ms Nevins, February 19, 2018

RE: Banning Distribution Center (GPA 17-2501; ZC 17-3501; DR 16-7002; ENV 16-1503) NOP comments.

The Sierra Club appreciates having this opportunity to raise some questions/concerns related to this proposed development which need to be addressed in the Draft EIR.

The public needs a figure which shows the location of “scattered residential uses” as well as rural residential, mobile home parks, and high density residential in relation to the the project site along with the roads that will be used by the project. There also needs to be a a figure which shows the allowed truck routes to and from the project as well as the proximity to other uses. Truck routes must avoid residential areas and the Draft EIR must easily show the public where it does and doesn’t.

Growth inducing impacts of the project with improvements like the extension of John Street, emergency fire access roadway, rail spur, wet utility area, extension of sewer and water lines as well as a lift station need to be fully analyzed/addressed. The Draft EIR analysis must include not only the project site, but all of improvements mentioned in the previous sentence and their impacts on all the areas you mentioned will be studied in the sectioned found above titled "Environmental Analysis”. The Growth inducing impacts and all other impacts related to the construction, development and operation of the project must include all adjacent lands — including the lands owned by the Morongo Indian Reservation.

The Draft EIR will need to show all the animals and plants that rely on the Ramsey Street wash well beyond the project site — at least one mile in each direction. How will the wash be protected to allow for animals to use it for linkages and connectivity? How will the project enhance it for all species that might use it and keep it clear from litter for the life of the project?

Will the project lighting maintain International Dark Sky standards? How will the lighting potentially interfere with airport operations. How will the height and roof material of the warehouse interfere with the airport? Will the projects lighting impact HWY 10. The headlights from the diesel trucks and other vehicles/equipment must be analyzed for their impacts on biological resources. All of these need to be analyzed/addressed in the Draft EIR. How will lighting impact the biological resources that use the Ramsey Creek Wash or are part of the nearby Criterial Cells or the resources found on the Morongo Indian Reservation. We disagree that this projects glare and light pollution impacts will be less than significant. They need to be addressed in the Draft EIR.

How does a 46 foot tall building maintain "preserve the natural vistas”? Will roof mounted equipment add to the height of the building making even more incompatible with the airport? Will that equipment be shielded from public view with what appears to be an internal part of the building? We disagree that it will have "less than a significant impact on scenic vistas." It needs to be addressed in the Draft EIR. This should include vistas from Highway 10.

Your check off on noise fails to mention the impacts caused during construction and operation of the project on those animals which would use the Ramsey Street wash as well as the MSHCP-designated Special Linkage Area. The operation of the warehouse could and will generate significant noise/vibration which would discourage wildlife from using these important linkages. This noise also includes that of the beeping sounds caused by trucks backing up. The standard for excessive noise/vibration cannot be that which just impacts humans, but must be what impacts all possible animals using the area that have much more sensitive hearing. The orientation of the building and loading bays as well as truck traffic must be considered when trying to address these negative impacts to wildlife. Cumulative noise increase must also be evaluated and mitigated at the project site as well as along all the truck routes on surface streets.

The alteration of the drainage pattern must analyze the impacts to both plant and animal life at the the site as well as beyond the project site — at least one mile. The Draft EIR must include the increase in toxic runoff from all the additional hard surfaces and their impacts on all the biological resources — again at least one mile beyond the project site. This must include birds.

Development of the Project will undoubtedly involve heavy diesel truck activity with significant impact on our already poor air quality. Therefore, we encourage and expect the City to explore and develop strong measures to mitigate diesel (NOx) emissions. Also, construction air quality mitigation must include measures such as the use of Tier 4 equipment and/or requiring the use of electric (non diesel) equipment. The project must provide the infrastructure for electric forklifts and hostlers/yard goats. The same for electric semi-trucks. (http://www.motortrend.com/news/tesla-semi-truck-finally-unveiled/) & (https://www.reuters.com/article/us-ups-tesla-orders/ups-reserves-125-tesla-semi-trucks-largest-public-pre-order-yet-idUSKBN1ED1QM) This projects adds to the unacceptable number of warehouses approved in our non-attainment Inland Empire and will further degrade our air quality. Every possible mitigation measure must be required to reduce its cumulative health impacts on all of us and the Sierra Club looks forward to reading them in the Draft EIR.

The EIR must fully disclose the Project's GHG emissions and evaluate its consistency with the City's Climate Action Plan. The EIR must require strong measures to off-set GHG emissions including mobile and energy emissions.

Cumulative Impacts. The EIR must consider all cumulative projects in its analysis. To the extent that future projects are known these must be included in the traffic analysis. This must also include all projects in adjacent jurisdictions like the San Gorgonio Crossings and Hidden Canyon Industrial Park Project, but not limited to those.

Thank you for considering these comments in your preparation of the Banning Distribution Center's Draft EIR. Please send me future documents and notices of public hearings by using the address under my name and this email address.

Sincerely,

George Hague

Subject: Notice of Preparation of a Draft Environmental Impact Report
Banning Distribution Center Project
State Clearinghouse No. 2018011032

Dear Ms. Nevins:

The Department of Fish and Wildlife (Department) appreciates the opportunity to comment on the Notice of Preparation (NOP) of a Draft Environmental Impact Report (DEIR) for the Banning Distribution Center Project (project) [State Clearinghouse No. 2018011032]. The Department is responding to the NOP as a Trustee Agency for fish and wildlife resources (California Fish and Game Code Sections 711.7 and 1802, and the California Environmental Quality Act [CEQA] Guidelines Section 15386), and as a Responsible Agency regarding any discretionary actions (CEQA Guidelines Section 15381), such as the issuance of a Lake or Streambed Alteration Agreement (California Fish and Game Code Sections 1600 *et seq.*) and/or a California Endangered Species Act (CESA) Permit for Incidental Take of Endangered, Threatened, and/or Candidate species (California Fish and Game Code Sections 2080 and 2080.1).

Project Description

The 63.9-acre project site is located north and east of the Banning Airport, south of the Union Pacific Railroad line and Interstate 10, in the City of Banning, Riverside County. The applicant, Banning Industrial, LP proposes the construction and operation of approximately 1,000,000 square feet (sf) of industrial warehouse/distribution uses on the approximate 63.9-acre site within the AI (Airport Industrial) and PFA (Public Facilities - Airport) Zones of the City of Banning General Plan area. Associated project entitlement actions include a General Plan Amendment (GPA) and Zone Change (ZC), changing the land use and zoning of Public Facilities-Airport (PF-A) to Airport Industrial (AI) on a portion of the subject site.

COMMENTS AND RECOMMENDATIONS

The Department has jurisdiction over the conservation, protection, and management of fish, wildlife, native plants, and the habitat necessary for biologically sustainable populations of those species (i.e., biological resources); and administers the Natural Community Conservation Planning Program (NCCP Program). The Department offers the comments and

recommendations presented below to assist the City of Banning (City; the CEQA lead agency) in adequately identifying and/or mitigating the project's significant, or potentially significant, impacts on biological resources. The comments and recommendations are also offered to enable the Department to adequately review and comment on the proposed project with respect to impacts on biological resources and the project's consistency with the Western Riverside County Multiple Species Habitat Conservation Plan (MSHCP). The Department recommends that the forthcoming DEIR address the following:

Assessment of Biological Resources

Section 15125(c) of the CEQA Guidelines states that knowledge of the regional setting of a project is critical to the assessment of environmental impacts and that special emphasis should be placed on environmental resources that are rare or unique to the region. To enable Department staff to adequately review and comment on the project, the DEIR should include a complete assessment of the flora and fauna within and adjacent to the project footprint, with particular emphasis on identifying rare, threatened, endangered, and other sensitive species and their associated habitats. The Department recommends that the DEIR specifically include:

1. An assessment of the various habitat types located within the project footprint, and a map that identifies the location of each habitat type. The Department recommends that floristic, alliance- and/or association based mapping and assessment be completed following *The Manual of California Vegetation*, second edition (Sawyer et al. 2009). Adjoining habitat areas should also be included in this assessment where site activities could lead to direct or indirect impacts offsite. Habitat mapping at the alliance level will help establish baseline vegetation conditions;

2. A general biological inventory of the fish, amphibian, reptile, bird, and mammal species that are present or have the potential to be present within each habitat type onsite and within adjacent areas that could be affected by the project. The Department's California Natural Diversity Database (CNDDB) in Sacramento should be contacted at (916) 322-2493 or CNDDB@wildlife.ca.gov to obtain current information on any previously reported sensitive species and habitat, including Significant Natural Areas identified under Chapter 12 of the Fish and Game Code, in the vicinity of the proposed project. The Department recommends that CNDDB Field Survey Forms be completed and submitted to CNDDB to document survey results. Online forms can be obtained and submitted at: https://www.wildlife.ca.gov/Data/CNDDB/Submitting-Data

   Please note that the Department's CNDDB is not exhaustive in terms of the data it houses, nor is it an absence database. The Department recommends that it be used as a starting point in gathering information about the *potential presence* of species within the general area of the project site.

3. A complete, *recent* inventory of rare, threatened, endangered, and other sensitive species located within the project footprint and within offsite areas with the potential to be effected, including California Species of Special Concern (CSSC) and California Fully Protected Species (Fish and Game Code § 3511). Species to be addressed should include all those which meet the CEQA definition (CEQA Guidelines § 15380). The inventory should address seasonal variations in use of the project area and should not be limited to resident species. Focused species-specific/MSHCP surveys, completed by a qualified biologist and conducted at the appropriate time of year and time of day when the sensitive species are

active or otherwise identifiable, are required. Acceptable species-specific survey procedures should be developed in consultation with the Department and the U.S. Fish and Wildlife Service, where necessary. Note that the Department generally considers biological field assessments for wildlife to be valid for a one-year period, and assessments for rare plants may be considered valid for a period of up to three years. Some aspects of the proposed project may warrant periodic updated surveys for certain sensitive taxa, particularly if the project is proposed to occur over a protracted time frame, or in phases, or if surveys are completed during periods of drought.

4. A thorough, recent, floristic-based assessment of special status plants and natural communities, following the Department's *Protocols for Surveying and Evaluating Impacts to Special Status Native Plant Populations and Natural Communities* (see https://www.wildlife.ca.gov/Conservation/Plants);

5. Information on the regional setting that is critical to an assessment of environmental impacts, with special emphasis on resources that are rare or unique to the region (CEQA Guidelines § 15125[c]);

Analysis of Direct, Indirect, and Cumulative Impacts to Biological Resources

The DEIR should provide a thorough discussion of the direct, indirect, and cumulative impacts expected to adversely affect biological resources as a result of the project. To ensure that project impacts to biological resources are fully analyzed, the following information should be included in the DEIR:

1. A discussion of potential impacts from lighting, noise, human activity (e.g., recreation), defensible space, and wildlife-human interactions created by zoning of development projects or other project activities adjacent to natural areas, exotic and/or invasive species, and drainage. The latter subject should address project-related changes on drainage patterns and water quality within, upstream, and downstream of the project site, including: volume, velocity, and frequency of existing and post-project surface flows; polluted runoff; soil erosion and/or sedimentation in streams and water bodies; and post-project fate of runoff from the project site.

   With respect to defensible space: please ensure that the DEIR fully describes and identifies the location, acreage, and composition of defensible space *within* the proposed project footprint. Please ensure that any graphics and descriptions of defensible space associated with this project comply with City of Banning Fire/CalFire/Riverside County Fire (or other applicable agency) regulations/ requirements. The City, through their planning processes, should be ensuring that defensible space is provided and accounted for *within proposed development areas*, and not transferred to adjacent open space or conservations lands.

2. A discussion of potential indirect project impacts on biological resources, including resources in areas adjacent to the project footprint, such as nearby public lands (e.g. National Forests, State Parks, etc.), open space, adjacent natural habitats, riparian ecosystems, wildlife corridors, and any designated and/or proposed reserve or mitigation lands (e.g., preserved lands associated with a Natural Community Conservation Plan, or other conserved lands).

3. A cumulative effects analysis developed as described under CEQA Guidelines § 15130.

Please include all potential direct and indirect project related impacts to riparian areas, wetlands, vernal pools, alluvial fan habitats, wildlife corridors or wildlife movement areas, aquatic habitats, sensitive species and other sensitive habitats, open lands, open space, and adjacent natural habitats in the cumulative effects analysis. General and specific plans, as well as past, present, and anticipated future projects, should be analyzed relative to their impacts on similar plant communities and wildlife habitats.

Mitigation Measures for Project Impacts to Biological Resources

The DEIR should include appropriate and adequate avoidance, minimization, and/or mitigation measures for all direct, indirect, and cumulative impacts that are expected to occur as a result of the construction and long-term operation and maintenance of the project. When proposing measures to avoid, minimize, or mitigate impacts, the Department recommends consideration of the following:

1. *Sensitive Plant Communities*: The Department considers sensitive plant communities to be imperiled habitats having both local and regional significance. Plant communities, alliances, and associations with a statewide ranking of S-1, S-2, S-3, and S-4 should be considered sensitive and declining at the local and regional level. These ranks can be obtained by querying the CNDDB and are included in *The Manual of California Vegetation* (Sawyer et al. 2009). The DEIR should include measures to fully avoid and otherwise protect sensitive plant communities from project-related direct and indirect impacts.

2. *Mitigation*: The Department considers adverse project-related impacts to sensitive species and habitats to be significant to both local and regional ecosystems, and the DEIR should include mitigation measures for adverse project-related impacts to these resources. Mitigation measures should emphasize avoidance and reduction of project impacts. For unavoidable impacts, onsite habitat restoration and/or enhancement should be evaluated and discussed in detail. If onsite mitigation is not feasible or would not be biologically viable and therefore not adequately mitigate the loss of biological functions and values, offsite mitigation through habitat creation and/or acquisition and preservation in perpetuity should be addressed.

   The DEIR should include measures to perpetually protect the targeted habitat values within mitigation areas from direct and indirect adverse impacts in order to meet mitigation objectives to offset project-induced qualitative and quantitative losses of biological values. Specific issues that should be addressed include restrictions on access, including, but not limited to measures to ensure domestic animals (e.g., cats and dogs) cannot access mitigation areas, and removal procedures to implement if they do; proposed land dedications; long-term monitoring and management programs; control of illegal dumping; water pollution; and increased human intrusion, etc.

3. *Habitat Revegetation/Restoration Plans*: Plans for restoration and revegetation should be prepared by persons with expertise in southern California ecosystems and native plant restoration techniques. Plans should identify the assumptions used to develop the proposed restoration strategy. Each plan should include, at a minimum: (a) the location of restoration sites and assessment of appropriate reference sites; (b) the plant species to be used, sources of local propagules, container sizes, and seeding rates; (c) a schematic depicting the mitigation area; (d) a local seed and cuttings and planting schedule; (e) a description of the irrigation methodology; (f) measures to control exotic vegetation on site; (g) specific

success criteria; (h) a detailed monitoring program; (i) contingency measures should the success criteria not be met; and (j) identification of the party responsible for meeting the success criteria and providing for conservation of the mitigation site in perpetuity. Monitoring of restoration areas should extend across a sufficient time frame to ensure that the new habitat is established, self-sustaining, and capable of surviving drought.

The Department recommends that local onsite propagules from the project area and nearby vicinity be collected and used for restoration purposes. Onsite seed collection should be initiated in the near future in order to accumulate sufficient propagule material for subsequent use in future years. Onsite vegetation mapping at the alliance and/or association level should be used to develop appropriate restoration goals and local plant palettes. Reference areas should be identified to help guide restoration efforts. Specific restoration plans should be developed for various project components as appropriate.

Restoration objectives should include protecting special habitat elements or re-creating them in areas affected by the project; examples could include retention of woody material, logs, snags, rocks, and brush piles.

4. *Nesting Birds and Migratory Bird Treaty Act:* Please note that it is the project proponent's responsibility to comply with all applicable laws related to nesting birds and birds of prey. Migratory non-game native bird species are protected by international treaty under the federal Migratory Bird Treaty Act (MBTA) of 1918, as amended (16 U.S.C. 703 *et seq.*). In addition, sections 3503, 3503.5, and 3513 of the Fish and Game Code (FGC) afford protective measures as follows: Section 3503 states that it is unlawful to take, possess, or needlessly destroy the nest or eggs of any bird, except as otherwise provided by FGC or any regulation made pursuant thereto; Section 3503.5 states that is it unlawful to take, possess, or destroy any birds in the orders Falconiformes or Strigiformes (birds-of-prey) or to take, possess, or destroy the nest or eggs of any such bird except as otherwise provided by FGC or any regulation adopted pursuant thereto; and Section 3513 states that it is unlawful to take or possess any migratory nongame bird as designated in the MBTA or any part of such migratory nongame bird except as provided by rules and regulations adopted by the Secretary of the Interior under provisions of the MBTA.

   The Department recommends that the DEIR include the results of avian surveys, as well as specific avoidance and minimization measures to ensure that impacts to nesting birds do not occur. Project-specific avoidance and minimization measures may include, but not be limited to: project phasing and timing, monitoring of project-related noise (where applicable), sound walls, and buffers, where appropriate. The DEIR should also include specific avoidance and minimization measures that will be implemented should a nest be located within the project site. If pre-construction surveys are proposed in the DEIR, the Department recommends that they be required no more than three (3) days prior to vegetation clearing or ground disturbance activities, as instances of nesting could be missed if surveys are conducted sooner.

5. *Moving out of Harm's Way:* The proposed project is anticipated to result in the clearing of natural habitats that support native species. To avoid direct mortality, the Department recommends that the lead agency condition the DEIR to require that a Department-approved qualified biologist be retained to be onsite prior to and during all ground- and habitat-disturbing activities to move out of harm's way special status species or other wildlife of low or limited mobility that would otherwise be injured or killed from project-related

activities. Movement of wildlife out of harm's way should be limited to only those individuals that would otherwise by injured or killed, and individuals should be moved only as far a necessary to ensure their safety (i.e., the Department does not recommend relocation to other areas). Furthermore it should be noted that the temporary relocation of onsite wildlife does not constitute effective mitigation for the purposes of offsetting project impacts associated with habitat loss.

6. *Translocation of Species*: The Department generally does not support the use of relocation, salvage, and/or transplantation as mitigation for impacts to rare, threatened, or endangered species as studies have shown that these efforts are experimental in nature and largely unsuccessful.

California Endangered Species Act

The Department is responsible for ensuring appropriate conservation of fish and wildlife resources including threatened, endangered, and/or candidate plant and animal species, pursuant to the California Endangered Species Act (CESA). The Department recommends that a CESA ITP be obtained if the project has the potential to result in "take" (California Fish and Game Code Section 86 defines "take" as "hunt, pursue, catch, capture, or kill, or attempt to hunt, pursue, catch, capture, or kill") of State-listed CESA species, either through construction or over the life of the project. CESA ITPs are issued to conserve, protect, enhance, and restore State-listed CESA species and their habitats.

The Department encourages early consultation, as significant modification to the proposed project and avoidance, minimization, and mitigation measures may be necessary to obtain a CESA ITP. Please note that the proposed avoidance, minimization, and mitigation measures must be sufficient for the Department to conclude that the project's impacts are fully mitigated and the measures, when taken in aggregate, must meet the full mitigation standard. Revisions to the California Fish and Game Code, effective January 1998, require that the Department issue a separate CEQA document for the issuance of a CESA ITP unless the Project CEQA document addresses all Project impacts to listed species and specifies a mitigation monitoring and reporting program that will meet the requirements of a CESA permit.

Western Riverside County Multiple Species Habitat Conservation Plan

Within the Inland Deserts Region, the Department issued Natural Community Conservation Plan Approval and Take Authorization for the Western Riverside County MSHCP per Section 2800, *et seq*., of the California Fish and Game Code on June 22, 2004. The MSHCP establishes a multiple species conservation program to minimize and mitigate habitat loss and provides for the incidental take of covered species in association with activities covered under the permit.

Compliance with approved habitat plans, such as the MSHCP, is discussed in CEQA. Specifically, Section 15125(d) of the CEQA Guidelines requires that the CEQA document discuss any inconsistencies between a proposed Project and applicable general plans and regional plans, including habitat conservation plans and natural community conservation plans. An assessment of the impacts to the MSHCP as a result of this Project is necessary to address CEQA requirements. To obtain additional information regarding the MSHCP please go to: http://rctlma.org/epd/WR-MSHCP.

The proposed Project occurs within the MSHCP area and is subject to the provisions and policies of the MSHCP. In order to be considered a covered activity, Permittees must demonstrate that proposed actions are consistent with the MSHCP and its associated Implementing Agreement. The City of Banning is the Lead Agency and is signatory to the Implementing Agreement of the MSHCP. The project is located within the Special Linkage Area of the Pass Plan Area and the following applies (p.3-259 of the MSHCP):

> *Special Linkage Area: This Special Linkage Area will contribute to assembly of a portion of the San Gorgonio River/San Bernardino-San Jacinto Mountains Linkage. Tribal coordination regarding American Indian Lands will be necessary in this area. The San Gorgonio River/San Bernardino-San Jacinto Mountains Linkage includes locations within and outside the MSHCP Plan Area. Features of the entire linkage area are described in Missing Linkages: Restoring Connectivity to the California Landscape (Penrod, K., November 2, 2000). A copy of this report is attached as Exhibit 24 to Comment Letter D in Volume V of the MSHCP. Local Permittees will apply the following rebuttable presumption of significance, taken from Appendix G to the 1998 State CEQA Guidelines, in CEQA review of proposed public and private projects within this Special Linkage Area and apply mitigation measures as appropriate: "Would the project interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites?" Draft and Final CEQA documentation prepared by Local Permittees for projects within this Special Linkage Area will be forwarded to the RCA for informational purposes to provide for MSHCP coordination regarding this area.*

The DEIR needs to address how the proposed project will affect the policies and procedures of the MSHCP. Based on aerial review there appear to be at least two washes that contain riparian and riverine resources. The project should complete a Determination of Biologically Equivalent or Superior Preservation to address impacts to the riparian/riverine resources. All surveys required by the MSHCP policies and procedures listed above to determine consistency with the MSHCP should be conducted and results included in the DEIR so that the Department can adequately assess whether the project will impact the MSHCP.

Lake and Streambed Alteration Program

Based on review of aerial photography at least two drainage features traverse the site. Depending on how the project is designed and constructed, it is likely that the project applicant will need to notify the Department per Fish and Game Code section 1602. For any activity that will divert or obstruct the natural flow, or change the bed, channel, or bank (which may include associated riparian resources) of a river or stream or use material from a streambed, the project applicant (or “entity”) is required to provide written notification to the Department pursuant to Section 1602 of the Fish and Game Code. Please note that streams include all those that flow at least episodically, including ephemeral streams, desert washes, and watercourses with subsurface flow. Based on the notification and supporting information, the Department determines if the proposed project activities may substantially adversely affect existing fish and wildlife resources and whether a Lake and Streambed Alteration (LSA) Agreement is required.

The Department’s issuance of an LSA Agreement is a “project” subject to CEQA (see Pub. Resources Code 21065). Therefore, to facilitate issuance of an LSA Agreement, if necessary, the DEIR should fully identify the potential impacts to the lake, stream, or riparian resources,

and provide adequate avoidance, mitigation, and monitoring and reporting commitments. Early consultation with the Department is recommended, since modification of the proposed project may be required to avoid or reduce impacts to fish and wildlife resources. To obtain a Lake or Streambed Alteration notification package, please go to https://www.wildlife.ca.gov/Conservation/LSA/Forms.

Additional Comments and Recommendations

To ameliorate the water demands of this project, the Department recommends incorporation of water-wise concepts in project landscape design plans. In particular the Department recommends xeriscaping with locally native California species, and installing water-efficient and targeted irrigation systems (such as drip irrigation). Local water agencies/districts, and resource conservation districts in your area may be able to provide information on plant nurseries that carry locally native species, and some facilities display drought-tolerant locally native species demonstration gardens. Information on drought-tolerant landscaping and water-efficient irrigation systems is available on California's Save our Water website: http://saveourwater.com/what-you-can-do/tips/landscaping/

Further Coordination

The Department appreciates the opportunity to comment on the NOP of a DEIR for the Banning Distribution Center Project (SCH No. 2018011032) and recommends that the City of Banning address the Department's comments and concerns in the forthcoming DEIR. If you should have any questions pertaining to the comments provided in this letter, please contact Heather Pert at (858) 395-9692 or at Heather.pert@wildlife.ca.gov.

Sincerely,

Heather A. Pert
for

Leslie MacNair
Regional Manager

RE: SCAG Comments on the Notice of Preparation of a Draft Environmental Impact Report for the Banning Distribution Center [SCAG NO. IGR9514]

Dear Ms. Nevins,

Thank you for submitting the Notice of Preparation of a Draft Environmental Impact Report for the Banning Distribution Center ("proposed project") to the Southern California Association of Governments (SCAG) for review and comment. SCAG is the authorized regional agency for Inter-Governmental Review (IGR) of programs proposed for Federal financial assistance and direct Federal development activities, pursuant to Presidential Executive Order 12372. Additionally, SCAG reviews the Environmental Impact Reports of projects of regional significance for consistency with regional plans pursuant to the California Environmental Quality Act (CEQA) and CEQA Guidelines.

SCAG is also the designated Regional Transportation Planning Agency under state law, and is responsible for preparation of the Regional Transportation Plan (RTP) including the Sustainable Communities Strategy (SCS) pursuant to Senate Bill (SB) 375. As the clearinghouse for regionally significant projects per Executive Order 12372, SCAG reviews the consistency of local plans, projects, and programs with regional plans.[1] SCAG's feedback is intended to assist local jurisdictions and project proponents to implement projects that have the potential to contribute to attainment of Regional Transportation Plan/Sustainable Community Strategies (RTP/SCS) goals and align with RTP/SCS policies.

SCAG staff has reviewed the Notice of Preparation of a Draft Environmental Impact Report for the Banning Distribution Center in Riverside County. The proposed project includes 1,000,000 square feet of industrial warehouse uses on 63.9 acres, as well as a General Plan amendment and zone change.

When available, please send environmental documentation to *SCAG's office in Los Angeles or by email to au@scag.ca.gov* providing, at a minimum, the full public comment period for review. Please note our new headquarters in Downtown Los Angeles is at *900 Wilshire Boulevard, Ste. 1700, Los Angeles, California 90017*.

If you have any questions regarding the attached comments, please contact the Inter-Governmental Review (IGR) Program, attn.: Anita Au, Associate Regional Planner, at (213) 236-1874 or au@scag.ca.gov. Thank you.

Sincerely,

Ping Chang
Acting Manager, Compliance and Performance Monitoring

[1] Lead agencies such as local jurisdictions have the sole discretion in determining a local project's consistency with the 2016 RTP/SCS for the purpose of determining consistency for CEQA. Any "consistency" finding by SCAG pursuant to the IGR process should not be construed as a determination of consistency with the 2016 RTP/SCS for CEQA.

COMMENTS ON THE NOTICE OF PREPARATION OF A DRAFT ENVIRONMENTAL IMPACT REPORT FOR THE BANNING DISTRIBUTION CENTER [SCAG NO. IGR9514]

CONSISTENCY WITH RTP/SCS

SCAG reviews environmental documents for regionally significant projects for their consistency with the adopted RTP/SCS. For the purpose of determining consistency with CEQA, lead agencies such as local jurisdictions have the sole discretion in determining a local project's consistency with the RTP/SCS.

2016 RTP/SCS GOALS

The SCAG Regional Council adopted the 2016 RTP/SCS in April 2016. The 2016 RTP/SCS seeks to improve mobility, promote sustainability, facilitate economic development and preserve the quality of life for the residents in the region. The long-range visioning plan balances future mobility and housing needs with goals for the environment, the regional economy, social equity and environmental justice, and public health (see http://scagrtpscs.net/Pages/FINAL2016RTPSCS.aspx). The goals included in the 2016 RTP/SCS may be pertinent to the proposed project. These goals are meant to provide guidance for considering the proposed project within the context of regional goals and policies. Among the relevant goals of the 2016 RTP/SCS are the following:

SCAG 2016 RTP/SCS GOALS	
RTP/SCS G1:	*Align the plan investments and policies with improving regional economic development and competitiveness*
RTP/SCS G2:	*Maximize mobility and accessibility for all people and goods in the region*
RTP/SCS G3:	*Ensure travel safety and reliability for all people and goods in the region*
RTP/SCS G4:	*Preserve and ensure a sustainable regional transportation system*
RTP/SCS G5:	*Maximize the productivity of our transportation system*
RTP/SCS G6:	*Protect the environment and health for our residents by improving air quality and encouraging active transportation (e.g., bicycling and walking)*
RTP/SCS G7:	*Actively encourage and create incentives for energy efficiency, where possible*
RTP/SCS G8:	*Encourage land use and growth patterns that facilitate transit and active transportation*
RTP/SCS G9:	*Maximize the security of the regional transportation system through improved system monitoring, rapid recovery planning, and coordination with other security agencies**
	**SCAG does not yet have an agreed-upon security performance measure.*

For ease of review, we encourage the use of a side-by-side comparison of SCAG goals with discussions of the consistency, non-consistency or non-applicability of the goals and supportive analysis in a table format. Suggested format is as follows:

SCAG 2016 RTP/SCS GOALS		
	Goal	Analysis
RTP/SCS G1:	*Align the plan investments and policies with improving regional economic development and competitiveness*	*Consistent: Statement as to why;* *Not-Consistent: Statement as to why;* *Or* *Not Applicable: Statement as to why;* *DEIR page number reference*
RTP/SCS G2:	*Maximize mobility and accessibility for all people and goods in the region*	*Consistent: Statement as to why;* *Not-Consistent: Statement as to why;* *Or* *Not Applicable: Statement as to why;* *DEIR page number reference*
etc.		etc.

2016 RTP/SCS STRATEGIES

To achieve the goals of the 2016 RTP/SCS, a wide range of land use and transportation strategies are included in the 2016 RTP/SCS. Technical appendances of the 2016 RTP/SCS provide additional supporting information in detail. To view the 2016 RTP/SCS, please visit: http://scagrtpscs.net/Pages/FINAL2016RTPSCS.aspx. The 2016 RTP/SCS builds upon the progress from the 2012 RTP/SCS and continues to focus on integrated, coordinated, and balanced planning for land use and transportation that the SCAG region strives toward a more sustainable region, while the region meets and exceeds in meeting all of applicable statutory requirements pertinent to the 2016 RTP/SCS. These strategies within the regional context are provided as guidance for lead agencies such as local jurisdictions when the proposed project is under consideration.

The 2016 RTP/SCS also identifies a goods movement system in the SCAG region and develops strategies to address expected growth trends and demands in goods movement. For further information on the goods movement strategies, please see the Goods Movement Appendix of the 2016 RTP/SCS (http://scagrtpscs.net/Documents/2016/final/f2016RTPSCS_GoodsMovement.pdf). For further information on SCAG's long-range comprehensive plan for the goods movement system in Southern California, please see "On the Move, Southern California Delivers the Goods" (http://www.freightworks.org/DocumentLibrary/CRGMPIS_Summary_Report_Final.pdf).

DEMOGRAPHICS AND GROWTH FORECASTS

Local input plays an important role in developing a reasonable growth forecast for the 2016 RTP/SCS. SCAG used a bottom-up local review and input process and engaged local jurisdictions in establishing the base geographic and socioeconomic projections including population, household and employment. At the time of this letter, the most recently adopted SCAG jurisdictional-level growth forecasts that were developed in accordance with the bottom-up local review and input process consist of the 2020, 2035, and 2040 population, households and employment forecasts. To view them, please visit http://www.scag.ca.gov/Documents/2016GrowthForecastByJurisdiction.pdf. The growth forecasts for the region and applicable jurisdictions are below.

	Adopted SCAG Region Wide Forecasts			Adopted City of Banning Forecasts		
	Year 2020	Year 2035	Year 2040	Year 2020	Year 2035	Year 2040
Population	19,663,000	22,091,000	22,138,800	32,400	36,500	37,600
Households	6,458,000	7,325,000	7,412,300	11,900	13,500	14,000
Employment	8,414,000	9,441,000	9,871,500	10,000	13,500	14,200

MITIGATION MEASURES

SCAG staff recommends that you review the Final Program Environmental Impact Report (Final PEIR) for the 2016 RTP/SCS for guidance, as appropriate. SCAG's Regional Council certified the Final PEIR and adopted the associated Findings of Fact and a Statement of Overriding Considerations (FOF/SOC) and Mitigation Monitoring and Reporting Program (MMRP) on April 7, 2016 (please see: http://scagrtpscs.net/Pages/FINAL2016PEIR.aspx). The Final PEIR includes a list of project-level performance standards-based mitigation measures that may be considered for adoption and implementation by lead, responsible, or trustee agencies in the region, as applicable and feasible. Project-level mitigation measures are within responsibility, authority, and/or jurisdiction of project-implementing agency or other public agency serving as lead agency under CEQA in subsequent project- and site- specific design, CEQA review, and decision-making processes, to meet the performance standards for each of the CEQA resource categories.

Re: Initial Study/Notice of Preparation for Banning Distribution Center

Dear Ms. Nevins:

This law firm represents Southwest Regional Council of Carpenters (Southwest Carpenters) and submits this letter on the above referenced project on its behalf. Southwest Carpenters represents 50,000 union carpenters in six states, including Southern California and has a keen interest on the environmental impacts of development projects, such as the Banning Distribution Center. The City of Banning (City) prepared an Initial Study for the Banning Distribution Center (Project) and concluded that the Project may have a significant effect on the environment warranting preparation of an Environmental Impact Report (EIR). These comments should not be interpreted as being exhaustive by any means, but are simply preliminary concerns based on the Initial Study. Southwest Carpenters look forward to reviewing the EIR and its full discussion of environmental impacts, including alternatives and mitigations.

The proposed Project involves development of a non-refrigerated high-cube warehouse building and offsite improvements with 990,000 square feet of warehouse space; 10,000 square feet of office space. Project site encompasses approximately 63.9 acres and is located north and east of the Banning Airport, south of the Union Pacific Railroad line and Interstate 10, in the City of Banning, Riverside County. The proposed Project involves construction and operation of approximately 1,000,000 square feet (sf) of industrial warehouse/distribution uses on the approximate 63.9-acre site within the AI (Airport Industrial) and PF-A (Public Facilities – Airport) Zones of the City of Banning General Plan area. The Initial Study found that the Project may have a potentially significant impact on the following environmental factors:

- Air Quality
- Greenhouse Gas Emissions

- Biological Resources
- Cultural Resources
- Hydrology and Water Quality
- Land Use Planning
- Noise
- Transportation
- Tribal Cultural Resources
- Utilities and Service Systems

Air Quality

The Initial Study found that the proposed Project has the potential to (1) conflict with or obstruct implementation of the South Coast Air Quality Management District's Air Quality Management Plan (AQMP); (2) violate or contribute substantially to an existing or projected air quality violation; (3) result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under applicable federal or state ambient air quality standards; (4) expose sensitive receptors to substantial pollutant concentrations; and, (5) create objectionable odors affecting a substantial number of people.

The Initial Study relies on the South Coast Air Quality Management District's AQMP to set a significance threshold regarding air quality. The EIR should detail in plain language the quantitative significance threshold for air quality that it is relying on to assess the Project's impacts. Specifically, the EIR should explain how both the Project's short-term construction and operational activities will impact the daily significance thresholds established by the South Coast Air Quality Management District as well as how the Project's long-term operational activities, including vehicle miles traveled, might impact the Air Quality Management District's significance thresholds.

The South Coast Air Basin is a non-attainment area for various state and federal air quality standards. The Initial Study lists federal ozone, inhalable particulates, and ultra-fine particulates as examples of standards that are currently in non-attainment. The EIR should contain an exhaustive discussion of all criteria pollutants for which the South Coast Air Basin is non-attainment and quantify the Project's pollutant emissions. In addition, the EIR should evaluate how such emissions may result in a considerable net increase of any criteria pollutant. The EIR should evaluate the Project's anticipated pollutant emissions and how such projected impact may expose sensitive receptors, i.e., residential communities and schools, to substantial pollutant concentrations.

Finally, given the region's persistent air quality woes, the EIR must analyze the cumulative impacts of this Project. The dire status of air quality in the City and region means that even greater care and attention is needed to analyze the direct and cumulative impacts of this Project. Indeed, in an analogous case,

> the significance of an activity depends upon the setting. (Guidelines § 15064, subd. (b)). The relevant question to be addressed in the EIR is not the relative amount of precursors emitted by the project when compared with preexisting emissions, but whether any additional amount of precursor emissions should be considered significant in light of the serious nature of the ozone problems in this air basin.

Kings County Farm Bureau v. City of Hanford (1990) 221 Cal.App.3d 692, 718. "Cumulative impacts can result from individually minor but collectively significant projects taking place over a period of time." CEQA Guidelines § 15355.

Biological Resources

If the EIR establishes that the site has the potential to contain a sensitive or special status species pursuant to applicable plans, policies, and regulations, the EIR should detail how the Project will avoid impacts to such species. The Initial Study states that the Project site is not located within a Criteria Area but is located within the Pass Area Plan under the Western Riverside County Multiple Species Habitat Conservation Plan (MSHCP). The Initial Study states that the MSHCP indicates that the Project site is located within the designated Section 6.1.3 Narrow Endemic Plant Species Survey Area (NEPSSA) for Marvin's onion and many-stemmed dudleya but a Critical Area Species survey is not required. The EIR should explain why such a survey is not required. The Initial Study also explains that the Project area is within the survey area for Burrowing Owl but not the Los Angeles Pocket Mouse. The EIR should explain whether any surveys for the Burrowing Owl will be conducted and their reasoning for its decision.

The EIR should discuss any other applicable provisions of the MSCHP to this Project, including whether the Project requires specific habitat assessment for a particular species. In addition, the Initial Study discusses the Project site's potential to facilitate wildlife movement on a local scale. The biological resources assessment shall disclose all such potential and should set forth whether the Project site consists of any habitat to support sensitive species.

Greenhouse Gas Emissions

The scale of the Project is likely to create a significant GHG impact both in the short-term and in the long-term operational activities. The EIR should include a Project-specific GHG emissions report. Such report should explain its methodology in projecting Project-specific GHG emissions associated with the development. Because the City has not adopted a Climate Action Plan (CAP) or any other plans and policies to reduce GHGs, the EIR will have to carefully disclose how this Project will impact statewide goals. The City must consider in its greenhouse gas analysis:

(1) The extent to which the project may increase or reduce greenhouse gas emissions as compared to the existing environmental setting;
(2) Whether the project emissions exceed a threshold of significance that the lead agency determines applies to the project
(3) The extent to which the project complies with regulations or requirements adopted to implement a statewide, regional, or local plan for the reduction or mitigation of greenhouse gas emissions. Such requirements must be adopted by the relevant public agency through a public review process and must reduce or mitigate the project's incremental contribution of greenhouse gas emissions…

Center for Biological Diversity v. Department of Fish & Wildlife (2015) 62 Cal.4th 204, 217. A cursory discussion of the Project's impacts against SCAQMD's recommended industrial threshold would be insufficient to disclose to the public the Project's greenhouse gas impact.

Hydrology/Water Quality

The Project would result in potentially significant impact to existing drainage features on the Project site. The EIR should fully analyze whether the Project would substantially alter the existing drainage pattern of the site or area, including through the alteration of a watercourse or wetland which would result in substantial erosion. Similarly, the Project should explain how the Project would impact the load on the existing stormwater drainage systems including whether the Project would provide substantial additional sources of polluted runoff. Similarly, the EIR should discuss the Project's ability to substantial degrade water quality. And, provided that the Zone A of the Project is located within a 100-year flood hazard area, the EIR should address the potentially significant impacts related to flooding.

Land Use/Planning

The Initial Study broadly states that the Project has the potential to conflict with Western Riverside County Multiple Species Habitat Conservation Plan. The EIR should analyze all applicable provisions in the MSHCP as well as discuss any other regulations and policies that are applicable to the Project. The EIR should compare the Project's impact to all pertinent baselines and policies, including analysis of whether the Project exceeds any thresholds of significance.

Transportation

The Initial Study broadly states that the Project may have a potential to significantly impact the effectiveness of the circulation system. The EIR's Traffic Impact Analysis should address all applicable plans, policies and regulations to the Project and discuss the Project's anticipated impact to vehicle miles traveled for the surrounding circulation system. The Initial Study mentions that the Riverside County Transportation (RCTC) is the County of Riverside's Congestion Management Agency. The EIR should analyze the Project utilizing any applicable congestion provisions set forth under the RCTC, including analysis regarding the Project's impact on I-10.

Environmental Factors

The Initial Study states that the Project will provide approximately 6,000 linear feet of sewer line and an associated lift station. In addition, the Project will be required to contribute development impact fees for projected future needs of the City wastewater collection and treatment system. The inference is that the Project may result in creation or expansion of existing wastewater treatment facilities or at the very least the Project's wastewater impact may be significant. The EIR should explain how the Project will not only impact construction of new water or wastewater treatment facilities but whether such impacts will be growth inducing.

Similarly, the Initial Study broadly states that the Project includes construction of storm drain facilities to accommodate existing and proposed stormwater flows. The EIR should describe the current stormwater drain capacity and analyze how the Project will impact the current capacity.

The Initial Study states that the Project requires construction of an offsite water line 9,350 linear feet in length to connect to existing lines. Approximately 4,715 linear feet of the water line extension will extend north on Hathaway and then east on the extension of John Street. The remaining 4,636 linear feet will be east and south of the Project site. And, in

addition to analyzing any environmental impacts that may come from extension of storm drains, the EIR should analyze any growth inducing potential that may arise from construction of storm drain extensions.

Conclusion

The Southwest Carpenters looks forward to commenting on the EIR when the draft document is released for public review. These initial comments pertaining to the Initial Study's preliminary findings are not exhaustive and highlight the initial suite of environmental concerns the Southwest Carpenters has regarding this Project. In preparing the EIR, the lead agency should propose clear and achievable mitigation measures that will successfully address significant impacts and mitigate them to a less than significant level.

We look forward to reviewing the draft EIR when it is released, and request being forwarded all other notices and documents pertaining to this Project. Thank you for your consideration of these comments.

Very truly yours,
WITTWER PARKIN LLP

Pearl Kan

Appendix C.1

ALBERT A. WEBB ASSOCIATES

Technical Memorandum

To: William R. Patton; Banning Industrial LP

From: Eliza Laws, Senior Environmental Analyst
Noemi Avila, Assistant Environmental Analyst

Date: January 4, 2018

Re: Air Quality/Greenhouse Gas Analysis for the Banning Distribution Center Project, City of Banning

The following air quality assessment was prepared to evaluate whether the expected criteria air pollutant emissions generated as a result of construction and operation of the proposed Project would cause exceedances of the South Coast Air Quality Management District's (SCAQMD) thresholds for air quality in the Project area. The greenhouse gas (GHG) assessment was prepared to evaluate whether the expected criteria GHG emissions generated as a result of construction and operation of the proposed Project would exceed the SCAQMD draft screening significance thresholds. This assessment was conducted within the context of the California Environmental Quality Act (CEQA, California Public Resources Code Sections 21000 et seq.). The methodology follows the *CEQA Air Quality Handbook* prepared by the SCAQMD for quantification of emissions and evaluation of potential impacts to air resources. As recommended by SCAQMD staff, the **Cal**ifornia **E**missions **E**stimator **Mod**el® version 2016.3.2 (CalEEMod) was used to quantify Project-related emissions.

The Project proposes development of a one million square foot high-cube warehouse building on approximately 63.9 gross acres at the end of John Street, south of Interstate 10 and north of the Banning Municipal Airport in the City of Banning, California. The warehouse will be non-refrigerated and thus does not require trucks with transport refrigeration units (TRUs). Also, the warehouse will not be used for e-commerce. Off-site improvements associated with the Project include: extension of John Street approximately 5,688 linear feet (LF), construction of a total of approximately 9,350 LF of water line and approximately 5,968 LF of sewer line and a lift station to serve the Project site. A 3,871 LF emergency fire access road will also be constructed south of the Project site and will be composed of an all-weather surface such as gravel.

▪ Regional Significance Thresholds

The thresholds contained in the *SCAQMD CEQA Air Quality Handbook*[1] (SCAQMD 1993) are considered regional thresholds and are shown in **Table 1 – SCAQMD CEQA Daily Regional Significance Thresholds**, below. These regional thresholds were developed based on the SCAQMD's treatment of a major stationary source.

[1] South Coast Air Quality Management District, *CEQA Air Quality Handbook*, November 1993. (Available at SCAQMD.)

Table 1 – SCAQMD CEQA Daily Regional Significance Thresholds

Emission Threshold	Units	VOC	NO_X	CO	SO_X	PM-10	PM-2.5
Construction	lbs/day	75	100	550	150	150	55
Operation	lbs/day	55	55	550	150	150	55

Air quality impacts can be described in a short- and long-term perspective. Short-term impacts occur during site grading and Project construction and consist of fugitive dust and other particulate matter, as well as exhaust emissions generated by construction-related vehicles. Long-term air quality impacts occur once the Project is in operation.

The Project will be required to comply with existing SCAQMD rules for the reduction of fugitive dust emissions. SCAQMD Rule 403 establishes these procedures. Compliance with this rule is achieved through application of standard best management practices in construction and operation activities, such as application of water or chemical stabilizers to disturbed soils, managing haul road dust by application of water, covering haul vehicles, restricting vehicle speeds on unpaved roads to 15 mph, sweeping loose dirt from paved site access roadways, cessation of construction activity when winds exceed 25 mph and establishing a permanent, stabilizing ground cover on finished sites. In addition, projects that disturb 50 or more acres or more of soil or move 5,000 cubic yards of materials per day are required to submit a Fugitive Dust Control Plan or a Large Operation Notification Form to SCAQMD. Based on the size of this Project's disturbance area (approximately 64 gross acres), a Fugitive Dust Control Plan or a Large Operation Notification Form would be required.

Short-Term Analysis

Short-term emissions from Project construction were evaluated using the CalEEMod version 2016.3.2 program. The estimated construction period for the proposed Project is approximately 16 months, beginning no sooner than January 2019. The default parameters within CalEEMod were used, except as identified below, and these default values generally reflect a worst-case scenario, which means that Project emissions are expected to be equal to or less than the estimated emissions. In addition to the default values used, Project-specific assumptions relevant to model inputs for short-term construction emission estimates used are:

- Construction is anticipated to begin in January 2019 with grading and end with architectural coating (painting) in April 2020:

Construction Activity	Start Date	End Date	Total Working Days
Grading	January 1, 2019	March 31, 2019	64 days
Off-site Grading (John St.)	January 1, 2019	January 31, 2019	23 days
Off-site Paving (John St.)	January 25, 2019	February 7, 2019	10 days
Building Construction	April 1, 2019	March 31, 2020	262 days
Off-site Construction	April 1, 2019	August 28, 2019	108 days
Paving	March 1, 2020	March 31, 2020	22 days
Architectural Coatings	March 1, 2020	April 30, 2020	44 days

- The equipment to be used for each activity is shown below based on CalEEMod defaults. Each piece of equipment is assumed to operate 8 hours per day:

Construction Activity	Off-Road Equipment	Unit Amount
Grading	Excavators	2
	Graders	1
	Rubber Tired Dozers	1
	Scrapers	2
	Tractors/Loaders/Backhoes	2

Off-site Grading (John St.)	Graders	1
	Rubber Tired Dozers	1
	Scrapers	1
	Tractors/Loaders/Backhoes	2
Off-site Paving (John St.)	Pavers	1
	Paving Equipment	1
	Rollers	2
Building Construction	Cranes	1
	Forklifts	3
	Generator Sets	1
	Tractors/Loaders/Backhoes	3
	Welders	1
Off-site Construction	Rubber Tired Dozers	1
	Tractors/Loaders/Backhoes	2
Paving	Pavers	2
	Paving Equipment	2
	Rollers	2
Architectural Coatings	Air Compressors	2

- Grading includes site preparation activities such as clear and grub and also accounts for on-site infrastructure installation. The Project site is proposed to balance, with no soil import or export required. However, during site preparation activities, truck hauling trips were included to account for debris removal. Removal of approximately one-tenth of a foot of the Project site is assumed, which equates to approximately 10,300 cubic yards of debris removal. Debris removal is assumed to occur over a one week period at the beginning of grading. Based on the CalEEMod default truck capacity of 16 cubic yards, approximately 129 truckloads of debris would be exported daily. Off-road equipment used during site preparation is (1) rubber tired dozer and two (2) scrapers.

- Off-site improvements include construction of John Street, construction of water line, sewer line, and the lift station, as well as the fire access road. This corresponds to approximately 9.11 acres of off-site paving, for John Street and portions of the off-site sewer line, as well as approximately .4.7 acres of unpaved off-site improvements for portions of the off-site sewer line and lift station, water line, and gravel fire access road.

- To evaluate Project compliance with SCAQMD Rule 403 for fugitive dust control, the Project utilized the mitigation option of watering the Project site three times daily which achieves a control efficiency of 61 percent for PM-10 and PM-2.5 emissions.

- Two (2) one-way vendor trips were added to the grading and paving on- and off-site activities to account for water truck trips.

- Four (4) one-way hauling trips were added to the off-site construction activities for John Street and other off-site infrastructure to account for material delivery and removal of excavated soils and/or construction waste.

- Approximately 1,500 cubic yards of gravel will be imported during construction of the off-site fire access road, which will remain unpaved.

The results of this analysis are summarized below.

Table 2 – Unmitigated Estimated Maximum Daily Construction Emissions

Activity	Peak Daily Emissions (lb/day)					
	VOC	NO_X	CO	SO_2	PM-10	PM-2.5
SCAQMD Daily Construction Thresholds	**75**	**100**	**550**	**150**	**150**	**55**
Grading – 2019	6.34	**109.18**	45.10	0.19	14.86	**5.20**
Off-site Grading (John St.) – 2019	3.28	**37.00**	19.85	0.04	5.58	**3.00**
Off-site Paving (John St.) – 2019	3.44	**10.61**	10.08	0.02	0.77	**0.58**
Building Construction – 2019	10.53	78.91	83.06	0.28	**17.72**	6.00
Off-site Construction – 2019	1.84	18.09	10.86	0.02	**4.04**	2.29
Building Construction – 2020	**9.55**	72.01	**76.79**	**0.28**	17.42	5.72
Paving – 2020	**3.78**	14.33	**15.32**	**0.03**	0.94	0.74
Architectural Coatings	**223.64**	5.26	**14.37**	**0.03**	2.91	1.00
Maximum[1]	**236.96**	**156.79**	**106.48**	**0.34**	**21.76**	**8.78**
Exceeds Threshold?	**Yes**	**Yes**	**No**	**No**	**No**	**No**

Note: [1]Maximum emissions are the greater of either Grading 2019, Off-site Grading 2019 and Off-site Paving 2019, or, Building Construction 2019 and Off-site Construction 2019, or Building Construction 2020, Paving 2020 and Architectural Coating 2020.

As shown in the table above, the emissions from construction of the Project are below the SCAQMD daily construction thresholds for all the criteria pollutants, except VOC from architectural coatings and NO_X emissions from grading operations alone and when combined with overlapping activities from off-site grading and paving. Please see the subheading "Recommended Mitigation Measures" for mitigation that reduces the Project's construction emissions.

Long-Term Analysis

Long-term emissions are evaluated at build-out of a project. The Project is assumed to be operational in 2020. Mobile source emissions refer to on-road motor vehicle emissions generated from the Project's traffic and based on the trip generation provided in the Project-specific Traffic Impact Analysis.[2] An average truck trip length of approximately 100 miles was assumed, which is the distance to the Ports of Los Angeles/Long Beach. For purposes of this analysis, it was assumed that the warehouse will not be used for e-commerce, will be un-refrigerated, and thus not require TRUs.

Area source emissions from the Project include stationary combustion emissions of natural gas used for space and water heating (shown in a separate row as energy), yard and landscape maintenance, and an average building square footage to be repainted each year. CalEEMod computes area source emissions based upon default factors and land use assumptions. CalEEMod defaults were modified with utility-specific information from the City of Banning. CalEEMod default energy consumption was used and reflects the 2016 Title 24 standards. The off-site lift station is part of the City's Master Plan and will only have 40 horsepower capacity at full build-out; however, this facility will be permitted by the SCAQMD to ensure that it will not be a significant new source of emissions.

Separate emissions were computed for both the summer and winter.

[2] Albert A. Webb Associates, *Traffic Impact Analysis Banning Distribution Center (Design Review No. 16-7002)*, April 2017.

Table 3 – Unmitigated Estimated Daily Project Operation Emissions (Summer)

Source	Peak Daily Emissions (lb/day)					
	VOC	NO_X	CO	SO_2	PM-10	PM-2.5
SCAQMD Daily Thresholds	**55**	**55**	**550**	**150**	**150**	**55**
Area	23.12	0.00	0.19	0.00	0.00	0.00
Energy	0.06	0.55	0.46	0.00	0.04	0.04
Mobile	13.35	254.57	179.97	1.28	68.15	19.90
Total	**36.53**	**255.12**	**180.62**	**1.28**	**68.19**	**19.94**
Exceeds Threshold?	**No**	**Yes**	**No**	**No**	**No**	**No**

Note: Emissions reported as zero are rounded and not necessarily equal to zero.

Table 4 – Unmitigated Estimated Daily Project Operation Emissions (Winter)

Source	Peak Daily Emissions (lb/day)					
	VOC	NO_X	CO	SO_2	PM-10	PM-2.5
SCAQMD Daily Thresholds	**55**	**55**	**550**	**150**	**150**	**55**
Area	23.12	0.00	0.19	0.00	0.00	0.00
Energy	0.06	0.55	0.46	0.00	0.04	0.04
Mobile	13.23	262.51	168.90	1.25	68.16	19.90
Total	**36.41**	**263.06**	**169.55**	**1.25**	**68.20**	**19.94**
Exceeds Threshold?	**No**	**Yes**	**No**	**No**	**No**	**No**

Note: Emissions reported as zero are rounded and not necessarily equal to zero.

Evaluation of the data presented on the above tables indicates that criteria pollutant emissions from operation of this Project will not exceed the SCAQMD regional daily thresholds for any pollutant during summer or winter, except for NO_X. Please see the subheading "Recommended Mitigation Measures" for mitigation that reduces the Project's operation emissions.

▪ Localized Significance Threshold Analysis

Background

As part of the SCAQMD's environmental justice program, attention has been focused on localized effects of air quality. Staff at SCAQMD has developed localized significance threshold (LST) methodology[3] that can be used by public agencies to determine whether or not a project may generate significant adverse localized air quality impacts (both short- and long-term). LSTs represent the maximum emissions from a project that will not cause or contribute to an exceedance of the state ambient air quality standard, and are developed based on the ambient concentrations of that pollutant for each source receptor area (SRA). The Project is located in SRA 29.

Short-Term Analysis

According to the LST methodology, only on-site emissions need to be analyzed. Emissions associated with vendor and worker trips are mobile source emissions that occur off site. The emissions analyzed under the LST methodology are NO_2, CO, PM-10, and PM-2.5. SCAQMD has provided LST lookup tables[4] to allow users to readily determine if the daily emissions for proposed construction or operational activities could result in significant localized air quality impacts for projects five acres or smaller. Although the Project site disturbs approximately 64 acres total, it is anticipated that an area of approximately four acres would be disturbed per day during construction of the Project site.[5] The proposed Project also includes the off-site construction of John Street and an emergency access road along Lincoln Street, as well as water lines that run along Hathaway Street and sewer lines along Westward Ave. While the

[3] South Coast Air Quality Management District, *Final Localized Significance Threshold Methodology*, Revised July 2008. (Available at http://www.aqmd.gov/home/regulations/ceqa/air-quality-analysis-handbook/localized-significance-thresholds, accessed March 2017.)

[4] http://www.aqmd.gov/home/regulations/ceqa/air-quality-analysis-handbook/localized-significance-thresholds

[5] http://www.aqmd.gov/docs/default-source/ceqa/handbook/localized-significance-thresholds/caleemod-guidance.pdf?sfvrsn=2

grading equipment for the off-site infrastructure would result in a disturbance area of two-acres per day, consistent with SCAQMD guidance, the LST for the one-acre site was used.[6] The LST threshold and tables can be used as a screening tool to determine if dispersion modeling would be necessary. Because the LST Look-Up Tables only provide thresholds for one-acre, two-acre, or five-acre site, the SCAQMD linear regression formula was utilized to predict the LST for a four-acre site and these thresholds were used in the screening-level analysis.

The LST thresholds are estimated using the maximum daily disturbed area (in acres) and the distance of the Project to the nearest sensitive receptors (in meters). The closest sensitive receptor to the Project construction site is the existing residence approximately 425 meters (1,394 feet) to the south of the Project site. However, there are several sensitive receptors located adjacent to the off-site improvements including residences directly adjacent to the off-site water line along Hathaway Street and residences located directly across Lincoln Street at the terminus of the extension of John Street at Lincoln Avenue. There is also a church facility at the corner of Lincoln Avenue and Hargrave Street approximately 120 meters from John Street. According to LST methodology, projects with boundaries closer than 25 meters to the nearest receptor should use the LSTs for receptors located at 25 meters. Therefore, a receptor distance of 25 meters (85 feet) was used. To ensure a conservative analysis, a 4-acre LST threshold was calculated and a receptor distance of 25 meters was utilized for the maximum daily construction emissions that include both on- and off-site construction activities that overlap. LST results for a one-acre site using the 25 meter receptor distance was also estimated to show the localized emissions from construction of the off-site improvements separately to ensure impacts were not underestimated. The results are summarized below.

Table 5 – LST Results for Daily Off-Site Construction Emissions

Pollutant	Peak Daily Emissions (lb/day)			
	NO_X	CO	PM-10	PM-2.5
LST Threshold for 1-acre at 25 meters	**103**	**1,000**	**6**	**4**
Off-site Grading (John Street)	36.24	18.79	5.32	2.93
Off-site Paving (John Street)	9.86	9.24	0.56	0.51
Off-site Construction	16.75	8.89	3.54	2.15
Maximum[1]	**46.10**	**28.03**	**5.88**	**3.44**
Exceeds Threshold?	**No**	**No**	**No**	**No**

Note: [1]Maximum emissions are the greater of either Off-site Grading and Off-site Paving 2019 or Off-site Construction as these activities overlap.

Table 6 – LST Results for Maximum Daily Construction Emissions

Pollutant	Peak Daily Emissions (lb/day)			
	NO_X	CO	PM-10	PM-2.5
LST Threshold for 4-acre at 25 meters	**178**	**1,966**	**14**	**8**
Grading[1]	100.62	61.41	17.73	7.69
Building Construction[2]	39.21	37.50	4.92	3.45
Paving	14.07	14.65	0.75	0.69
Maximum	**100.62**	**61.41**	**17.73**	**7.69**
Exceeds Threshold?	**No**	**No**	**Yes**	**No**

Note: SCAQMD LST for 4-acre site predicted using Appendix K of SCAQMD LST Methodology.
[1]Grading emissions include the maximum of on-site grading and off-site grading or on-site grading and off-site paving as these activities could overlap. [2]Building construction includes the maximum of either on-site and off-site construction in 2019 as these activities could overlap or on-site construction, paving, and architectural coatings in 2020.

[6] http://www.aqmd.gov/docs/default-source/cega/handbook/localized-significance-thresholds/caleemod-guidance.pdf?sfvrsn=2

Emissions from construction of the Project will be below the LST established by SCAQMD for the Project, except for PM-10 emissions. Please see the subheading "Recommended Mitigation Measures" for mitigation that reduces the Project's construction emissions.

Long-Term Analysis

According to the LST methodology, LSTs only apply to the operational phase if a project includes stationary sources or attracts mobile sources that may spend long periods of time idling at the site, such as warehouse/transfer facilities. Although the Project includes an off-site lift station, this facility is part of the City's Master Plan and will only have 40 horsepower capacity at full build-out; additionally, this facility will be permitted by the SCAQMD to ensure that it will not be a significant new source of emissions. Additionally, a fire pump will be installed at the Project site; however, this will only operate during emergency situations and for intermittent testing. As such, the fire pump will be a negligible source of emissions from the Project site. This fire pump generator may be diesel or gasoline fueled, and if so, it would also be permitted by SCAQMD to further ensure that it will not be a significant new source of emissions.

Because the proposed Project will operate as a logistics center and has the potential to attract mobile sources that will idle at the site, a long-term LST analysis was prepared for this Project.

CalEEMod version 2016.3.2 was utilized to estimate the Project's emissions from trucks traveling on the Project site. An on-site distance of 1 mile was conservatively assumed to be traveled for each one of the Project's truck trips identified in the Traffic Impact Analysis. The output is attached to this memo and summarized below. Idling emissions from trucks at loading docks is not available in CalEEMod; therefore, PM-10 and PM-2.5 idling emissions were calculated separately to account for 15-minutes of on-site idling per truck per day.[7] The closest sensitive receptor to the Project site is the existing residence approximately 425 meters to the south of the Project site. LST Look-Up Tables have been developed for receptor distances of 200 meters and 500 meters. Therefore, a receptor distance of 200 meters was used to ensure a conservative analysis. The five-acre operational thresholds were used, which are different than the construction LST, and are more conservative since the Project site is approximately 64 acres. The results are summarized below.

Table 7 – Unmitigated LST Results for Daily Operational Emissions

Pollutant	Peak Daily Emissions (lb/day)			
	NO_X	CO	PM-10[1]	PM-2.5[1]
LST Threshold for 5-acre at 200 meters	**434**	**10,383**	**44**	**14**
On-Site Truck Travel	46.04	15.88	1.44	0.44
Exceeds Threshold?	**No**	**No**	**No**	**No**

Note: The greater of summer or winter emissions from CalEEMod is shown. Output attached hereto.

[1] CalEEMod output emissions added to idling emissions

Therefore, as indicated in the table above, Project-related long-term operational emissions will not exceed any SCAQMD operational LST.

CO Hot Spots Analysis

A carbon monoxide (CO) "hot spot" is a localized concentration of CO that is above the state or federal 1-hour or 8-hour ambient air quality standards (AAQS). Localized high levels of CO are associated with traffic congestion and idling or slow-moving vehicles.

[7] Idling emission factors obtained from CalEEMod; idling calculations attached herewith

Based on the information presented below, a CO "hot spot" analysis is not needed to determine whether the addition of Project related traffic will contribute to an exceedance of either the state or federal AAQS for CO emissions in the Project area.

The analysis prepared for CO attainment in the South Coast Air Basin by the SCAQMD can be used to assist in evaluating the potential for CO exceedances in the South Coast Air Basin. CO attainment was thoroughly analyzed as part of the SCAQMD's 2003 Air Quality Management Plan (2003 AQMP)[8] and the Revised 1992 Federal Attainment Plan for Carbon Monoxide (1992 CO Plan). [9] As discussed in the 1992 CO Plan, peak carbon monoxide concentrations in the South Coast Air Basin are due to unusual meteorological and topographical conditions, and not due to the impact of particular intersections (2003 AQMP Appendix V, p. V-4-32). Considering the region's unique meteorological conditions and the increasingly stringent CO emissions standards, CO modeling was performed as part of the 1992 CO Plan and subsequent plan updates and air quality management plans.

In the 1992 CO Plan, a CO hot spot analysis was conducted for four busy intersections in Los Angeles at the peak morning and afternoon time periods. The intersections evaluated included: Long Beach Blvd. and Imperial Highway (Lynwood); Wilshire Blvd. and Veteran Ave. (Westwood); Sunset Blvd. and Highland Ave. (Hollywood); and La Cienega Blvd. and Century Blvd. (Inglewood). These analyses did not predict a violation of CO standards. The busiest intersection evaluated in the 1992 CO Plan and subsequent 2003 AQMP was that at Wilshire Blvd. and Veteran Ave., which has a daily traffic volume of approximately 100,000 vehicles per day (2003 AQMP Appendix V, Table 4-7). The Los Angeles County Metropolitan Transportation Authority (MTA)[10] evaluated the LOS in the vicinity of the Wilshire Blvd./Veteran Ave. intersection and found it to be level E at peak morning traffic and Level F at peak afternoon traffic (MTA, Exhibit 2-5 and 2-6). This hot spot analysis was conducted at intersections subject to extremes in vehicle volumes and vehicle congestion, and did not predict any violation of CO standards. Considering Project-related traffic as well as existing conditions, ambient growth, and cumulative project traffic, the highest average daily trips would be 12,587 trips on Hargrave Street between East Ramsey Street to the Interstate 10 (I-10) westbound ramps, which is lower than the values studied by SCAQMD.[11] Additionally, the Project-specific traffic impact analysis[12] showed that all study intersections would operate at LOS D or better with existing plus ambient growth plus cumulative development project plus Project traffic conditions. Therefore, it can reasonably be concluded that Project-related traffic would not have daily traffic volumes exceeding those at the intersections modeled in the 2003 AQMP, nor would there be any reason unique to the meteorology to conclude that intersections affected by the Project would yield higher CO concentrations if modeled in detail. Thus, the Project would not result in CO hot spots.

▪ Greenhouse Gas Analysis

Greenhouse gases (GHG) are not presented in lbs/day like criteria pollutants; they are typically evaluated on an annual basis using the metric system. Several agencies, at various levels, have proposed draft GHG significance thresholds for use in CEQA documents. SCAQMD has been working on GHG thresholds for development projects. In December 2008, the SCAQMD adopted a threshold of 10,000 metric tonnes per year of carbon dioxide equivalents ($MTCO_2E/yr$) for stationary source projects where SCAQMD is the lead agency. The most recent draft proposal was in September 2010[13] and included screening significance thresholds for residential, commercial, and mixed-use projects at 3,500, 1,400, and 3,000 $MTCO_2E/yr$, respectively. Alternatively, a lead agency has the option to use 3,000 $MTCO_2E/yr$ as a threshold for all non-industrial projects. Although both options are recommended by SCAQMD, a lead

[12] Albert A. Webb Associates, *Traffic Impact Analysis Banning Distribution Center (Design Review No. 16-7002)*, April 2017.

[13] http://www.aqmd.gov/docs/default-source/cega/handbook/greenhouse-gases-(ghg)-cega-significance-thresholds/year-2008-2009/ghg-meeting-15/ghg-meeting-15-main-presentation.pdf?sfvrsn=2

agency is advised to use only one option and to use it consistently. The SCAQMD significance thresholds also evaluate construction emissions by amortizing them over an expected project life of 30 years. If emissions are above the screening level threshold, additional analysis may be required.

In 2014, the Western Riverside County Council of Governments (WRCOG) completed a Subregional Climate Action Plan (CAP)[14] that addresses statewide legislation for sustainability through the preparation of GHG inventories and strategies to reduce emissions consistent with AB 32, which established a statewide target to reduce GHG emission to 1990 levels by 2020. Preparing a CAP supports AB 32 at the local level. The CAP provides a policy framework for how the subregion can do its part to reduce emissions.

The WRCOG Subregional CAP establishes a community-wide emissions reduction target of 15% below 2010 emissions levels. Because the City of Banning is a participating member in the Subregional CAP, it is appropriate to use the methodology in the CAP for this analysis. Projects that demonstrate compliance with the CAP target are considered consistent with the AB 32 reduction target. Although the City of Banning has not adopted a CEQA document for the Subrebgional CAP, reliance upon the methodology in the CAP may still be used as a threshold to evaluate the Project's GHG emissions.

Accordingly, a BAU Analysis will be prepared if the Project's GHG emissions exceed the SCAQMD screening threshold level for industrial projects.

Short-Term Analysis

Construction-Related Emissions

The CalEEMod model calculates GHG emissions from fuel usage by construction equipment and construction-related activities, like construction worker trips, for the Project. The CalEEMod estimate does not analyze emissions from construction-related electricity or natural gas. Construction-related electricity and natural gas emissions vary based on the amount of electric power used during construction and other unknown factors which make them too speculative to quantify. The CalEEMod output results for construction-related GHG emissions present the GHG emissions estimates for the Project for CO_2, methane (CH_4), nitrous oxide (N_2O), and CO_2E.[15]

Table 8 – Project Construction Equipment GHG Emissions

Year	Metric Tons per year (MT/yr)			
	Total CO_2	Total CH_4	Total N_2O	Total CO_2E
2019 – On-site[1]	2,737.00	0.23	0.00	2,742.85
2019 – Off-site	157.25	0.04	0.00	158.22
2020 – On-site	905.34	0.06	0.00	906.95
Total	3,799.59	0.33	0.00	3,808.02
			Amortized[2]	**126.93**

Note: [1]"On-site" refers to construction activities on the Project site and "Off-site" refers to construction of off-site improvements.
[2]Construction emissions were amortized over a 30 year period, as recommended by SCAQMD.

Evaluation of **Table 8** indicates that an estimated 3,808.02 $MTCO_2E$ will occur from Project construction equipment over the course of the estimated approximately 1.3 year construction period. Since the draft SCAQMD GHG threshold guidance document released in October 2008[16] recommends that construction emissions be amortized for a project lifetime of 30 years to ensure that GHG reduction measures address construction GHG emissions as part of the operational reduction strategies, the total GHG emissions from Project construction were amortized and are included in **Table 10**, below.

[14] http://www.wrcog.cog.ca.us/uploads/media_items/wrcog-climate-action-plan-final-draft-april-2014.original.pdf

[15] CO_2E is the sum of CO_2 emissions estimated plus the sum of CH_4 and N_2O emissions estimated multiplied by their respective global warming potential (GWP).

[16] http://www.aqmd.gov/docs/default-source/cega/handbook/greenhouse-gases-(ghg)-cega-significance-thresholds/year-2008-2009/ghg-meeting-6/ghg-meeting-6-guidance-document-discussion.pdf?sfvrsn=2

Long-Term Analysis

Area Source Emissions

CalEEMod estimates the GHG emissions associated with area sources which include landscape equipment emissions, architectural coating, consumer products, and hearths. Landscape equipment servicing the Project site create CO_2 resulting from fuel combustion based on the Project's land uses. Consumer products consist of consumer use of solvents and personal care products and architectural coatings consist of an average building square footage to be repainted each year. **Table 10** summarizes the Project's area source emissions.

Energy-Related Emissions

CalEEMod estimates the GHG emissions associated with building electricity and natural gas usage (non-hearth) for each land use type. Electricity and natural gas used in buildings is typically generated at an off-site power plant which indirectly generates GHG emissions. The default energy usage values used in CalEEMod are based on the CEC sponsored California Commercial End Use Survey and Residential Appliance Saturation Survey studies and reflect 2016 Title 24 improvements (CalEEMod User's Guide, Appendix A p. 36). As stated above, the emissions have been adjusted to incorporate utility-specific information from the City of Banning Utility Company.[17] **Table 9** summarizes the GHG emissions estimates reported by CalEEMod for the Project.

Table 9 – Energy-Related GHG Emissions

Source	Metric Tons per year (MT/yr)			
	CO_2	CH_4	N_2O	Total CO_2E
Electricity	732.85	0.03	0.01	736.82
Natural Gas	108.33	0.00	0.00	108.97
Total	**841.18**	**0.03**	**0.01**	**845.79**

Note: Emissions reported as zero are rounded and not necessarily equal to zero.

Mobile Source Emissions

CalEEMod estimates the annual GHG emissions from Project-related vehicle usage based on trip generation data contained in defaults or in a project-specific traffic analyses. The trip generation rate and fleet mix were adjusted based on the rates and ratios found in the Project-specific Traffic Study prepared by Albert A. Webb Associates in April 2017. Trip length data was based on CalEEMod defaults and the distance from the Ports of Los Angeles and Long Beach to the Project site of approximately 100 miles. **Table 10** shows the mobile source emissions of GHG from the Project.

Solid Waste Emissions

CalEEMod also calculates the GHG emissions associated with the disposal of solid waste into landfills based on default data contained within the model for waste disposal rates, composition, and the characteristics of landfills throughout the state. A large percentage of this waste will be diverted from landfills by a variety of means, such as reducing the amount of waste generated, recycling, and/or composting. The remainder of the waste not diverted will be disposed of at a landfill. This analysis assumes a solid waste diversion from the landfills of 75 percent as required by Assembly Bill 341. **Table 10** shows the solid waste GHG emissions from the Project.

Water-Related Energy Usage

Electricity is also indirectly used in water supply, treatment, and distribution, as well as wastewater treatment in Southern California and plays a large role in GHG production. There are three processes necessary to supply potable water to urban users (i.e., residential, commercial, and industrial): (1) supply and conveyance of the water from the source; (2) treatment of the water to potable standards; and (3) distribution of the water to individual users. After use, the wastewater is treated and either reused as reclaimed/recycled water or returned to the environment. CalEEMod calculates the GHG emissions from these processes based on default emissions factors and water/wastewater generation rates for a project's location. Default values were used for electricity intensity factor associated with the supply and

[17] Per WRCOG Subregional CAP.

conveyance of water from its source which assumes that the water is being imported from Northern California. Water demand was obtained from the Water Supply Assessment[18]. The Project's emissions were adjusted to account for the CalGreen building code which requires a 20 percent reduction in indoor water use. **Table 10** shows the GHG emissions from water-related energy usage for the Project.

Total Project GHG Emissions

As shown on **Table 10 – Total Unmitigated Project-Related GHG Emissions**, using all the emissions quantified above, the total GHG emissions generated from the Project is approximately 23,018 $MTCO_2E$/yr which includes construction-related emissions amortized over a typical project life of 30 years.

Table 10 – Total Unmitigated Project-Related GHG Emissions

Source	Metric Tons per year (MT/yr)			
	CO_2	CH_4	N_2O	Total CO_2E
Amortized Construction	--	--	--	126.93
Area	0.05	0.00	0.00	0.05
Energy	841.18	0.03	0.01	845.79
Mobile	21,840.66	1.04	0.00	21,866.59
Solid Waste	47.70	2.82	0.00	118.18
Water	53.16	0.22	0.01	60.46
Total	**22,782.75**	**4.11**	**0.02**	**23.018.00**

Note: Emissions reported as zero are rounded and not necessarily equal to zero.

The total GHG emissions from the Project are above the SCAQMD interim screening threshold level of 10,000 $MTCO_2E$/yr for industrial projects. Therefore, a BAU analysis was prepared in accordance with the Subregional CAP to determine the Project's consistency with AB 32.

Business-As-Usual (BAU) Analysis

The BAU analysis presented herein was performed to determine if the Project's GHG emissions would meet the Subregional CAP reduction target in 2020, which equals a reduction of 15%. BAU is an estimate of the GHG emissions expected to occur if none of the foreseeable measures in the Subregional CAP were implemented. These measures are implemented at the state, regional, and local level.

Many aspects of the GHG estimates for the BAU analysis are similar to those analyzed for the proposed Project. BAU emissions for construction will be similar to those shown for the Project, as the same Project footprint will be disturbed. Therefore, construction under the BAU analysis is assumed to be equivalent to that of the Project and was not modeled separately. BAU emissions for the remaining sources of GHG emissions were estimated using CalEEMod and are similar to the GHG estimates for the Project with the following exceptions:

- The operational year selected was 2010, to reflect the baseline year of the Subregional CAP.
- The energy-related GHG emissions were estimated according to the 2008 Title 24 standards.[19]
- Mobile source emissions factors exclude the Pavley motor vehicle standards for cars and light trucks and the Low Carbon Fuel Standard (LCFS) for motor vehicle fuels.
- No adjustments were made to water demand because the CalGreen code requirements were not in effect at the time the Subregional CAP baseline was set.
- The City's solid waste diversion rate of 53% was used consistent with what was occurring prior to Assembly Bill 341.

Table 11, below, indicates that the BAU GHG emissions based on the assumptions outlined above, result in 26,201.05 $MTCO_2E$/year.

[18] Albert A. Webb Associates. *Water Supply Assessment Banning Distribution Center,* November 3, 2017.

[19] Energy usage factors from Appendix D of CalEEMod User's Guide for version 2011.1.1, which reflect 2008 Title 24 standards.

Table 11 – Total BAU GHG Emissions

Source	Metric Tons per year (MT/yr)			
	CO_2	CH_4	N_2O	Total CO_2E
Amortized Construction	--	--	--	126.93
Area	0.05	0.00	0.00	0.05
Energy	1,373.91	0.04	0.02	1,379.67
Mobile	24,339.25	1.74	0.00	24,382.79
Solid Waste	89.68	5.30	0.00	222.18
Water	80.34	0.27	0.01	89.43
Total	**25,883.23**	**7.36**	**0.03**	**26,201.05**

Note: Emissions reported as zero are rounded and not necessarily equal to zero.

Because the Subregional CAP target year is 2020, and the Project will be operational in 2020, the Subregional CAP will be fully implemented at this time. For example, the Renewable Portfolio Standard (RPS) which requires 33 percent of each utility company's energy sources to be renewable by 2020 was included in CalEEMod for the Project. **Table 10 – Total Project-Related GHG Emissions**, above, shows the Project's GHG emissions in 2020 which includes full implementation of the following statewide GHG reduction measures in addition to the Project design features described previously:

- RPS where renewable energy sources are required to be 33 percent. This is not directly calculated within CalEEMod, but adjustments were made to the default CO_2 electricity intensity factor within the model.
- 75% reduction in waste disposed per AB 341 requirements, which will be fully implemented in 2020.[20]

The Project will implement mitigation measure **MM AQ 6** to require installation of high efficiency lighting and reduce electricity use. As shown in **Table 12 – Total Mitigated Project-Related GHG Emissions**, this will reduce the Project's GHG emissions to 22,744.03 $MTCO_2E$ /year.

Table 12 – Total Mitigated Project-Related GHG Emissions

Source	Metric Tons per year (MT/yr)			
	CO_2	CH_4	N_2O	Total CO_2E
Amortized Construction	--	--	--	126.93
Area	0.05	0.00	0.00	0.05
Energy	568.69	0.02	0.01	571.82
Mobile	21,840.66	1.04	0.00	21,866.59
Solid Waste	47.70	2.82	0.00	118.18
Water	53.16	0.22	0.01	60.46
Total	**22,510.26**	**4.10**	**0.02**	**22,744.03**

Note: Emissions reported as zero are rounded and not necessarily equal to zero.

A comparison of the Project's GHG emissions in 2020 from **Table 12** (22,744.03 $MTCO_2E$ /year) to the BAU GHG emissions estimated in **Table 11** (26,201.05 $MTCO_2E$/year) corresponds to a 13.2 percent reduction, which does not achieve the 15 percent reduction target to meet the goal of the Subregional CAP.

Recommended Mitigation Measures

The following mitigation measures are recommended to reduce VOC and NO_X emissions from Project construction:

MM AQ 1: To reduce VOC emissions associated with architectural coating, the project designer and contractor shall reduce the use of paints and solvents by utilizing pre-coated materials (e.g. bathroom stall dividers, metal awnings), materials that do not require painting, and require coatings and solvents with a VOC content lower than required under Rule 1113 to be utilized. The construction contractor shall be required to utilize "Super-Compliant" VOC paints, which are defined in SCAQMD's Rule 1113. Construction specifications shall be included in building specifications that assure these requirements are implemented. The specifications for each implementing development project shall be reviewed by the City of Banning's Building and Safety Division for compliance with this mitigation measure prior to issuance of a building permit.

MM AQ 2: To reduce NO_X emissions associated with off-road construction equipment, the construction schedule for Site Preparation (clear and grub) and Grading of the Project site shall not overlap. During on-site Site Preparation and Off-site Grading (John Street) activities, heavy-duty construction equipment greater than 75 horsepower shall be certified to meet or exceed United States Environmental Protection Agency (USEPA) Tier 3 standards. Proof of compliance shall be reviewed by the Public Works Department Engineering Division prior to issuance of a grading permit.

The following mitigation measures are recommended to reduce NO_X emissions from Project operation:

MM AQ 3: Although the Project does not include refrigerated warehouse space, trucks accessing the Project site may have auxiliary power units (APU) and/or transport refrigeration units (TRUs). Therefore, electrical hookups shall be installed at all loading docks to allow trucks with APU and/or TRUs with electric standby capabilities to plug in when TRUs are in use. The City shall verify electrical hookups have been installed prior to occupancy.

MM AQ 4: All facilities shall post signs informing users of requirements limiting idling to five minutes or less pursuant to Title 13 of the California Code of Regulations, Section 2485. No overnight/long-term parking will be allowed. The City shall verify signage has been installed prior to occupancy.

MM AQ 5: Service equipment (i.e., yard hostlers and forklifts) used within the site shall be electric or compressed natural gas-powered.

The following mitigation measure is recommended to reduce greenhouse gas emissions from Project operation:

MM AQ 6: High efficiency lighting shall be installed at the Project site.

Impacts after Mitigation

Implementation of mitigation measures **MM AQ 1** and **MM AQ 2** will reduce the Project's short-term construction-related emissions. **MM AQ 1** and **MM AQ 2** have quantitative reductions associated with them available in CalEEMod. The mitigated regional emissions are shown in **Table 13**, below, and indicate that VOC emissions from architectural coatings (painting) activities and NO_X emissions from off-road equipment and overlapping construction activities for the proposed warehouse building will be reduced below the SCAQMD thresholds with implementation of **MM AQ 1** and **MM AQ 2**.

Table 13 – Mitigated Estimated Daily Construction Emissions

Activity	Peak Daily Emissions (lb/day)					
	VOC	NO_X	CO	SO_2	PM-10	PM-2.5
SCAQMD Daily Construction Thresholds	**75**	**100**	**550**	**150**	**150**	**55**
Site Preparation 2019[1]	2.50	73.07	31.84	0.17	11.26	3.48
Grading – 2019[2]	4.85	54.82	34.33	0.06	6.75	3.74
Off-site Grading (John St.) – 2019	0.99	18.59	21.56	0.04	3.51	2.15
Off-site Paving (John St.) – 2019[2]	3.44	10.61	10.08	0.02	0.77	0.58
Building Construction – 2019[2]	10.53	**78.91**	83.06	0.28	**17.72**	**6.00**
Off-site Construction – 2019[2]	1.84	**18.09**	10.86	0.02	**4.04**	**2.29**
Building Construction – 2020[2]	**9.55**	72.01	**76.79**	**0.28**	17.42	5.72
Paving – 2020[2]	**3.78**	14.33	**15.32**	**0.03**	0.94	0.74
Architectural Coatings – 2020	**34.02**	5.26	**14.37**	**0.03**	2.91	1.00
Maximum[3]	**47.35**	**97.00**	**106.48**	**0.34**	**21.76**	**8.29**
Exceeds Threshold?	**No**	**No**	**No**	**No**	**No**	**No**

Note: [1] Site preparation includes one rubber tired dozer and two scrapers operating eight hours per day and approximately 129 truckloads of debris exported daily for five days.
[2] Represents unmitigated emissions reported in Table 2.
[3] Maximum emissions are the greater of either: 1) the sum of Site Preparation 2019 and Off-site Grading (John St.); 2) Grading 2019, Off-site Grading 2019 and Off-site Paving 2019; 3) Building Construction 2019 and Off-site Construction 2019, or 4) Building Construction 2020, Paving 2020 and Architectural Coating 2020.

Implementation of **MM AQ 2** also reduces the LST emissions of PM-10 from overlapping activities. The mitigated LST emissions are shown in **Table 14**, below, and indicate the PM-10 emissions from overlapping construction activities are reduced below the LST.

Table 14 – Mitigated LST Results for Maximum Daily Construction Emissions

Pollutant	Peak Daily Emissions (lb/day)			
	NO_X	CO	PM-10	PM-2.5
LST Threshold for 4-acre at 25 meters	**178**	**1,966**	**14**	**8**
Site Preparation[1]	18.46	20.69	8.39	2.57
Grading[2]	54.52	33.38	6.51	3.67
Off-site Grading (John St.)	17.86	20.81	3.32	2.10
Off-site Paving (John St.)[2]	9.86	9.24	0.56	0.51
Building Construction[2,3]	39.46	37.50	4.92	3.45
Maximum[4]	**82.24**	**63.43**	**11.71**	**6.29**
Exceeds Threshold?	**No**	**No**	**No**	**No**

Note: SCAQMD LST for 4-acre site predicted using Appendix K of SCAQMD LST Methodology.
[1] Site preparation includes one rubber tired dozer and two scrapers operating eight hours per day and approximately 129 truckloads of debris exported daily for five days.
[2] Represents unmitigated emissions reported in Table 6.
[3] Building construction includes the maximum of either on-site and off-site construction in 2019 as these activities could overlap or on-site construction, paving, and architectural coatings in 2020.
[4] Maximum emissions are the greater of either: 1) the sum of Site Preparation 2019 and Off-site Grading (John St.); 2) Grading 2019, Off-site Grading 2019 and Off-site Paving 2019; 3) Building Construction 2019 and Off-site Construction 2019, or 4) Building Construction 2020, Paving 2020 and Architectural Coating 2020.

Implementation of mitigation measures **MM AQ 3** through **MM AQ 5** will reduce operational emissions of NO_X from transportation emissions however; they do not have quantitative reductions associated with them available in CalEEMod. Therefore, after implementation of mitigation measures, the operational emissions of NO_X exceed the SCAQMD threshold.

Implementation of **MM AQ 6** will reduce Project-related energy emissions, shown in **Table 12**, above, by approximately 274 $MTCO_2E$/year. However, the Project's mitigated GHG emissions do not achieve the 15 percent reduction target to meet the goal of the Subregional CAP.

▪ Conclusion

The conclusion of this analysis indicates that construction of the proposed Project will not exceed criteria pollutant thresholds established by SCAQMD on a regional or localized level after implementation of mitigation measures. The analysis also concludes that operation of the proposed Project will exceed criteria pollutant thresholds for NO_X established by SCAQMD on a regional level after implementation of mitigation measures. The Project's operation will not exceed criteria pollutant thresholds established by SCAQMD on a localized level without mitigation required. In addition, the Project will not create a CO hot spot. The Project has a 13.2 percent GHG reduction, which does not achieve the 15 percent GHG reduction target set forth in the Subregional CAP.

1.0 Project Characteristics

1.1 Land Usage

Land Uses	Size	Metric	Lot Acreage	Floor Surface Area	Population
Unrefrigerated Warehouse-No Rail	1,000.00	1000sqft	22.96	1,000,000.00	0
Other Asphalt Surfaces	856.47	1000sqft	19.66	856,470.00	0
Other Non-Asphalt Surfaces	20.89	Acre	20.89	909,968.40	0

1.2 Other Project Characteristics

Urbanization	Urban	**Wind Speed (m/s)**	2.2	**Precipitation Freq (Days)**	31
Climate Zone	10			**Operational Year**	2020
Utility Company	User Defined				
CO2 Intensity (lb/MWhr)	684.6	**CH4 Intensity (lb/MWhr)**	0.029	**N2O Intensity (lb/MWhr)**	0.01

1.3 User Entered Comments & Non-Default Data

Project Characteristics - City of Banning Electricity Co. 33%RPS included

Land Use - Per Site Plan

Construction Phase - Per Developer

Off-road Equipment - Part of Grading Phase

Off-road Equipment - Equipment assumed to run 8 hr/day

Off-road Equipment -

Off-road Equipment -

Off-road Equipment - Part of Grading Phase

Trips and VMT - Added water truck trips to grading/paving. 11.5 miles to the nearest landfill

Grading - Per Engineer

Vehicle Trips - 100 miles from ports, TIA truck trips.

Landscape Equipment -

Energy Use -

Water And Wastewater - Per WSA

Construction Off-road Equipment Mitigation - Per Rule 403

Energy Mitigation - Project Mitigation for High Efficiency Lighting

Water Mitigation - Per CalGreen

Waste Mitigation - Per AB 341

Fleet Mix - Per TIA truck trip

1.3 User Entered Comments & Non-Default Data

Project Characteristics - City of Banning Electricity Co. 33%RPS included

Land Use - Per Site Plan

Construction Phase - Per Developer

Off-road Equipment - Part of Grading Phase

Off-road Equipment - Equipment assumed to run 8 hr/day

Off-road Equipment -

Off-road Equipment -

Off-road Equipment - Part of Grading Phase

Trips and VMT - Added water truck trips to grading/paving. 11.5 miles to the nearest landfill

Grading - Per Engineer

Vehicle Trips - 100 miles from ports, TIA truck trips.

Landscape Equipment -

Energy Use -

Water And Wastewater - Per WSA

Construction Off-road Equipment Mitigation - Per Rule 403

Energy Mitigation - Project Mitigation for High Efficiency Lighting

Water Mitigation - Per CalGreen

Waste Mitigation - Per AB 341

Fleet Mix - Per TIA truck trip

Date: 1/4/2018 11:39 AM

Banning Dist Center Unmitigated_Offsites

South Coast AQMD Air District, Summer

1.0 Project Characteristics

1.1 Land Usage

Land Uses	Size	Metric	Lot Acreage	Floor Surface Area	Population
Other Asphalt Surfaces	396.86	1000sqft	9.11	396,863.50	0
Other Non-Asphalt Surfaces	203.14	1000sqft	4.66	203,136.50	0

1.2 Other Project Characteristics

Urbanization	Urban	**Wind Speed (m/s)**	2.2	**Precipitation Freq (Days)**	31
Climate Zone	10			**Operational Year**	2019
Utility Company	User Defined				
CO2 Intensity (lb/MWhr)	684.6	**CH4 Intensity (lb/MWhr)**	0.029	**N2O Intensity (lb/MWhr)**	0.01

1.3 User Entered Comments & Non-Default Data

Project Characteristics - Banning Electrical Co. RPS 33% reduction

Land Use - Paved and unpaved area for offsite wet utilities, John St. and fire access

Construction Phase - Per engineer estimates

Off-road Equipment - Per Engineer

Off-road Equipment - Per Engineer

Off-road Equipment - Per Engineer

Trips and VMT - 2 water truck trips for dust control, material import and export.

Grading - 1,500 CY gravel imported for fire access road

Energy Use -

Construction Off-road Equipment Mitigation - Per Rule 403

Banning Dist Center Unmitigated_Offsites

South Coast AQMD Air District, Winter

1.0 Project Characteristics

1.1 Land Usage

Land Uses	Size	Metric	Lot Acreage	Floor Surface Area	Population
Other Asphalt Surfaces	396.86	1000sqft	9.11	396,863.50	0
Other Non-Asphalt Surfaces	203.14	1000sqft	4.66	203,136.50	0

1.2 Other Project Characteristics

Urbanization	Urban	**Wind Speed (m/s)**	2.2	**Precipitation Freq (Days)**	31
Climate Zone	10			**Operational Year**	2019
Utility Company	User Defined				
CO2 Intensity (lb/MWhr)	684.6	**CH4 Intensity (lb/MWhr)**	0.029	**N2O Intensity (lb/MWhr)**	0.01

1.3 User Entered Comments & Non-Default Data

Project Characteristics - Banning Electrical Co. RPS 33% reduction

Land Use - Paved and unpaved area for offsite wet utilities, John St. and fire access

Construction Phase - Per engineer estimates

Off-road Equipment - Per Engineer

Off-road Equipment - Per Engineer

Off-road Equipment - Per Engineer

Trips and VMT - 2 water truck trips for dust control, material import and export.

Grading - 1,500 CY gravel imported for fire access road

Energy Use -

Construction Off-road Equipment Mitigation - Per Rule 403

1.0 Project Characteristics

1.1 Land Usage

Land Uses	Size	Metric	Lot Acreage	Floor Surface Area	Population
Other Asphalt Surfaces	396.86	1000sqft	9.11	396,863.50	0
Other Non-Asphalt Surfaces	203.14	1000sqft	4.66	203,136.50	0

1.2 Other Project Characteristics

Urbanization	Urban	**Wind Speed (m/s)**	2.2	**Precipitation Freq (Days)**	31
Climate Zone	10			**Operational Year**	2019
Utility Company	User Defined				
CO2 Intensity (lb/MWhr)	684.6	**CH4 Intensity (lb/MWhr)**	0.029	**N2O Intensity (lb/MWhr)**	0.01

1.3 User Entered Comments & Non-Default Data

Project Characteristics - Banning Electrical Co. RPS 33% reduction

Land Use - Paved and unpaved area for offsite wet utilities, John St. and fire access

Construction Phase - Per engineer estimates

Off-road Equipment - Per Engineer

Off-road Equipment - Per Engineer

Off-road Equipment - Per Engineer

Trips and VMT - 2 water truck trips for dust control, material import and export.

Grading - 1,500 CY gravel imported for fire access road

Energy Use -

Construction Off-road Equipment Mitigation - Per Rule 403

Banning Dist. Center BAU - South Coast AQMD Air District, Annual

Project Characteristics - BAU Baseline 2010 per Riverside CAP; City of Banning Electricity Co.

Land Use - Per Site Plan

Construction Phase - Construction not modeled

Off-road Equipment - Construction not modeled

Vehicle Trips - 100 miles from ports, TIA truck trips

Waste Mitigation - Per CalReclycle diversion rate for Banning 2006

Fleet Mix - per TIA truck trip

Water And Wastewater - Per Landscape Architect

Energy Use - Per Banning Utility

Energy Mitigation -

Health Risk Assessment Modeling Methodology

Modeling Parameters

Health risk associated with the Project's operational truck traffic on local roadways were modeled for the potential to exposure sensitive receptors to cancer and non-cancer risk in excess of applicable thresholds.

The health risk assessment was performed using AERMOD version 16216r and in accordance with the South Coast Air Quality management District's (SCAQMD's) *Health Risk Assessment Guidance for Analyzing Cancer Risk from Mobile Source Diesel Idling Emissions for CEQA Air Quality Analysis* (SCAQMD 2003) and the 2017 Risk Assessment Procedures for Rules 1401, 1401.1 and 212 Version 8.1 based on the Office of Environmental health Hazard Assessment's (OEHHA's) *The Air Toxics Hot Spots Program Guidance Manual for the Preparation of Health Risk Assessments* ("Guidance Manual"), March 2015.

SCAQMD recommends using the USEPA's AERMOD model for mobile source emissions impact assessments by modeling the individual roadways as line sources represented by adjacent volume sources, consistent with the USEPA Haul Road Workgroup Recommendations (USEPA 2012). For dispersion analysis, AERMOD has four source types that the user can choose from. Point sources refer to stacks, where the pollutants are released from a single point. The area source model is used to simulate the effects of fugitive emissions from sources such as storage piles and slag lumps. The open pit source model is used to stimulate fugitive emissions from below-grade open pits, such as surface coal mines or stone quarries. The volume source model is used to simulate the effects of emissions from sources such as building roof monitors and line sources, which include roads. This analysis uses the line volume source model.

Tables showing the roadways and volume sources modeled are attached hereto. In order to model the mobile source emissions from the Project's diesel truck traffic, the local roadways were treated as line sources represented by multiple adjacent volume sources. The initial horizontal and vertical plume standard deviations must be computed for each volume source modeled. According to the AERMOD user's guide, the initial horizontal standard deviation (σ_y) of individual volume sources should be estimated as the distance between separate volume sources divided by 2.15. In a similar manner, the AERMOD user guide specifies that the source initial vertical standard deviation (σ_z) for a surface-based source (simulating truck travel on roadways or idling at truck bays) should be estimated as the height of the building divided by the same factor of 2.15. For roadway parameters, the USEPA Haul Road Workgroup Recommendations was utilized for calculating the volume source characteristics based on the height and width of heavy duty diesel trucks.

The area studied as part of this health risk assessment is larger than the Project site itself and is bounded by Interstate 10 (I-10) to the north, Adams Street to the south, and South Florida Street to the west. The local roadway segments modeled are attached hereto and are based on the truck distribution patterns identified in the Project-specific Traffic Impact Analysis (TIA).

In order to do the dispersion analysis, the initial concentration of diesel particulate matter (DPM) emitted per local roadway segment modeled has to be estimated. The EMFAC2014 developed by the California Air Resources Board (CARB) was utilized to obtain an average emission factor for 2019 (Project opening year) using the meteorological data for the Banning area to estimate the particulate matter (PM) emissions generated by the truck traffic on the local roads near the Project site.

EMFAC2014 results are available by vehicle category. Vehicle categories from EMFAC2007 were used to develop the DPM emissions because they correspond to the vehicle classes used in the TIA and SCAQMD guidance. The Project-specific TIA provides truck data by axle number categorizing trucks as either 2-axle, 3-axle, or 4+-axle. To convert the axle-based truck categories to those within EMFAC2014, one of SCAQMD's recommended methods was used which equates 2-axle trucks to Light-Heavy Duty Diesel trucks (LHDT), 3-axle trucks to Medium-Heavy Duty Diesel Trucks (MHDT), and 4+-axle trucks to Heavy-Heavy Duty Diesel Truck (HHDT).[1]

Since PM emissions are also a function of vehicle speed, the modeled vehicle speeds along local roads and ranging between 5 miles per hour (mph) and 25 mph, depending on the road segment, were used. On-site truck travel was modeled as 5 miles per hour. An average vehicle speed of 5 mph was modeled for the trucks traveling within the Project site. These vehicle speeds were chosen after consultation with staff at SCAQMD,[2] who suggested that the average vehicle speed be reduced for each roadway below the posted speed limit in order to model emissions from diesel trucks while they are idling at traffic lights or in congested traffic conditions. The emission factors and corresponding vehicle speeds used are attached hereto.

The emission factors were adjusted to reflect actual percentages for each truck category identified in the TIA for the modeled scenarios on each road modeled to produce an average emission factor for each road segment modeled. The annual average emissions were calculated for each year within the extent of the risk assessment period and averaged for each of the four age bins in the 2017 SCAQMD Guidance. The emissions rates for each age bin were averaged starting in 2019 to provide a conservative analysis. For assessment of residential cancer risk, the risk is calculated in four individual age bins (e.g., third trimester, 0 to 2 years, etc.) rather than a single lifetime calculation, whereas, for offsite workers the default assumption is that working age begins at 16 years. These age bins are based on scientific data, which has shown that young animals are more sensitive than adult animals to exposure to many carcinogens, and are designed to take into account the increased sensitivity to carcinogens during early-in-life exposure. Each age bin is adjusted by an Age Sensitivity Factor (ASF) when calculating cancer risks to account for this increased sensitivity.

Truck Counts

The number of Project-generated trucks using local roads in 2019 was modeled based on the TIA, which estimated total average daily truck trips and the truck distribution showing the roadways used to access the Project site. The assumptions for truck distributions (LHDT, MHDT, and HHDT) are attached hereto. Trucks were also modeled traveling on the Project site.

Truck Idling

In addition to the emissions of DPM from trucks traveling along the roadways, it is also important to model the emissions of DPM from trucks while they are idling at the loading areas of the Project site. There are three loading areas at the Project site. The emissions from the loading areas were calculated as line volume sources utilizing the idling emission factor calculated by EMFAC2014. All trucks were assumed to idle in the loading areas for 15 minutes. Truck auxiliary power units (APUs) or transportation

[2] Staff communication with James Koizumi on March 5, 2004.

refrigeration units (TRUs) were not modeled because the warehouse will be unrefrigerated and electrical hookups will be installed at the loading docks to avoid unnecessary idling.

Diesel Particulate Matter Dispersion Modeling

The AERMOD dispersion model uses available meteorological data (provided by SCAQMD) for the Project area in order to estimate the DPM concentrations at receptor locations. The meteorological data provided by SCAQMD used was for Banning, CA. A uniform Cartesian receptor grid, with receptors placed at 100 meter intervals, extending in each direction of the Project boundary was used. Receptor height was set a zero meters. The urban modeling option with regulatory defaults was utilized, consistent with SCAQMD guidance.[3]

Modeled Receptors

Sensitive and off-site worker receptors were placed at discrete residential and non-residential locations. The existing land use designations surrounding the Project site and the extension of John Street include airport-related and other industrial uses. The closest sensitive land use to the Project site is very low density residential approximately 2,700 feet southwest of the Project boundary. However, existing residential and sensitive uses currently exist within these areas and are in closer proximity to the Project site and roadways used to access the Project site. There are pockets of residential uses west of Hargrave Street and south of Barbour Street as well as scattered residential uses off of Lincoln Avenue and Westward Avenue.

Eleven (11) separate discrete receptors located at sensitive receptors and off-site worker receptors within the Project vicinity were modeled. Receptors 1 through 6 are located at the edge of the existing residential uses on Hargrave Street between the I-10 freeway and Lincoln Avenue. Receptor 7 is a church located on the southeast corner of Hargrave Street and Lincoln Avenue. Receptor 8 is an existing residence located on Lincoln Avenue, southwest of the proposed extension of John Street. Receptors 9 through 11 are off-site worker receptors located at the non-residential uses on Hargrave Street, Lincoln Avenue, and Barbour Street.

Estimation of Health Risks

Cancer Risks

Cancer risks are a calculated probability of the number of people who will develop cancer after exposure to DPM at the same concentration, 24 hours a day, 350 days a year for a lifetime of 30 years. As a conservative measure, the SCAQMD does not recognize indoor adjustments for residents. However, a study by published in the Journal of Air and Waste Management Association in 2001 (Cackette/Lloyd, pp. 809–847) shows that the typical person spends approximately 87 percent of their time indoors, 5 percent of their time outdoors, and 7 percent of their time in vehicles.

---

[3] http://www.aqmd.gov/home/air-quality/air-quality-data-studies/meteorological-data/modeling-guidance

The cancer risks from DPM occur exclusively through the inhalation pathway; therefore, the maximum individual cancer risk (MICR) can be estimated from the following equation:

$$*MICR_{DPM} = CP_{DPM} \bullet DI_{DPM}$$

where,

$MICR_{DPM}$ Cancer risk from diesel particulate matter (DPM); the probability of an individual developing cancer as a result of exposure to DPM.

CP_{DPM} [1] Cancer Potency factor for DPM $(mg/kg\text{-}day)^{-1}$; estimated probability that a person will contract cancer as a result of inhalation of a DPM concentration of 1mg per kilogram of bodyweight continuously over a period of 70 years CP_{DPM} value of 1.1 $(mg/kg\text{-}day)^{-1}$

DI_{DPM} Dose through inhalation (mg/kg-day)

- obtained by multiplying C_{air} x ASF x ED x FAH x DBR x (EF/70) x 10^{-6}
    - C_{air} is the Annual Average 24 hour per day concentration of DPM in air ($\mu g/m^3$) (calculated by AERMOD).
    - ASF is the age specific factor.
    - ED is the exposure duration in years.
    - FAH is the fraction of time at home.
    - DBR is the daily breathing rate
        - To be most protective, the DBR was adjusted for each age group, [2]
    - EF is the exposure factor[2]
        - Most sensitive value of 0.96 used.

* Table of data used in calculations can be found attached hereto.

1. From Table 2.0 of the 2017 SCAQMD Permit Application Package "N" (For Use in Conjunction with the Risk Assessment Procedures for Rules 1401, 1401.1 and 212 Version 8.1 [SCAQMD 2017]).
2. From Table 4.0 of the 2017 SCAQMD Permit Application Package "N".

This probability is usually expressed in terms of the number of people who will develop cancer per one million people who are also exposed. The exposure assumptions provided in the above calculations are based on the SCAQMD 2017 Permit Applications Package "N" which is based on The Air Toxics Hot Spots Program Guidance Manual for Preparation of Health Risk Assessments updated by OEHHA in 2015.

Non-Cancer Risks

The non-cancer risks can be described as acute (short-term, generally 1-hour peak exposures) or chronic (long-term exposure, defined as 12 percent of a lifetime or about 8 years for humans) health impacts. OEHHA has developed acute and chronic reference exposure levels (REL) for determining the non-cancer health impacts of toxic substances. Exceeding the acute or chronic REL does not necessarily indicate that an adverse health impact will occur; however, levels of exposure above the REL have an increasing but undefined probability of resulting in an adverse health impact, particularly in sensitive individuals. For DPM, there is no value for the acute REL and the chronic REL is 5 $\mu g/m^3$.

The relationship for the non-cancer health effects of DPM is given by the following equation:

$$\mathbf{HI_{DPM} = C_{DPM} / REL_{DPM}}$$

where,

HI_{DPM} Hazard Index; an expression of the potential for non-cancer health effects.

C_{DPM} Annual average DPM concentration in $\mu g/m^3$.

REL_{DPM} Reference exposure level (REL) for DPM; the DPM concentration at which no adverse health effects are anticipated.

**Model Is Setup For Calculation of Average CONCentration Values.

  --  DEPOSITION LOGIC  --
**NO GAS DEPOSITION Data Provided.
**NO PARTICLE DEPOSITION Data Provided.
**Model Uses NO DRY DEPLETION.  DRYDPLT  =  F
**Model Uses NO WET DEPLETION.  WETDPLT  =  F

**Model Uses URBAN Dispersion Algorithm for the SBL for   740 Source(s),
  for Total of    1 Urban Area(s):
  Urban Population =   2189641.0 ;  Urban Roughness Length =  1.000 m

**Model Uses Regulatory DEFAULT Options:
       1. Stack-tip Downwash.
       2. Model Accounts for ELEVated Terrain Effects.
       3. Use Calms Processing Routine.
       4. Use Missing Data Processing Routine.
       5. No Exponential Decay.
       6. Urban Roughness Length of 1.0 Meter Assumed.

**Other Options Specified:
       ADJ_U*   - Use ADJ_U* BETA option for SBL in AERMET
       TEMP_Sub - Meteorological data includes TEMP substitutions

**Model Assumes No FLAGPOLE Receptor Heights.

**The User Specified a Pollutant Type of:  DPM

**Model Calculates PERIOD Averages Only
```

```
**This Run Includes:    740 Source(s);       1 Source Group(s); and     611 Receptor(s)

               with:      0 POINT(s), including
                          0 POINTCAP(s) and      0 POINTHOR(s)
                and:    740 VOLUME source(s)
                and:      0 AREA type source(s)
                and:      0 LINE source(s)
                and:      0 OPENPIT source(s)
                and:      0 BUOYANT LINE source(s) with      0 line(s)

**Model Set To Continue RUNning After the Setup Testing.

**The AERMET Input Meteorological Data Version Date:  16216

**Output Options Selected:
         Model Outputs Tables of PERIOD Averages by Receptor
         Model Outputs External File(s) of High Values for Plotting (PLOTFILE Keyword)
         Model Outputs Separate Summary File of High Ranked Values (SUMMFILE Keyword)

**NOTE:  The Following Flags May Appear Following CONC Values:  c for Calm Hours
                                                                m for Missing Hours
                                                                b for Both Calm and Missing Hours

**Misc. Inputs:  Base Elev. for Pot. Temp. Profile (m MSL) =   660.00 ;  Decay Coef. =    0.000     ;  Rot. Angle =     0.0
                 Emission Units = GRAMS/SEC                              ;  Emission Rate Unit Factor =   0.10000E+07
                 Output Units   = MICROGRAMS/M**3

**Approximate Storage Requirements of Model =      3.9 MB of RAM.

**Detailed Error/Message File:   Project AB1.err
**File for Summary of Results:   Project AB1.sum
```

                                        ***   MODEL SETUP OPTIONS SUMMARY   ***
- -

**Model Is Setup For Calculation of Average CONCentration Values.

  -- DEPOSITION LOGIC --
**NO GAS DEPOSITION Data Provided.
**NO PARTICLE DEPOSITION Data Provided.
**Model Uses NO DRY DEPLETION. DRYDPLT = F
**Model Uses NO WET DEPLETION. WETDPLT = F

**Model Uses URBAN Dispersion Algorithm for the SBL for   740 Source(s),
  for Total of   1 Urban Area(s):
  Urban Population =   2189641.0 ; Urban Roughness Length = 1.000 m

**Model Uses Regulatory DEFAULT Options:
       1. Stack-tip Downwash.
       2. Model Accounts for ELEVated Terrain Effects.
       3. Use Calms Processing Routine.
       4. Use Missing Data Processing Routine.
       5. No Exponential Decay.
       6. Urban Roughness Length of 1.0 Meter Assumed.

**Other Options Specified:
       ADJ_U*   - Use ADJ_U* BETA option for SBL in AERMET
       TEMP_Sub - Meteorological data includes TEMP substitutions

**Model Assumes No FLAGPOLE Receptor Heights.

**The User Specified a Pollutant Type of: DPM

**Model Calculates PERIOD Averages Only

**This Run Includes: 740 Source(s);   1 Source Group(s); and   611 Receptor(s)

               with: 0 POINT(s), including
                          0 POINTCAP(s) and   0 POINTHOR(s)
                and: 740 VOLUME source(s)
                and: 0 AREA type source(s)
                and: 0 LINE source(s)
                and: 0 OPENPIT source(s)
                and: 0 BUOYANT LINE source(s) with   0 line(s)

**Model Set To Continue RUNning After the Setup Testing.

```
**The AERMET Input Meteorological Data Version Date:  16216

**Output Options Selected:
         Model Outputs Tables of PERIOD Averages by Receptor
         Model Outputs External File(s) of High Values for Plotting (PLOTFILE Keyword)
         Model Outputs Separate Summary File of High Ranked Values (SUMMFILE Keyword)

**NOTE:  The Following Flags May Appear Following CONC Values:  c for Calm Hours
                                                                m for Missing Hours
                                                                b for Both Calm and Missing Hours

**Misc. Inputs:  Base Elev. for Pot. Temp. Profile (m MSL) =   660.00 ;  Decay Coef. =    0.000     ;  Rot. Angle =     0.0
                 Emission Units = GRAMS/SEC                              ;  Emission Rate Unit Factor =   0.10000E+07
                 Output Units   = MICROGRAMS/M**3

**Approximate Storage Requirements of Model =      3.9 MB of RAM.

**Detailed Error/Message File:   Project AB2.err
**File for Summary of Results:   Project AB2.sum
```

                                        ***   MODEL SETUP OPTIONS SUMMARY   ***
- -

**Model Is Setup For Calculation of Average CONCentration Values.

  -- DEPOSITION LOGIC --
**NO GAS DEPOSITION Data Provided.
**NO PARTICLE DEPOSITION Data Provided.
**Model Uses NO DRY DEPLETION. DRYDPLT = F
**Model Uses NO WET DEPLETION. WETDPLT = F

**Model Uses URBAN Dispersion Algorithm for the SBL for   740 Source(s),
  for Total of   1 Urban Area(s):
  Urban Population =   2189641.0 ; Urban Roughness Length = 1.000 m

**Model Uses Regulatory DEFAULT Options:
       1. Stack-tip Downwash.
       2. Model Accounts for ELEVated Terrain Effects.
       3. Use Calms Processing Routine.
       4. Use Missing Data Processing Routine.
       5. No Exponential Decay.
       6. Urban Roughness Length of 1.0 Meter Assumed.

**Other Options Specified:
       ADJ_U*   - Use ADJ_U* BETA option for SBL in AERMET
       TEMP_Sub - Meteorological data includes TEMP substitutions

**Model Assumes No FLAGPOLE Receptor Heights.

**The User Specified a Pollutant Type of: DPM

**Model Calculates PERIOD Averages Only

**This Run Includes: 740 Source(s);   1 Source Group(s); and   611 Receptor(s)

              with: 0 POINT(s), including
                         0 POINTCAP(s) and   0 POINTHOR(s)
               and: 740 VOLUME source(s)
               and: 0 AREA type source(s)
               and: 0 LINE source(s)
               and: 0 OPENPIT source(s)
               and: 0 BUOYANT LINE source(s) with   0 line(s)

**Model Set To Continue RUNning After the Setup Testing.

```
**The AERMET Input Meteorological Data Version Date:  16216

**Output Options Selected:
         Model Outputs Tables of PERIOD Averages by Receptor
         Model Outputs External File(s) of High Values for Plotting (PLOTFILE Keyword)
         Model Outputs Separate Summary File of High Ranked Values (SUMMFILE Keyword)

**NOTE:  The Following Flags May Appear Following CONC Values:  c for Calm Hours
                                                                m for Missing Hours
                                                                b for Both Calm and Missing Hours

**Misc. Inputs:  Base Elev. for Pot. Temp. Profile (m MSL) =   660.00 ;  Decay Coef. =    0.000     ;  Rot. Angle =     0.0
                 Emission Units = GRAMS/SEC                              ;  Emission Rate Unit Factor =   0.10000E+07
                 Output Units   = MICROGRAMS/M**3

**Approximate Storage Requirements of Model =      3.9 MB of RAM.

**Detailed Error/Message File:   Project AB3.err
**File for Summary of Results:   Project AB3.sum
```

Other Asphalt Surfaces	856.47	1000sqft	19.66	856,470.00	0
Other Non-Asphalt Surfaces	20.89	Acre	20.89	909,968.40	0

1.2 Other Project Characteristics

Urbanization	Urban	**Wind Speed (m/s)**	2.2	**Precipitation Freq (Days)**	31
Climate Zone	10			**Operational Year**	2030
Utility Company	User Defined				
CO2 Intensity (lb/MWhr)	510.9	**CH4 Intensity (lb/MWhr)**	0.029	**N2O Intensity (lb/MWhr)**	0.01

1.3 User Entered Comments & Non-Default Data

Project Characteristics - City of Banning Electricity Co. 50% RPS included
Land Use - Per Site Plan
Construction Phase - Construction not modeled
Off-road Equipment - Construction not modeled
Vehicle Trips - 100 miles from ports, TIA truck trips
Energy Use - Per Banning Utility
Water And Wastewater - Per Landscape Architect
Energy Mitigation - Project Mitigation for High Efficiency Lighting
Water Mitigation -
Waste Mitigation - Per AB 341

Fleet Mix - per TIA truck trip

Trips and VMT -

EXECUTIVE SUMMARY

Amec Foster Wheeler Environment & Infrastructure, Incorporated (Amec Foster Wheeler) conducted a biological resources assessment and prepared a Habitat Assessment and Western Riverside County Multiple Species Habitat Conservation Plan Consistency Analysis Report for an approximately sixty acre project site located in the City of Banning, Riverside County, California. The proposed development of the parcel includes development of industrial buildings, a parking lot, detention basin, and associated off-site infrastructure including 5,968 linear feet of off-site sewer, 9,350 of off-site water utilities and 5,000 linear foot of emergency road access. These off-site infrastructure areas are also part of the project. The project occurs within the Western Riverside County Multiple Species Habitat Conservation Plan (MSHCP).

The project site encompasses Assessor's Parcel Numbers: 532-110-006, 532-130-001, and 532-130-002 as well as the off-site infrastructure alignments (Figure 1). The Banning Industrial Park Project (project site) is currently undeveloped, with no existing structures, and appears to contain natural scrub habitat that has been heavily disturbed by historic grazing activities. It is dominated by desert scrub with patches of disturbed non-native grassland vegetation. Surrounding land use includes existing railroad right-of-way and Interstate 10 to the north, the Banning Airport to the south, undeveloped open space to the east, rural residential to the west.

Tasks performed by Amec Foster Wheeler included a literature review, a general biological field assessment, a jurisdictional delineation of waters of the US/State (under separate cover), and analysis of the project relative to the MSHCP. As part of the MSHCP, a habitat assessment was completed for burrowing owl (*Athene cunicularia*), Marvin's onion (*Allium marvinii*), and many-stemmed dudleya (*Dudleya multicaulis*). Also, the project site was evaluated for sensitive biological resources and/or habitat such as riparian/riverine areas, vernal pools, and those sensitive species associated with those habitats.

The project site is located in The Pass Area Plan of the MSHCP. The project site does not lie within any MSHCP Criteria Cells or Cell Groups.

The project site and off-site alignments are located within the MSHCP designated burrowing owl survey area. No suitable habitat (i.e. burrows) or other man-made structures (i.e. pipes, concrete refuge, etc.) suitable for burrowing owl use were observed on-site during the reconnaissance-level survey. Marginal, low quality burrowing owl foraging habitat (i.e. scattered pockets of non-native grasslands) were found within the project boundary of the site at the time of the surveys. The nearest known burrowing owl occurrence is approximately 3 miles northeast of the project site (Scott Crawford personal observation 2008). Due to the low potential for burrowing owls to forage on the site at any time in the future, and considering that construction is not scheduled to occur within the next six months, it is a requirement of the MSHCP that a 30-day pre-construction clearance survey be conducted immediately prior to commencement of construction activities to ensure no owls have migrated onto the site to prevent impacts to any burrowing owls.

The project site and off-site alignments are located within the MSHCP designated narrow endemic plant species survey area. Two narrow endemic plants, Marvin's onion (*Allium*

marvinii) and many-stemmed dudleya (*Dudleya variegata*) were identified as potentially occurring within the project site and require a habitat assessment/focused surveys. No suitable habitat (i.e. chaparral and/or clay soils) is present on-site. Therefore, focused surveys for these plants are not required.

A portion of the off-site utility alignment, south of the project site, occurs immediately adjacent to the survey area for Los Angeles pocket mouse (*Perognathus longimembris brevinasus, LAPM*). The proposed project was redesigned to avoid the LAPM survey area. The majority of the suitable habitat in this area is associated with Smith Creek which the project improvements do not impact. There is some marginally suitable habitat southeast of the utility line, but will not be impacted by project improvements. The proposed utility line will be a temporary impact and this portion of the MSHCP planning area is fragmented from any Core Conservation Areas and is not suitable for long-term conservation and will not likely impede any dispersal of this species to surrounding habitat. Therefore, a Determination of Biologically Equivalent or Superior Preservation (DBESP) report is not required for Los Angeles pocket mouse.

The MSHCP Conservation Summary Generator indicates that the project area does not require Criteria Area Plant Species or Sensitive Amphibian survey.

The project site does contain suitable nesting habitat for several birds protected under the Migratory Bird Treaty Act (MBTA) and California Department of Fish and Wildlife (CDFW) Code within the project boundaries. Several trees are located in the vicinity of the project site and tall shrubs and dense non-native grasslands occur throughout the site providing nesting habitat for a variety of migratory birds. If construction activities are to take place during the nesting season (mid-February through the end of August), pre-construction nesting bird surveys are required to ensure that no active nests are present within the work area and to ensure MBTA compliance. Impact avoidance generally requires that no construction activities be conducted within a 500-foot radius of active raptor or sensitive species nests and/or a 300-foot radius for other unlisted passerine species.

The project site is not located within any United States Fish and Wildlife Service (USFWS) designated Critical Habitat for any species.

According to the MSHCP, the Urban/Wildlands Interface Guidelines are intended to address indirect effects associated with locating development in proximity to the MSHCP Conservation Areas (MSHCP, pages 6-42). The project site is within a Special Linkage Area; therefore the project will need to incorporate Urban/Wildlife Interface Guidelines during construction.

Based on the current project design, the project and associated infrastructure will potentially impact all six drainage features within the project site. As such, regulatory permitting will be required prior to any grading activity affecting these drainages. Also, a DBESP Report was prepared for impacts to Riparian/Riverine areas within the project site and off-site infrastructure alignments (also under separate cover). A total of 0.23 acre of permanent impacts and 0.07 acre of temporary impacts will occur during project development. These impacts will be mitigated by on-site habitat creation of 1.20 acre within two separate drainage features, both of which will be constructed in existing upland areas and will convey nuisance flows and natural

run-off around the proposed development to minimize erosion and maintain off-site flows. If it is determined that on-site mitigation is not feasible, additional alternatives could include, but are not limited to off-site purchase of land or payment into an acceptable mitigation bank, in-lieu fee program, or RCA conservation area.

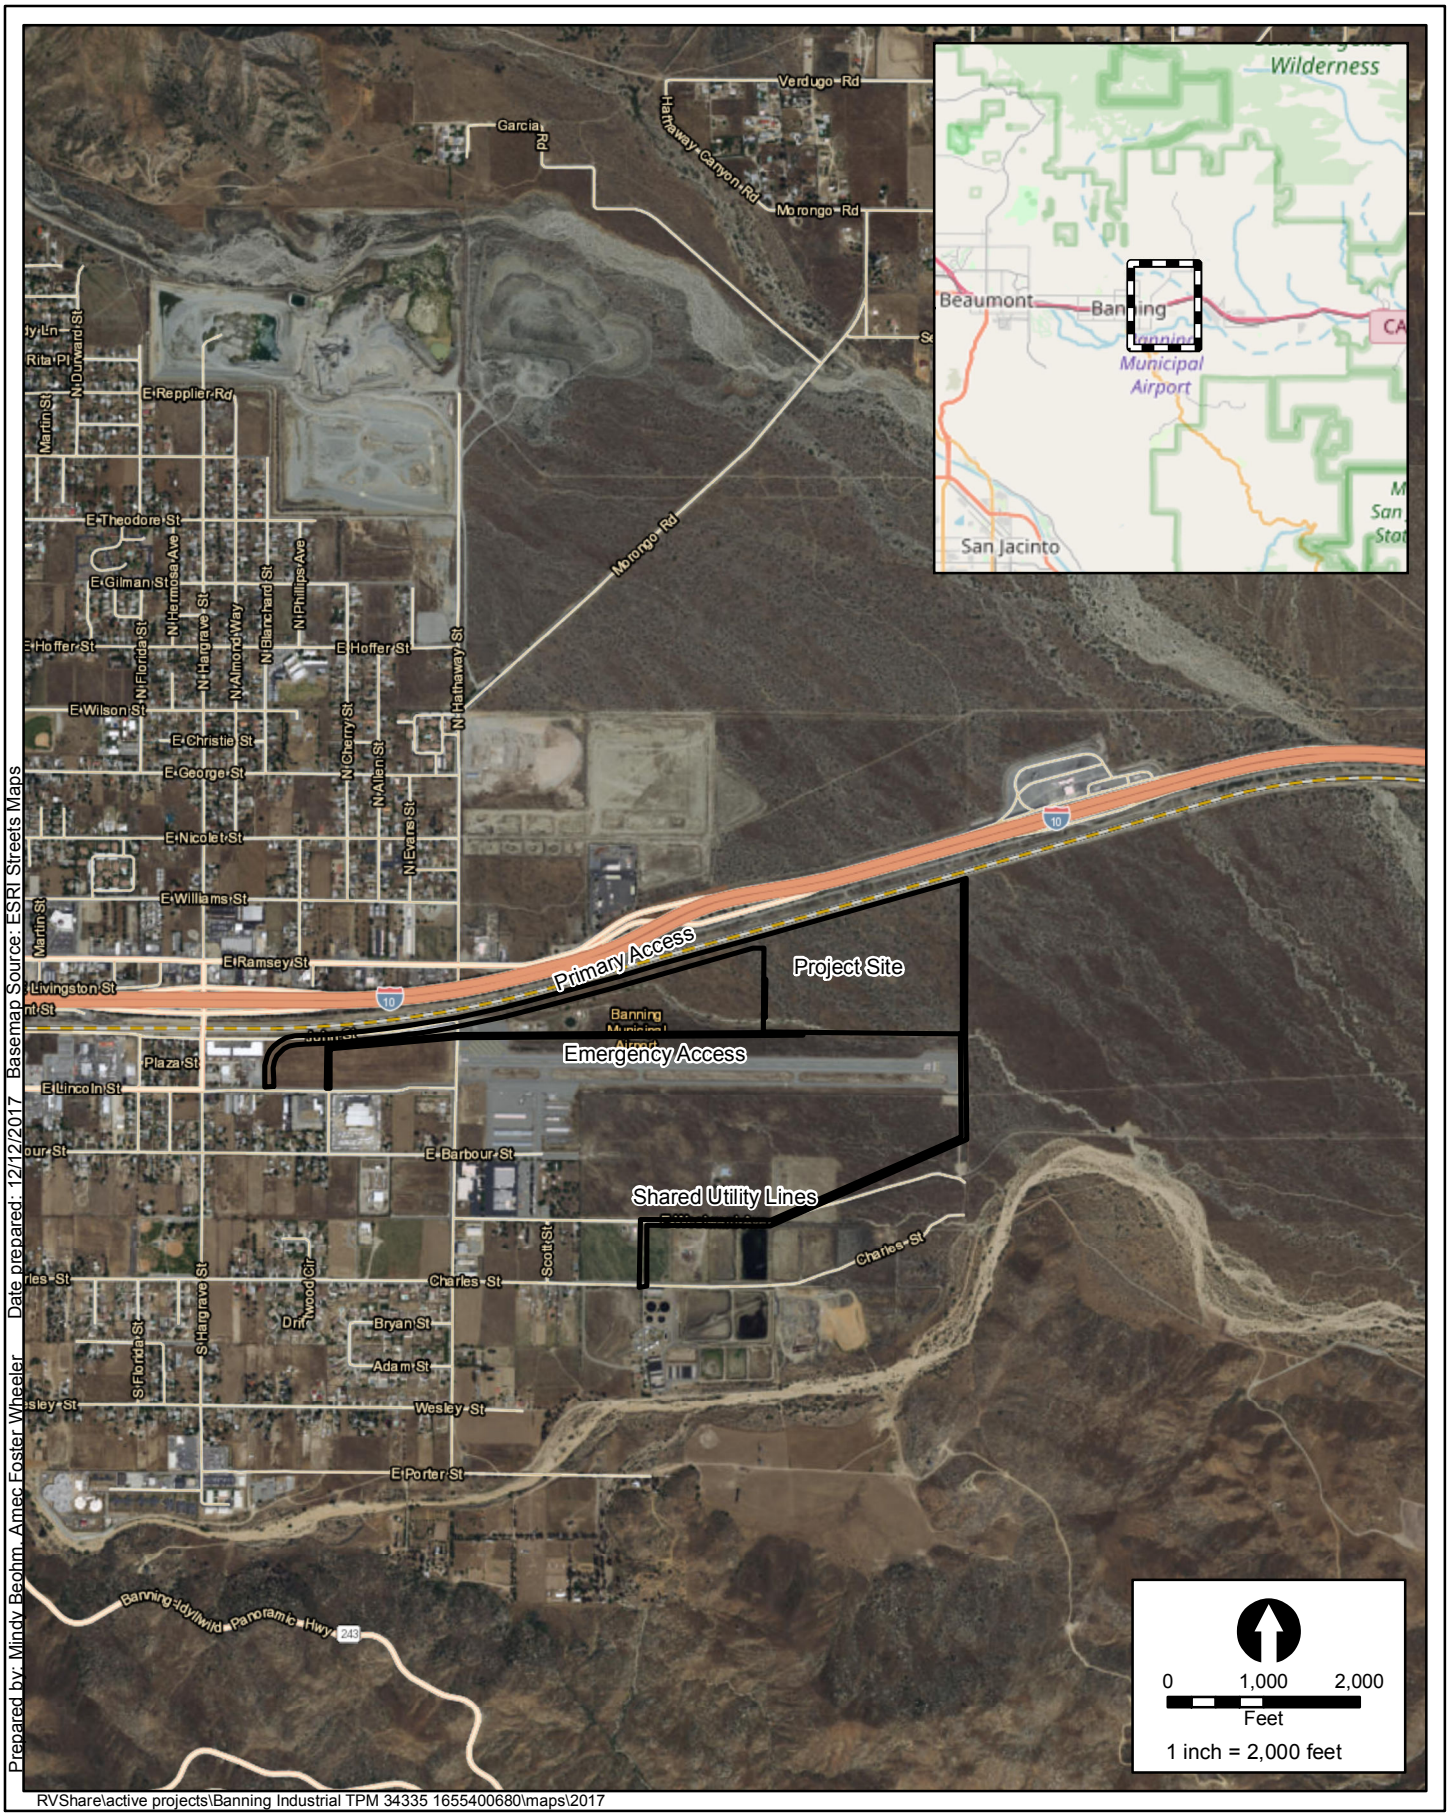
1.0 INTRODUCTION

Amec Foster Wheeler Environment & Infrastructure, Inc. (Amec Foster Wheeler) was contracted by Albert A. Webb Associates (Webb) to conduct a biological resources assessment and a Western Riverside County Multiple Species Habitat Conservation Plan (MSHCP) compliance report for a 63.9-acre project site located in the city of Banning, Riverside County, California.

The proposed project involves the development of Assessor's Parcel Number (APN) 532-110-006, 532-130-001, and 532-130-002. The proposed project includes the development of the Banning Industrial park, which includes industrial buildings, associated parking lot, detention basin, and associated infrastructure. The project area analyzed herein also includes 5,968 linear feet of off-site sewer, 9,350 of off-site water utilities and 5,000 linear foot emergency road access. These off-site infrastructure areas are also part of the project.



The City of Banning requires a biological resources assessment in compliance with the MSHCP as part of the California Environmental Quality Act (CEQA) requirements.

2.0 PROJECT LOCATION AND SITE DESCRIPTION

The project site and associated infrastructure is specifically located north of Charles Street, south of Interstate 10, and east of Hargrave Street (Figure 1) and can be found in Sections 11 and 14 of Township 3 South, Range 1 East, as shown on the *Cabazon, California,* United States Geological Survey (USGS) 7.5 minute quadrangle (Figure 2). The elevation of the project site ranges from 2,105 to 2,240 feet above sea level. The geographic coordinates near the middle of the site are 33° 55.520' North latitude and -116°50.767' West longitude.

The project site is currently undeveloped with no existing structures. Desert scrub habitat dominates the site with small patches of disturbed non-native grasslands. The study area contains evidence of routine grazing by cattle. However, no cattle were observed within the project site during the survey. Cattle were observed in a pasture just south of the airport. Surrounding land use includes Union Pacific Railroad right-of-way and Intestate 10 to the north, Banning Airport to the south, existing rural residential development to the west, vacant Morongo-owned property to the east.

3.0 REGULATORY FRAMEWORK

3.1 Federal

Federal Endangered Species Act - The USFWS administers the Federal Endangered Species Act (FESA). The FESA provides a process for listing species as either threatened or endangered, and methods of protecting listed species. The FESA defines as "endangered" any plant or animal species that is in danger of extinction throughout all or a significant portion of its known geographic range. A "threatened" species is a species that is likely to become endangered. A "proposed" species is one that has been officially proposed by the USFWS for addition to the federal threatened and endangered species list.

FESA Section 9 prohibits "take" of threatened or endangered species. The term "take" means to harass, harm, pursue, hunt, shoot, wound, kill, trap, capture, or collect, or to attempt to engage in such conduct. Take can include disturbance to habitats used by a threatened or endangered species during any portion of its life history. The presence of any federally threatened or endangered species in a biological survey area generally imposes severe constraints on development, particularly if development would result in "take" of the species or its habitat. Under the regulations of the FESA, the USFWS may authorize "take" when it is incidental to, but not the purpose of, an otherwise lawful act.

3.1.1 California Endangered Species Act

California Department Fish and Wildlife (CDFW) administers the California Endangered Species Act (CESA). The State of California considers an "endangered" species one whose prospects of survival and reproduction are in immediate jeopardy. A "threatened" species is one present in such small numbers throughout its range that it is likely to become an endangered species in the near future in the absence of special protection or management. A "rare" species is one present in such small numbers throughout its portion of its known geographic range that it may become endangered or threatened if its present environment worsens. The rare species designation applies to California native plants. State threatened and endangered species are fully protected against take, as defined above. The term "species of special concern" is an informal designation used by CDFW for some declining wildlife species that are not state candidates for listing. This designation does not provide legal protection, but signifies that these species are recognized as sensitive by CDFW.

3.1.2 Migratory Bird Treaty Act

The Migratory Bird Treaty Act (MBTA) protects all wild birds, common or otherwise, found in the United States (U.S.) except non-native species such as the house sparrow (*Passer domesticus*), European starling (*Sturnus vulgaris*), -rock dove (*Columba livia*), Eurasian collared dove (*Streptopelia decaocto*) and resident game birds such as ring-neck pheasant (*Phasianus colchicus*), grouse (various genera and species), quail (*Callipepla* spp), and wild turkey (*Meleagris gallopavo*). Resident game birds are managed separately by each state. The MBTA

makes it unlawful for anyone to kill, capture, collect, possess, buy, sell, trade, ship, import, or export any migratory bird including feathers, parts, nests, or eggs.

Pursuant to the MBTA, it is unlawful to "take" (i.e., capture, kill, pursue, or possess) migratory and resident birds and/or their nests. Nesting birds must not be disturbed. The MBTA requires that impacts to nesting bird species be minimized or eliminated by avoiding impacts to active nest sites present in the project area.

3.1.3 California Fish and Wildlife Code – Section 3503 and Section 3511

The CDFW administers the California Fish and Game (CFG) Code. There are particular sections of the CFG Code that are applicable to natural resource management. For example, Section 3503 of the CFG Code states it is unlawful to take, possess, or needlessly destroy the nest or eggs of any bird that is protected under the MBTA. CFG Code Section 3503.5 further protects all birds in the orders Falconiformes and Strigiformes, birds of prey such as hawks and owls, and their eggs and nests from any form of take. CFG Code Section 3511 lists fully protected bird species where the CDFW is unable to authorize the issuance of permits or licenses to take these species.

3.1.4 Riverside County

The MSHCP is a comprehensive, multi-jurisdictional effort that includes Riverside County, fourteen (14) cities (including Banning) and seven public agencies. Rather than address sensitive species on an individual basis, the purpose of the MSHCP is to focus on the collective conservation of 146 species known to occur in the coverage area. Most importantly, the MSHCP allows participating entities to issue Take permits for listed species so that individual applicants need not seek their own permits on a case-by-case basis from the USFWS and/or the CDFW. The MSHCP consists of a reserve system of approximately 500,000 acres and includes a mechanism to fund and implement the reserve system (Riverside County MSHCP 2005). Approximately 347,000 acres of the reserve system are currently within public ownership and 153,000 acres are currently in private ownership. This 500,000-acre reserve system throughout the County is intended to compensate for impacts to these sensitive species from development projects throughout the plan area. The MSCHP is designed to contribute to the economic viability of the County by providing landowners and developers with a more efficient and cost-effective regulatory and permitting process. The MSHCP was adopted on June 17, 2003 by the Riverside County Board of Supervisors, and the Incidental Take Authorization issued by both the USFWS and CDFG on June 22, 2004, thereby approving the final MSHCP. In western Riverside County many federal and state listed or sensitive species and habitats are now considered “covered species” under the MSHCP. In most instances the MSHCP requires no further surveys for most of the 146 covered species; however, Section 6 of the MSHCP states that additional surveys for 38 of these species are required if either the property occurs in a specific species survey area (i.e., burrowing owl, Criteria Area Species Survey Area [CASSA]) or if potential habitat exists on the property (i.e., least Bell’s vireo [*Vireo bellii pusillus*], or Riverside fairy shrimp [*Streptocephalus wootoni*]). This plan satisfies requirements of the Natural Communities Conservation Plan (NCCP) legislation.

3.1.5 Jurisdictional Waters and Wetlands

Impacts to natural drainage features and wetland areas are regulated by the U.S. Army Corps of Engineers (USACE), Regional Water Quality Control Board (RWQCB), and CDFW based upon the policies and regulations discussed below.

United States Army Corp of Engineers Regulations

Federal Clean Water Act - Section 404

The USACE administers Section 404 of the federal Clean Water Act (CWA). These sections regulate the discharge of dredge and fill material into waters of the U.S. USACE has established a series of nationwide permits that authorize certain activities in waters of the U.S., if a proposed activity can demonstrate compliance with standard conditions. Normally, USACE requires an individual permit for an activity that will affect an area equal to or in excess of 0.5 acre of waters of the U.S. Projects that result in impacts to less than 0.5 acre can normally be conducted pursuant to one of the nationwide permits, if consistent with the standard permit conditions.

Waters of the United States

Waters of the U.S. (WUS), as defined in the Code of Federal Regulations (CFR) Section 328.3, include all waters or tributaries to waters such as lakes, rivers, intermittent and perennial streams, mudflats, sand-flats, natural ponds, wetlands, wet meadows, and other aquatic habitats. Frequently, WUS, with at least intermittently flowing water or tidal influences are demarcated by an Ordinary High Water Mark (OHWM). The OHWM is defined in CFR Section 328.3(e) as the line on the shore established by the fluctuations of water and indicated by physical characteristics such as a clear, natural line impressed on the bank shelving, changes in the character of soil, destruction of terrestrial vegetation, the presence of litter and debris, or other appropriate means that consider the characteristics of the surrounding areas. In this region, the OHWM is typically indicated by the presence of an incised streambed with defined bank shelving.

In June 2001, the USACE South Pacific Division has issued Guidelines for Jurisdictional Delineations for Waters of the United States in the Arid Southwest. The purpose of this document was to provide background information concerning physical characteristics of dry land drainage systems. These guidelines were reviewed and used to identify jurisdictional drainage features within the biological survey area.

Wetlands

According to the USACE Wetlands Delineation Manual, Technical Report, three criteria must be satisfied to classify an area as a jurisdictional wetland:

1. A predominance of plant life that is adapted to life in wet conditions (hydrophytic vegetation)

2. Soils that saturate, flood, or pond long enough during the growing season to develop anaerobic conditions in the upper part (hydric soils)
3. Permanent or periodic inundation or soils saturation, at least seasonally (wetland hydrology)

Wetland vegetation is characterized by vegetation in which more than 50 percent of the composition of dominant plant species are obligate wetland, facultative wetland, and/or facultative species that occur in wetlands. As a result of the 2001 Solid Waste Agency of North Cook County (SWANCC) case, a wetland must show connectivity to a stream course in order for such a feature to be considered jurisdictional. Although wetland criteria was used to identify if areas were considered wetlands, the exact limits of jurisdiction were not measured based on the standard wetland delineation protocol as described in the 1987 USACE manual.

United States Army Corp of Engineers Regulated Activities
The USACE regulates the discharge of dredged or fill material, including, but not limited to, grading, placing of rip-rap for erosion control, pouring concrete, laying sod, and stockpiling excavated material. Activities that generally do not involve a regulated discharge, if performed specifically in a manner to avoid discharges, include driving pilings, drainage channel maintenance, temporary mining and farm/forest roads, and excavating without stockpiling.

Regional Water Quality Control Board Regulations

Clean Water Act - Section 401

According to section 401 of the CWA, "any applicant for a Federal permit for activities that involve a discharge to waters of the State, shall provide the Federal permitting agency a certification from the State in which the discharge is proposed that states that the discharge will comply with the applicable provisions under the Federal CWA." Therefore, before the USACE will issue a Section 404 permit, applicants must apply for and receive a Section 401 water quality certification from the RWQCB.

Porter-Cologne Water Quality Act
The RWQCB regulates actions that would involve "discharging waste, or proposing to discharge waste, within any region that could affect the water of the state" (water code §13260(a)), pursuant to provisions of the Porter-Cologne Water Quality Act. "Waters of the State" (WSC) are defined as "any surface water or groundwater, including saline waters, within the boundaries of the state" (water code Section 13050 [e]).

Regional Water Quality Control Board Regulated Activities
Under Section 401 of the CWA, the RWQCB regulates all activities that are regulated by the USACE. Additionally, under the Porter-Cologne Water Quality Act, the RWQCB regulates all activities, including dredging, filling, or discharge of materials into waters of the state that are not regulated by the USACE due to a lack of connectivity with a navigable water body and/or lack of an OHWM.

3.1.6 California Department of Fish and Game Regulations

California Fish and Game Code Section 1600 to Section 16003

The CFG Code mandates that "it is unlawful for any person to substantially divert or obstruct the natural flow or substantially change the bed, channel, or bank of any river, stream, or lake designated by the department, or use any material from the streambeds, without first notifying the department of such activity." CDFW jurisdiction includes ephemeral, intermittent, and perennial watercourses, including dry washes, characterized by the presence of hydrophytic vegetation, the location of definable bed and banks, and the presence of existing fish or wildlife resources.

Furthermore, CDFW jurisdiction is often extended to habitats adjacent to watercourses, such as oak woodlands in canyon bottoms or willow woodlands that function as part of the riparian system. Historic court cases have further extended CDFW jurisdiction to include watercourses that seemingly disappear, but re-emerge elsewhere. Under the CDFW definition, a watercourse need not exhibit evidence of an OHWM to be claimed as jurisdiction. However, CDFW does not regulate isolated wetlands; that is, those that are not associated with a river, stream, or lake.

California Department of Fish and Wildlife Regulated Activities

The CDFW regulates activities that involve diversions, obstruction, or changes to the natural flow or bed, channel, or bank of any river, stream, or lake that supports fish or wildlife resources.

.

4.0 METHODOLOGY

4.1 Western Riverside County MSCHP Consistency Analysis

Geographic Information System (GIS) software was utilized to map the project site in relation to the MSHCP areas including Criteria Cells, Core Habitat, Linkages, and areas proposed for conservation. The Riverside County Integrated Project (RCIP) Conservation Summary Report Generator was queried to determine habitat assessment and potential survey requirements for the project site.

The MSHCP requires habitat assessments for the burrowing owl, and two narrow endemic plant species Marvin's onion and many-stemmed dudleya. The documentation for the assessment shall include mapping and a description of the functions and values of the mapped areas with respect to the species listed in Section 6.1.3 and Section 6.3.2.

4.1.1 Literature Review

Prior to the field visit, a literature review was conducted of the environmental and regulatory setting for the biological project site. The literature review provides a baseline from which to evaluate the biological resources potentially occurring within the study area, and within the local and regional vicinity.

A list of special-status plant and wildlife species and their habitats, known to occur near the project site was compiled. The primary source for this data was the CDFW California Natural Diversity Database (CNDDB 2017), which is a sensitive species and plant community database. Amec Foster Wheeler conducted a query of the CNDDB records based on a 5-mile radius surrounding the project site that included the Cabazon and Beaumont, California USGS 7.5-minute topographic quadrangle maps.

Additionally a review of pertinent literature and database search was conducted, including records from the California Native Plant Society (CNPS) on-line inventory database was also queried for the project site and vicinity (CNPS 2017). The CNPS on-line inventory provided additional sensitive species information for many species that have not been reported to the CNDDB database. The on-line *Web Soil Survey* (United States Department of Agriculture, Natural Resources Conservation Service [USDA NRCS] 2017), and the MSHCP Conservation Summary Generator and website (Western Riverside County 2017) were also queried for the project site and vicinity. The collective knowledge of Amec Foster Wheeler staff was also utilized. *Scientific* nomenclature for this report is from the following standard reference sources: plant communities, Holland (1986); flora, Sawyer Keeler Wolf (2009); flora, Baldwin et al (2012) and Munz (1974); reptiles, Moriarty, John J. (2012); and, birds, American Ornithologists Union (2015).

The Habitat Assessment Report for the Messenger Industrial Park-Banning Airport Project, Riverside County, CA (Rocks 2006) was also reviewed prior to conducting surveys on the

project site. This report was prepared for a previous development plan, but the project was not completed. The purpose of reviewing the document was to identify any additional sensitive species that may have been previously observed within the project site. The report was also reviewed to determine if existing project conditions have changed over time.

The Riverside County Integrated Project (RCIP) Summary Report Generator (online) was queried by parcel number for specific MSHCP concerns (2017).

4.1.2 Jurisdictional Waters and Wetlands

Aerial photography was reviewed prior to conducting general surveys (Imagery Date: 21 November 2016). The photographs were used to locate and inspect any potential natural drainage features and water bodies that may be considered under the jurisdiction of either the USACE and/or CDFW. An inspection of the project site to determine presence or absence of potential jurisdictional wetlands and waters was conducted during the above mentioned general biological assessment.

4.1.3 Field Investigation

Amec Foster Wheeler senior Scott Crawford conducted a reconnaissance-level field survey on 9 May 2017 from 0800 to 1245 hours. Weather conditions during the survey included clear skies with a temperature of 57°F (degrees Fahrenheit) and winds between 5 and 6 miles per hour. Habitat was assessed based on the presence or absence of habitat components (e.g., soils, vegetation and topography) that are characteristic of potentially occurring special-status species determined by the literature review. All flora and vertebrate fauna observed or otherwise detected (e.g., vocalizations, presence of scat, tracks, and/or bones) on the project site during the course of this assessment were recorded and are included in Appendices A and B.

4.1.4 Wildlife Corridor

Wildlife corridors link together areas of suitable habitat that are otherwise separated by rugged terrain, changes in vegetation, or human disturbance. The fragmentation of open space areas by urbanization creates isolated “islands” of wildlife habitat. In the absence of habitat linkages that allow movement to adjoining open space areas, various studies have concluded that some wildlife species, especially the larger and more mobile mammals, will not likely persist over time in fragmented or isolated habitat areas because they prohibit the infusion of new individuals and genetic information (MacArthur and Wilson 1967, Soule 1987, Harris and Gallagher 1989, Bennett 1990). Corridors effectively act as links between different populations of a species. A group of smaller populations (termed “demes”) linked together via a system of corridors is termed a “metapopulation.” The long-term health of each deme within the metapopulation is dependent upon its size and the frequency of interchange of individuals (immigration vs. emigration). The smaller the deme, the more important immigration becomes, because prolonged inbreeding with the same individuals can reduce genetic variability. Immigrant individuals that move into the deme from adjoining demes mate with individuals and supply that deme with new genes and gene combinations that increases overall genetic diversity. An

increase in a population's genetic variability is generally associated with an increase in a population's health.

Corridors mitigate the effects of habitat fragmentation by (1) allowing animals to move between remaining habitats, which allows depleted populations to be replenished and promotes genetic diversity; (2) providing escape routes from fire, predators, and human disturbances, thus reducing the risk that catastrophic events (such as fires or disease) will result in population or local species extinction; and (3) serving as travel routes for individual animals as they move within their home ranges in search of food, water, mates, and other needs (Noss 1983, Fahrig and Merriam 1985, Simberloff and Cox 1987, Harris and Gallagher 1989).

Wildlife movement usually fall into one of three categories: (1) dispersal (e.g., juvenile animals from natal areas, individuals extending range distributions); (2) seasonal migration; and (3) movements related to home range activities (foraging for food or water, defending territories, searching for mates, breeding areas, or cover). A number of terms have been used in various wildlife movement studies, such as "wildlife corridor," "travel route," "habitat linkage," and "wildlife crossing" to refer to areas in which wildlife move from one area to another. To clarify the meaning of these terms and facilitate the discussion on wildlife movement in this study, these terms are defined as follows:

Travel Route: A landscape feature (such as a ridgeline, drainage, canyon, or riparian strip) within a larger natural habitat area that is used frequently by animals to facilitate movement and provide access to necessary resources (e.g., water, food, cover, den sites). The travel route is generally preferred because it provides the least amount of topographic resistance in moving from one area to another; it contains adequate food, water, and/or cover while moving between habitat areas; and provides a relative direct link between target habitat areas.

Wildlife Corridor: A piece of habitat, usually linear in nature that connects two or more habitat patches that would otherwise be fragmented or isolated from one another. Wildlife corridors are usually bounded by urban land areas or other areas unsuitable for wildlife. The corridor generally contains suitable cover, food, and/or water to support species and facilitate movement while in the corridor. Larger, landscape-level corridors (often referred to as "habitat or landscape linkages") can provide both transitory and resident habitat for a variety of species.

Wildlife Crossing: A small, narrow area, relatively short in length and generally constricted in nature, that allows wildlife to pass under, over or through an obstacle or barrier that otherwise hinders or prevents movement. Crossings typically are manmade and include culverts, underpasses, drainage pipes, and tunnels to provide access across or under roads, highways, pipelines, or other physical obstacles. These are often "choke points" along a movement corridor.

5.0 RESULTS

5.1 Soils

The United States Department of Agriculture National Resources Conservation Service (USDA NCRS) maintains an on-line searchable soils database, the Web Soil Survey (USDA 2015), which was consulted during the project literature search in order to determine the soil associations and soil types occurring on the project site. The following mapping units occur on the site (Figure 3):

- Gorgonio gravelly loamy fine sand (GmD) – This somewhat excessively drained soil occurs on alluvial fans with 2 to 15 percent slopes. It is composed of gravelly loamy fine sand on the surface and the parent material is alluvium derived from granite.
- Gorgonio cobbly loamy fine sand (GnD) – This somewhat excessively drained soil occurs on alluvial fans with 2 to 15 percent slopes. It is composed of cobbly loamy fine sand on the surface and the parent material is composed of alluvium derived from granite.
- Hanford cobbly coarse sandy loam (HdD2) – This somewhat excessively drained soil occurs on alluvial fans with 2 to 15 percent slopes. It is composed of cobbly coarse sandy loam on the surface and the parent material is composed of alluvium derived from granite.
- Hanford coarse sandy loam, 2 to 8 percent slopes (HcC) – This well drained soil occurs on alluvial fans and alluvial plains with 2 to 8 percent slopes. It is composed of a mix of coarse and sandy loam on the surface and the parent material is composed of alluvium derived from granite.
- Tujunga gravelly loamy sand, 0 to 8 percent slopes (TwC) – This excessively drained soil occurs on flood plains and alluvial fans with 0 to 8 percent slopes. The parent material is composed of sandy alluvium derived from granite.

The NRCS lists Hanford Cobbly Coarse Sandy loam as a hydric soils. This soil is the most prevalent soil within the project site, followed by isolated patches of Gorgonio gravelly loamy fine sand. The other three soils occur in areas containing associated infrastructure such as utility lines, and emergency access roads.

5.2 Vegetation

As shown in the Photographic Exhibits (Appendix B), and depicted on Figure 4, the site contains a mix of desert scrub habitat and non-native grasslands. The plant list compiled by Amec Foster Wheeler during the assessment consists of sixty-one (61) plant species. This number does not reflect the total number of plant species likely to occur on the site, as surveys were conducted during the middle of spring when some species may still be undetectable, either because they are early emergence plants and have already flowered or are late blooming plants and have not

flowered yet. The common desert scrub plants observed on-site include desert encelina (*Encelia farinosa*), California buckwheat (*Eriogonum fasciculatum*), and deer weed (*Acmispon glaber*). Non-native grassland species observed on-site include Russian thistle (*Salsola tragus*), wild mustard (*Hirschfeldia incana*), rip-gut grass (*Bromus diandrus*), and red-stemmed filaree (*Erodium cicutarium*).

5.3 Narrow Endemic Plant Species (MSHCP Section 6.1.3)

The project site is located within the MSHCP designated Narrow Endemic Plant Species Survey Area (NEPSSA) for Marvin's onion (*Allium marvinii*) and many-stemmed dudleya (*Dudleya variegata*) (Figure 5). Suitable habitat (i.e. chaparral and/or clay soils) is, however, not present on-site. Therefore, focused surveys for these plant species is not required.

5.4 Wildlife

Appendix A lists the twenty-nine (29) wildlife species that were observed within the project site or immediate vicinity. A complete inventory of the wildlife on the project site would require extensive year-round surveys for invertebrates, birds, amphibians, and reptiles, and a live-trapping program for the detection of nocturnal and/or fossorial mammals.

Birds detected during the field survey include (but not limited to) species commonly seen in many areas of western Riverside County including red-tailed hawk (*Buteo jamaicensis*), American crow (*Corvus brachyrhynchos*), western meadowlark (*Sturnella neglecta*), and white-crowned sparrow (*Zonotrichia leucophrys*).

5.4.1 Sensitive Plant Species.

Of the 14 special status plant species known from the general project area, 8 plants are assumed to be absent due to lack of habitat, elevational range, extirpation, or extinction. Three plants have a Moderate Potential to occur within the project site including Plummer's mariposa lily (*Calochortus plummerae*), Parry's spineflower (*Chorizanthe parryi* var. *parryi*), and white-bracted spineflower (*Chorizanthe xanti* var. *leucotheca*). The remaining 3 species, some of which are state and/or federally listed as threatened and/or endangered, have low potential for occurrence.

Table 1. Special Status Plant Species Potential for Occurrence

Species	Status (F=Federal, C=California)	Habitat	Flowering Period	BSA Occurrence Probability
Abronia villosa var. *aurita* chaparral sand-verbena	F: BLM, FS C: S2 CNPS: 1B.1 MSHCP: No	In sandy areas in chaparral, coastal dunes and desert dunes, 75 - 1,600 meters (elevation).	(January) March-September	Absent. No suitable dune habitat on-site. No records near the BSA. Not observed during survey.
Allium marvinii Yucaipa onion	F: FS C: S1 CNPS: 1B.2 MSHCP: Yes	Chaparral in openings on clay soils. 850-1070 meters.	April – May	Absent No clay soils mapped in BSA.
Astragalus lentiginosus var. *coachellae* Coachella Valley milk-vetch	F: END C: S1 CNPS: 1B.2 MSHCP: No	Desert dunes and sandy Sonoran desert scrub. 40 - 655 meters.	February - May	Absent No suitable habitat. Details on CNPS record unknown.
Astragalus pachypus var. *jaegeri* Jaeger's bush milk-vetch	F: BLM, FS C: S2 CNPS: 1B.1 MSHCP: Yes	Sandy or rocky places in chaparral, cismontane woodland, coastal scrub, and valley & foothill grassland, 365 - 975 meters.	December - June	Low A few patches of habitat present in BSA

Species	Status (F=Federal, C=California)	Habitat	Flowering Period	BSA Occurrence Probability
Calochortus plummerae Plummer's mariposa lily	F: ND C: S4 CNPS: 4.2 MSHCP: Yes	Cismontane woodlands, chaparral, coastal scrub, grasslands, lower montane coniferous forest; 100 - 1,700 meters.	May - July	Moderate Patches of potential habitat in BSA.
Caulanthus simulans Payson's jewelflower	F: FS C: S4 CNPS: 4.2 MSHCP: Yes	Sandy, granitic areas in chaparral and coastal scrub, 90 - 2,200 meters.	(February) March-May (June)	Low Only known local record upslope on San Jacinto Mountains.
Centromadia pungens ssp. *laevis* smooth tarplant	F: ND C: S2 CNPS: 1B.1 MSHCP: Yes	Annual herb found in alkaline areas within chenopod scrub, meadows, playas, riparian woodland, valley and foothill grassland below 480 meters.	April - November	Absent. No records near the BSA and no suitable habitat.
Chorizanthe parryi var. *parryi* Parry's spineflower	F: BLM, FS C: S2 CNPS: 1B.1 MSHCP: Yes	Sandy or rocky openings in chaparral, coastal sage scrub, cismontane woodland & valley foothill grassland; 275-1,220 meters.	April - June	Moderate Patches of potential habitat present in BSA.
Chorizanthe xanti var. leucotheca white-bracted spineflower	F: N/A C: S3 CNPS: 1B.2 MSHCP: Yes	Coastal scrub, Mojavean desert scrub, and Pinyon and juniper woodland in sandy and gravelly areas; 300-1,220 meters.	April - June	Moderate Patches of potential habitat present in BSA.
Deinandra mohavensis Mojave tarplant	F: BLM, FS C: **END**, S2 CNPS: 1B.3 MSHCP: Yes	Low sand bars in river beds; mostly in riparian areas or in ephemeral grassy areas. Riparian scrub, coastal scrub, chaparral. 640-1600 meters.	(May) June –October (January)	Low Habitat present in BSA, but no records in immediate BSA.
Horkelia cuneata var. *puberula* mesa horkelia	F: FS C: S1 CNPS: 1B.1 MSHCP: No	Sandy or gravelly soils in chaparral, or rarely in cismontane woodland or coastal scrub at 70 - 825 meters.	February – September	Absent Marginal habitat patches specifically located within Drainage A, which will mostly be avoided. Not observed during surveys.
Mentzelia tricuspis spiny-hair blazing star	F: ND C: S2 CNPS: 2B.1 MSHCP: No	Sandy, gravelly, slopes, and washes in Mojavean desert scrub, 150 - 1,280 meters.	March - May	Absent No suitable Mojavean desert scrub habitat present. There is one old record in the vicinity, likely misidentified.
Petalonyx linearis Narrow-leaf sandpaper-plant	F: ND C: S2S3 CNPS: 2B.3 MSHCP: No	Mojavean desert scrub at -25 – 1115 meters. Known from only one occurrence 3 miles south of the project site. Last seen in1999.	March-May	Absent No suitable habitat present.

Species	Status (F=Federal, C=California)	Habitat	Flowering Period	BSA Occurrence Probability
Symphyotrichum defoliatum San Bernardino aster	F: BLM, FS C: S2 CNPS: 1B.2 MSHCP: No	Vernally wet sites such as ditches, streams, and springs in many plant communities below 2,040 meters.	July - November	Absent. No records near the BSA and no suitable habitat onsite.

KEY TO TABLE 1

Definitions of occurrence probability:

Occurs: Observed on the site by Amec Foster Wheeler biologists, or recorded on-site by other qualified biologists.
High: Observed in similar habitat in region by qualified biologists, or habitat on the site is a type often utilized by the species and the site is within the known range of the species.
Moderate: Reported sightings in surrounding region, or site is within the known range of the species and habitat on the site is a type occasionally used by the species.
Low: Site is within the known range of the species but habitat on the site is rarely occupied by the species.
Absent: A focused study failed to detect the species, or, no suitable habitat is present.
Unknown: Distribution and habitat use has not been clearly determined.

Federal designations: (F = federal Endangered Species Act or federal agency designations)
END: Federally listed, Endangered
THR: Federally listed, Threatened
CAN: Candidate for Federal listing
BLM = Bureau of Land Management Sensitive
FS: Forest Service sensitive
ND: No designation

***State designations*:** (C = California Endangered Species Act or CDFG designations)
END: State listed, Endangered
THR: State listed, Threatened
CAN: Candidate for State listing
RARE: State listed, Rare
FP: Fully Protected Species
SSC: Species of Special Concern
WL: Watch List Species
ND: No designation

CDFW state rankings are a reflection of the overall condition of an element throughout its California range. The number after the decimal point represents a threat designation attached to the rank:
S1 = Critically Imperiled. Less than (<) 6 Element Occurrences (EOs) OR < 1,000 individuals OR < 2,000 acres
  S1.1 = very threatened
  S1.2 = threatened
  S1.3 = no current threats known
S2 = Imperiled. 6-20 EOs OR 1,000-3,000 individuals OR 2,000-10,000 acres
  S2.1 = very threatened
  S2.2 = threatened
  S2.3 = no current threats known
S3 = Vulnerable. 21-80 EOs OR 3,000-10,000 individuals OR 10,000-50,000 acres
  S3.1 = very threatened
  S3.2 = threatened
  S3.3 = no current threats known
S4 = Apparently Secure. Uncommon but not rare in the state; some cause for long-term concern.
S5 = Secure. Common, widespread, and abundant in the state.
SH = All known California sites are historical, not extant

MSHCP designations (Riverside County only)
Yes: Covered by the plan

No: Not covered by the plan

California Native Plant Society (CNPS) designations (Rare Plant Ranks):

Primary Categories (Lists)
1A: Plants presumed extirpated in California and either rare or extinct elsewhere
1B: Plants rare, threatened, or endangered in California and elsewhere
2A: Plants presumed extirpated in California, but common elsewhere
2B: Plants rare, threatened, or endangered in California, but more common elsewhere
3: Plants about which more information is needed - a Review List
4: Plants of limited distribution - a Watch List
Subdivisions within Categories (threat ranks)
0.1: Seriously threatened in California
0.2: Moderately threatened in California
0.3: Not very threatened in California

According to the CDFW (Special Plants): "all California Rare Plant Rank 1 and 2 and some Rank 3 and 4 plants may fall under Section 15380 of CEQA."

5.4.2 Sensitive Wildlife Species

Wildlife species may be considered "sensitive" due to declining populations, vulnerability to habitat change or loss, or because of restricted distribution. Three sensitive wildlife species were observed on the study area during the field survey, loggerhead shrike (*Lanius ludovicianus*), horned lark (*Eremophila alpestris*), and San Diego black-tailed jackrabbit (*Lepus californicus bennettii)*. All three species are covered adequately under the existing MSHCP and no additional protocol surveys are required.

Invertebrates – Of the two special status invertebrates known from the BSA, one is presumed absent due to lack of habitat and/or extirpation (Jerusalem cricket). The habitats of the second, Crotch bumble bee (*Bombus crotchii*), are little known, but several of its host plants are known to occur within the project site. It is not listed as threatened and/or endangered. None were observed during the habitat assessment site visit.

Fish – No special status fish species have been recorded to occur within the vicinity of the project site. No fish or fish habitat was observed during the habitat assessment site visit.

Amphibians – Two special status amphibian species, southern mountain yellow-legged frog (*Rana muscosa*) and western spadefoot (*Spea hammondii*), are known to occur within the vicinity of the BSA. No suitable habitat occurs within the BSA for either of these species.

Reptiles – Of the five special status reptiles known to occur within the vicinity of the BSA, three have a high potential to occur. These include: (Belding's) orange-throated whiptail (*Aspidoscelis hyperythra*), coastal western whiptail (*Aspidoscelis tigris stejnegeri*), and (northern) red-diamond rattlesnake (*Crotalus ruber*). The other two species, California (coastal) glossy snake (*Arizona elegans occidentalis*) and coast (San Diego) horned lizard (*Phrynosoma blainvillii*) have a moderate potential to occur. None of the five species were observed during the site visit.

Birds – Two special status bird species have been recorded within the BSA and are considered present California horned lark and loggerhead shrike. Five sensitive avian species are considered absent, Ferruginous hawk (*Buteo regalis*), purple martin (*Progne subis*), yellow

warbler (*Setophaga petechia*), Le Conte's thrasher (*Toxostoma lecontei*), and least Bell's vireo (*Vireo bellii pusillus*). Suitable habitat for these species does not occur within the project site. Of the remaining three species, the coastal California gnatcatcher (*Polioptila californica californica*) is the only federally listed threatened species. This species has a moderate potential to occur, due to a known recorded occurrence in the vicinity of the project site, but a general lack of suitable coastal sage scrub habitat. The remaining two species, both of which are unlisted, have varying potentials for occurrence which are shown in Table 3 below. The other two species are Southern California rufous-crowned sparrow (*Aimophila ruficeps canescens*) and burrowing owl (*Athene cunicularia*).

Burrowing owl is treated differently than most unlisted birds because they are uniquely vulnerable to ground disturbance. This is because they roost and nest underground. No suitable habitat (i.e. burrows) or other man-made structures (i.e. pipes, concrete refuge, etc.) suitable for burrowing owl use were observed on-site during the reconnaissance-level survey. Marginal, low quality burrowing owl foraging habitat (i.e. scattered pockets of non-native grasslands) were found within the project boundary of the site at the time of the surveys. The nearest known burrowing owl occurrence is approximately 3 miles northeast of the project site (Scott Crawford personal observation 2008). Due to the low potential for burrowing owls to forage on the site at any time in the future, and considering that construction is not scheduled to occur within the next six months, it is a requirement of the MSHCP that a 30-day pre-construction clearance survey be conducted immediately prior to commencement of construction activities to ensure no owls have migrated onto the site to prevent impacts to any burrowing owls.

Mammals – Of the seven special status mammal species known occur within the vicinity of the BSA, only one, the San Diego black-tailed jackrabbit is the only species recorded to be present within the BSA. The Palm Springs round-tailed ground squirrel (*Xerospermophilus tereticaudus chlorus*) is the only species considered to be absent. The one local record was far out of range and believed to be a vagrant. The remaining five species, all of which are unlisted, have varying potentials for occurrence which are shown in Table 3 below. Three of the mammal species have a moderate potential to occur and are not covered under the MSHCP including pallid bat (*Antrozous pallidus*), pallid San Diego pocket mouse (*Chaetodipus fallax pallidus*), and American badger (*Taxidea taxus*). Although the pallid bat has a moderate potential to occur on-site, it is in reference to foraging and not roosting. The project site has no rocky areas or similar habitat that would provide suitable roosting areas. The incremental loss of foraging habitat within the project site would not constitute a significant impact because there is an abundance of similar foraging habitat to the east and south of the project. Pallid San Diego pocket mouse is not a federal or state listed threatened or endangered species. The only suitable habitat is within the active portion of Drainage 1, which will be mostly avoided. The loss of a small portion of the drainage will not reduce the population of pallid San Diego Pocket mouse to a less than self-sustaining level. Therefore, even if present in low numbers, impacts to this species would not constitute a significant impact under CEQA guidelines. No American badger or any sign of this species was observed during the reconnaissance-level survey. This species is known to occur throughout the area in large open-space areas. Due to the relatively isolated nature of the project site, situated between Interstate 10 and the Banning Airport, it is reasonable to assume that this species potential to occur within the project site is lower than the surrounding areas. However, the presence of this species can't be completely ruled out, due to the size of the

suitable habitat within the project site. A biological monitor is required during initial vegetation removal and any initial soil disturbance to ensure that no American badgers are impacted by project development.

Table 3. Special Status Animals

Species	Protective Status (F=Federal; C=California)	Habitat	BSA Occurrence Probability
Invertebrates			
Bombus crotchii Crotch bumble bee	F: ND C: S1S2 MSHCP: No	Occurs in open grassland and scrub habitats. Host plants include Asclepias, Chaenactis, Lupinus, Medicago, Phacelia, and Salvia sp.	Low Little is known about this species preferred habitat, but food plants occur on-site & records are scattered around the BSA.
Stenopelmatus cahuilaensis Coachella Valley Jerusalem cricket	F: ND C: S1S2 MSHCP: No	Desert dune habitats	Absent No suitable habitat in BSA. No recorded occurrences in the vicinity.
Amphibians			
Rana muscosa *Southern mountain yellow-legged frog*	F: END C: END, WL MSHCP: Yes	Aquatic habitats with sloping banks with rocks and vegetation to the water's edge. Seldom found away from water.	Absent No suitable habitat in BSA. No recorded occurrences in the vicinity.
Spea hammondii western spadefoot	F: BLM C: SSC, S3 MSHCP: Yes	Occurs primarily in grassland habitats, but can be found in valley-foothill hardwood woodlands. Vernal pools are essential for breeding and egg-laying.	Absent No vernal pool or ponded habitat in BSA. No recorded occurrences in the vicinity.
Reptiles			
Arizona elegans occidentalis California (coastal) glossy snake	F: ND C: SSC, S2 MSHCP: No	Reported from a range of scrub and grassland habitats, often with loose or sandy soils.	Moderate Suitable habitat present in BSA.
Aspidoscelis hyperythra (Belding's) orange-throated whiptail	F: FS C: WL, S2S3 MSHCP: Yes	Prefers chaparral, coastal sage scrub, juniper woodland, and oak woodland.	High Known from recent records in vicinity of BSA. Ample suitable habitat in BSA.
Aspidoscelis tigris stejnegeri coastal western whiptail	F: ND C: SSC, S3 MSHCP: Yes	Wide variety of habitats including coastal sage scrub, sparse grassland, and riparian woodland; coastal and inland valleys and foothills; Ventura County to Baja California.	High Suitable habitat present in BSA.

Species	Protective Status (F=Federal; C=California)	Habitat	BSA Occurrence Probability
Crotalus ruber (northern) red-diamond rattlesnake	F: FS C: SSC, S3 MSHCP: Yes	Chaparral, woodland, grassland, & desert areas. Occurs in rocky areas and dense vegetation. Needs rodent burrows, cracks in rocks or surface cover objects.	High Suitable habitat present in BSA.
Phrynosoma blainvillii coast (San Diego) horned lizard	F: BLM C: SSC, S3S4 MSHCP: Yes	Occurs in many scrub and woodland habitats, grasslands; loose soils. Prefers open country, especially sandy areas, washes, and floodplains. Requires open areas for sunning, bushes for cover, ants.	Moderate Potential habitat patches present in BSA.
Birds			
Aimophila ruficeps canescens Southern California rufous-crowned sparrow	F: MBTA C: WL, S3, FGC MSHCP: Yes	Steep, rocky coastal sage scrub and open chaparral habitats, particularly scrubby areas mixed with grasslands. From Santa Barbara County to northwestern Baja California.	High Suitable habitat present in BSA and there are recent nearby records.
Athene cunicularia burrowing owl	F: BCC, BLM, MBTA C: SSC, S3, FGC MSHCP: Yes	Occupies ground squirrel burrows in open, dry grasslands, agricultural, railroad rights-of-way, and margins of highways, golf courses, and airports. Often utilizes man-made structures, such as earthen berms, cement culverts, cement, asphalt, rock, or wood debris piles. Nests in burrows, drainpipes, and piles of debris in grasslands, scrub habitats, and agricultural areas.	Low Potential habitat scattered throughout BSA, but no suitable burrows. Recorded to occur within 5-miles of the site.
Buteo regalis ferruginous hawk	F: BCC, MBTA C: WL, S3S4, FGC MSHCP: Yes	Open terrain, grasslands, deserts.	Nesting: Absent BSA not in breeding range. Foraging: Moderate In winter and migration.
Eremophila alpestris actia California horned lark	F: MBTA C: WL, S4, FGC MSHCP: Yes	Open grasslands and fields, agricultural area, open montane grasslands with very short or no vegetation, including bare agricultural fields. During the breeding season, this species is found in short grassland, short-stature sage shrubland, and desert habitat.	Present Observed in isolated patches of grasslands and disturbed roads in BSA.
Lanius ludovicianus loggerhead shrike	F: BCC, MBTA C: SSC, S4, FGC MSHCP: Yes	Found in open habitats with widely spaced vegetation.	Present Observed in the southeastern corner of the BSA.
Polioptila californica californica coastal California gnatcatcher	F: **THR**, MBTA C: SSC, S2, FGC MSHCP: Yes	Inhabits sage scrub in low-lying foothills and valleys, and sparse chaparral habitats.	Moderate Potential habitat patches present in BSA. Amec Foster Wheeler surveys in the surrounding area in recent years have found the species, but not observed on-site. The BSA is located at the eastern extent of this species range.

Species	Protective Status (F=Federal; C=California)	Habitat	BSA Occurrence Probability
Progne subis purple martin	F: MBTA C: SSC, S3, FGC MSHCP: Yes	Inhabits woodlands, coniferous forest often in tall, isolated tree/snag.	Absent No suitable habitat in BSA, remnant population in our area breeds in montane settings.
Setophaga petechia yellow warbler	F: BCC, MBTA C: SSC, S3S4, FGC MSHCP: Yes	Riparian plant associations in close proximity to water. Also nests in montane shrubbery in open conifer forests in Cascades and Sierra Nevada. Frequently found nesting and foraging in willow shrubs and thickets, and in other riparian plants including cottonwoods, sycamores, ash,& alders	Absent No recorded occurrences within the project site and no suitable habitat within the BSA.
Toxostoma lecontei LeConte's thrasher	F: BCC C: CSC (San Joaquin population only) State rank: S3 MSHCP: No	Resident of open desert wash, scrub, alkali scrub, succulent scrub habitats, nests in dense spiny shrubs and cacti in washes	Absent (Site lacks dense, spiny shrubs for nesting habitat)
Vireo bellii pusillus least Bell's vireo	F: END, MBTA C: END, S2, FGC MSHCP: Yes	Inhabits riparian forests and willow thickets. Nests from central California to northern Baja California and winters in southern Baja California.	Absent No recorded occurrences within the project site and no suitable habitat within the BSA.
Mammals			
Antrozous pallidus pallid bat	F: BLM, FS C: SSC, S3 WBWG: H MSHCP: No	Deserts, grasslands, shrublands, woodlands & forests. Most common in open, dry habitats with rocky areas for roosting. Roosts must protect bats from high temperatures. Very sensitive to disturbance of roosting sites.	Moderate Potential foraging habitat is present, but no roosting areas present.
Chaetodipus fallax fallax Northwestern San Diego pocket mouse	F: ND C: SSC, S3S4 MSHCP: Yes	Found in sandy herbaceous areas, usually associated with rocks or coarse gravel in coastal scrub, chaparral, grasslands, and sagebrush.	Moderate Highest probability in the BSA is within the active wash area south of the project site.
Chaetodipus fallax pallidus Pallid San Diego pocket mouse	F: ND C: CSC State rank: S3S4 CVMSHCP: No	Found in sandy herbaceous areas, usually associated with rocks or coarse gravel in desert wash, desert scrub, desert succulent scrub, pinyon-juniper woodlands, etc. in desert border areas of Southern California into Mexico.	Moderate Marginal quality sandy habitat only occurs within Drainage A south of the project site, which is mostly avoided. No desert scrub, succulent scrub, or pinyon-juniper woodlands occur on-site.
Lepus californicus bennettii San Diego black-tailed jackrabbit	F: ND C: SSC, S3S4 MSHCP: Yes	Variety of habitats including herbaceous and scrub areas, early stages of open forest and chaparral. Most common in relatively open habitats. Restricted to the cismontane areas of Southern California.	High Extensive suitable habitat in the BSA, seen by Amec Foster Wheeler biologists in the general area.

Species	Protective Status (F=Federal; C=California)	Habitat	BSA Occurrence Probability
Perognathus longimembris brevinasus Los Angeles pocket mouse	F: ND C: SSC, S1S2 MSHCP: Yes	Lower elevation grasslands and coastal sage communities in and around the Los Angeles Basin on open ground with fine, sandy soils.	Moderate Highest probability in the BSA at the southeast corner of the shared utility line.
Taxidea taxus American badger	F: ND C: SSC, S3 MSHCP: No	Inhabits areas herbaceous, shrub, and open stages of most habitats with dry, friable soils.	Moderate Where contiguous open habitats are present in the BSA.
Xerospermophilus tereticaudus chlorus Palm Springs round-tailed ground squirrel.	F: ND C: SSC, S2 MSHCP: No	Chenopod scrub, Sonoran desert scrub	Absent No recorded occurrences within the project site and no suitable habitat within the BSA.

KEY TO TABLE

Definitions of occurrence probability:

Occurs: Observed on the site by Amec Foster Wheeler biologists, or recorded on-site by other qualified biologists.
High: Observed in similar habitat in region by qualified biologists, or habitat on the site is a type often utilized by the species and the site is within the known range of the species.
Moderate: Reported sightings in surrounding region, or site is within the known range of the species and habitat on the site is a type occasionally used by the species.
Low: Site is within the known range of the species but habitat on the site is rarely occupied by the species.
Absent: A focused study failed to detect the species, or, no suitable habitat is present.
Unknown: Distribution and habitat use has not been clearly determined.

***Federal designations*:** (F = federal Endangered Species Act or federal agency designations)
END: Federally listed, Endangered
THR: Federally listed, Threatened
CAN: Candidate for Federal listing
MBTA: Migratory Bird Treaty Act
BEPA: Bald Eagle Protection Act (also protects Golden Eagles)
BCC: Birds of Conservation Concern
BLM = Bureau of Land Management Sensitive
FS: Forest Service sensitive
ND: No designation

***State designations*:** (C = California Endangered Species Act or CDFG designations)
END: State listed, Endangered
THR: State listed, Threatened
CAN: Candidate for State listing
RARE: State listed, Rare
FP: Fully Protected Species
SSC: Species of Special Concern
WL: Watch List Species
FGC: Bird species protected by Fish and Game Code
ND: No designation

CDFW state rankings are a reflection of the overall condition of an element throughout its California range. The number after the decimal point represents a threat designation attached to the rank:

S1 = Critically Imperiled. Less than (<) 6 Element Occurrences (EOs) OR < 1,000 individuals OR < 2,000 acres
- **S1.1** = very threatened
- **S1.2** = threatened
- **S1.3** = no current threats known

S2 = Imperiled. 6-20 EOs OR 1,000-3,000 individuals OR 2,000-10,000 acres
- **S2.1** = very threatened
- **S2.2** = threatened
- **S2.3** = no current threats known

S3 = Vulnerable. 21-80 EOs OR 3,000-10,000 individuals OR 10,000-50,000 acres
- **S3.1** = very threatened
- **S3.2** = threatened
- **S3.3** = no current threats known

S4 = Apparently Secure. Uncommon but not rare in the state; some cause for long-term concern.
S5 = Secure. Common, widespread, and abundant in the state.
SH = All known California sites are historical, not extant

MSHCP designations (Riverside County only)
Yes: Covered by the plan
No: Not covered by the plan

Western Bat Working Group (WBWG) designations:
H = High: Species which are imperiled or are at high risk of imperilment based on available information on distribution, status, ecology and known threats.
M: = Medium: Species which warrant a medium level of concern and need closer evaluation, more research, and conservation actions of both the species and possible threats. A lack of meaningful information is a major obstacle in adequately assessing these species' status and should be considered a threat.
L: = Low: Species for which most of the existing data support stable populations, and for which the potential for major changes in status in the near future is considered unlikely. There may be localized concerns, but the overall status of the species is believed to be secure. Conservation actions would still apply for these bats, but limited resources are best used on High and Medium status species.
P: = Periphery: This designation indicates a species on the edge of its range, for which no other designation has been determined.

5.4.3 Special Status Vegetation Communities

Of the special status vegetation communities known from the general project area, none were observed and are considered to be absent.

Table 2. Special Status Vegetation Communities Potential for Occurrence

Community	Status (F=Federal, C=California)	Habitat		BSA Occurrence Probability
Southern Cottonwood Willow Riparian Forest	F: ND C: S3.2 MSHCP: No	Riparian forest community dominated by Fremont cottonwood and any of several species of willow. Trees are generally greater than 20 feet high.		**Absent**

KEY TO TABLE 2

Definitions of occurrence probability:
Occurs: Observed on the site by Amec Foster Wheeler biologists, or recorded on-site by other qualified biologists.
High: Observed in similar habitat in region by qualified biologists, or habitat on the site is a type often utilized by the species and the site is within the known range of the species.
Moderate: Reported sightings in surrounding region, or site is within the known range of the species and habitat on the site is a type occasionally used by the species.
Low: Site is within the known range of the species but habitat on the site is rarely occupied by the species.
Absent: A focused study failed to detect the species, or, no suitable habitat is present.
Unknown: Distribution and habitat use has not been clearly determined.

Federal designations: (F = federal Endangered Species Act or federal agency designations)
ND: No designation

***State designations*:** (C = California Endangered Species Act or CDFG designations)

CDFW state rankings are a reflection of the overall condition of an element throughout its California range. The number after the decimal point represents a threat designation attached to the rank:

S1 = Critically Imperiled. Less than (<) 6 Element Occurrences (EOs) OR < 1,000 individuals OR < 2,000 acres
- **S1.1** = very threatened
- **S1.2** = threatened

S5 = Secure. Common, widespread, and abundant in the state.
SH = All known California sites are historical, not extant

MSHCP designations (Riverside County only)
Yes: Covered by the plan
No: Not covered by the plan

5.4.4 Wildlife Corridors

The project site was assessed to determine if a wildlife corridor occurs on or within a portion of the project site. The project site does not lie within any designated MSHCP core linkages or proposed linkages; the nearest designated MSHCP core linkage lies approximately 9 miles east (Constrained Linkage 22). The project site does not connected any large blocks of undisturbed lands that may be used as a wildlife corridor. Localized wildlife species may utilize a portion of the project site as a daily travel path, but it is not part of a regional wildlife corridor.

The project site is within an area designated as a Special Linkage Area (SLA) under the MSHCP. Under the plan, project within the SLA require a separate assessment to determine if the proposed project provides connecting habitat for providing a corridor for wildlife movement. Since the project site is located between the Banning Airport and the I-10 corridor/Union Pacific Railroad right-of-way, and there is residential and commercial development to the west, it does not function as a wildlife corridor and does not provide an extension of contiguous habitat. Also, the project site is located on the eastern extent of the city of Banning development footprint and is adjacent to the undeveloped portion of the Morongo Reservation. The location of the project site will not inhibit any regional wildlife movement along the San Gorgonio Wash and does not result in the loss of contiguous lands.

5.4.5 Protection of Species Associated with Riparian/Riverine Areas and Vernal Pools (MSHCP Section 6.1.2)

Riparian avian species identified in Section 6.1.2 of the MSHCP, including southwestern willow flycatcher, western yellow-billed cuckoo, and least bell's vireo, require a separate habitat assessment in addition to the Riverside County Report Generator. Based on the MSHCP habitat assessment survey, there are individual riparian trees that are commonly found within

suitable habitat for these species, including arroyo willow and mule fat, but do not meet the density requirements or canopy cover to be considered suitable habitat for these species. The presence of one or two individual trees does not constitute a vegetation community, which is the basis for determining suitable habitat. Therefore, the project site does not contain any suitable habitat for southwestern willow flycatcher, western yellow-billed cuckoo, and least bell's vireo.

5.4.6 Burrowing Owl (MSHCP Section 6.3.2)

As mentioned previously, the project area lies within the MSHCP survey area for burrowing owl (Figure 5). The burrowing owl is an avian species of special concern that is protected by the MBTA and CFG Code Section 3503. This species typically occurs in grassland and scrub habitats characterized by low-growing vegetation with an abundance of small mammal burrows, including the California ground squirrel (*Otospermophilus beecheyi*). Burrowing owls often prefers areas with moderate disturbance and/or berms or drainage features. Reasons for burrowing owl population decline include habitat destruction, insecticide poisoning, rodenticide (particularly California ground squirrel eradication), and shooting.

No suitable habitat (i.e. low-growing vegetation with adequate sized burrows) or other manmade structures suitable for burrowing owl refuse (i.e. pipes, concrete refuge, etc.) were observed on-site. Marginal, low quality burrowing owl habitat (i.e. few isolated patches of non-native grasslands) were found at the time of the survey, but are not large enough to support a population of burrowing owl. Also, no suitable burrows or burrowing owl refuse was observed during the burrow survey. A single large burrow (estimated at 24 inches tall and 12 inches wide) was observed within dense scrub habitat along the northern property boundary and is most likely from a San Diego black-tailed jackrabbit based on the size and shape of the hole and the scat surrounding the opening. No sign of burrowing owl was observed during the survey. The nearest known burrowing owl occurrence is over three miles northeast of the project. Due to the low potential for burrowing owls to occur on the site at any time in the future, and considering that construction is not scheduled to occur within the next six months, it is a requirement of the MSHCP that a 30-day pre-construction clearance survey be conducted immediately prior to commencement of construction activities to ensure no owls have migrated onto the site to prevent impacts to any burrowing owls.

5.4.7 Los Angeles Pocket Mouse (MSHCP Section 6.3.2)

A portion of the proposed water line and proposed sewer line, south of the project site, occurs immediately adjacent to the MSHCP required survey area for Los Angeles pocket mouse. The majority of the suitable habitat in the vicinity of the BSA is associated with Smith Creek. However, there is some marginally suitable habitat at the southeastern corner of the utility line easement, but has been avoided by project realignment. The project off-site utility alignment was re-designed to be outside of the LAPM survey area. Therefore, focused surveys for Los Angeles pocket mouse will not be required.

5.4.8 Urban/Wildlands Interface Analysis (MSHCP 6.1.4)

The project site does not lie within and is not adjacent to any MSCHP Conservation Areas. The nearest Core (Core I) is approximately 2 miles north of the project site. Core K is located 3 miles south of the project site. However, the project site is located within Special Linkage Area subunit 3 (San Timoteo Creek Portion that connects San Gorgonio River/San Bernardino-San Jacinto Mountain Range). Thus, the project will require design features from MSHCP Section 6.1.4 "Guidelines Pertaining to the Urban/Wildlands Interface" to minimize potentially significant impacts associated with the Urban/Wildlands interface. Compliance with Section 6.1.4 of the MSHCP is covered under Section 6.3 below.

5.5 Drainages and/or Jurisdictional Waters

The project site contains six drainage features that meet the requirements to be considered riverine areas and/or jurisdictional water features. A jurisdictional delineation was prepared to assess the impacts to drainage features within the project site. A stand-alone jurisdictional delineation report is under separate cover. All drainage features contain sandy soils with gravel, cobbles, and boulders. There is no evidence of hydric soils and no wetland hydrology indicators. Although some riparian vegetation occurs along the edges of the drainage features, the majority of the channels are relatively un-vegetated. All six drainage features are considered non-wetland waters of the US/State, as well as riverine features under Section 6.1.2 of the MSHCP.

6.0 MSHCP DISCUSSION AND RECOMMENDATIONS

6.1 Migratory Bird Treaty Act

The project site contains suitable nesting habitat for ground-nesting birds protected under the MBTA such as killdeer (*Charadrius vociferous*), western meadowlark, and horned lark. Several large trees adjacent to the project site and several small bushes scattered throughout the project may also provide nesting habitat. Some common native birds that could potentially nest in the vegetation found within the project site include, but are not limited to: bushtit (*Psaltriparus minimus*), black phoebe (*Sayornis nigricans*), western kingbird (*Tyrannus verticalis*), house finch (*Haemorhous mexicana*), Bewick's wren (*Thryomanes bewickii*), mourning dove (*Zenaida macroura*), common raven (*Corvus corax*), and a variety of raptors.

Impacts to nesting birds, both direct and indirect, can be minimized or eliminated by conducting work activities outside of the breeding season. Although some nesting birds can occur year-round in Southern California, typical avian breeding season is from mid-February through the end of August, so it is recommended to schedule work from about early September through the end of January to avoid nesting activity. If work must be done during the nesting season, the project site and adjacent areas (500-foot buffer) should be examined by a qualified biologist prior to any ground disturbance or vegetation removal activities, especially where there could be any direct impacts to potential nest areas. If active nests are found, the nests should be avoided and a no disturbance buffer zone established and observed until young have fledged. While there is no established protocol for nest avoidance and buffer zones, when consulted the CDFW generally recommends avoidance buffers of 500 feet for raptors and listed species and 100–300 feet for other unlisted birds. Nest avoidance and buffer zones are decided on a case by case basis and can sometimes be reduced depending on a variety of factors including topography, vegetation structure and the species in question. Construction activity may encroach into the buffer area at the discretion of the biological monitor with CDFW concurrence.

6.2 Burrowing Owls

As previously mentioned above, the project site is located within the MSHCP Burrowing Owl Survey Area, which requires habitat assessment surveys for burrowing owl habitat and focused surveys where habitat is present. Based on the 2006 Rocks Biological Consulting Report, suitable habitat was not present and burrowing owl focused surveys were not recommended. Following the most recent site visit (May 2017), the existing habitat on-site is less suitable for burrowing owl than during the 2006 survey. Due to the recent 2017 rain events, the vegetation within the project site has grown higher, which has diminished the habitat suitability for burrowing owls. Although some isolated patches of grassland still remain within the project site, it is not sufficient to support a population of burrowing owl and is not considered suitable habitat. A burrow survey was conducted on the site and only a single burrowing, assumed to be a San Diego black-tailed jackrabbit based on the size and shape of the hole and the scat surrounding the opening. No sign of burrowing owl was observed during the survey.

However, due to the presence of marginally suitable foraging habitat, it is a requirement of the MSHCP that prior to any project-related ground disturbance or vegetation removal a 30-day pre-construction clearance survey be conducted prior to construction activities. This will ensure that burrowing owls that may have migrated onto the project site and/or adjacent to the project site are avoided during project implementation.

6.3 Los Angeles Pocket Mouse

The Los Angeles pocket mouse is a California species of concern and a covered species under the MSHCP. This species likely occurs in patchy distribution in relation to soils and habitat conditions. Although this species is widespread within the MSHCP area, it is uncommon. Although the size and extent of the current populations of Los Angeles pocket mouse in the Plan Area is unknown, the key populations are well understood. Most of the key populations are already conserved within the MSHCP conservation areas. With the exception of populations in Temecula and Murrieta, it is unlikely that additional key populations will need conserving. Currently, the proposed project site is extremely fragmented from either Core I or Core K, and conservation of the area identified as potential Los Angeles pocket mouse adjacent to the project utility line easement is not suitable for long term conservation (Figure 5). In addition, the installation of the utility lines will be a temporary impact and will not permanently affect any Los Angeles pocket mouse habitat, even though it is outside of the required survey area. Based on the 2015 habitat assessment report from Rocks Biological Consulting, no additional surveys are required for this species within the main project site. Also, due to the relocation of the utility lines outside of the LAPM survey area, a protocol survey for LAPM will not be required.

6.1 Narrow Endemic Plant Species

Although located within a MSHCP designated NEPSSA for Marvin's onion and many-stemmed dudleya, suitable chaparral and/or clay soil habitats are not present on the project site. No further action or consideration of narrow endemic plant species is required.

6.2 MSHCP Criteria Cells, Cores, and Linkages

Criteria Area Cells are lands where the MSHCP reserve system is being assembled. The project site is not within or located directly adjacent to the criteria cell and thus will not contribute to any connectivity to the Criteria Cell(s) or its conservation objectives.

6.3 Urban/Wildlands Interface Analysis (MSHCP 6.1.4)

The entire project site is located within Special Linkage Area subunit 3 (San Timoteo Creek Portion that connects San Gorgonio River/San Bernardino-San Jacinto Mountain Range). To minimize indirect impacts to the adjacent open-space lands that are located to the east, the following recommendations pertaining to urban/wildlands interface should be implemented. With these guidelines implemented, no significant impacts are likely to occur to the adjacent wildlands or the SLA. Guidelines Pertaining to Urban/Wildlands Interface for the management of

edge factors such as lighting, urban runoff, toxics, and noise are presented in Section 6.1.4 of the MSHCP document.

• **Drainages.** The project will comply with State water quality permitting requirements under Federal Clean Water Act (CWA) Section 402, Storm Water Discharge and Wastewater Discharge Requirements; National Pollution Discharge Elimination System (NPDES) and local ordinances (Storm Water Pollution Prevention Plan [SWPPP]). The Regional Water Quality Control Board (RWQCB) has issued Tentative Order No. R9-2010-0016, NPDES No. CAS-0108766. The proposed storm water system modifications and water treatment facilities include construction of bio-strips, bio-swales, and potentially a detention basin. The new storm water facilities will be located within the along the eastern and western perimeter of the project site.

• **Toxics.** The project will incorporate measures to minimize the potential impacts of chemicals harmful or toxic to plants, animals, and water quality. These measures are detailed in the Storm Water Data Report.

• **Lighting.** Night lighting during and after construction will be shielded and directed away from the adjacent natural communities. Light beams from vehicle headlights will be blocked by road barriers and/or landscaping along the right-of-way. Shielding will be incorporated in project design to ensure ambient lighting in the habitat areas is not increased.

• **Noise.** According to the MSHCP Guidelines Pertaining to the Urban/Wildlands Interface Section 6.1.4, the MSHCP Conservation area should not be subject to noise greater than residential noise standards (50–65 Community Noise Equivalent Level [CNEL]). Noise levels during construction should be monitored to ensure that noise levels do not exceed the residential standard. A minimization measure in the form of a sound wall would be excessive since the existing ambient noise levels from the I-10 mainline (68–70 dBA Leq) would not be attenuated. Noise minimization measure suggestions for the interchange loop are planting native trees and shrubs in the temporary impact areas, if necessary.

• **Invasive Plants.** Plant species identified in any associated landscape plan or restoration plan for this project will not include plants identified as invasive such as, but not limited to, tamarisk, fountain grass, Arundo, and/or pampas grass, or

• **Barriers.** At this point, no barriers are currently designed along the eastern boundary, other than the proposed drainage feature to off-set impacts to on-site drainage features. Although this portion of the project site is immediately adjacent to an open-space area (Morongo Reservation), it is not part of a residential development and therefore there are no specific recommendation for perimeter fencing, other than for aesthetics.

• **Grading/Land Development.** Grading will be minimized to the extent feasible to construction the project site. The project perimeter will be staked or otherwise marked to identify the edges of grading and the limits of development. This will ensure that all grading activities and project development will be completely within the project footprint.

6.4 Riparian/Riverine Areas and Vernal Pools

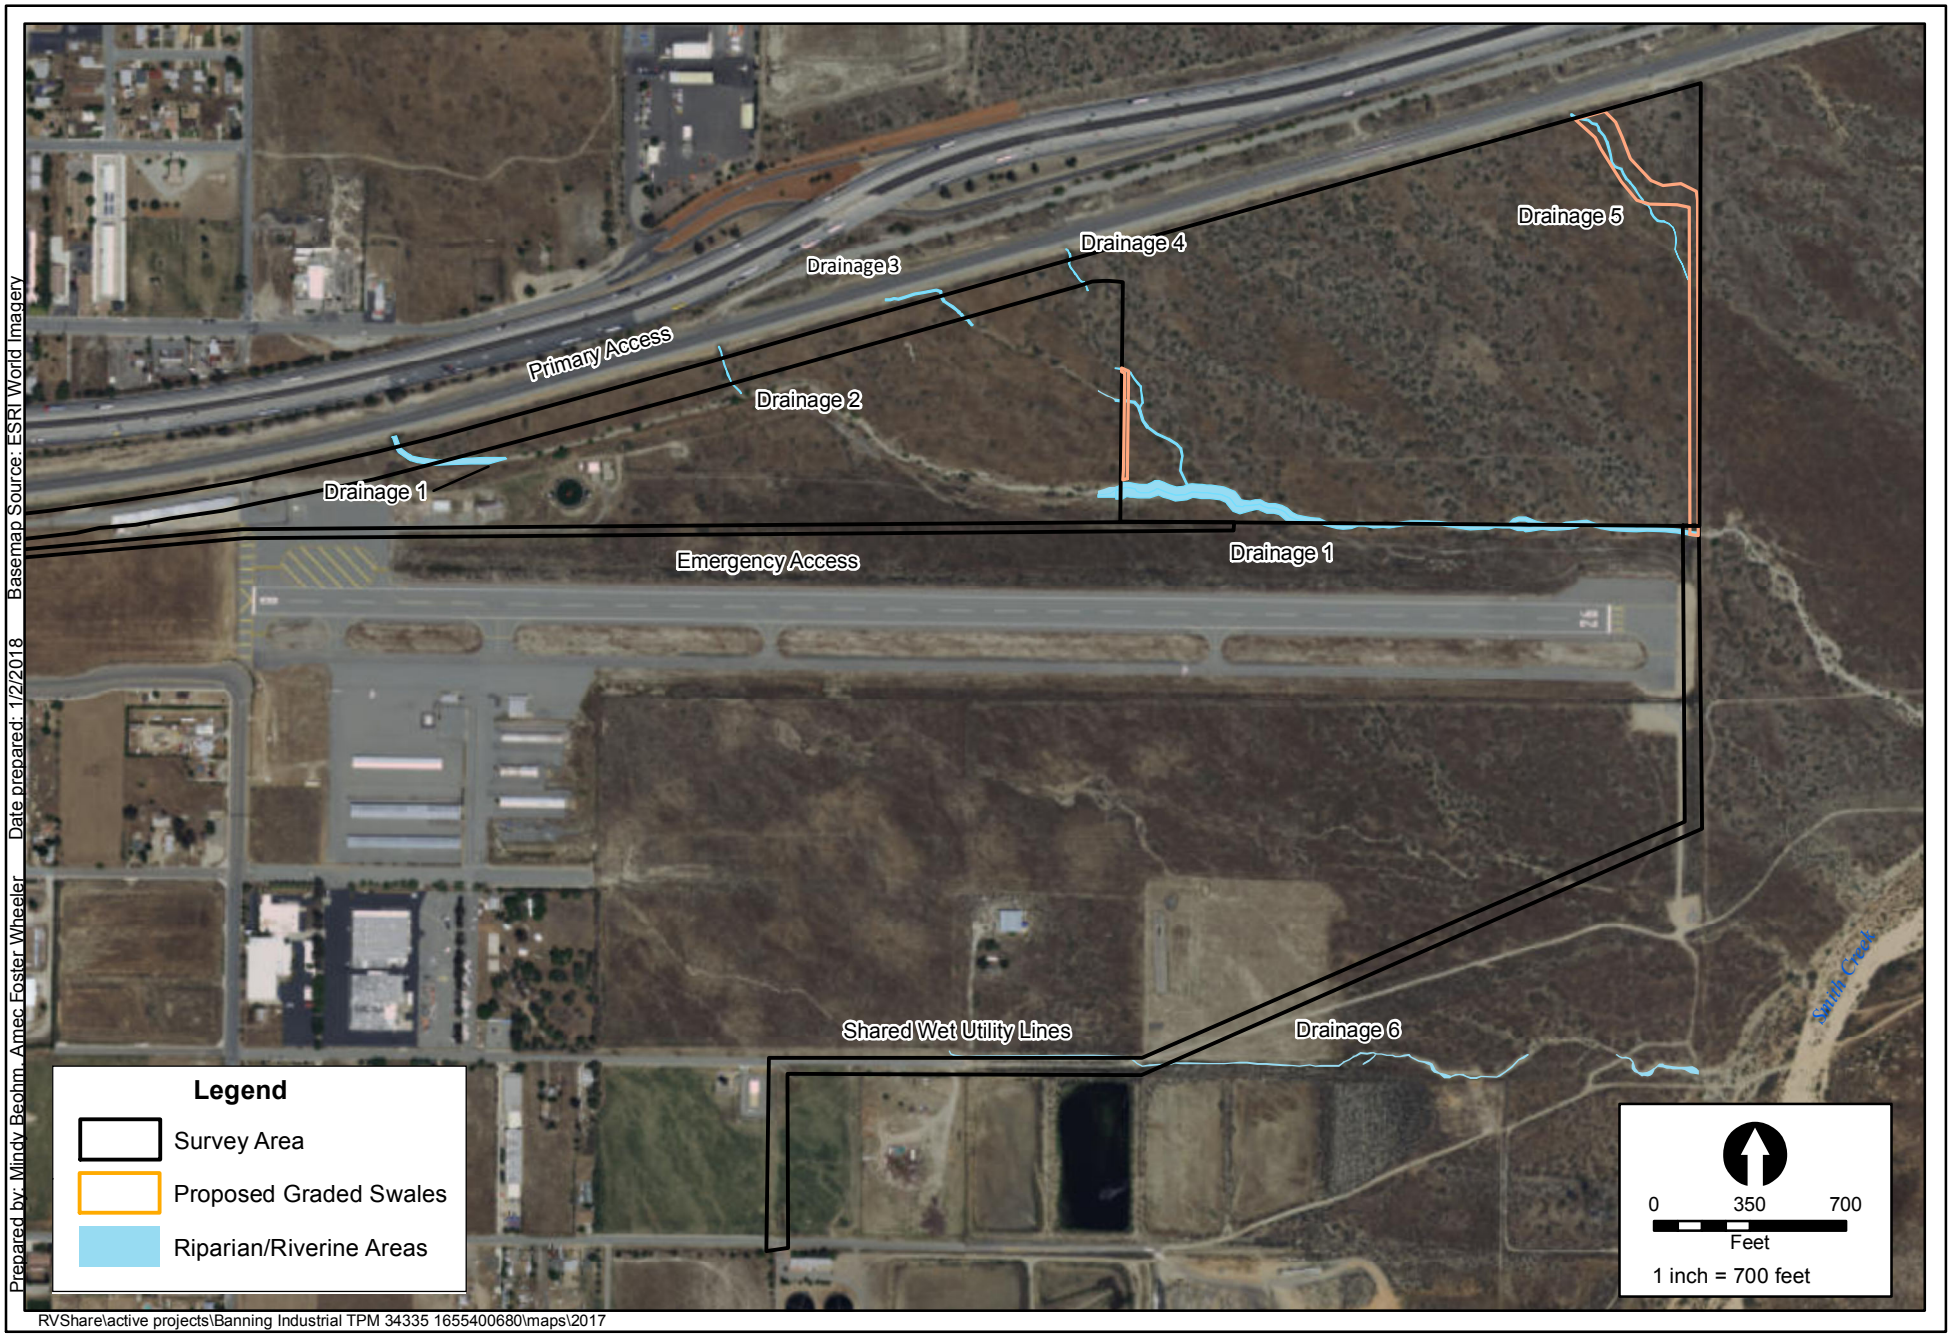
There are no vernal pools present within or adjacent to the project site. No additional actions are required for vernal pool compliance.

The project site contains six drainage features that are described as riparian/riverine features and convey storm flows from the project site to Smith Creek south of the project site (Figure 6). Although these drainage feature does not convey flows to a conservation area, they do flow into Smith Creek, which is considered a wildlife corridor and connects Cabazon with the Badlands. Therefore, any impacts to these riverine areas will require a DBESP report to discuss project related impacts and mitigation measures.

Based on the current project design (Figure 7), the proposed project will result in 0.23 acre of permanent impacts and 0.07 acres of temporary impacts to the riparian/riverine areas found within the project site, both on- and off-site. Proposed mitigation for project related impacts to riparian/riverine areas will include the creation of 1.20 acres of riparian/riverine areas will include on-site drainage creation of in-kind habitat, described below. Currently, there are no active mitigation banks or in-lieu fee programs in this area.

The proposed habitat creation areas will occur in two areas along the edges of the proposed development. The first area is located along the western edge of the project site boundary (Figure 7). A 30-foot wide low-flow drainage feature will be constructed along the western portion of the project site and will redirect flows from Drainages 3 and 4 to the south, around the development, and then empty into Drainage 1 south of the proposed development. The drainage will meander within the mitigation area creating a natural looking drainage for approximately 400 linear feet. The active channel will be approximately 0.27 acres and include in-kind replacement of non-wetland riparian scrub habitat.

The second feature will convey flows in a 20 to 30 foot wide channel along the eastern property boundary. The swale will have an overall length of 1,587 linear feet and includes approximately 0.93 acres.



Dominant vegetation within the mitigation area will consist of California encelia (*Encelia farinosa*) and coyote bush (*Baccharis pilularis*). The upland area adjacent to the riparian habitat will consist of California buckwheat (*Eriogonum fasciculatum*), California sagebrush (*Artemisia californica*), interior golden bush (*Ericameria linearifolia*), and deerweed (*Lotus scoparius*).

Under the MSHCP, the created habitat will be monitored by the project proponent for a minimum of 5 years; monitoring reports shall be provided to the City and appropriate regulatory agency on an annual basis. The restoration area must meet standardized success criteria as described in the Habitat Mitigation and Monitoring Plan, which is required as part of the permit process for a Streambed Alteration Agreement with the California Department of Fish and Wildlife. Since project related impacts within the site will all be permanent, no temporary impacts will occur.

Project related mitigation measures associated with the impacts to riparian/riverine areas will not conflict with the mitigation measures required by the United States Army Corps of Engineers, Regional Water Quality Control Board, and CDFW as part of the regulatory permitting process.

Since portion of some drainage features will be relocated along the edge of the project site, it will be maintained as a natural filter for potentially contaminated water flowing from I-10 and the adjacent railroad ROW to the north. The increased amount of flows, due to the impermeable surface associated with the proposed development will be maintained within a channel that is wider than the current channel, which will reduce any significant erosion or scouring caused by an increase in flows. The amount of project related direct and/or indirect impacts is relatively small, will be completely mitigated on-site and off-site, and will not have any significant downstream effects on conserved species. Typically, habitat creation areas established for the purpose of mitigation for impacts to riparian/riverine areas under the MSHCP are conserved in a conservation easement and managed with funds generated from a non-wasting endowment. However, due to the isolated nature of the proposed mitigation, a conservation easement may not be required since it will not contribute lands within or adjacent to an existing conservation area.

7.0 CONCLUSIONS

A biological resources assessment and MSHCP consistency analysis was conducted for the 63.9-acre Banning Industrial Park project site along with the off-site infrastructure improvements needed to support the project development (An additional 8.0 acres). The project site is located within the MSHCP designated burrowing owl survey area; no suitable nesting habitat and marginally suitable foraging habitat for the burrowing owl was found on-site. No burrowing owls or their sign (i.e. pellets, white wash, or feathers) were detected during the burrowing owl burrow survey. A pre-construction/clearance survey, conducted no more than 30 days prior to site disturbance is required to ensure that burrowing owls have not colonized the site prior to initiating construction activities.

The project site and off-site infrastructure improvements are located within the MSHCP designated narrow endemic plant survey area. There is no suitable habitat on-site for either of these two narrow endemic plant species (Marvin's onion and many-stemmed dudleya). The project site does not lie within any linkage or proposed linkages and does not connect any large blocks of undisturbed lands that may be used as a wildlife corridor. The proposed project does occur immediately adjacent to open space areas of the Morongo Reservation.

The project site is located adjacent to the MSHCP designated Los Angeles pocket mouse survey area, but not within (See Figure 5). Project development will not impact any portion of the LAPM survey area. Therefore, a protocol survey for Los Angeles Pocket Mouse is not required since the alignment of the utility line was redesigned to avoid this area. Due to the fragmented nature of the habitat on-site the project is not suitable for any long-term conservation under the Plan. The project site will not impede any future dispersal of this species and is not connected to any large blocks of conservation areas. Therefore, additional mitigation for impacts to this species are not required.

The non-native grasslands and a few large trees and shrubs located on and/or immediately adjacent to the project site provide suitable nesting habitat for raptors, common ravens and various songbirds protected by the MBTA. If ground disturbance and/or vegetation removal occurs during the nesting bird season (mid-February through the end of August) a pre-construction clearance survey will be required to avoid any indirect impacts to nesting birds.

The project site contains six drainage features (Figure 6) that are described as waters of the US/State and qualify as riparian/riverine features under the MSHCP. Prior to obtaining a grading permit, all regulatory permits will be required including the 404 permit from USACE, 401 Certification from RWQCB, and 1602 permit from CDFW. In addition, impacts to riparian/riverine areas will require a DBESP report to discuss project related impacts and mitigation measures. Both the Jurisdictional Delineation and DBESP are prepared under separate cover. The

preferred mitigation for impacts to on-site drainage features is on-site creation of 1.20 acres of in-kind desert scrub habitat within an ephemeral drainage feature.

Based on the biological resources assessment and MSHCP consistency analysis, the development of the Banning Industrial Park project and associated off-site infrastructure improvements, following the above mentioned avoidance/minimization measures and proposed mitigation measures, will ensure that the proposed project is consistent with the MSHCP.

8.0 CERTIFICATION

I hereby certify that the statements furnished above and in the attached exhibits present data and information required for this biological evaluation, and that the facts, statements, and information presented are true and correct to the best of my knowledge and belief.

APPENDIX A

Plant & Wildlife Species List

Fauna Compendium

Pieridae		**Whites, Sulphurs, and Orangetips**
Pieris	*rapae*	cabbage white
Riodinidae		**Metalmarks**
Apodemia	*mormo virgulti*	Behr's metalmark
Phrynosomatidae		**Lizards**
Sceloporus	*occidentalis*	western fence lizard
Cathartidae		**Vultures**
Cathartes	*aura*	turkey vulture
Accipitridae		**Hawks**
Buteo	*jamaicensis*	red-tailed hawk
Aquila	*chrysaetos*	golden eagle
Falconidae		**Falcons**
Falco	*sparverius*	American kestrel
Charadriidae		**Plovers**
Charadrius	*vociferus*	killdeer
Columbidae		**Pigeons/Doves**
Zenaida	*macroura*	mourning dove
Trochilidae		**Hummingbirds**
Calypte	*anna*	Anna's hummingbird
Tyrannidae		**Flycatchers**
Sayornis	*nigricans*	black phoebe
Sayornis	*saya*	Say's phoebe
Tyrannus	*verticalis*	western kingbird
Laniidae		**Shrikes**
Lanius	*ludovicianus*	loggerhead shrike
Corvidae		**Jays/Crows**
Corvus	*corax*	common raven
Alaudidae		**Larks**
Eremophila	*alpestris*	horned lark
Hirundinidae		**Swallows**
Stelgidopteryx	*serripennis*	northern rough-winged swallow
Aegithalidae		**Bushtits**
Psaltriparus	*minimus*	bushtit
Troglodytidae		**Wrens**
Thryomanes	*bewickii*	Bewick's wren
Parulidae		**New world warblers**
Dendroica	*coronata*	yellow-rumped warbler
Emberizidae		**Warblers, sparrow, etc.**
Zonotrichia	*leucophrys*	white-crowned sparrow

Fauna Compendium

Icteridae		**New world blackbirds**
Sturnella	*neglecta*	western meadowlark
Fringillidae		**Finches**
Haemorhous	*mexicanus*	house finch
Carduelis	*psaltria*	lesser goldfinch
Leporidae		**Hares and Rabbits**
Lepus	*californicus*	black-tailed jackrabbit
Sylvilagus	*audubonii*	desert cottontail
Sciuridae		**Squirrels**
Otospermophilus	*beecheyi*	California ground squirrel
Geomyidae		**Pocket Gophers**
Thomomys	*bottae*	Botta's pocket gopher
Canidae		**Wolves and Foxes**
Canis	*latrans*	coyote

Flora Compendia

Amaranthaceae		**Amaranth Family**
Amaranthus	*albus*	tumbling pigweed
Anacardiaceae		**Sumac or Cashew Family**
Schinus	*molle*	Peruvian pepper tree
Asteraceae		**Sunflower Family**
Ambrosia	*acanthicarpa*	annual bursage
Ambrosia	*psilostachya*	western ragweed
Ambrosia	*salsola*	cheese bush
Artemisia	*californica*	California sagebrush
Baccharis	*salicifolia*	mule fat
Centaurea	*solstitialis*	yellow star-thistle
Chaenactis	*sp.*	unknown pincushion species
Conyza	*canadensis*	horseweed
Corethrogyne	*filaginifolia*	California aster
Cotula	*coronopifolia*	brass-buttons
Encelia	*farinosa*	brittlebush
Ericameria	*linearifolia*	interior goldenbush
Gnaphalium	*californicum*	California everlasting
Helianthus	*annuus*	common sunflower
Hemizonia	*paniculata*	San Diego tarweed
Heterotheca	*grandiflora*	telegraphweed
Logfia	*californica*	California cottonrose
Senecio	*flaccidus*	threadleaf ragwort
Senecio	*vulgaris*	common groundsel
Stephanomeria	*virgata*	twiggy wreathplant
Tetradymia	*comosa*	hairy horsebrush
Boraginaceae		**Borage Family**
Amsinckia	*menziesii*	Menzies' fiddleneck
Heliotropium	*curassivicum*	saltmarsh heliotrope
Brassicaceae		**Mustard Family**
Brassica	*tournefortii*	Asian mustard
Hirschfeldia	*incana*	short-podded mustard
Cactaceae		**Cactus Family**
Cylindropuntia	*california var. parkeri*	cane cholla
Opuntia	*basilaris*	beavertail cactus
Chenopodiaceae		**Goosefoot Family**
Salsola	*tragus*	Russian thistle
Cucurbitaceae		**Gourd Family**
Cucurbita	*foetidissima*	calabazilla
Cucurbita	*palmata*	coyote gourd

Flora Compendia

Marah	*macrocarpus*	wild cucumber
Elaeagnaceae		**Oleaster Family**
Elaeagnus	*angustifolia*	oleaster
Euphorbiaceae		**Spurge Family**
Chamaesyce	*albomarginata*	rattlesnake weed
Croton	*californicus*	California croton
Fabaceae		**Legume Family**
Acacia	*greggii*	catclaw acacia
Lotus	*scoparius*	common deerweed
Lupinus	*hirsutissimus*	stinging lupine
Lupinus	*succulentus*	arroyo lupine
Geraniaceae		**Geranium Family**
Erodium	*botrys*	broadleaf filaree
Erodium	*cicutarium*	red-stemmed stork's bill
Lamiaceae		**Mint Family**
Salvia	*columbariae*	chia
Trichostema	*lanatum*	woolly bluecurls
Nyctaginaceae		**Four O'Clock Family**
Mirabilis	*laevis var. crassifolia*	California wishbone bush
Polygonaceae		**Buckwheat Family**
Eriogonum	*fasciculatum*	California buckwheat
Rhamnaceae		**Buckthorn Family**
Ceanothus	*sp.*	unknown ceanothus sp.
Salicaceae		**Willow Family**
Populus	*fremontii ssp. fremontii*	Fremont cottonwood
Salix	*gooddingii*	Goodding's willow
Salix	*lasiolepis*	arroyo willow
Simaroubaceae		**Quassia Family**
Ailanthus	*altissima*	tree of heaven
Solanaceae		**Nightshade Family**
Datura	*wrightii*	jimson weed
Nicotiana	*glauca*	tree tobacco
Tamaricaceae		**Tamarisk Family**
Tamarix	*sp.*	unknown tamarisk sp.
Agavaceae		**Agave Family**
Yucca	*schidigera*	Mohave yucca
Poaceae		**Grass Family**
Avena	*barbata*	slender oat
Avena	*fatua*	wild oat

Flora Compendia

Bromus	*diandrus*	ripgut brome
Bromus	*rubens*	red brome
Lamarckia	*aurea*	golden top grass
Themidaceae		**Brodiaea Family**
Dichelostemma	*capitatum*	blue dicks

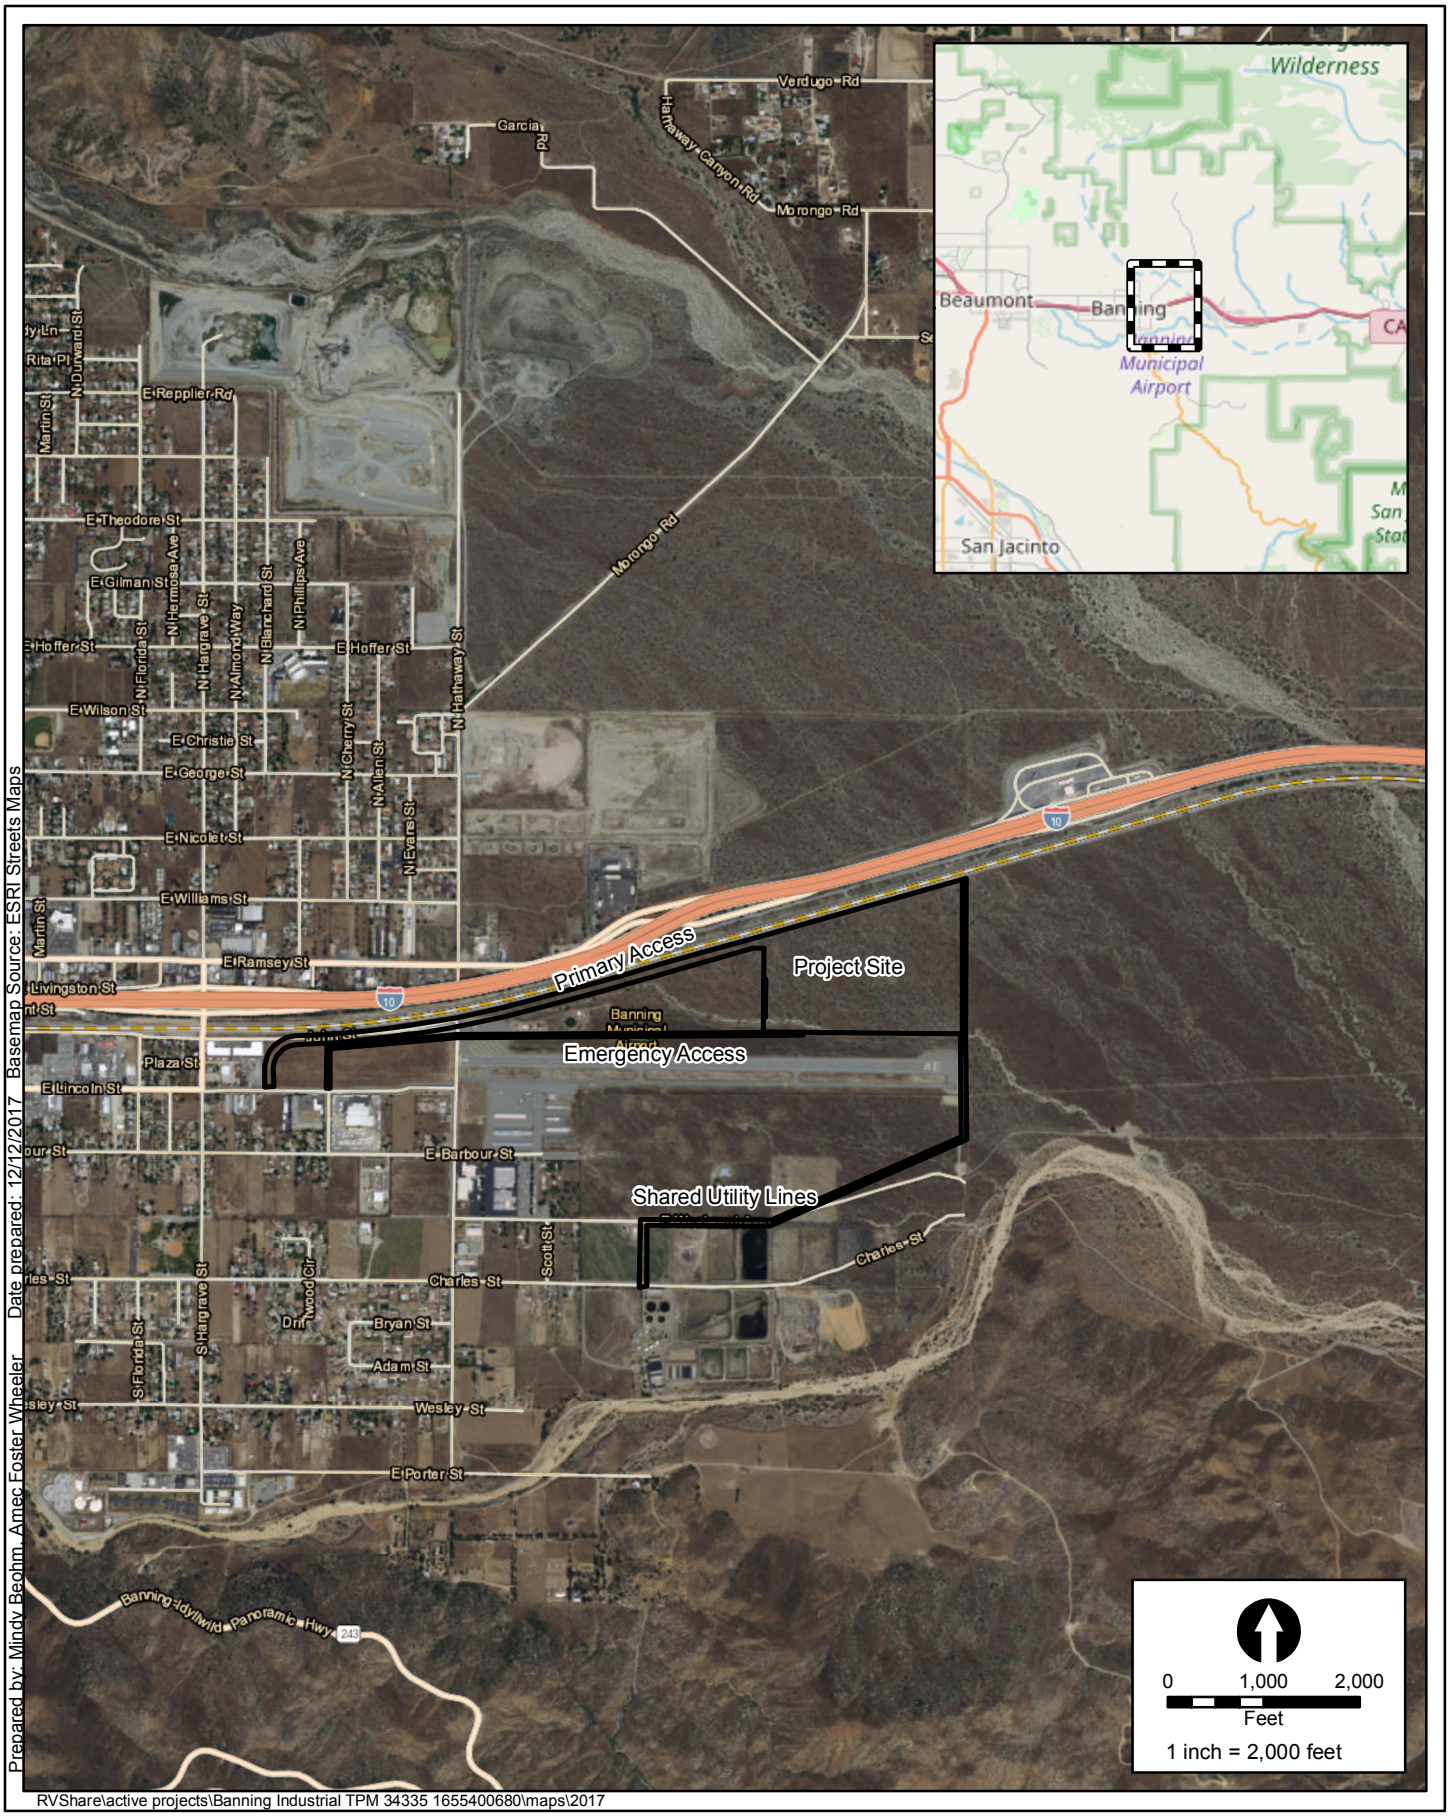
1.0 INTRODUCTION

Wood Environment and Infrastructure Solutions (Wood E&I Solutions) was contracted by Albert A. Webb Associates (Webb) to conduct a focused western burrowing owl (*Athene cunicularia hypugaea*) survey.

The proposed project involves the development of Assessor's Parcel Number (APN) 532-110-006, 532-130-001, and 532-130-002. The proposed project includes the development of the Banning Industrial Park, which includes industrial buildings, associated parking lot, detention basin, and associated infrastructure.

1.1 Project Description and Location



The proposed development of the parcel includes development of industrial buildings, a parking lot, detention basin, and associated off-site infrastructure including 5,968 linear feet of off-site sewer, 9,350 of off-site water utilities and 5,000 linear foot of emergency road access. These off-site infrastructure areas are also part of the project.

The project site and associated infrastructure is specifically located north of Charles Street, south of Interstate 10, and east of Hargrave Street (Figure 1) and can be found in Sections 11 and 14 of Township 3 South, Range 1 East, as shown on the *Cabazon, California,* United States Geological Survey (USGS) 7.5 minute quadrangle (Figure 2). The elevation of the project site ranges from 2,105 to 2,240 feet above sea level. The geographic coordinates near the middle of the site are 33° 55.520' North latitude and -116°50.767' West longitude.

1.2 Purpose and Need

The project site and off-site alignments are located within the MSHCP designated burrowing owl survey area. No suitable habitat (i.e. burrows) or other man-made structures (i.e. pipes, concrete refuge, etc.) suitable for burrowing owl use were observed on-site during the reconnaissance-level survey. Marginal, low quality burrowing owl foraging habitat (i.e. scattered pockets of non-native grasslands) were found within the project boundary of the site at the time of the biological assessment surveys. The nearest known burrowing owl occurrence is approximately 3 miles northeast of the project site (Wood E&I Solutions senior biologist Scott Crawford personal observation 2008). Due to marginal suitable habitat found onsite during previous surveys conducted by Wood E&I Solutions, Webb contacted Wood E&I Solutions to conduct a focused western burrowing owl survey to ensure no owls were present with adjacent areas where marginal suitable habitat for burrowing owl occurred.

2.0 EXISTING CONDITIONS

The proposed project site is currently an active airport with associated structures. Elevations on the proposed project site range from approximately 2,105 to 2,240 feet above sea level. Surrounding land use includes Union Pacific Railroad right-of-way and Intestate 10 to the north, Banning Airport to the south, existing rural residential development to the west, vacant Morongo-owned property to the east.

The project site is currently undeveloped with no existing structures. Desert scrub habitat dominates the site with small patches of disturbed non-native grasslands. The common desert scrub plants observed on-site include desert encelina (*Encelia farinosa*), California buckwheat (*Eriogonum fasciculatum*), and deer weed (*Acmispon glaber*). Non-native grassland species observed on-site include Russian thistle (*Salsola tragus*), wild mustard (*Hirschfeldia incana*), rip-gut grass (*Bromus diandrus*), and red-stemmed filaree (*Erodium cicutarium*).

The study area contains evidence of routine grazing by cattle. However, no cattle were observed within the project site during the survey. Cattle were observed in a pasture just south of the airport. Additionally, during the last day of surveys a tractor was observed grubbing and blading vegetation areas within the airport runway.

3.0 BURROWING OWL BACKGROUND

The western burrowing owl is listed as a “species of special concern” by the California Department of Fish and Wildlife (CDFW). Take of individual burrowing owls and their nests is prohibited by Fish and Game Code (FGC) sections 3503, 3503.5 and 3513. Take is defined in FGC Section 86 as “hunt, pursue, catch, capture or kill, or attempt to hunt, pursue, catch, capture or kill”. The western burrowing owl is also protected under the Migratory Bird Treaty Act.

In California, preferred habitat is generally typified by short, sparse vegetation with few shrubs, level to gentle topography and well-drained soils (Haug et al., 1993). Grassland, shrub steppe, and desert are naturally occurring habitat types used by the species. In addition, burrowing owls may occur in some agricultural areas, ruderal grassy fields, vacant lots and pastures if the vegetation structure is suitable and there are useable burrows and foraging habitat in proximity (Gervais et al., 2008). Burrows used by the owls are usually dug by other species termed host burrowers. In California, California ground squirrel (*Spermophilus beecheyi*) and round-tailed ground squirrel (*Citellus tereticaudus*) burrows are frequently used by burrowing owls but they may use dens or holes dug by other fossorial species including badger (*Taxidea taxus*), coyote (*Canis latrans*), and fox (Ronan, 2002). In some instances, owls have been known to excavate their own burrows (Thompson, 1971, Barclay 2007). Natural rock cavities, debris piles, culverts, and pipes also are used for nesting and roosting (Rosenberg et al., 1998).

In California, the breeding season for the burrowing owl typically occurs between 1 February and 31 August (Thompson, 1971, Gervais et al., 2008). Breeding behavior includes nest site selection by the male, pair formation, copulation, egg laying, hatching, fledging, and post-fledging care of young by the parents. The peak of the breeding season occurs between 15 April and 15 July and is the period when most burrowing owls have active nests (eggs or young). The incubation period lasts 29 days (Coulombe, 1971) and young fledge after 44 days (Haug et al., 1993).

This page intentionally left blank

4.0 METHODOLOGY

Burrowing owl surveys were conducted in accordance with the Burrowing Owl Survey Instructions for the Western Riverside Multiple Species Habitat Conservation Plan Area (County of Riverside, 2006). A burrowing owl habitat assessment was conducted on the project site on 9 May 2017 (AMEC, 2017). The habitat assessment no suitable habitat (i.e. burrows) or other man-made structures (i.e. pipes, concrete refuge, etc.) suitable for burrowing owl use on-site during the reconnaissance-level survey completed in 2017. However, marginal, low quality burrowing owl foraging habitat (i.e. scattered pockets of non-native grasslands) were found within the project boundary of the site at the time of the survey.

A focused burrow survey was then conducted during the breeding season which extends generally from March 1st to August 31st. The study area for the survey included the entire project site in addition to all suitable habitat within 500 feet of the project site boundary. The locations of all burrows suitable for habitation by burrowing owl were recorded. Survey transects were spaced <100 feet apart to allow for 100% visual coverage of the ground surface in areas accessible by foot. Areas not accessible (i.e. on private property, field adjacent to active airport runway) were surveyed using binoculars and/or spotting scopes to determine if owls were present in these areas adjacent to project site. A total of four surveys were conducted. The focused burrow survey was conducted at the same time as the first focused burrowing owl survey. Surveys were conducted either in the morning one hour before sunrise to two hours after sunrise or in the evening two hours before sunset to one hour after sunset. Surveys were not conducted during rain or within five days of rain, winds greater than 20 miles per hour, dense fog, or temperatures over 90 degrees Fahrenheit. Surveys were conducted in accordance with the Burrowing Owl Survey Instructions for the WRMSHCP (County of Riverside, 2006).

Table 1-1
Survey Data

Survey Date	Surveyor	Time	Temperature (°F)	Wind (MPH)	Skies
14 May 2018	L. Wadley	0520-0815	51-55	3-8	100% to partly cloudy (5%)
16 May 2018	L. Wadley	0520-0815	50-56	1-6	clear
22 May 2018	L. Wadley	1740-1950	71-62	3-13	Partly cloudy (50%) to clear
24 May 2018	L. Wadley	0520-0800	50-54	3-10	100% with mist

Notes: °F = degrees Fahrenheit, MPH = miles per hour

This page intentionally left blank

5.0 RESULTS

The area surveyed is shown in Figure 3 along with the locations of suitable burrows. No burrowing owls were observed during the focused burrowing owl surveys of the project site or buffer area. Some fossorial animal burrows were found along the fence line adjacent to the fields and the project site; however, no burrows showed characteristic burrowing owl sign of excrement, pellets, or feathers outside the burrows. No suitable burrows were associated with any of the onsite drainages identified in previous reports. At the present time, the western burrowing owl is considered to be absent from the project site (which includes the on and off-site project improvement areas) and/or surrounding buffer area. The absence of burrowing owls is likely due to presence of larger, predatory avian species observed on-site and within buffer areas during the focused survey (i.e. red-tailed hawk (*Buteo jamaicensis*), common raven (*Corvus corax*), and prairie falcon (*Falco mexicanus*).

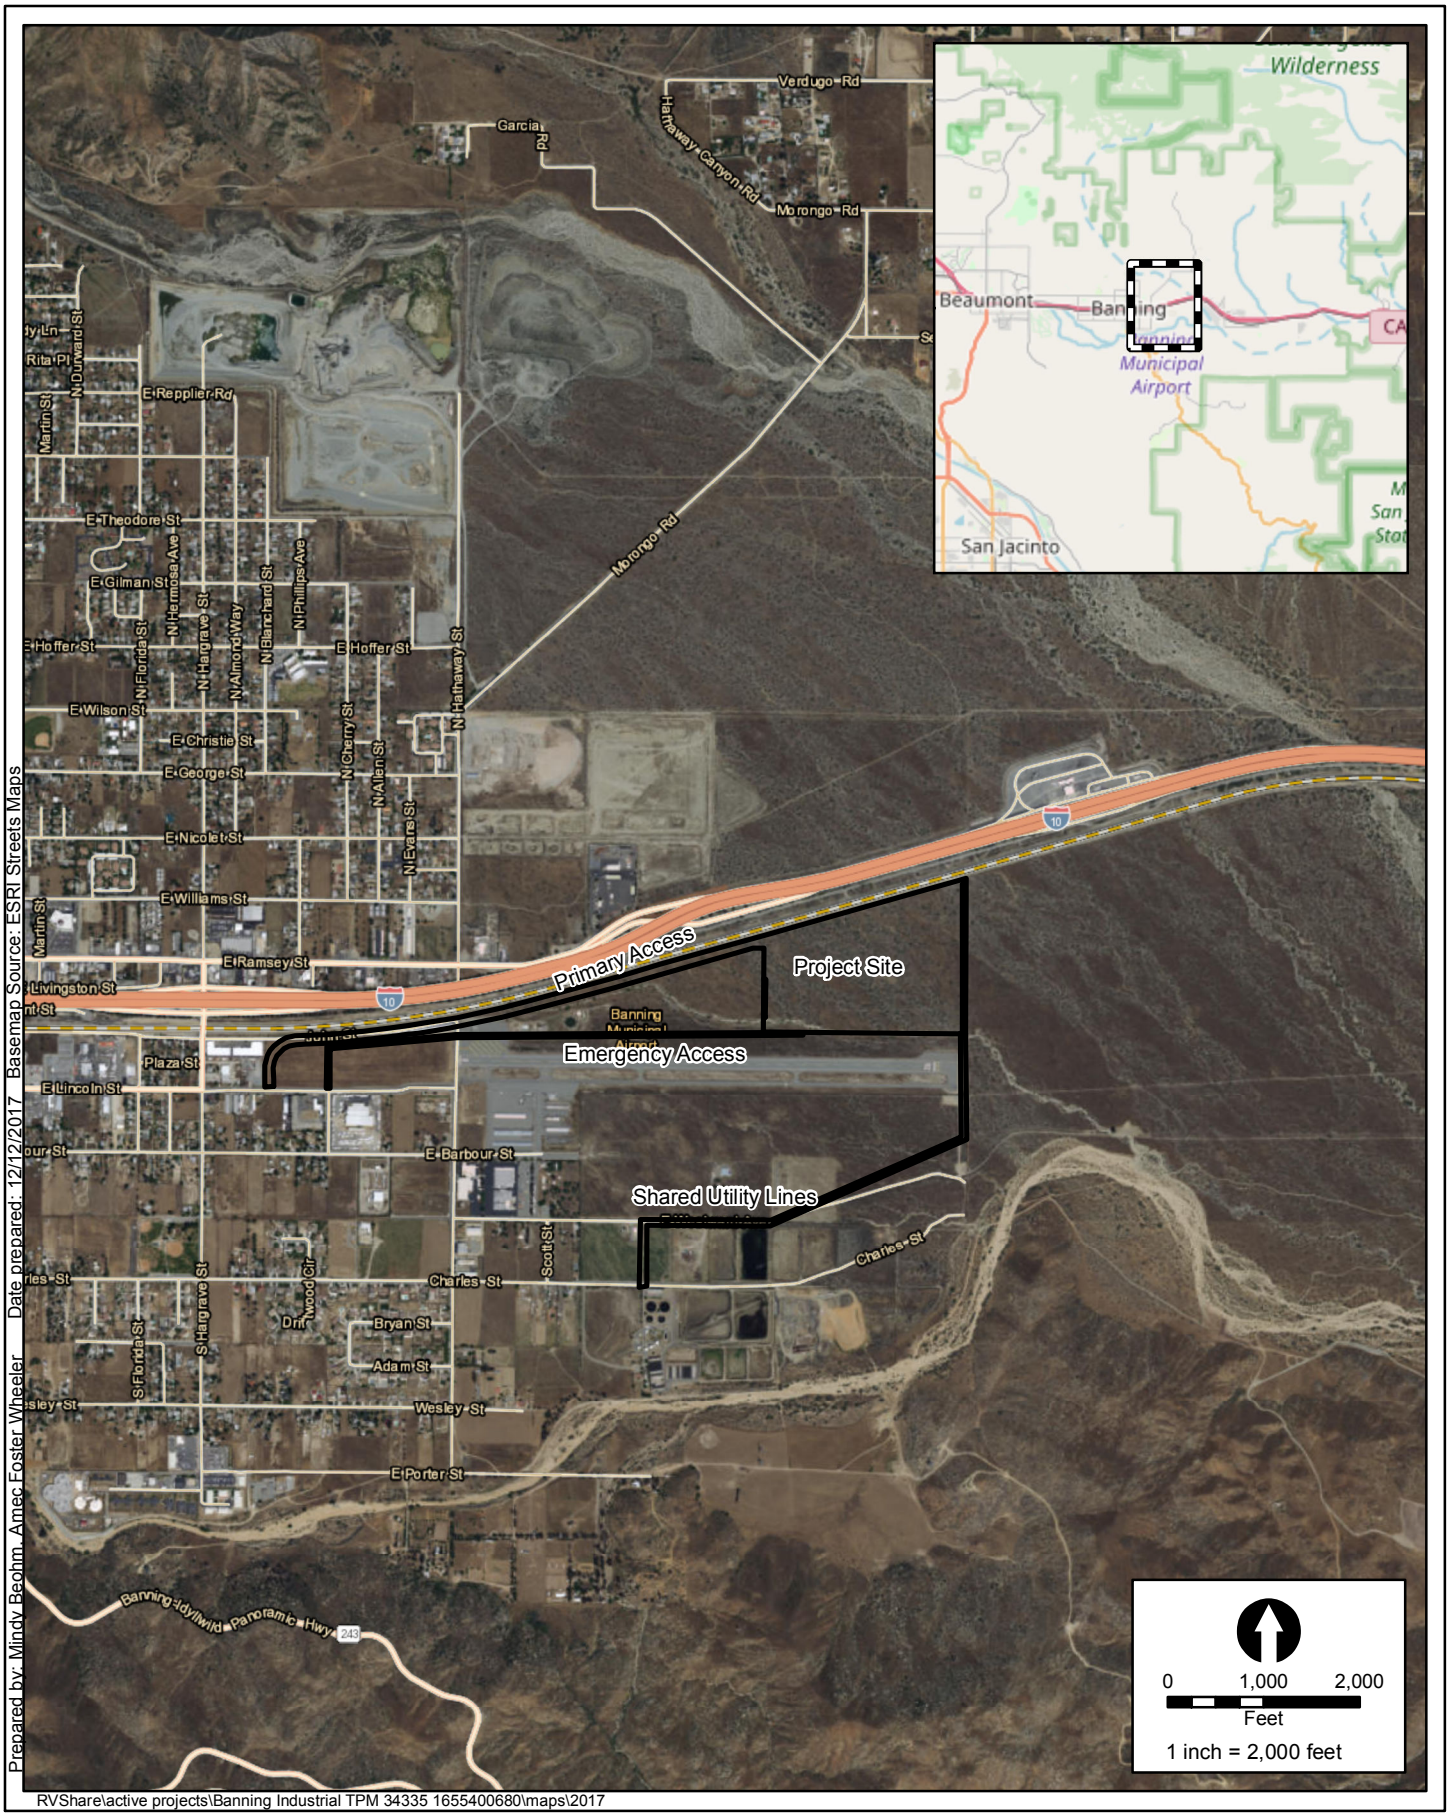
1.0 INTRODUCTION



Amec Foster Wheeler, Environment & Infrastructure, Inc. (Amec Foster Wheeler) was contracted by Albert A. Webb Associates to conduct a Western Riverside Multiple Species Habitat Conservation Plan (MSHCP) Determination of Biologically Equivalent or Superior Preservation (DBESP) for the Banning Industrial Project parcels, hereafter referred to as project, project site, or site. A DBESP is required because the project will result in impacts to riparian/riverine areas, as defined by the MSHCP (Riverside County 2003). The purpose of this report is to demonstrate that the proposed mitigation would provide an equivalent or superior preservation of habitat functions and values of riparian/riverine resources.

1.1 Project Description

The proposed project involves the development of Assessor's Parcel Number (APN) 532-110-006, 532-130-001, and 532-130-002. The proposed project includes the development of the Banning Industrial park, which includes industrial buildings, associated parking lot, detention basin, and associated infrastructure. The project area analyzed herein also includes 5,968 linear feet of off-site sewer, 9,350 of off-site water utilities and 5,000 linear foot emergency road access. These off-site infrastructure areas are also part of the project.

1.2 Project Location

The project site is generally located north of State Route (SR) 74, south of Interstate (I) 10, east of SR 243, and west of SR 111 (Figure 1). The project is located in Section 11 and 14 of Township 3 South, Range 1 East on the Cabazon, California United States Geological Survey (USGS) 7.5-minute topographic quadrangle (Figure 2). The project is specifically located north of the Banning Municipal Airport, south of I-10, east of Hargrave Street, and west of the San Gorgonio River. The project site boundary was provided to Amec Foster Wheeler Environment and Infrastructure, Inc. (Amec Foster Wheeler) by Albert A. Webb Associates, Inc. The geographic coordinates near the middle of the project site are 33° 55.520' North latitude and -116°50.767' West longitude.

2.0 METHODS

2.1 Literature Review

Amec Foster Wheeler conducted a review of existing documents for the proposed project and other relevant reference materials prior to the subject analysis. Previous documentation for the proposed project reviewed for the preparation of the subject DBESP includes the following:

- Biological Resources at the messenger industrial Park-Banning Airport Project (Rocks Biological Consulting, 2015)
- Habitat Assessment Report for the Messenger Industrial Park Banning Airport Project, Riverside County, CA (Rocks Biological Consulting, 2006)
- Jurisdictional Delineation Report Banning Industrial Park, City of Banning, Riverside County, California (Amec Foster Wheeler 2016)
- Habitat Assessment and Western Riverside County MSHCP Consistency Analysis Report, Banning Industrial Park Project, City of Banning, Riverside County, California (Amec Foster Wheeler 2017)

2.2 Field Reconnaissance

Amec Foster Wheeler senior biologists Scott Crawford conducted a jurisdictional delineation survey on 24 May, 2016 from 0830 to 1130 hours. It was revised on 9 May 2017 from 0800 to 1200 hours. Weather conditions during the surveys included clear to cloudy skies with an average temperature of 55°F to 57°F (degrees Fahrenheit) and winds between 5 and 10 miles per hour. All drainage features within the project site were assessed based on the presence or absence of riparian/riverine habitat components (e.g., bed and bank features, riparian vegetation, and change in soil texture) that are characteristic of riparian/riverine areas. All flora and vertebrate fauna observed or otherwise detected (e.g., vocalizations, presence of scat, tracks, and/or bones) on the project site during the course of this assessment were recorded and are included in Appendix A.

2.2.1 Riparian/Riverine/Vernal Pools and Fairy Shrimp Habitat Methods

MSHCP Section 6.1.2, “Protection of Species Associated with Riparian/Riverine Areas and Vernal Pools,” (Riverside County 2003) describes the process through which the biological functions and values of such areas throughout the MSHCP area are maintained such that habitat values for species in the MSHCP conservation area are maintained. Protection of these resources is important for a number of MSHCP conservation objectives. An assessment of a project’s potentially significant effects on riparian/riverine areas, vernal pools, and fairy shrimp habitat is required. Guidelines for determining whether these resources exist on-site are described below.

Riparian/riverine areas, vernal pools, and fairy shrimp habitat are defined as follows:

- **Riparian/Riverine Areas:** Lands which contain habitat dominated by trees, shrubs, persistent emergents, or emergent mosses and lichens, which occur close to or which depend upon soil moisture from a nearby fresh water source; or areas with fresh water flow during all or a portion of the year.
- **Vernal Pools:** Seasonal wetlands that occur in depression areas that have wetlands indicators of all three parameters (soils, vegetation and hydrology) during the wetter portion of the growing season but normally lack wetlands indicators of hydrology and/or vegetation during the drier portion of the growing season. Obligate hydrophytes and facultative wetlands plant species are normally dominant during the wetter portion of the growing season, while upland species (annuals) may be dominant during the drier portion of the growing season. The determination that an area exhibits vernal pool characteristics, and the definition of the watershed supporting vernal pool hydrology, must be made on a case-by-case basis. Such determinations should consider the length of the time the area exhibits upland and wetland characteristics and the manner in which the area fits into the overall ecological system as a wetland. Evidence concerning the persistence of an area's wetness can be obtained from its history, vegetation, soils, and drainage characteristics, uses to which it has been subjected, and weather and hydrologic records.
- **Fairy Shrimp:** For fairy shrimp, mapping of stock ponds, ephemeral pools and other features shall also be undertaken as determined appropriate by a qualified biologist.

To assess the potential impacts to riparian/riverine resources, vernal pools, and fairy shrimp habitat, features exhibiting the characteristics described above are evaluated, including wetlands created for the specific purpose of providing wetlands habitat or resulting from human actions to create open waters or from the alteration of natural stream courses. Other made-made features are excluded. The delineation should consider topography/ hydrology, soil composition, vegetation communities, and other biological factors. The reported results consider hydrologic regime, flood storage and flood flow modification, nutrient retention and transformation, sediment trapping and transport, toxicant trapping, public use, wildlife habitat, and aquatic habitat in relation to determining functions and values to the "purpose species" listed in Table 1 and the additional species listed in Table 2. The functions and values assessment focuses on those areas (if any) that should be considered for priority acquisition for the Conservation Area, as well as those functions that may affect downstream values related to conservation of Covered Species.

Table 1
Riparian / Riverine Areas and Vernal Pools Purpose Species*

Species Category	Species
Plants	Brand's phacelia (*Phacelia stellaris*)

	white-tailed kite (*Elanus leucurus*)
	Wilson's warbler (*Wilsonia pusilla*)
	yellow-breasted chat (*Icteria virens*)
	yellow warbler (*Dendroica petechia brewsteri*)

[1] If suitable habitat for the noted species is identified and those habitats cannot be avoided, focused surveys for those species shall be conducted, and avoidance and minimization measures implemented in accordance with the species-specific objectives for those species found in Section 9 of the MSHCP.

*MSHCP (Volume II) Species

When riparian/riverine areas and vernal pools are identified, they are avoided to the extent feasible. When avoidance is not feasible, the potential direct and indirect impacts are minimized to the extent feasible. Unavoidable impacts are mitigated such that lost functions and values as related to conservation of Covered Species are replaced by equivalent or superior preservation as described in this DBESP.

Assessments of riparian/riverine/vernal pool resources and the results will be discussed below.

2.2.2 DBESP REPORT REQUIREMENTS

A habitat assessment and a jurisdictional delineation were conducted to determine presence of MSHCP defined riparian/riverine areas, vernal pools, and/or conservation areas and covered species identified as being associated with such areas on the project site. The results determined that there would be unavoidable impacts to some of those resources, so this DBESP report was required. This DBESP report will demonstrate how lost functions and values of riparian/riverine and vernal pool habitats will be replaced, as they relate to those MSHCP elements. Requirements for this report set forth in the MSHCP document (Riverside County 2003, Section 6.1.2, pages 6-24 and 6-25) include:

- Definition of the project area.
- A written project description, demonstrating why an avoidance alternative is not possible.
- A written description of biological information available for the project site including the results of resource mapping.
- Quantification of unavoidable impacts to riparian/riverine areas and vernal pools associated with the project, including direct and indirect effects.
- A written description of project design features and mitigation measures that reduce indirect effects, such as edge treatments, landscaping, elevation difference, minimization and/or compensation through restoration or enhancement.
- A finding demonstrating that, although the proposed project would not avoid impacts, with proposed design and compensation measures, the project would be biologically equivalent or superior to that which would occur under an avoidance alternative without these measures, based on one or more of the following factors:

    1. Effects on Conserved Habitats;
    2. Effects on the species listed under “Purpose” in Section 6.1.2; and,
    3. Effects on riparian linkages & functions of the MSHCP Conservation Area.

3.0 EXISTING CONDITIONS (RESULTS)

3.1 Environmental Setting

The project site and associated infrastructure occurs immediately south of existing railroad tracks. The drainage features that flow onto the project site originate from natural run-off and sheet flow from the north, beneath or along the existing rail-road right-of-way. Flows are conveyed beneath the existing railroad tracks through underground box or corrugated metal culverts or flows enter the project site from sheet flows along the southern portion of the Union Pacific Railroad right-of-way. The drainage features, as they begin to flow within the project site are within relatively undisturbed earthen channels and flow off-site within earthen channels or sheet flow.

Surrounding land uses include the Banning Airport to the south, Union Pacific Railroad right-of-way and I-10 to the north, undisturbed natural habitat to the east, and residential and commercial development to the west. There are currently no structures within the project site. It is dominated by desert scrub and non-native grasslands with six relatively unvegetated ephemeral drainages.

3.2 Topography

The project site slopes from northwest to south with gently rolling topography. The highest elevation on the site is approximately 2,240 feet above mean sea level (AMSL) near the west extent of the project site. The lowest elevation is approximately 2,105 feet AMSL at the southeast boundary (see Figure 2).

3.3 Hydrology and Riparian/Riverine Resources

The average rainfall for the area is 15.72 inches per year (Western Regional Climate Center, 2016). Weather data was recorded nearby in the city of Cabazon, approximately three miles east of the project site.

Runoff from the site generally flows southeast for approximately a half mile before entering Smith Creek (Figure 2). Flows continue in Smith Creek for 1.5 miles before flowing into the San Gorgonio River, which then empties into the Whitewater River (11.5 miles to the east). The Whitewater River flows for 50 miles before reaching the Salton Sea.

Storm flows and nuisance flows enter the project site from soft-bottom natural channels that originate from underground culverts that convey flows beneath Interstate-10 and the existing railroad tracks north of the project site. No flowing water, standing water, or any evidence of ponding was observed within any portion of the drainage features within the project site. Flows likely percolate quickly due to the nature of the streambeds (boulders, cobbles, gravel, and sand). Surface flows likely enter the project during and immediately following large storm events. Therefore, the drainage features on-site are considered ephemeral riverine MSHCP features.

The primary drainage, which enters the site near the northwestern portion of the project site, exits at the southeastern corner, is a USGS designated blue-line stream. Four small, ephemeral drainage features, tributary to the blue-line drainage, also cross portions of the project site.

Riverine areas are located within the six on-site drainages (Figure 4). Appendix C, Site Photographs, shows the conditions of the on-site riverine areas. For the purposes of this report, riverine acreage has been considered equivalent to California Department of Fish and Wildlife (CDFW) jurisdictional acreage.

The project site and associated infrastructure affect six drainage features. Photographs of the drainage features are in Appendix C. The Riparian/Riverine Map (Figure 4) identifies the general location of the drainage features within the project site. Table 3 includes a list of drainage features identified in the project area, their area, length, location, and Cowardin classification.

The USACE, in combination with the Environmental Protection Agency (EPA), when necessary, reserves the ultimate authority in making the final jurisdictional determination of WUS and the RWQCB reserves the ultimate authority in making the final jurisdictional determination of WSC. Additionally, CDFW has ultimate discretion in the determination of their jurisdiction.

Table 3
Summary of Jurisdictional Areas

Drainage ID	Riparian/ Riverine Area (acres)	Length (feet)	Latitude/ Longitude	Cowardin Class
Drainage 1	1.05	2,480	33.923479/ -116.845137	R4SBJ
Drainage 2	0.01	180	33.924887/ -116.853413	R4SBJ
Drainage 3	0.13	670	33.924304/ -116.848170	R4SBJ
Drainage 4	0.03	350	33.924867/ -116.848537	R4SBJ
Drainage 5	0.07	760	33.926706/ -116.842612	R4SBJ
Drainage 6	0.42	2,100	33.918099/ 116.845239	R4SBJ
Total	1.71	6,540	n/a	n/a

WSC – Waters of the State of California
CDFW – California Department of Fish and Wildlife
R4SBJ – Riverine, Intermittent, Streambed Intermittently Flooded based on Classification of Wetlands and Deepwater Habitats of the United States (Cowardin, et. al., 1979).

The total estimated area of Riparian/Riverine Habitat within the project site is 1.71 acres. The sections below describes each individual drainage feature identified during the evaluation:

3.4 Drainage 1

Drainage 1 is the largest drainage within the project site and it originates in the western portion of the project site along the off-site improvement John Street and exits the project site in the southeastern corner (See photos 1, and 2). This feature is an ephemeral drainage, relatively unvegetated, and contains boulders and cobbles along the creek bed. This feature temporarily flows off-site before entering the southern portion of the main project site and flows along the southern boundary. The sparse vegetation observed within the channel includes scalebroom (*Lepidospartum squamatum*), catclaw acacia (*Acacia greggii*), western ragweed (*Ambrosia psilostachya*), and tumbleweed (*Salsola tragus*). There is not sufficient vegetation cover to be considered a vegetation community. The drainage ordinary high water mark varies across the project site from 14 to 30 feet in width. The drainage depth varies from 1 to 6 feet. The overall length of Drainage 1 within the project site is approximately 2,480 feet. There is no evidence of hydric soils or hydrophytic vegetation and therefore, the drainage feature has no associated wetlands. The estimated Riparian/Riverine area is 1.05 acres.

3.5 Drainage 2

Drainage 2 is a small ephemeral swale with intermittent bed and bank features that occurs along the off-site improvement, John Street. The bed and bank features are periodic and is often visible only as a noticeable change in sediment or vegetation. The majority of the drainage contains similar soils as the adjacent uplands. This feature conveys flows from the adjacent railroad right-of-way to Drainage 1. The majority of this drainage contains unknown grass species. There are sparse California buckwheat (*Eriogonum fasciculatum*) and London rocket (*Sisymbrium irio*). This feature is approximately 1 foot in width with no clear evidence of depth. The overall length of Drainage 2 within the project site is approximately 180 feet. There is no evidence of hydric soils or hydrophytic vegetation, therefore, the drainage feature has no associated wetlands. The estimated Riparian/Riverine area is 0.01 acre.

3.6 Drainage 3

Drainage 3 is tributary to Drainage 1 and conveys flows from the adjacent railroad right-of-way that occurs along the off-site improvement, John Street. This feature is an ephemeral drainage, relatively unvegetated, and contains cobbles and sand along the creek bed. This feature temporarily flows off-site before entering the western portion of the main project site and flows within the southwestern corner of the project site before flowing into Drainage 1. The drainage width was consistent throughout the project site at approximately 6 feet. The drainage depth varies from 1 to 3 feet. The overall length of Drainage 3 within the project site is approximately 670 feet. There is no evidence of hydric soils or hydrophytic vegetation

and therefore, the drainage feature has no associated wetlands. The estimated Riparian/Riverine area is 0.13 acre.

3.7 Drainage 4

Drainage 4 is a small tributary to Drainage 3 and about half the size that occurs along the off-site improvement, John Street. This feature is similar to Drainage 3, as it is an ephemeral drainage, unvegetated, and contains cobbles and sand along the creek bed. This feature temporarily flows off-site before entering the western portion of the main project site and flows within the southwestern corner of the project site before flowing into Drainage 3. The drainage width was consistent throughout the project site at approximately 3 feet. The drainage depth varies from 0 to 1 feet. The overall length of Drainage 4 within the project site is approximately 350 feet. There is no evidence of hydric soils or hydrophytic vegetation and therefore, the drainage feature has no associated wetlands. The estimated Riparian/Riverine area is 0.03 acre.

3.8 Drainage 5

Drainage 5 is an ephemeral drainage that originates in the northeast corner of the project site. It is also an ephemeral drainage, unvegetated, and contains cobbles and sand along the creek bed. This drainage feature terminates as sheet-flow along the eastern edge of the project site. Downstream of the project, the ordinary high water mark is visible and the drainage eventually flows into Smith Creek. Although this drainage feature has a periodic ordinary high water mark, it is hydrologically connected to downstream drainage features. The ordinary high water mark averaged from 0 to 3 feet in width. The drainage depth varies from 0 to 0.5 feet. The overall length of Drainage 5 within the project site is approximately 760 feet. There is no evidence of hydric soils or hydrophytic vegetation and therefore, the drainage feature has no associated wetlands. The estimated Riparian/Riverine area is 0.07 acre.

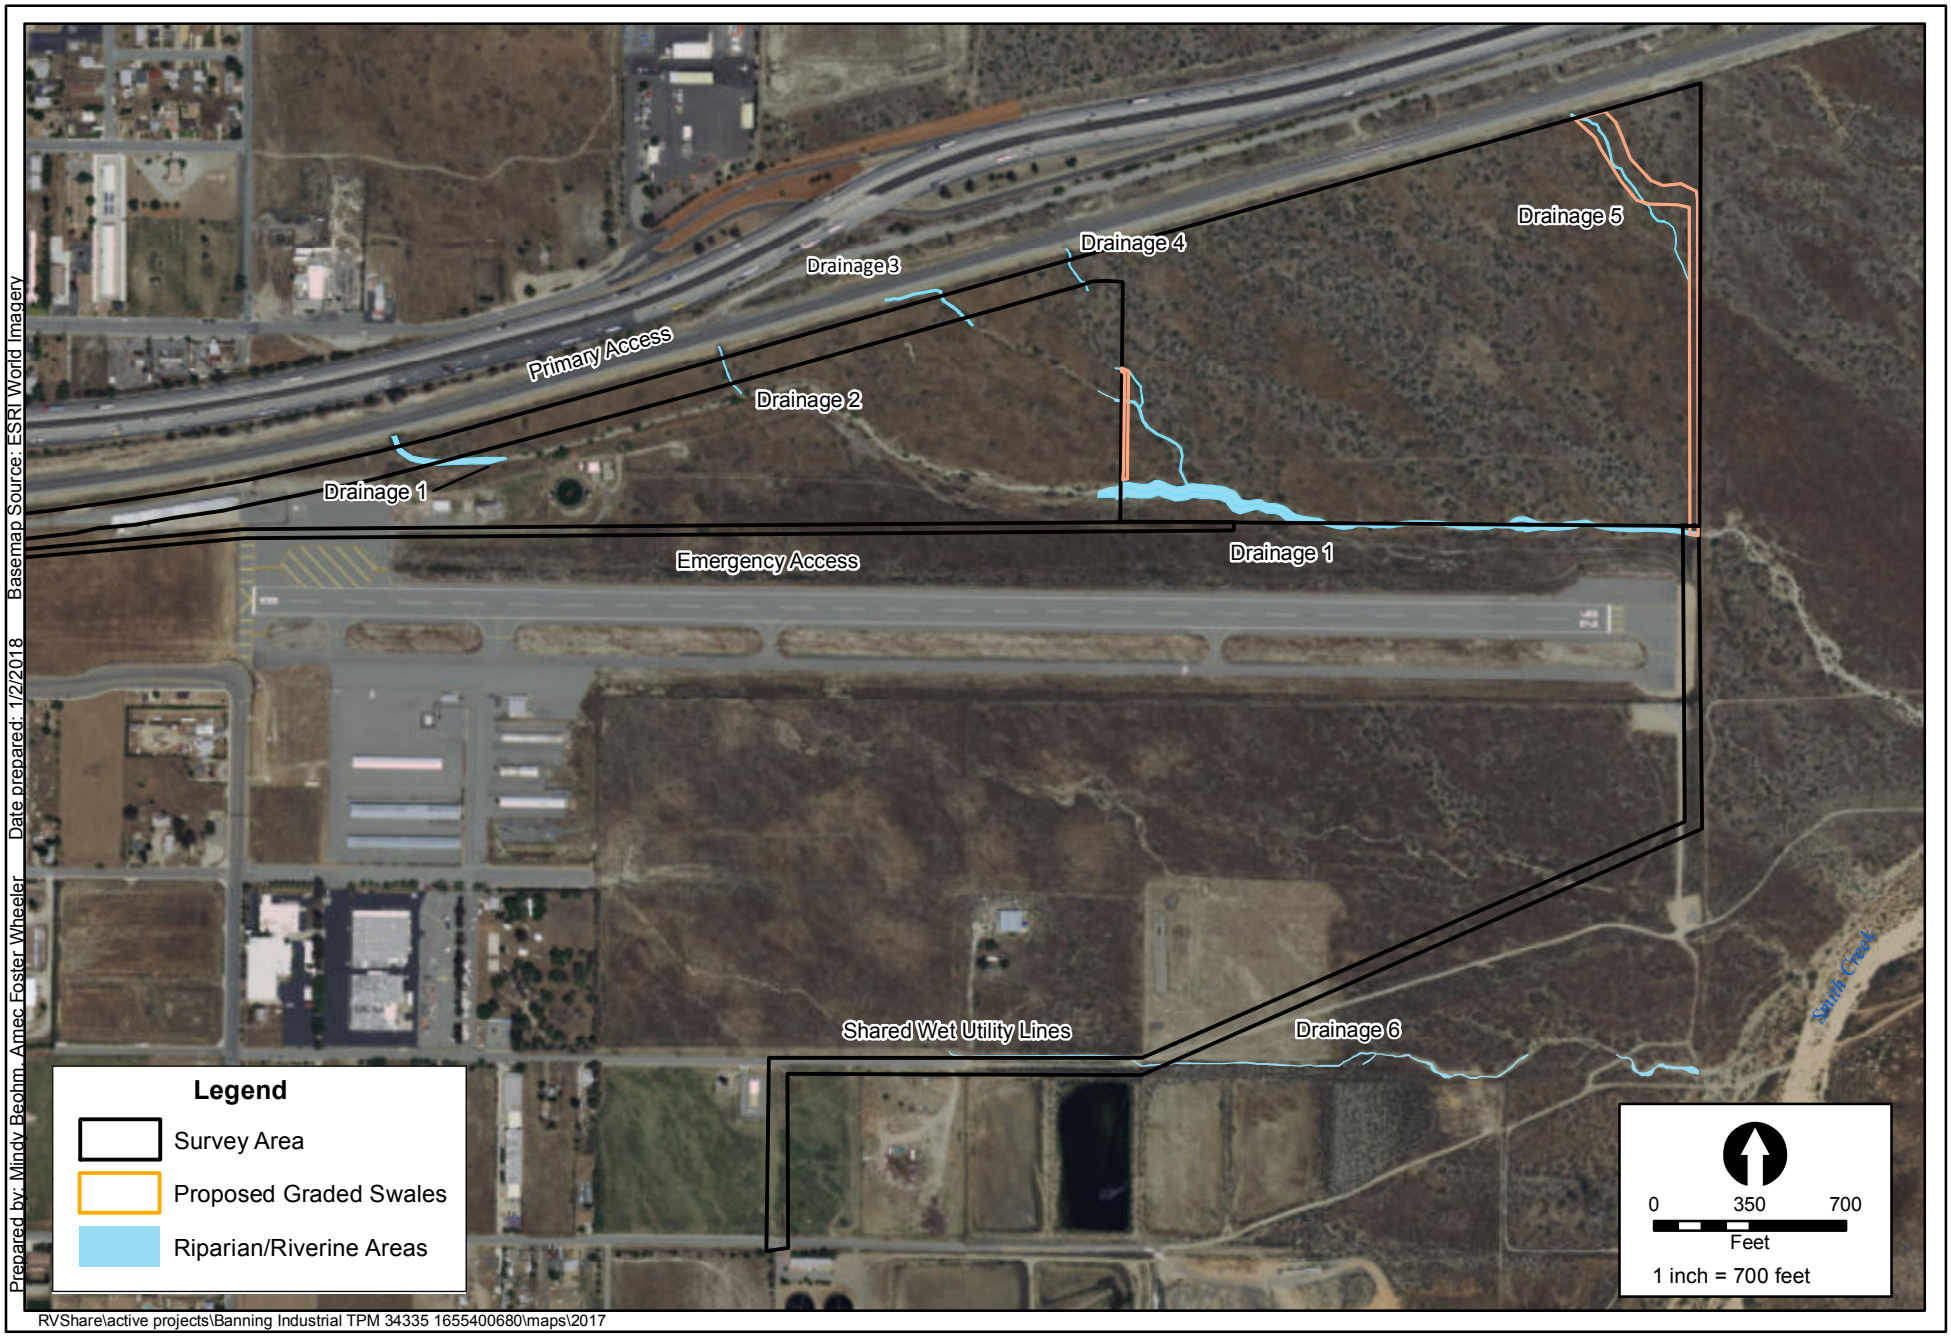
3.9 Drainage 6

Drainage 6 is an ephemeral drainage that originates south of the main project site and the Banning Airport at the eastern terminus of Barbour Street. It is also relatively unvegetated and contains cobbles and sand along the creek bed. This drainage feature enters the project site as a 2 to 3 foot wide meandering drainage that conveys urban run-off from the west. The drainage meanders to the southeast, across an existing cow pasture, for approximately 0.25 miles and then parallels Westward Avenue to the east along the off-site wet utility alignment. The drainage meanders to the east for approximately 0.5 miles before heading northeast and then joining Smith Creek. The drainage gradually increases in size from west to east (3 feet to 12 feet). As the drainage flows further to the east from the edge of the proposed project's utility alignment, it widens to approximately 7 to 8 feet and is the widest at the edge of the utility alignment, approximately 12 feet. Downstream of the project, the ordinary high water mark remains visible and the drainage eventually flows into Smith Creek. This drainage feature has a continuous ordinary high water mark, and is

hydrologically connected to downstream drainage features. The ordinary high water mark averaged from 3 to 12 feet in width. The drainage depth varies from 1 to 3 feet. The overall length of Drainage 6 within the project utility alignment is approximately 2,100 feet. There is no evidence of hydric soils or hydrophytic vegetation and therefore, the drainage feature has no associated wetlands. The estimated Riparian/Riverine area is 0.42 acre.

3.10 Soils

The United States Department of Agriculture, Natural Resources Conservation Service (USDA) maintains an on-line searchable soils database, the Web Soil Survey (USDA, 2017a), which was consulted during the project literature search in order to determine the soil associations and soil types occurring on the project site. The following mapping units occur on the site (Figure 5):



- Gorgonio gravelly loamy fine sand (GmD) – This somewhat excessively drained soil occurs on alluvial fans with 2 to 15 percent slopes. It is composed of gravelly loamy fine sand on the surface and the parent material is alluvium derived from granite.
- Gorgonio cobbly loamy fine sand (GnD) – This somewhat excessively drained soil occurs on alluvial fans with 2 to 15 percent slopes. It is composed of cobbly loamy fine sand on the surface and the parent material is composed of alluvium derived from granite.
- Hanford cobbly coarse sandy loam (HdD2) – This somewhat excessively drained soil occurs on alluvial fans with 2 to 15 percent slopes. It is composed of cobbly coarse sandy loam on the surface and the parent material is composed of alluvium derived from granite.
- Hanford coarse sandy loam, 2 to 8 percent slopes (HcC) – This well drained soil occurs on alluvial fans and alluvial plains with 2 to 8 percent slopes. It is composed of a mix of coarse and sandy loam on the surface and the parent material is composed of alluvium derived from granite.
- Tujunga gravelly loamy sand, 0 to 8 percent slopes (TwC) – This excessively drained soil occurs on flood plains and alluvial fans with 0 to 8 percent slopes. The parent material is composed of sandy alluvium derived from granite.

USDA (2014) lists Hanford Cobbly Coarse Sandy Loam within the project site as hydric soils. None of these soils are known to be specifically associated with sensitive biological resources.

3.11 Vegetation

The vegetation associated with the project site and surrounding areas is dominated by desert scrub and non-native grasslands. Due to the ephemeral nature of these features, there is no riparian habitat (Figure 6) associated with the drainages on-site. All of these features are considered unvegetated ephemeral channels.

Species nomenclature follows The Jepson Manual, Vascular Plants of California, 2nd Edition (Baldwin, 2012). When The Jepson Manual does not list a common name, common name nomenclature follows the USDA Plants Database (USDA, 2017b). None of the riparian/riverine "purpose" plant species listed in Table 1 were found or are expected on-site. Appendix A includes a list of all plant species observed.

3.12 Wildlife Species

Expected wildlife such as common side-blotched lizard (*Uta stansburiana*), red-tailed hawk (*Buteo jamaicensis*), common raven (*Corvus corax*), California ground squirrel (*Spermophilus beecheyi*), and desert cottontail (*Sylvilagus audubonii*) inhabit the site. A single sensitive species (loggerhead shrike) was previously detected during the habitat assessment conducted in 2006 (Rocks Biological Consulting, 2006) and again during the field verification completed in 2017, but none of the “purpose” species listed in Table 1 were observed. No suitable habitat is present for any of the animal species from Table 1.

3.13 MSHCP Conservation Area

The project site is located within Special Linkage Area (SLA) subunit 3 (San Timoteo Creek Portion that connects San Gorgonio River/San Bernardino-San Jacinto Mountain Range). The Rocks Biological Consulting 2006 and 2015 reports, recommends a 50-foot buffer established between the final grading limits of the project and the drainage feature 1. Although this will allow localized wildlife to move from east to west, it should be described as a local travel path. Since the project site is bordered to the north by Interstate 10 and to the south by the Banning Airport, and to the west by residential and commercial development, construction of the project site will not affect wildlife movement on a regional scale. The guidelines in MSHCP Section 6.1.4 "Guidelines Pertaining to the Urban/Wildlands Interface" (Appendix A) will apply to the project as described in the 2017 MSHCP report, but only because it is located within the Special Linkage Area.

4.0 UNAVOIDABLE IMPACTS

The proposed project includes the development of industrial buildings, a parking lot, a detention basin, and associated off-site infrastructure including water and sewer lines. The completed project would also include two access roads; one for general vehicle access and one for emergency vehicles (see Figure 7). Preservation of all riverine/riparian systems, which flows through portions of the project site, is not feasible or compatible with the project. Functional warehouses could not be constructed while also preserving the existing systems in place.

4.1 Quantification of Riparian/Riverine Impacts

The proposed development plan was overlaid on the jurisdictional delineation boundary using GIS to determine the extent of impacts to jurisdictional areas (Figure 8). Albert A. Webb Associates, Inc. provided Amec Foster Wheeler with the development plan. Permanent impacts were assessed for the proposed access road, the warehouse footprint, and the emergency access roads. Temporary impacts are associated with additional construction work areas and the installation of the shared utility lines, which will be completed by trenching. Project related permanent and temporary impacts to Riparian/Riverine areas are listed in Table 4.

Table 4
Summary of Impacts to Riparian/Riverine Areas

Drainage ID	Permanent Impacts to Riparian/Riverine Areas	Temporary Impacts to Riparian/Riverine Areas	Length (feet)
Drainage 1	0.09	0.04	166
Drainage 2	0.01	0.00	94
Drainage 3	0.05	0.01	329
Drainage 4	0.01	0.00	178
Drainage 5	0.07	0.00	760
Drainage 6	0.00	0.02	140
Total	0.23	0.07	1,667

WSC – Waters of the State of California
CDFW – California Department of Fish and Wildlife
R4SBJ – Riverine, Intermittent, Streambed Intermittently Flooded based on Classification of Wetlands and Deepwater Habitats of the United States (Cowardin, et. al., 1979).

The proposed project will result in the direct, permanent loss of 0.23 acres of riparian/riverine areas (Table 4) under the MHSCP. An additional 0.07 acres will be temporarily impacted as the result of the shared utility line installation. The proposed project will have a total of 0.30 acre of project related impacts.

4.2 Impacts on the MSHCP Conservation Area

The on-site drainages do not provide hydrology, sediment, or biological resources to any downstream conservation areas within the MSHCP. Currently storm flow and nuisance run-off is conveyed within the Pass Special Linkage Area (SLA) and into Smith Creek. Smith Creek flows to the east and may provide some wildlife movement connectivity on a local scale.

The proposed project will redirect and convey these flows within an underground storm drain system where development will be constructed. Portions of Drainage 1 will remain undisturbed along the southern project boundary.

Indirect impacts associated with the loss of the current functions and values could include changes in water quality and increased intensity of stormwater flows; however, the drainage features remaining on-site, as well as on-site storm flow treatment, will clean the stormwater discharged from the site prior to release into any downstream drainage system.

4.3 Protection of Species Associated With Riparian/Riverine Areas and Vernal Pools

4.3.1 Plants

The Riverside County Report Generator identifies two plant species potentially requiring surveys: 1) Marvin's onion (*Allium marvinii*) and 2) many-stemmed dudleya (*Dudleya multicaulis*). Marvin's onion habitat is chaparral in heavy clay soils and the site does not contain suitable habitat. Many-stemmed dudleya habitat is coastal sage scrub, chaparral, and grasslands on clay soils with a cobble layer below or on the soil surface. Since the site does not contain any clay soils, it does not contain suitable habitat for this species either. No further botanical surveys are required on the site. None of the plants listed in Tables 1 and 2 have been found or are expected on the project site.

4.3.2 Vernal Pools / Fairy Shrimp

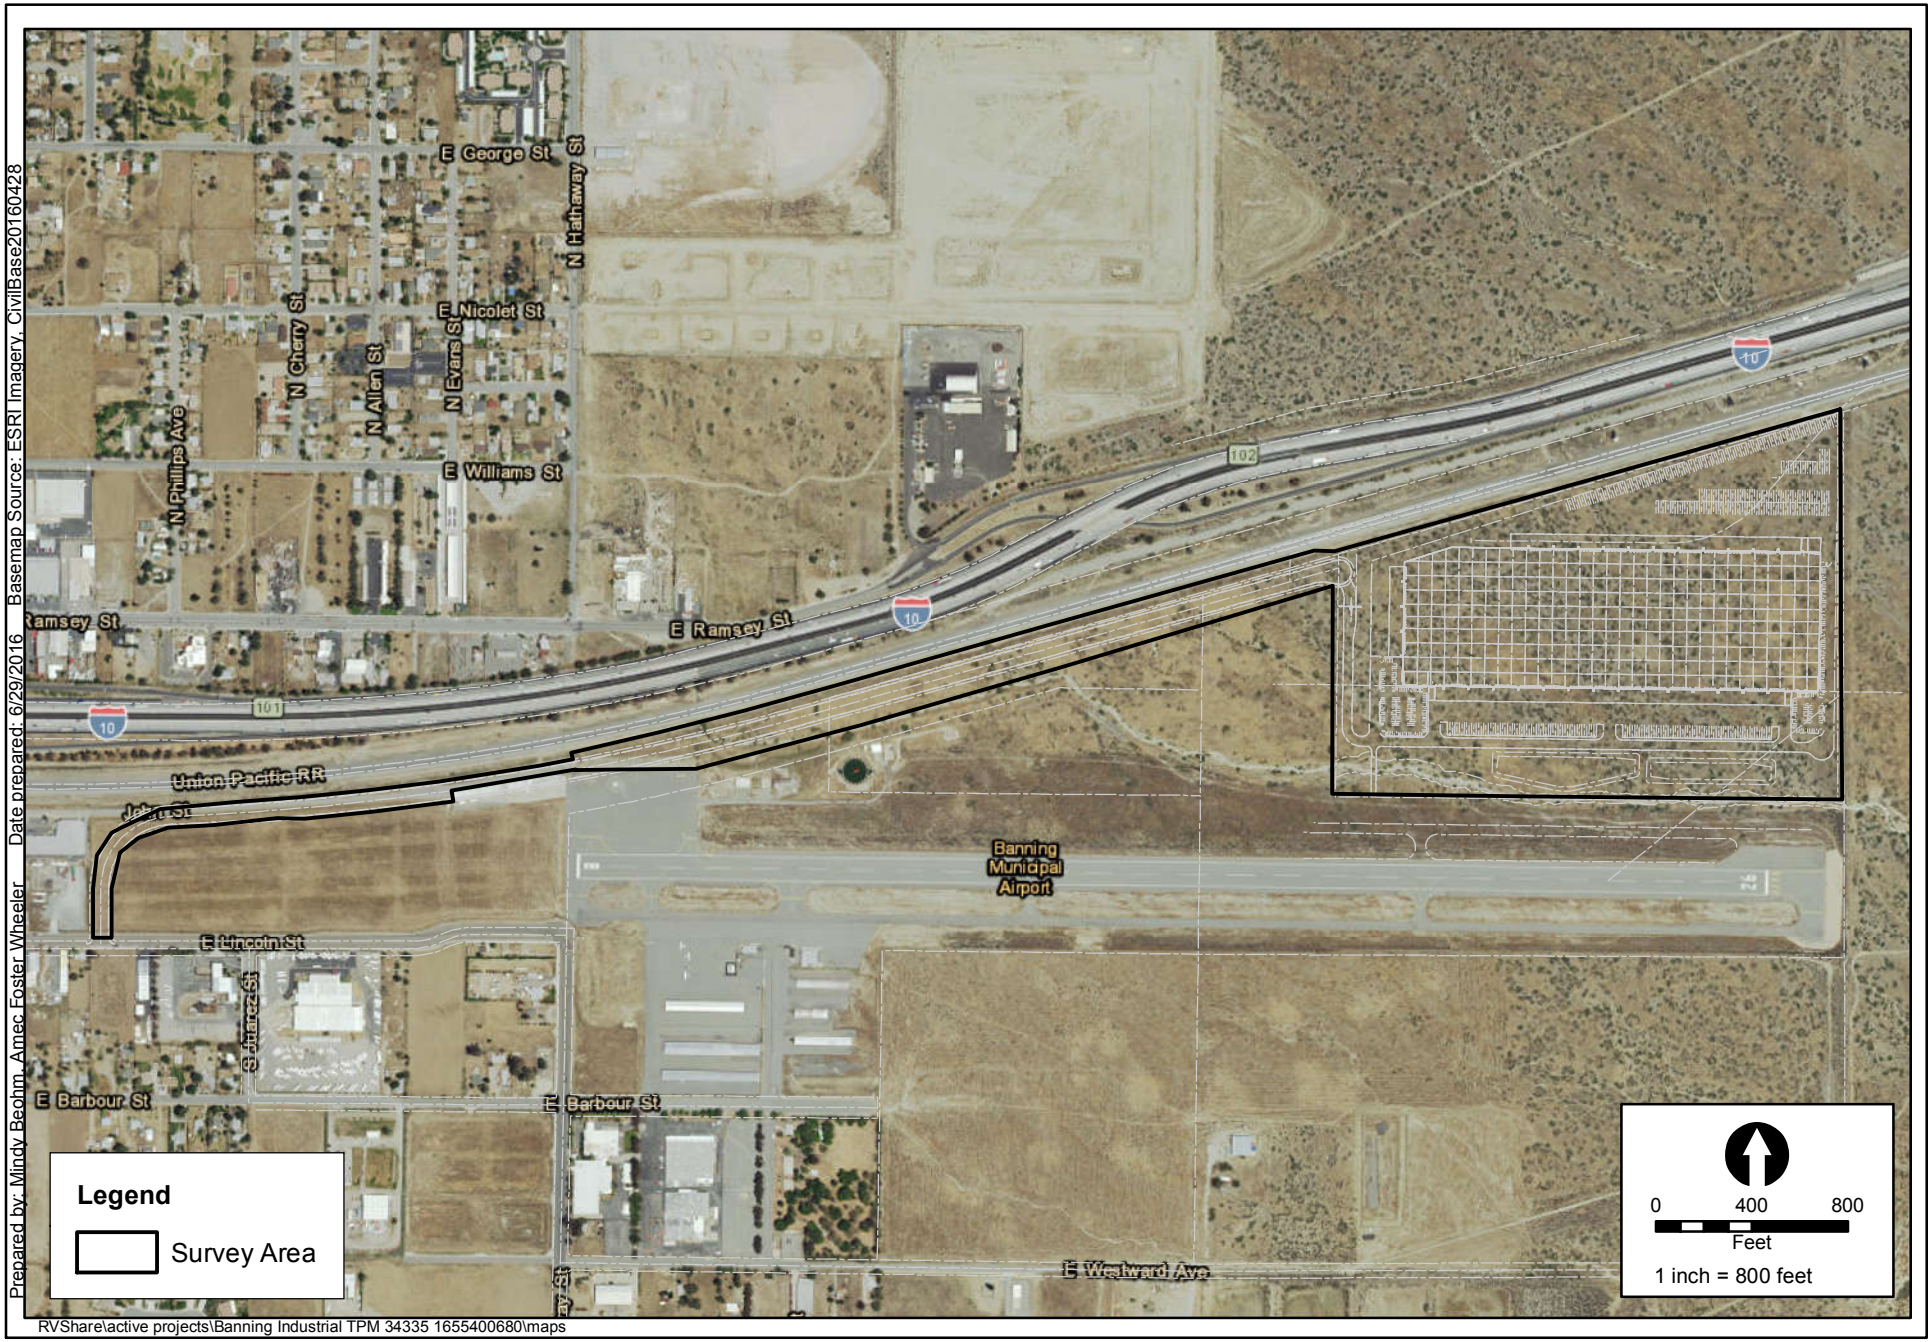
No natural vernal pool habitats are present within the project site and off-site improvements due to lack of suitable soils. No listed fairy shrimp are expected to occur on-site or within the off-site improvements due to lack of suitable soils.

4.3.3 Fish

There is no fish habitat on-site.

4.3.4 Amphibians

The project is not in any MSHCP designated survey areas for amphibians. There is no potential habitat for any of the species in Tables 1 and 2 above.



4.3.5 Birds

The Riverside County Report Generator identifies Burrowing owl (*Athene cunicularia*) as a species that should be surveyed. No burrows suitable for use by burrowing owls were detected; however, a pre-construction survey will still be required on the site to insure there is no direct take of burrowing owl as a result of the project.

Potential nesting habitat does not occur for any of the avian species listed in Tables 1 and 2: Therefore, they will not be discussed further as a riverine/riparian issue.

Project construction should be conducted outside of the nesting season for migratory birds (between mid-February and the end of August) protected under the MBTA. Therefore, if construction activities must be conducted within the nesting season, a nesting bird survey will be required to identify. If any bird protected under the MBTA is present on-site, avoidance measures must be taken to avoid any nest failures.

In addition, riparian avian species identified in Section 6.1.2 of the MSHCP, including southwestern willow flycatcher, western yellow-billed cuckoo, and least bell's vireo, require a separate habitat assessment in addition to the Riverside County Report Generator. Based on the MSHCP habitat assessment survey, there are individual trees that are commonly found within suitable habitat for these species, including arroyo willow and mule fat, but do not meet the density requirements or canopy cover to be considered suitable habitat for these species. The presence of one or two individual trees does not constitute a vegetation community, which is the basis for determining suitable habitat. Therefore, the project site does not contain any suitable habitat for southwestern willow flycatcher, western yellow-billed cuckoo, and least bell's vireo.

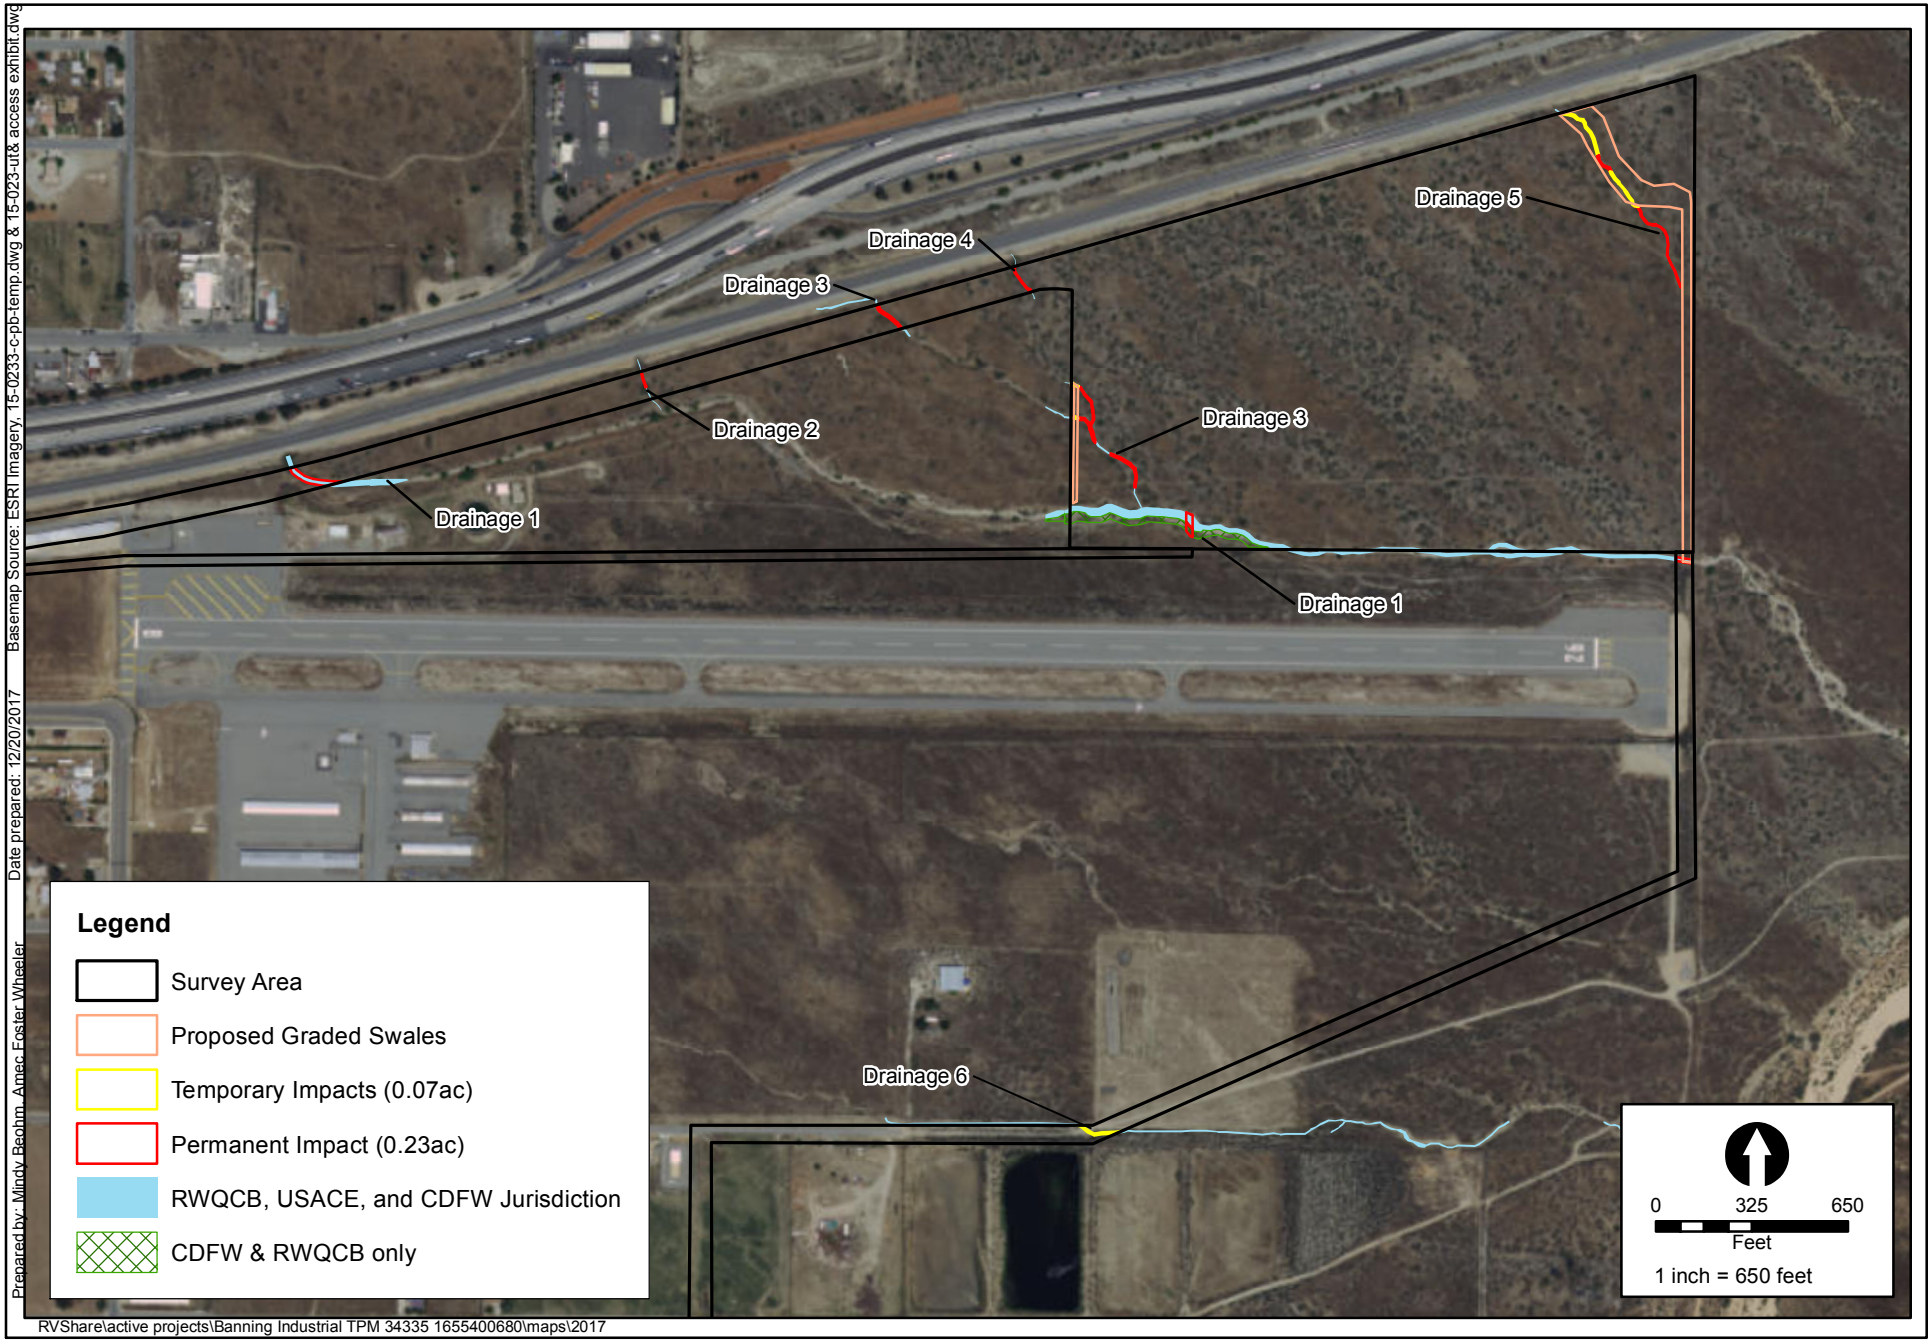
5.0 PROJECT DESIGN FEATURES/MITIGATION MEASURES

5.1 Direct Impacts

5.1.1 Vegetation Communities

The proposed project will result in 0.23 acre of permanent impacts and 0.07 acre of temporary impacts to the riparian/riverine areas found within the project site. These impacts will be mitigated by on-site habitat creation of 1.20 acre within two separate drainage features, both of which will be constructed in existing upland areas and will convey nuisance flows and natural run-off around the proposed development to minimize erosion and maintain off-site flows. Currently, there are no active mitigation banks or in-lieu fee programs in this area.

The proposed on-site habitat creation/restoration areas will vary from 20 to 50 feet wide with a total combined length of 1,987 linear feet totaling approximately 1.20 acres (Figure 8). Two drainage features will be constructed to contain the on-site mitigation, one along the western edge of the project site, conveying flows from both Drainage 3 and 4 and a second constructed drainage in the north-eastern corner of the site that conveys flows from Drainage 5. Both created features eventually convey flows into Drainage 1. The created drainages will meander within the mitigation area creating a natural looking drainage. The active channels will be approximately 1.20 acres and include in-kind replacement of non-wetland riparian scrub habitat. Drainage restoration will occur along the temporary impacts associate with Drainage 6, just south of the project site. Drainage 6 impacts are temporary in nature and the impacted area will be restored to its pre-construction condition.



Dominant vegetation within the mitigation area will consist of California encelia (*Encelia farinosa*) and coyote bush (*Baccharis pilularis*). The upland area adjacent to the riparian habitat will consist of California buckwheat (*Eriogonum fasciculatum*), California sagebrush (*Artemisia californica*), interior golden bush (*Ericameria linearifolia*), and deerweed (*Acmispon glaber*).

Under the MSHCP, the created habitat will be monitored by the project proponent for a minimum of 5 years; monitoring reports shall be provided to the City and appropriate regulatory agency on an annual basis. The restoration area must meet standardized success criteria as described in the Habitat Mitigation and Monitoring Plan, which is required as part of the permit process for a Streambed Alteration Agreement with the California Department of Fish and Wildlife. All temporary impact area will be returned to their previous natural state.

Project related mitigation measures associated with the impacts to riparian/riverine areas will not conflict with the mitigation measures required by the United States Army Corps of Engineers, Regional Water Quality Control Board, and CDFW as part of the regulatory permitting process.

Since portion of some drainage features will be relocated along the edge of the project site, it will be maintained as a natural filter for potentially contaminated water flowing from I-10 and the adjacent railroad ROW to the north. The increased amount of flows, due to the impermeable surface associated with the proposed development will be maintained within a channel that is wider than the current channel, which will reduce any significant erosion or scouring caused by an increase in flow volume and velocity. The amount of project related direct and/or indirect impacts is relatively small, will be completely mitigated on-site, and will not have any significant down steam effects on conserved species.

Typically, habitat creation areas established for the purpose of mitigation for impacts to riparian/riverine areas under the MSHCP are conserved in a conservation easement and managed with funds generated from a non-wasting endowment. However, due to the isolated nature of the proposed mitigation, a conservation easement may not be required since it will not contribute lands within or adjacent to an existing conservation area. In this case, a deed restriction would be more appropriate.

Jurisdictional Delineation Impact Map

Banning Industrial Park

FIGURE

8

This page intentionally left blank

5.1.2 Wildlife Species

Four sensitive wildlife species were observed or otherwise detected utilizing some portion of the project site. San Diego black-tailed jackrabbit was observed within the open shrub areas within the project site and immediately adjacent to the project site. A golden eagle was observed soring over the project site, but was not observed on-site. The only sensitive wildlife species observed utilizing the riverine areas within the project site was the loggerheaded shrike. Impacts to this species is covered under the MSHCP and no project design changes or mitigation is proposed.

5.1.3 Riparian/Riverine Linkages

The proposed project does not involve any design features that would discourage or prohibit wildlife from utilizing an Existing or Proposed Linkages and/or Constrained Linkages and no mitigation is proposed.

5.1.4 MSHCP Conservation Area

The proposed project will not directly affect any MSHCP conservation area(s), and is not immediately adjacent to an existing conservation area. The nearest Core (Core I) is approximately 2 miles north of the project site. Core K is located 3 miles south of the project site. Project specific design features associated with Urban/Wildlife Interface Guidelines will be required because the project site is located within Special Linkage Area subunit 3 (San Timoteo Creek Portion that connects San Gorgonio River/San Bernardino-San Jacinto Mountain Range). Thus, the project will require design features from MSHCP Section 6.1.4 "Guidelines Pertaining to the Urban/Wildlands Interface" to minimize potentially significant impacts associated with the Urban/Wildlands interface.

5.1.5 Temporary Indirect Impacts

Noise resulting from project grading and construction activities will not cause indirect adverse effects to sensitive biological resources within the project site or immediate vicinity. There were two sensitive species detected within the project site during the survey, loggerheaded shrike and horned lark. Both of these species are highly mobile and are not likely affected by temporary indirect impacts associated with project construction. During construction activities, these species will likely relocate to the open-space area to the east.

Temporary impacts to nesting birds, sensitive species or not, may be considered significant if the noise impacts indirectly affect nesting birds adjacent to the project site. Both direct and indirect impacts, can be minimized or eliminated by conducting work activities outside of the breeding season. Although some nesting birds can occur year-round in Southern California, typical avian breeding season is from mid-February through the end of August, so it is recommended to schedule work from about early September through the end of January to avoid nesting activity. If work must be done during the nesting season, the project site and adjacent areas (500-foot buffer) should be examined by a qualified biologist prior to any

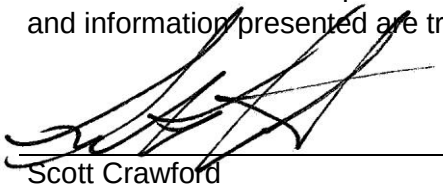
ground disturbance or vegetation removal activities, especially where there could be any direct impacts to potential nest areas. If active nests are found, the nests should be avoided and a no disturbance buffer zone established and observed until young have fledged. While there is no established protocol for nest avoidance and buffer zones, when consulted the CDFW generally recommends avoidance buffers of 500 feet for raptors and listed species and 100–300 feet for other unlisted birds. Nest avoidance and buffer zones are decided on a case by case basis and can sometimes be reduced depending on a variety of factors including topography, vegetation structure and the species in question. Construction activity may encroach into the buffer area at the discretion of the biological monitor with CDFW concurrence.

5.1.6 Permanent Indirect Impacts

There are no design features of the proposed project that will cause indirect impacts after the project is installed and therefore, no mitigation for permanent indirect impacts is proposed.

6.0 DETERMINATION OF BIOLOGICALLY EQUIVALENT OR SUPERIOR PRESERVATION

The proposed project contains ephemeral drainage systems that will be impacted by the project. The existing drainages offer no riparian function or value, that would benefit any downstream Conservation Areas within the Western Riverside County MSHCP, including flood storage and flood flow modification, nutrient retention and transformation, and sediment trapping and transport. The drainage features on-site drain to the east and eventually flow outside of the Western Riverside County MSHCP area. However, the riverine features on-site eventually flow into the Cabazon Conservation Area (sand transport system) as described in the Coachella Valley MSHCP (one mile to the southeast). To mitigate for the loss of these functions and values, an on-site drainage feature will be created along eastern edge of the project site and a second on-site drainage will be created along the western edge of the project site. These would be newly created features that would convey natural run-off and nuisance flow around the proposed development (referenced as "proposed graded swales" on Figure 8). The existing drainage features on-site consist primarily of unvegetated channels with no riparian habitat. The ephemeral drainage features do not provide any suitable habitat for sensitive riparian avian species such as southwestern willow flycatcher, western yellow-billed cuckoo, and least bell's vireo. The newly created feature would be similar in design and function as the existing on-site drainage features, but would be expanded to include the additional mitigation area necessary for compensation for both temporary and permanent impacts.



The created drainage features associated with the proposed mitigation will consist of a low-flow channel dominated with desert scrub along the upper banks. The created mitigation habitat is considered superior habitat in comparison to the existing drainage because it will: continue to convey local storm run-off from the north of the project site, it will be planted with native desert scrub habitat, it will meander like a natural occurring drainage, that will allow for continued percolation in the native sandy/cobble soils and it will provide better quality habitat for nesting birds. The proposed drainage will reduce excessive erosion and provide natural biological filtration for upstream pollutants associated with the adjacent roadway and railroad right-of-way. The desert scrub habitat will utilize significantly less irrigation than a more standard riparian habitat. Since the proposed mitigation (1.20 acre) is nearly four times the amount of total project direct and indirect impacts (0.30 acre), this mitigation is considered superior than current existing conditions.

A Habitat Mitigation Management Plan will be prepared by a qualified biologist and submitted to the City, USFWS, and CDFW for review, which will describe the habitat creation and establish success criteria that will extend five years from the start of the habitat creation effort. Success criteria will include 85% coverage of the existing riparian habitat, no more than 10% cover of non-native species, and removal of supplemental watering during the last two years of monitoring. With these measures, the proposed project will be consistent with MSHCP Section 6.1.2 (Protection of Species Associated with Riparian/Riverine Areas and Vernal Pools), and will result in equivalent or superior preservation of riparian/riverine resources over those that will be impacted by the project. If it is determined that the on-site mitigation is not feasible, additional alternatives could include,

but are not limited to off-site purchase of land already in a conservation area, such as lands owned and maintained by RCA. Currently, there are no active mitigation banks or in-lieu fee programs in this area.

7.0 CERTIFICATION

I hereby certify that the statements furnished above and in the attached exhibits present data and information required for this biological assessment, and that the facts, statements, and information presented are true and correct to the best of my knowledge and belief.

APPENDIX A

PLANT SPECIES LIST

APPENDIX A

PLANT SPECIES LIST

This list reports only plants observed on the site by this study. Other species may have been overlooked or undetectable due to their growing season. Plants were identified from keys, descriptions, and drawings in Baldwin et al (ed.) 2012 and Munz 1974.

MAGNOLIOPHYTA: MAGNOLIOPSIDA	**DICOT FLOWERING PLANTS**
Amaranthaceae	**Amaranth family**
*Amaranthus albus**	Tumbling (white) pigweed
Anacardiaceae	**Sumac family**
*Schinus molle**	Peruvian pepper tree
Asteraceae	**Sunflower family**
Baccharis salicifolia	Mule fat
*Centaurea solstitialis**	Yellow star-thistle
Conyza canadensis	Canadian horseweed
Deinandra fasciculata	fascicled tarplant
Encelia farinosa	Brittlebush
Filago californica	California filago
Helianthus annuus	Common sunflower
Heterotheca grandiflora	Telegraph weed
Oncosiphon piluliferum	Stinknet
Stephanomeria virgata	Tall wreath-plant
Boraginaceae	**Borage family**
Amsinckia intermedia	Common fiddleneck
Heliotropium curassavicum	Salt heliotrope
Brassicaceae	**Mustard family**
*Hirschfeldia incana**	Shortpod mustard
Cactaceae	**Cactus family**
Cylindropuntia californica var. *parkeri*	Valley cholla
Chenopodiaceae	**Saltbush family**
*Salsola tragus**	Russian thistle
Elaeagnaceae	**Oleaster family**
*Elaeagnus angustifolia**	Russian olive
Euphorbiaceae	**Spurge family**
Chamaesyce albomarginata	Rattlesnake weed
Croton setigerus	Dove weed
Fabaceae	**Pea family**
Acmispon glaber	Common deerweed, California broom
Geraniaceae	**Geranium family**

*Erodium botrys**	Longbeak stork's bill
*Erodium cicutarium**	Redstem stork's bill
Lamiaceae	**Mint family**
Trichostema lanceolatum	Vinegar weed
Polygonaceae	**Buckwheat family**
Eriogonum fasciculatum	California buckwheat
Rhamnaceae	**Buckthorn family**
Ceanothus sp.	Ceanothus
Salicaceae	**Willow family**
Populus fremontii	Fremont cottonwood
Salix lasiolepis	Arroyo willow
Simaroubaceae	**Quassia family**
*Ailanthus altissima**	Tree of heaven
Solanaceae	**Nightshade family**
*Nicotiana glauca**	Tree tobacco
Tamaricaceae	**Tamarisk family**
Tamarix sp.*	Tamarisk
MONOCOTYLEDONEAE	**MONOCOT FLOWERING PLANTS**
Poaceae	**Grass family**
*Avena barbata**	Slender wild oat
*Avena fatua**	Wild oat
Avena sp.*	Oat
*Bromus diandrus**	Ripgut brome
Bromus madritensis ssp. *rubens**	Red brome
*Bromus madritensis**	Foxtail chess
Salix gooddingii	Goodding's Black willow

VERTEBRATE ANIMALS SPECIES LIST

APPENDIX B

VERTEBRATE ANIMALS SPECIES LIST

This list reports only animals or their sign observed during AMEC's site visit. Burrows of unidentified small mammals are not included. Other species may have been overlooked or undetectable due to their nocturnal and/or subterranean activity patterns. Nomenclature and taxonomy for fauna observed generally follows the American Ornithologists' Union Checklist and its supplements (2015) for avifauna, CDFG (2006) for mammals, and Center for North American Herpetology (2015) for herpetofauna.

REPTILIA	**REPTILES**
Phrynosomatidae	**Phrynosomatid Lizards**
Sceloporus occidentalis longipes	Great Basin fence lizard
Uta stansburiana	Common side-blotched lizard

AVES	**BIRDS**
Cathartidae	**American Vultures**
Cathartes aura	Turkey vulture
Accipitridae	**Kites, Hawks, and Eagles**
Buteo jamaicensis	Red-tailed hawk
***Aquila chrysaetos*	Golden eagle
Falconidae	**Falcons**
Falco sparverius	American kestrel
Charadriidae	**Plovers and Lapwings**
Charadrius vociferus	Killdeer
Columbidae	**Pigeons and Doves**
Zenaida macroura	Mourning dove
Trochilidae	**Hummingbirds**
Calypte anna	Anna's hummingbird
Tyrannidae	**Tyrant Flycatchers**
Sayornis nigricans	Black phoebe
Sayornis saya	Say's phoebe
Tyrannus verticalis	Western kingbird
Corvidae	**Crows and Ravens**
Corvus corax	Common raven
Alaudidae	**Larks**
***Eremophila alpestris*	Horned lark
Hirundinidae	**Swallows**
Stelgidopteryx serripennis	Northern rough-winged swallow
Aegithalidae	**Bushtits**
Psaltriparus minimus	Bushtit
Troglodytidae	**Wrens**
Thryomanes bewickii	Bewick's wren
Fringillidae	**Finches**
Carpodacus mexicanus	House finch
Carduelis psaltria	Lesser goldfinch

MAMMALIA	**MAMMALS**
LAGOMORPHA	***RABBITS, HARES AND PIKA***
Leporidae	**Rabbits and Hares**
***Lepus californicus	San Diego black-tailed jackrabbit
Sylvilagus audubonii	Desert cottontail
RODENTIA	***RODENTS***
Sciuridae	**Squirrels**
Spermophilus beecheyi	California ground squirrel
Geomyidae	**Pocket Gophers**
Thomomys bottae	Botta's pocket gopher
Heteromyidae	**Pocket Mice and Kangaroo Rats**
Dipodomys sp.	Kangaroo rat
CARNIVORA	***CARNIVORES***
Canidae	**Foxes, Wolves and Dogs**
Canis latrans	Coyote

Attn: Stephanie Standerfer

Subject: Mature Tree Assessment Letter Report for the Banning Industrial Park Project, located in the City of Banning, Riverside County, California

Dear Mrs. Standerfer;

Amec Foster Wheeler, Environment and Infrastructure, Inc. (Amec Foster Wheeler) has prepared this memo to document project related impacts associated with the City of Banning's Mature Tree Ordinance. The project consists of the development of the Banning Industrial Park, which includes industrial warehouse buildings, associated parking lot, detention basins, and associated off-site infrastructure including an access road, lift station, water and sewer lines. Appendix A shows the Project Site boundary.

This memo details the tree evaluation efforts required to determine whether mature trees occur within the project site. The City of Banning Ordinance is as follows:

> **17.32.060 - Removal or destruction of trees.**
> A.
> Removal of healthy, shade providing, and aesthetically valuable trees shall be strongly discouraged, and shall be in conformance with the policies and programs of the General Plan. A tree removal and replacement plan shall be required for the removal and replacement of all trees in excess of 50 years of age, unless their removal is required to protect the public health and safety.
>
> B.
> Each tree that is removed in a new subdivision is considered a part of the common wealth of the citizens of Banning, is an important component of the habitat of surrounding wildlife, and is of value to the City. Each identified tree removed shall be replaced with at least one 36 inch box specimen tree, in addition to any other required landscaping. Individual single family residential lots of less than one-half acre and commercial tree farms shall be exempt from this provision. (Zoning Ord. dated 1/31/06, § 9108.06.)

Methods

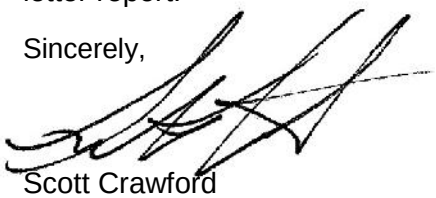
Amec Foster Wheeler biologist Scott Crawford preformed the original biological resource assessment surveys and jurisdictional delineation survey on the Banning Industrial Park project site on 9 and 24 May 2017. During the surveys, all vegetation observed during the surveys was recorded. Trees were among the biological resources identified during the survey, a subsequent analysis was completed to determine if any of the trees on-site were in excess of 50 years. This analysis was completed by comparing a recent aerial photograph from 2016 with a historic aerial photograph taken from 1967. Aerial photographs were compared using the slide tool on the HistoricAerials.com website.

The first step in the process required a printed aerial photograph with the most recent project boundary. HistoricalAerial.com and google earth were utilized to identify the location of existing trees within the project site, both recent and historic. Field notes were referenced from the previous biological resource surveys to verify the species of tree identified during the analysis. A map was created to identify the location of current and previous trees located within the project site; these locations are shown in Appendix A.

Conclusions

Based on the information collected for this analysis, all trees identified within the project site are associated with existing drainage features. This is likely due to the availability of moisture often associated with surface flows. A total of 15 trees were identified within the assessment area between 1967 and 2016, which included the project site, off-site improvements, and a 50-foot buffer. Six of the trees were identified within the project footprint in 2016 (See Figure 1). Eight trees are outside of the project footprint and will not be impacted by project development. One tree was observed in the 1967 aerial photograph but not in the 2016 aerial photograph. There are no trees associated with any of the off-site improvements.

Of the trees observed within the project site during the assessment in 1967 and 2016, one unidentified tree was observed in 1967 and was located in the southwestern corner of the proposed development on the south side of Drainage 1 (as described in the Jurisdictional Delineation Report 2017). This tree was not observed during the 2016 survey or within the 2016 aerial photograph, which means it died or was otherwise removed from the project site prior to 2016.

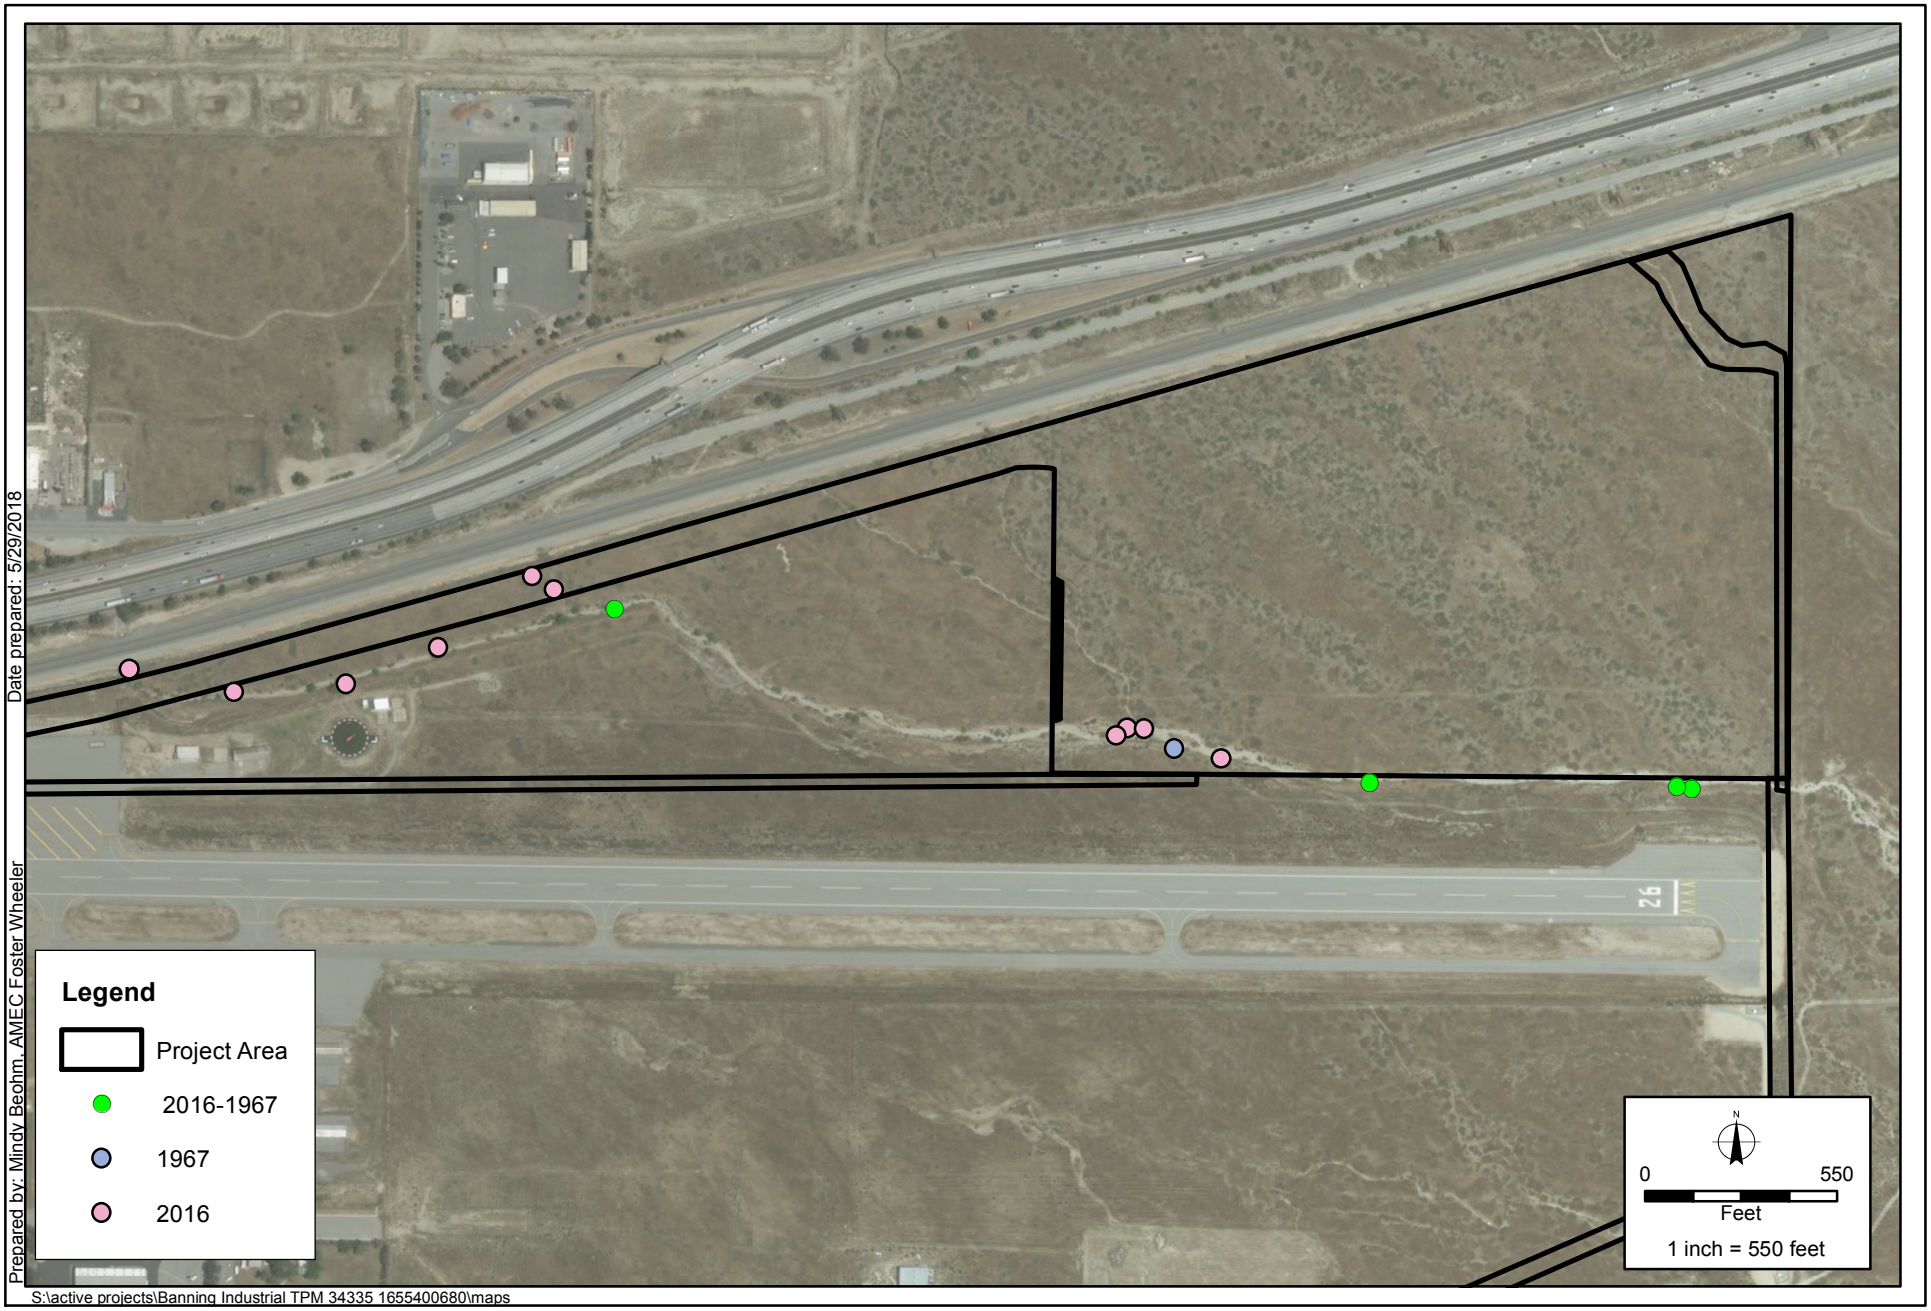


The six trees that are within the project site include three peppertrees (*Schinus molle*), one arroyo willow (*Salix lasiolepis*), one black willow (*Salix goodingii*), and one Freemont's cottonwood (*Populus fremontii)* (Figure 2). All six of these trees began growing on the site sometime after the 1967 photograph and therefore do not meet the minimum criteria to be considered a Mature Tree under the City of Banning Municipal Code.

Based on the information collected for this analysis, four trees meet the minimum requirement to be considered 'Mature Trees', since they were identified in both the 1967 and 2016 aerial photographs. However, these four trees are located outside of the project site and/or off-site improvements and will not be impacted by the project. There are two trees within the northern portion of the project site and are associated with the proposed access road. One Black Willow and one Cottonwood will be removed prior to grading, but are not considered mature trees under the City of Banning Municipal Code.

Based on these findings, no Mature Trees occur within the project site and no Mature Trees will be impacted by project development.

Please do not hesitate to contact me at (951) 369-8060 if you have any questions regarding this letter report.



Sincerely,

Scott Crawford
Biology Group Manager

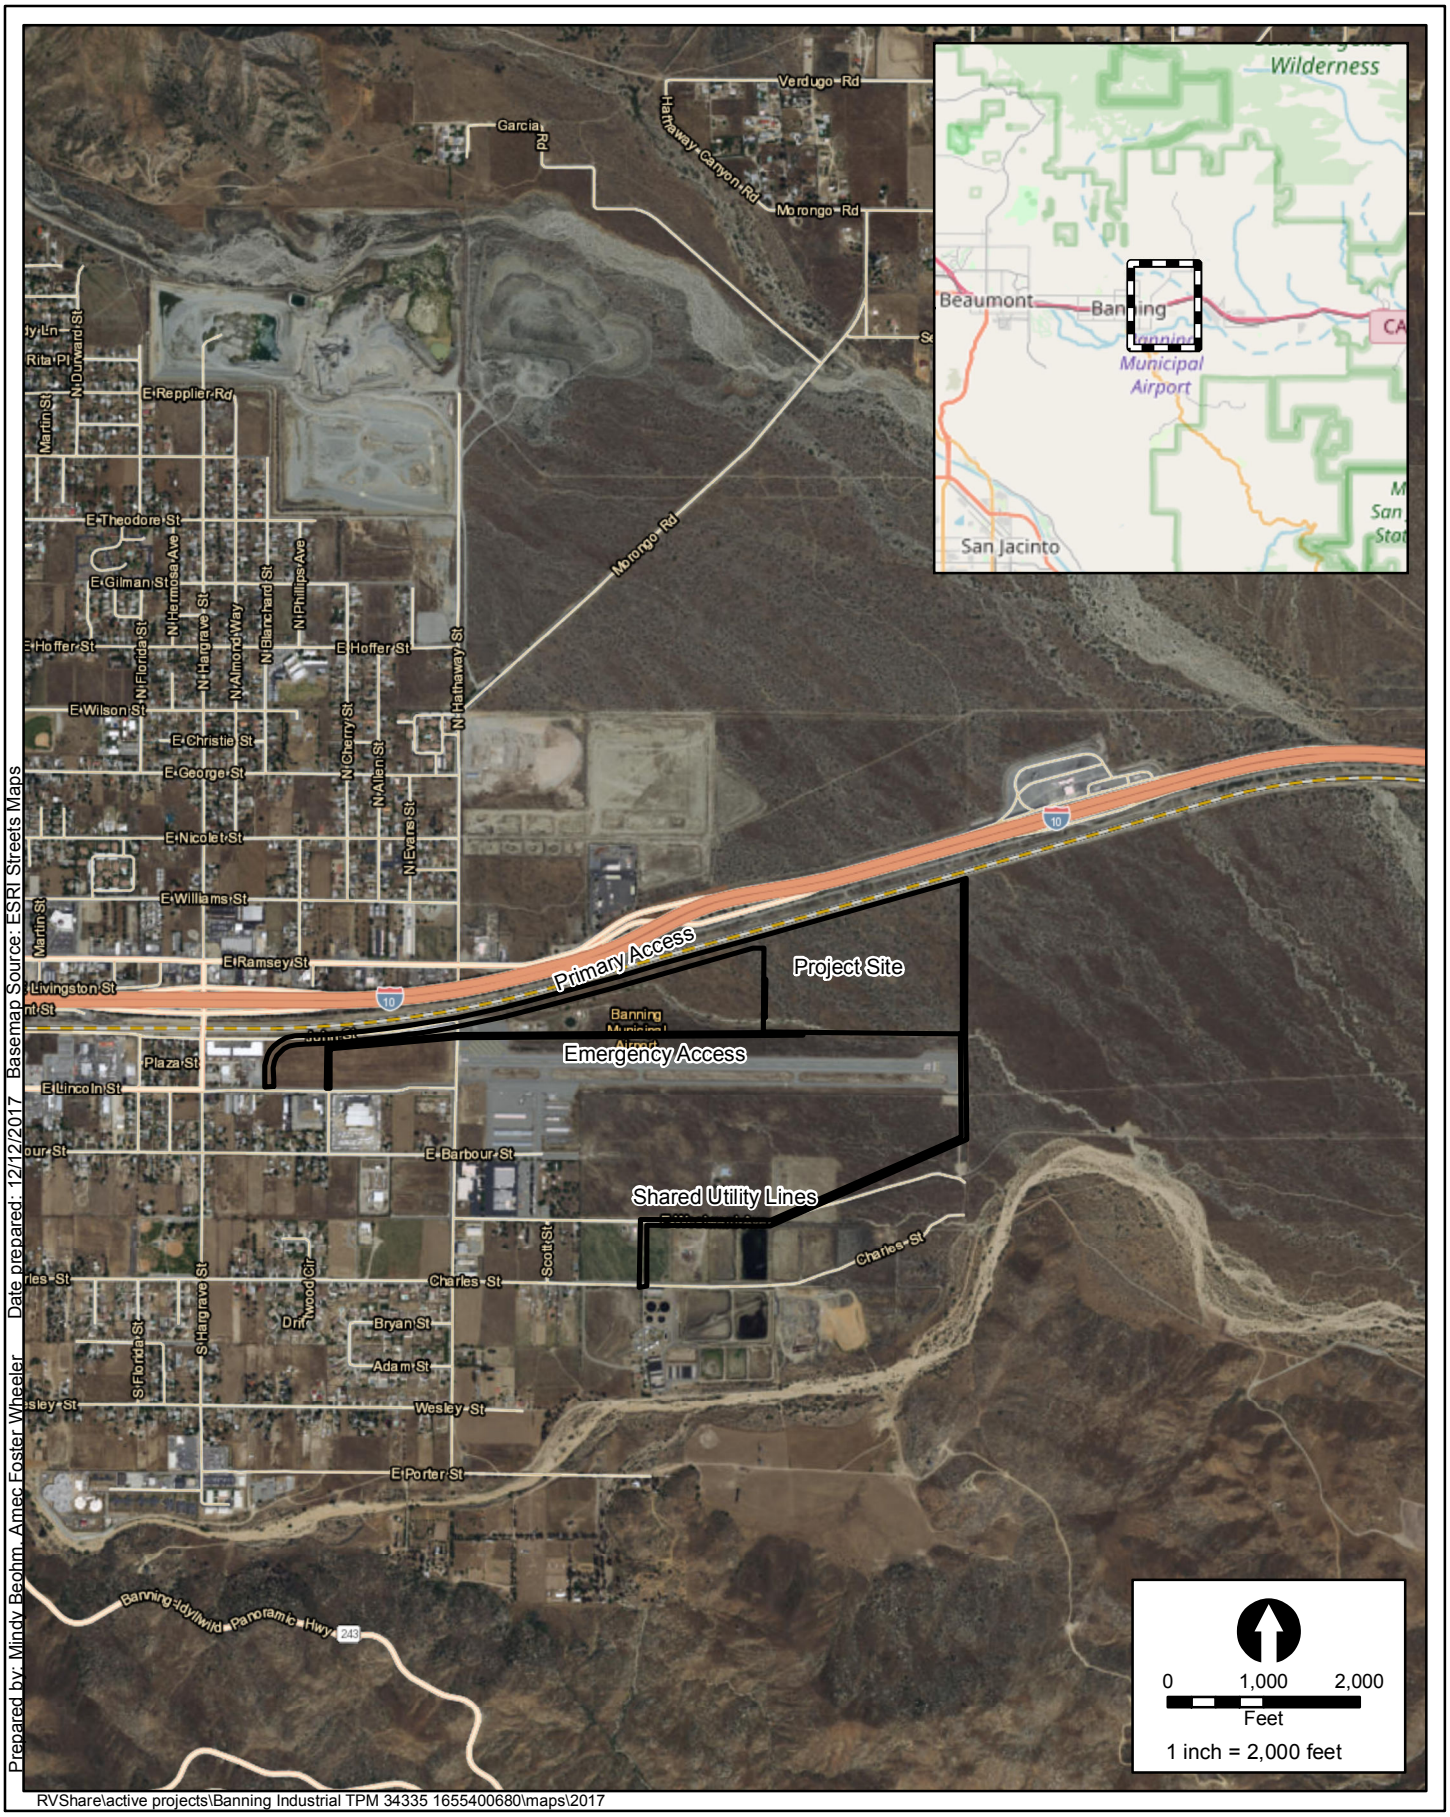
1.0 INTRODUCTION



This report presents regulatory framework, methods, and results of a delineation of jurisdictional waters, wetlands, and associated riparian habitat potentially impacted by construction of the Banning Industrial Park (hereafter referred to as project or project site). The purpose of the delineation is to determine the extent of state and federal jurisdiction within the project site potentially subject to regulation by the U.S. Army Corps of Engineers (USACE) under Section 404 of the Clean Water Act (CWA), Regional Water Quality Control Board (RWQCB) under Section 401 of the CWA and Porter Cologne Water Quality Control Act, and California Department of Fish and Wildlife (CDFW) under Section 1602 of the California Fish and Game Code.

1.1 Project Description

The proposed project includes the development of industrial buildings, a parking lot, a detention basin, and associated infrastructure (Figure 1). The completed project would also include two off-site access roads; one for general vehicle access and one for emergency vehicles. It also includes installation of sewer lines and water lines south of the project site.

1.2 Project Location

The project site is generally located north of State Route (SR) 74, south of Interstate (I) 10, east of SR 243, and west of SR 111 (Figure 1). The project is located in Section 11 of Township 3 South, Range 1 East on the Cabazon, California United States Geological Survey (USGS) 7.5-minute topographic quadrangle (Figure 2). The project is specifically located north of the Banning Municipal Airport, south of I-10, east of Hargrave Street, and west of the San Gorgonio River. The study area boundary was provided to Amec Foster Wheeler Environment and Infrastructure, Inc. (Amec Foster Wheeler) by Albert A. Webb Associates, Inc. The geographic coordinates near the middle of the project site are 33.925300° North latitude and -116.845199° West longitude.

2.0 REGULATORY FRAMEWORK

2.1 U.S. Army Corps of Engineers

The USACE regulates the discharge of dredged or fill material in waters of the United States (WUS) pursuant to Section 404 of the CWA.

2.1.1 Waters of the U.S.

CWA regulations (33 CFR 328.3(a)) define WUS as follows:

1. All waters which are currently used, or were used in the past, or may be susceptible to use in interstate or foreign commerce, including all waters which are subject to the ebb and flow of the tide;
2. All interstate waters including interstate wetlands;
3. All other waters such as intrastate lakes, rivers, streams (including intermittent streams), mudflats, sandflats, wetlands, sloughs, prairie potholes, wet meadows, playa lakes, or natural ponds, the use, degradation or destruction of which could affect interstate or foreign commerce including any such waters: (i) Which are or could be used by interstate or foreign travelers for recreational or other purposes; or (ii) From which fish or shellfish are or could be taken and sold in interstate or foreign commerce; or (iii) Which are used or could be used for industrial purpose by industries in interstate commerce;
4. All impoundments of waters otherwise defined as WUS under the definition;
5. Tributaries of WUS;
6. The territorial seas;
7. Wetlands adjacent to WUS (other than waters that are themselves wetlands).

The USACE delineates non-wetland waters in the Arid West Region by identifying the ordinary high water mark (OHWM) in ephemeral and intermittent channels (USACE 2008a). The OHWM is defined in 33 CFR 328.3(e) as:

> "…that line on the shore established by the fluctuations of water and indicated by physical characteristics such as clear, natural line impresses on the bank, shelving, changes in the character of soil, destruction of terrestrial vegetation, the presence of litter and debris, or other appropriate means that consider the characteristics of the surrounding areas."

Identification of OHWM involves assessments of stream geomorphology and vegetation response to the dominant stream discharge. Determining whether any non-wetland water is a jurisdictional WUS involves further assessment in accordance with the regulations, case law, and clarifying guidance as discussed below.

2.1.2 Wetlands and Other Special Aquatic Sites

Wetlands are defined at 33 CFR 328.3(b) as "those areas that are inundated or saturated by surface or ground water at a frequency and duration sufficient to support, and that under normal circumstances do support, a prevalence of vegetation typically adapted for life in saturated soil conditions. Wetlands generally include swamps, marshes, bogs, and similar areas."

Special aquatic sites are geographic areas, large or small, possessing special ecological characteristics of productivity, habitat, wildlife protection, or other important and easily disrupted ecological values. These areas are generally recognized as significantly influencing or positively contributing to the general overall environmental health or vitality of the entire ecosystem of a region. Special aquatic sites include sanctuaries and refuges, wetlands, mud flats, vegetated shallows, coral reefs, and riffle and pool complexes. They are defined in 40 CFR 230 Subpart E.

2.1.3 Supreme Court Decisions

2.1.3.1 Solid Waste Agency of Northern Cook County

On January 9, 2001, the Supreme Court of the United States issued a decision on Solid Waste Agency of Northern Cook County v. United States Army Corps of Engineers, et al. with respect to whether the USACE could assert jurisdiction over isolated waters. The Solid Waste Agency of North Cook County (SWANCC) ruling stated that the USACE does not have jurisdiction over "non-navigable, isolated, intrastate" waters.

2.1.3.2 Rapanos/Carabell

In the Supreme Court cases of Rapanos v. United States and Carabell v. United States (herein referred to as Rapanos), the court attempted to clarify the extent of USACE jurisdiction under the CWA. The nine Supreme Court justices issued five separate opinions (one plurality opinion, two concurring opinions, and two dissenting opinions) with no single opinion commanding a majority of the Court. In light of the Rapanos decision, the USACE will assert jurisdiction over a traditional navigable waterway (TNW), wetlands adjacent to TNWs, non-navigable tributaries of TNWs that are a relatively permanent waterway (RPW) where the tributaries typically flow year-round or have continuous flow at least seasonally (e.g., typically three months) and wetlands that directly abut such tributaries. The USACE will decide jurisdiction over the following waters based on a fact-specific analysis to determine whether they have a significant nexus with a TNW: non-navigable tributaries that are not relatively permanent, wetlands adjacent to non-navigable tributaries that are not RPWs, and wetlands adjacent to but that do not directly abut a non-navigable RPW.

Flow characteristics and functions of the tributary itself and the functions performed by all wetlands adjacent to the tributary indicate whether they significantly affect the chemical, physical and biological integrity of downstream TNWs. Analysis of potentially jurisdictional streams includes consideration of hydrologic and ecologic factors. The consideration of

hydrological factors includes volume, duration, and frequency of flow, proximity to traditional navigable waters, size of watershed, average annual rainfall, and average annual winter snow pack. The consideration of ecological factors also includes the ability for tributaries to carry pollutants and flood waters to a TNW, the ability of a tributary to provide aquatic habitat that supports a TNW, the ability of wetlands to trap and filter pollutants or store flood waters, and maintenance of water quality.

2.2 Regional Water Quality Control Board

The RWQCB regulates activities pursuant to Section 401(a)(1) of the CWA. Section 401 of the CWA specifies that certification from the State is required for any applicant requesting a federal license or permit to conduct any activity including, but not limited to, the construction or operation of facilities that may result in any discharge into navigable waters. Through the Porter Cologne Water Quality Control Act, the RWQCB asserts jurisdiction over Waters of the State of California (WSC) which is generally the same as WUS, but may also include isolated waterbodies. The Porter Cologne Act defines WSC as “surface water or ground water, including saline waters, within the boundaries of the state”.

2.3 California Department of Fish and Wildlife

The CDFW regulates water resources under Section 1600-1616 of the California Fish and Game Code. Section 1602 states:

> “An entity may not substantially divert or obstruct the natural flow of, or substantially change or use any material from the bed, channel, or bank of, any river, stream, or lake, or deposit or dispose of debris, waste, or other material containing crumbled, flaked, or ground pavement where it may pass into any river, stream, or lake (CDFW, 2015).”

Evaluation of CDFW jurisdiction followed guidance in the Fish and Game Code and A Review of Stream Processes and Forms in Dryland Watersheds. In general, under 1602 of the Fish and Game Code, CDFW jurisdiction extends to the maximum extent or expression of a stream on the landscape (CDFW, 2010). It has been the practice of CDFW to define a stream as “a body of water that flows perennially or episodically and that is defined by the area in a channel which water currently flows, or has flowed over a given course during the historic hydrologic course regime, and where the width of its course can reasonably be identified by physical or biological indicators” (Brady and Vyverberg, 2013). Thus, a channel is not defined by a specific flow event, nor by the path of surface water as this path might vary seasonally. Rather, it is CDFW's practice to define the channel based on the topography or elevations of land that confine the water to a definite course when the waters of a creek rise to their highest point.

3.0 METHODS

Prior to conducting delineation fieldwork, the following literature and materials were reviewed:

- Aerial photographs of the project site at a scale of 1:1500 to determine the potential locations of jurisdictional waters or wetlands;
- USGS topographic map (Figure 2) to determine the presence of any "blue line" drainages or other mapped water features;
- USDA soil mapping data; and
- USFWS NWI map to identify areas mapped as wetland features.

Field surveys of the project site were conducted by Amec Foster Wheeler delineator Scott Crawford on 24 May 2016 and 9 May 2017. Surveys consisted of walking the entire survey area and identifying potentially jurisdictional water features. Visual observations of vegetation types and changes in hydrology and culvert locations were used to locate areas for evaluation. Weather conditions during delineation fieldwork were conducive for surveying with generally cloudy skies with winds ranging from 5 to 10 miles per hour and a temperature of 55 degrees Fahrenheit.

USACE WUS, including wetlands, and RWQCB WSC were delineated according to the methods outlined in *A Field Guide to the Identification of the Ordinary High Water Mark (OHWM) in the Arid West Region of the Western United States* (USACE, 2008a). The extent of WUS was determined based on indicators of an OHWM. The OHWM width was measured at points wherever clear changes in width occurred.

Federally regulated wetlands were identified based on the *Wetlands Delineation Manual* (USACE, 1987) and *Regional Supplement to the Corps of Engineers Wetland Delineation Manual: Arid West Region* (USACE, 2008b). Additional data was recorded to determine if an area fulfilled the wetland criteria parameters. Three criteria must be fulfilled in order to classify an area as a wetland under the jurisdiction of the USACE: 1) a predominance of hydrophytic vegetation, 2) the presence of hydric soils, and 3) the presence of wetland hydrology. Details of these criteria are described below:

- **Hydrophytic Vegetation.** The hydrophytic vegetation criterion is satisfied at a location if greater than 50% of all the dominant species present within the vegetation unit have a wetland indicator status of obligate (OBL), facultative wetland (FACW), or facultative (FAC) (USACE, 2008b). An OBL indicator status refers to plants that almost always occur in wetlands. A FACW indicator status refers to plants that usually occur in wetlands, but may occur in non-wetlands. A FAC indicator status refers to plants that occur in wetlands and non-wetlands. Other wetland indicator statuses include facultative upland (FACU) which refers to plants that usually occur in non-wetlands, but may occur in wetlands, upland (UPL) for species that almost never occur in wetlands, and NL for plants that are not listed on the *National Wetland Plant List*. The wetland

indicator status used for this report follows the 2013 National Wetland Plant List (Arid West Region) (Lichvar, 2014).

- **Hydric Soils**. The hydric soil criterion is satisfied at a location if soils in the area can be inferred or observed to have a high groundwater table, if there is evidence of prolonged soil saturation, or if there are any indicators suggesting a long-term reducing environment in the upper part of the soil profile. Reducing conditions are most easily assessed using soil color. Soil colors were evaluated using the *Munsell Soil Color Charts* (Gretag/Macbeth, 2000).
- **Wetland Hydrology.** The wetland hydrology criterion is satisfied at a location based upon conclusions inferred from field observations that indicate an area has a high probability of being inundated or saturated (flooded, ponded, or tidally influenced) long enough during the growing season to develop anaerobic conditions in the surface soil environment, especially the root zone (USACE, 1987 and 2008b).

CDFW jurisdiction was delineated by measuring the elevations of land that confine a stream to a definite course when its waters rise to their highest level and to the extent of associated riparian vegetation.

To determine jurisdictional boundaries, the surveyor walked the length of the drainage within the project area and recorded the centerline with a Trimble GeoXH global positioning system. The width of the drainage was determined by the OHWM and bankfull width measurements at locations where transitions were apparent. Other data recorded included bank height and morphology, substrate type, and all vegetation within the streambed and riparian vegetation adjacent to the streambed. Upon completion of fieldwork, all data collected in the field were incorporated into a Geographic Information System (GIS) along with basemap data. The GIS was then used to quantify the extent of jurisdictional waters.

4.0 ENVIRONMENTAL SETTING

4.1 Existing Conditions

The project site and associated infrastructure occurs immediately south of existing railroad tracks. The drainage features that flow onto the project site originate from natural run-off and nuisance flow from the north. Flows are conveyed beneath the existing railroad tracks through underground box or corrugated metal culverts and sheet flow along the southern edge of the railroad right-of-way. This features is not contained within an active channel and has been routinely disturbed as part of the efforts to minimize erosion for run-off. The drainage features begin along the northern project site as erosion features associated with relatively undisturbed earthen channels and proceed to flow off-site within similar earthen channels or sheet flow.

Surrounding land uses include the Banning Airport to the south, undisturbed natural habitat to the north and east, and residential and commercial development to the west.

Elevations within the project site are generally flat and range from a high of 2,265 feet above mean sea level (AMSL) at the western extent of the project site to a low of 2,105 feet AMSL at the southeastern corner of the project site.

4.2 Hydrology

The average rainfall for the area is 15.72 inches per year (Western Regional Climate Center, 2016). Weather data was recorded nearby in the city of Cabazon, approximately three miles east of the project site.

Runoff from the site generally flows southeast for approximately a half mile before entering Smith Creek. Flows continue in Smith Creek for 1.5 miles before flowing into the San Gorgonio River, which then empties into the Whitewater River (11.5 miles to the east). The Whitewater River flows for 50 miles before reaching the Salton Sea.

4.3 Vegetation

Vegetation nomenclature follows The Jepson Manual, Vascular Plants of California, 2nd Edition (Baldwin, 2012). When The Jepson Manual does not list a common name, common name nomenclature follows the United States Department of Agriculture, Natural Resources Conservation Service (USDA) Plants Database (USDA, 2016a).

The vegetation associated with the project site and surrounding areas is dominated by Catclaw Acacia Thorn Scrub *Acacia greggii* Shrubland Alliance (Figure 3). This community contains small to large catclaw acacia as the dominate plant species. Vegetation within the majority of the project site is 3 to 6 feet in height and has a relatively open canopy. Other common species include desert encelina (*Encelia farinosa*), California buckwheat (*Eriogonum fasciculatum*), and deer weed (*Acmispon glaber*). Understory species observed on-site include Russian

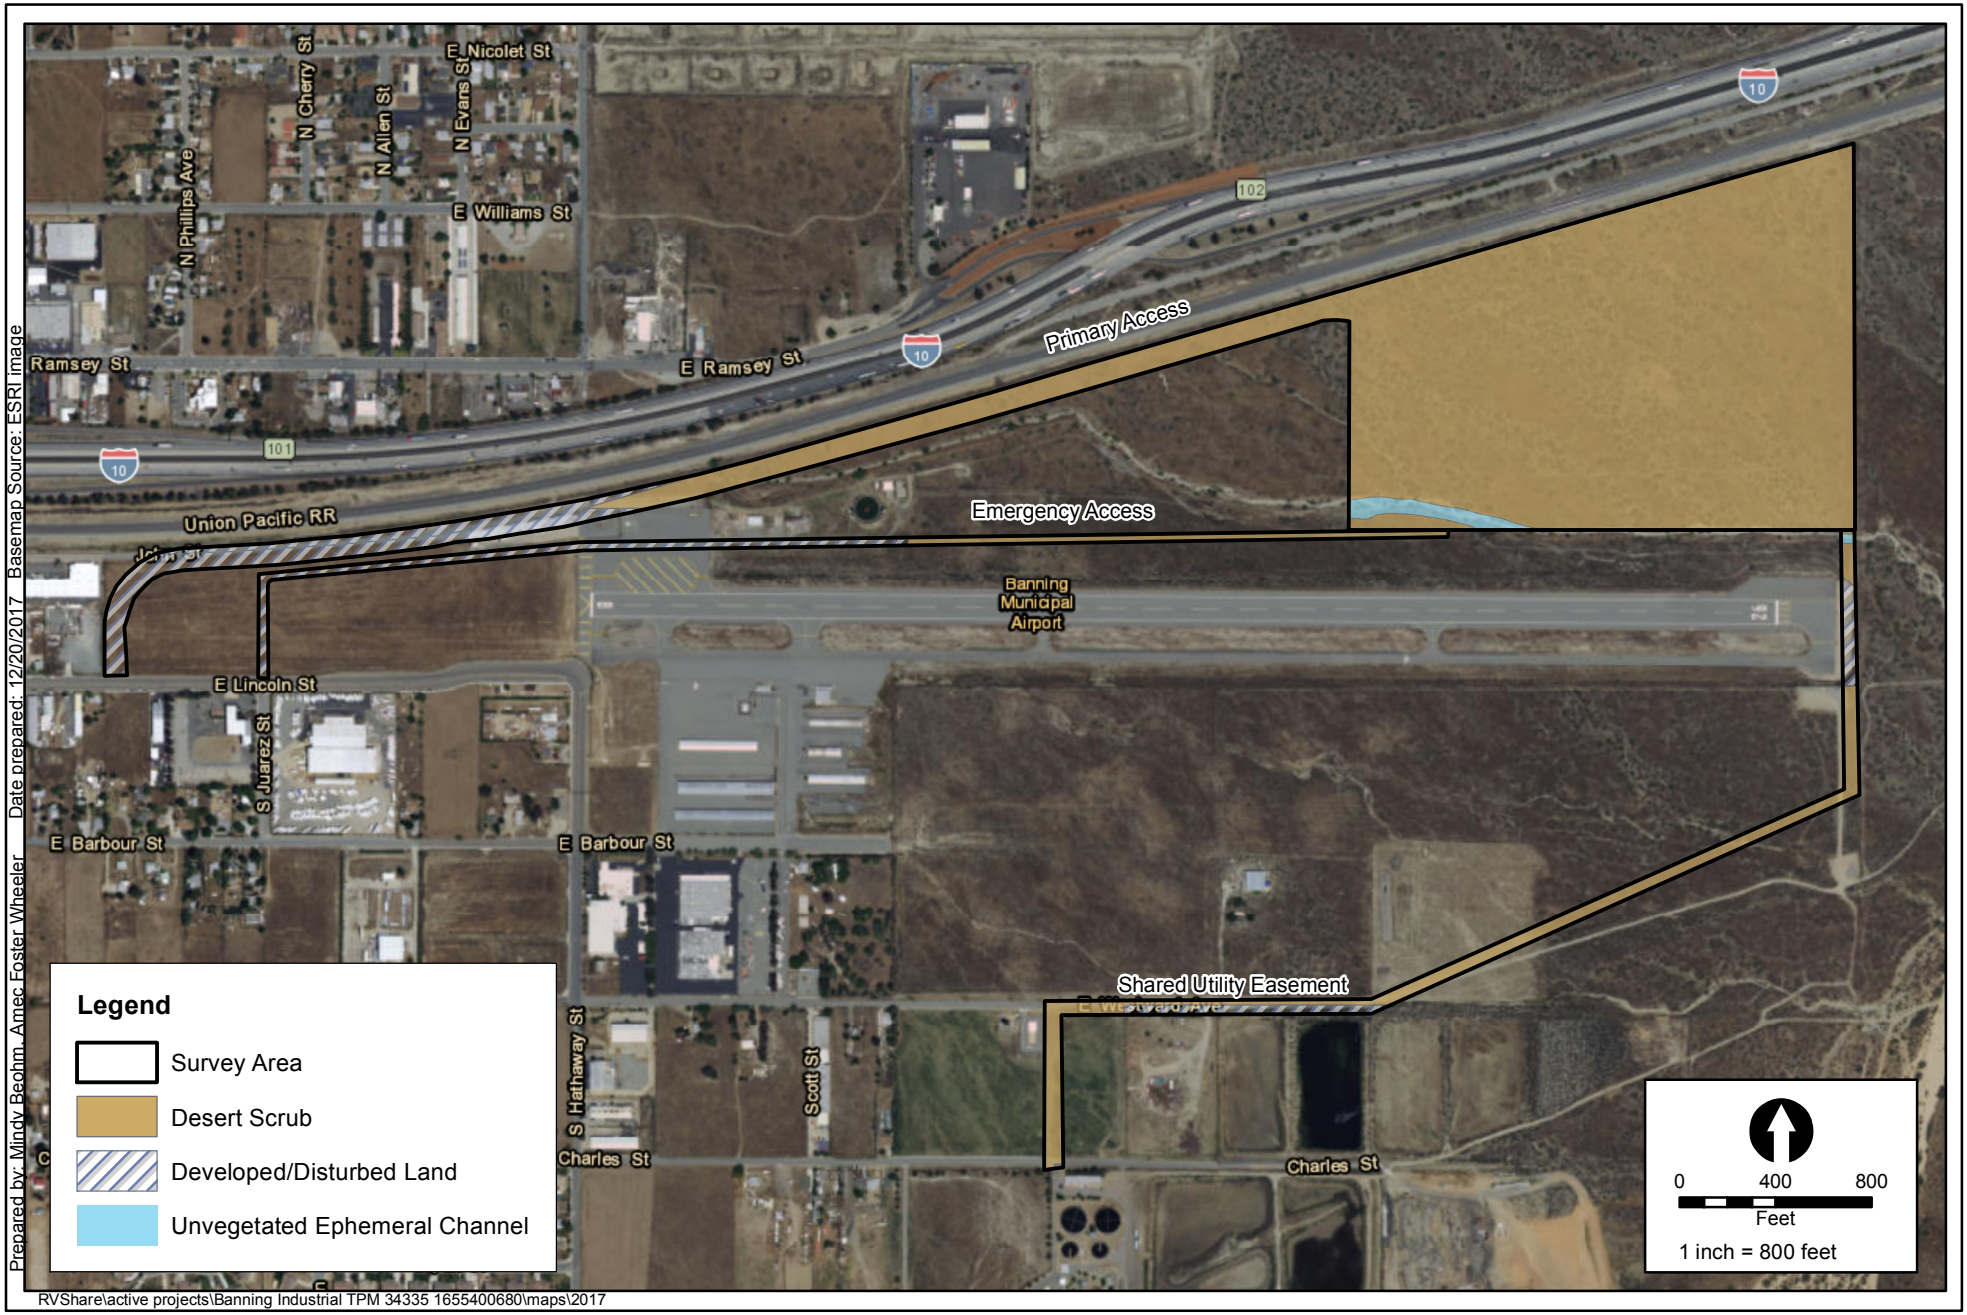
thistle (*Salsola tragus*), wild mustard (*Hirschfeldia incana*), rip-gut grass (*Bromus diandrus*), and red-stemmed filaree (*Erodium cicutarium*).

The majority of the drainage features are un-vegetated and do not contain enough vegetation coverage to be considered an independent vegetation community. Plant species observed with the drainages and not within the rest of the project site include scalebroom (Lepidospartum squamatum),

4.4 Soils

The USDA online Web Soil Survey (based on the *Soil Survey of Coachella Valley Area, Riverside County, California*) (Soil Survey Staff, 2016) was reviewed to determine the soil types mapped as occurring within the study area. The study area crosses five individual soil types within three different soil series (Figure 4) including:

- **Gorgonio gravelly loamy fine sand** (GmD) – This somewhat excessively drained soil occurs on alluvial fans with 2 to 15 percent slopes. It is composed of gravelly loamy fine sand on the surface and the parent material is alluvium derived from granite.
- **Gorgonio cobbly loamy fine sand** (GnD) – This somewhat excessively drained soil occurs on alluvial fans with 2 to 15 percent slopes. It is composed of cobbly loamy fine sand on the surface and the parent material is composed of alluvium derived from granite.
- **Handford cobbly coarse sandy loam** (HdD2) – This somewhat excessively drained soil occurs on alluvial fans with 2 to 15 percent slopes. It is composed of cobbly coarse sandy loam on the surface and the parent material is composed of alluvium derived from granite.
- **Hanford coarse sandy loam**, 2 to 8 percent slopes (HcC) – This well drained soil occurs on alluvial fans and alluvial plains with 2 to 8 percent slopes. It is composed of a mix of coarse and sandy loam on the surface and the parent material is composed of alluvium derived from granite.
- **Tujunga gravelly loamy sand**, 0 to 8 percent slopes (TwC) – This excessively drained soil occurs on flood plains and alluvial fans with 0 to 8 percent slopes. The parent material is composed of sandy alluvium derived from granite.



USDA (2014) lists Hanford Cobbly Coarse Sandy Loam within the project site as hydric soils. None of these soils are known to be specifically associated with sensitive biological resources.

4.5 National Wetlands Inventory

The United States Fish and Wildlife Service (USFWS) is the principal Federal agency that provides information to the public on the extent and status of the Nation's wetlands. The USFWS has developed a series of maps, known as the National Wetlands Inventory (NWI) to show wetlands and deep-water habitat. This geospatial information is used by Federal, State, and local agencies, academic institutions, and private industry for management, research,

policy development, education, and planning activities. The NWI program was neither designed nor intended to produce legal or regulatory products; therefore, wetlands identified by the NWI program are not the same as wetlands defined by the USACE.

The NWI Mapper (USFWS, 2017) was accessed on-line to review mapped wetlands within the project study area. There is one NWI feature mapped within the project site. This feature is associated with Drainage 1 and consists of an ephemeral riverine area with no evidence of wetlands. The next closest NWI feature has a Riverine Wetland Type and is located about a half mile southeast of the project site (Smith Creek). It is categorized as an intermittent riverine system with a temporary flooded water regime.

5.0 RESULTS

The project site and off-sites affect a total of six jurisdictional drainage features. Photographs of the drainage features are shown in Appendix A. The Jurisdictional Delineation Maps (Figure 4) identifies the general location of the jurisdictional resources. Table 1 includes a list of drainage features identified in the project area, their jurisdictional status and area of jurisdiction, Cowardin classification, and length of waterway within the project study area.

The USACE, in combination with the Environmental Protection Agency (EPA), when necessary, reserves the ultimate authority in making the final jurisdictional determination of WUS and the RWQCB reserves the ultimate authority in making the final jurisdictional determination of WSC. Additionally, CDFW has ultimate discretion in the determination of their jurisdiction.

Table 1
Summary of Jurisdictional Areas

Drainage ID	USACE/RWQCB Jurisdiction	WSC and CDFW Jurisdiction (acres)	Length (feet)	Latitude/ Longitude	Cowardin Class	Class of Aquatic Resource
Drainage 1	0.71	1.05	2,480	33.923479/ 116.845137	R4SBJ	non-section10-non wetland
Drainage 2	0.01	0.01	180	33.924887/ 116.853413	R4SBJ	non-section10-non wetland
Drainage 3	0.13	0.13	670	33.924304/ 116.848170	R4SBJ	non-section10-non wetland
Drainage 4	0.03	0.03	350	33.924867/ 116.848537	R4SBJ	non-section10-non wetland
Drainage 5	0.07	0.07	760	33.926706/ 116.842612	R4SBJ	non-section10-non wetland
Drainage 6	0.42	0.42	2,100	33.918099/ 116.845239	R4SBJ	non-section10-non wetland
Total	1.37	1.71	6,540	n/a	n/a	n/a

WSC – Waters of the State of California
CDFW – California Department of Fish and Wildlife
R4SBJ – Riverine, Intermittent, Streambed Intermittently Flooded based on Classification of Wetlands and Deepwater Habitats of the United States (Cowardin, et. al., 1979).

The total estimated area of USACE/RWQCB jurisdiction within the project site is 1.37 acre. The total estimated area of CDFW jurisdiction is 1.71 acres. The sections below describe each individual drainage feature identified during the wetland delineation:

5.1 Drainage 1

Drainage 1 is the largest drainage within the project site and it originates in the western portion of the project site along the off-site improvement John Street and exits the project site in the southeastern corner (See photos 1, 2, and 3). This feature is an ephemeral drainage, relatively unvegetated, and contains boulders and cobbles along the creek bed. This feature temporarily flows off-site before entering the southern portion of the main project site and flows along the southern boundary. The sparse vegetation observed within the channel includes scalebroom, catclaw acacia (*Acacia greggii*), western ragweed (*Ambrosia psilostachya*), and tumbleweed (*Salsola tragus*). There is not sufficient vegetation cover to be considered a vegetation community. The drainage ordinary high water mark varies across the project site from 14 to 30 feet in width. The drainage depth varies from 1 to 6 feet. The overall length of Drainage 1 within the project site is approximately 2,480 feet. There is no evidence of hydric soils or hydrophytic vegetation and therefore, the drainage feature has no associated wetlands. Wetland datasheets were not completed for this drainage. The estimated area for USACE jurisdiction is 0.71 acre. The estimated area for RWQCB/CDFW jurisdiction is 1.05 acres.

5.2 Drainage 2

Drainage 2 is a small ephemeral swale with intermittent bed and bank features that occurs along the off-site improvement, John Street. The OHWM is periodic and is often only visible as a noticeable change in sediment or vegetation. The majority of the drainage contains similar soils as the adjacent uplands. This feature conveys flows from the adjacent railroad right-of-way into Drainage 1. The majority of this drainage contains unknown grass species. There are sparse California buckwheat (*Eriogonum fasciculatum*) and London rocket (*Sisymbrium irio*). This feature is approximately 1 foot in width with no evidence of depth. The overall length of Drainage 2 within the project site is approximately 180 feet. There is no evidence of hydric soils or hydrophytic vegetation and therefore, the drainage feature has no associated wetlands. Wetland datasheets were not completed for this drainage. The estimated area for USACE/RWQCB/CDFW jurisdiction is 0.01 acre.

5.3 Drainage 3

Drainage 3 is tributary to Drainage 1 and also conveys flows from the adjacent railroad right-of-way that occurs along the off-site improvement, John Street. This feature is an ephemeral drainage, relatively unvegetated, and contains cobbles and sand along the creek bed. This feature temporarily flows off-site before entering the western portion of the main project site and flows within the southwestern corner of the project site before flowing into Drainage 1. The ordinary high water mark was consistent throughout the project site at approximately 6 feet in width. The drainage depth varies from 1 to 3 feet. The overall length of Drainage 3 within the project site is approximately 670 feet. There is no evidence of hydric soils or hydrophytic vegetation and therefore, the drainage feature has no associated wetlands. Wetland datasheets were not completed for this drainage. The estimated area for USACE/RWQCB/CDFW jurisdiction is 0.13 acre.

5.4 Drainage 4

Drainage 4 is a small tributary to Drainage 3 and about half the size that occurs along the off-site improvement, John Street. This feature is similar to Drainage 3. It is an ephemeral drainage, unvegetated, and contains cobbles and sand along the creek bed. This feature temporarily flows off-site before entering the western portion of the main project site and flows within the southwestern corner of the project site before flowing into Drainage 3. The ordinary high water mark was consistent throughout the project site at approximately 3 feet in width. The drainage depth varies from 0 to 1 feet. The overall length of Drainage 4 within the project site is approximately 350 feet. There is no evidence of hydric soils or hydrophytic vegetation and therefore, the drainage feature has no associated wetlands. Wetland datasheets were not completed for this drainage. The estimated area for USACE/RWQCB/CDFW jurisdiction is 0.03 acre.

5.5 Drainage 5

Drainage 5 is an ephemeral drainage that originates in the northeast corner of the project site. It is also an ephemeral drainage, unvegetated, and contains cobbles and sand along the creek bed. This drainage feature terminates as sheet-flow along the eastern edge of the project site. Downstream of the project, the ordinary high water mark is visible and the drainage eventually flows into Smith Creek. Although this drainage feature has a periodic ordinary high water mark, it is hydrologically connected to downstream drainage features. The ordinary high water mark averaged from 0 to 3 feet in width. The drainage depth varies from 0 to 0.5 feet. The overall length of Drainage 5 within the project site is approximately 760 feet. There is no evidence of hydric soils or hydrophytic vegetation and therefore, the drainage feature has no associated wetlands. Wetland datasheets were not completed for this drainage. The estimated area for USACE/RWQCB/CDFW jurisdiction is 0.07 acre.

5.6 Drainage 6

Drainage 6 is an ephemeral drainage that originates at the eastern terminus of Barbour Street, south of the project site. It is an ephemeral drainage, unvegetated, and contains cobbles and sand along the creek bed. This drainage feature originates as sheet-flow along the eastern edge of a paved road and flows into a soft-bottom channel. The drainage meanders to the southeast for 1,500 feet before heading east along the north side of Westward Avenue and occurs along the off-site wet utility alignment. The drainage flows due east for approximately 700 linear feet before flowing over Westward Avenue and continuing east for approximately 2,000 linear feet before entering Smith Creek. This drainage feature has a noticeable bed and bank feature ordinary high water mark, it is hydrologically connected to downstream drainage features. The ordinary high water mark averaged from 0 to 3 feet in width on the western extent and approximately 12 to 17 feet on the eastern end. The drainage depth varies from 0 to 4 feet. The overall length of Drainage 6 within the project site is approximately 2,100 feet. There is no evidence of hydric soils or hydrophytic vegetation and therefore, the drainage feature has no associated wetlands. Wetland datasheets were not completed for this drainage. The estimated area for USACE/RWQCB/CDFW jurisdiction is 0.42 acre.

5.7 Jurisdictional Determination

All 6 drainage features are ephemeral washes that likely flow for less than 3 months per year. Therefore, the USACE will likely classify these features as non-RPW. All six features eventually flow into the Whitewater River. The USACE will likely classify the Whitewater River as an RPW. The Whitewater River flows into the Salton Sea approximately 50 river miles from the study area and exhibits both physical surface channel connectivity and hydrologic connectivity with the Salton Sea. The Salton Sea is classified as a TNW as a result of a Supreme Court decision (Colvin v. United States). Therefore, the USACE will likely consider these features to be jurisdictional under the CWA.

The USACE is ultimately responsible for jurisdictional determinations, and this report has been prepared to provide the necessary information to assist the USACE with that determination. An Approved Jurisdictional Determination could be requested of the USACE to provide an analysis to determine if the subject reach of these features has a “significant nexus” to the Salton Sea, and are therefore jurisdictional WUS. Otherwise, the project proponent can request a Preliminary Jurisdictional Determination in which the USACE assumes jurisdiction over these features, and process permits accordingly.

6.0 IMPACTS TO JURISDICTIONAL AREAS

The proposed development plan was overlaid on the jurisdictional delineation boundary using GIS to determine the extent of impacts (limits of grading) to jurisdictional areas (Figure 5). Albert A. Webb Associates, Inc. provided Amec Foster Wheeler with the development plan. Permanent impacts were assessed for the proposed access road, the warehouse footprint, and the emergency access roads for a total of 0.23 acres. There will be approximately 0.07 acre of temporary impacts to jurisdictional resources associated with construction work areas and utility line right-of-way. The temporary impact area will be returned to its previous impact conditions. Permanent and temporary impacts are listed in Table 2.

Table 2
Summary of Impacts to Jurisdictional Areas

Drainage ID	USACE/WSC Permanent Impacts	USACE/WSC Temporary Impacts	CDFW Permanent Impacts	CDFW Temporary Impacts	Length (feet)
Drainage 1	0.09	0.04	0.09	0.04	166
Drainage 2	0.01	0.00	0.01	0.00	94
Drainage 3	0.05	0.01	0.05	0.01	329
Drainage 4	0.01	0.00	0.01	0.00	178
Drainage 5	0.07	0.00	0.07	0.00	760
Drainage 6*	0.00	0.02	0.00	0.42	140
Total	0.23	0.07	0.23	0.47	1,667

*Temporary Impacts
WSC – Waters of the State of California
CDFW – California Department of Fish and Wildlife
R4SBJ – Riverine, Intermittent, Streambed Intermittently Flooded based on Classification of Wetlands and Deepwater Habitats of the United States (Cowardin, et. al., 1979).

6.1 Permitting Requirements

Since all six drainage features will be impacted by project development, authorizations from the USACE, RWQCB, and CDFW will be required as described below. At this point, all mitigation is designed to be on-site mitigation associated with habitat creation along the western and eastern project site boundary. However, if additional area is needed to comply with regulatory agency requirements, additional off-site mitigation credits may be purchased from an in-lieu fee program/mitigation bank or from the RCA.

6.1.1 U.S. Army Corps of Engineers

The two most common types of permits issued by USACE under Section 404 of the CWA to authorize the discharge of dredged or fill material into WUS are: a nation-wide permit (NWP) or an individual permit (IP).

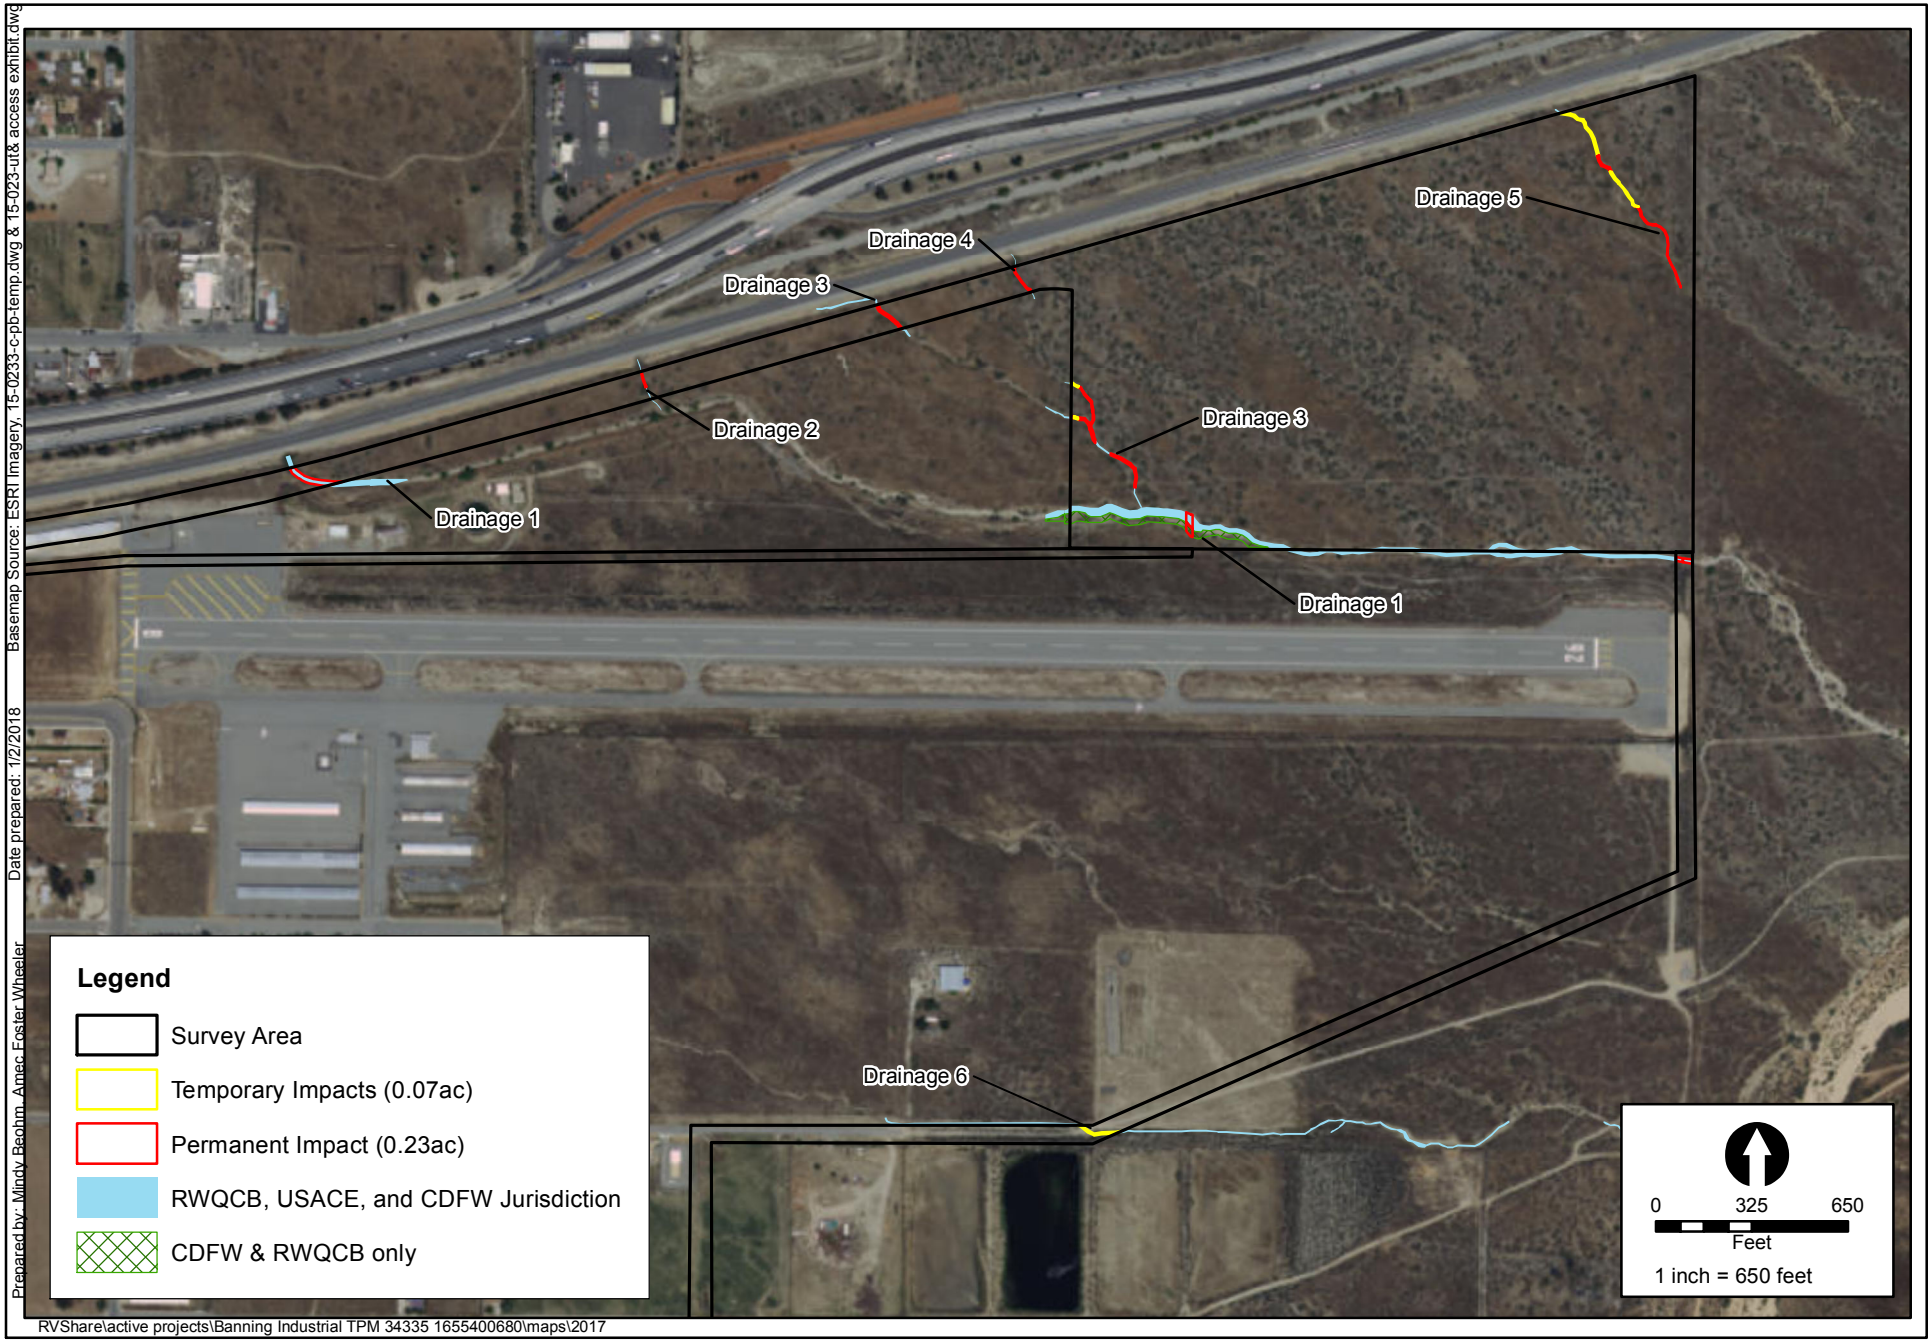
NWPs are general permits for specific categories of activities that result in minimal impacts to aquatic resources.

NWP 39 can be used for Commercial and Institutional Developments. The discharge cannot cause the loss of greater than ½ acre of WUS and no more than 300 linear feet of streambed. The permittee must submit a pre-construction notification to the district engineer prior to commencing the activity. The proposed project would likely qualify under NWP 39 and could likely wave the 300-linear foot requirements to the USACE, due to the low quality habitat associated with the drainage feature.

For project impacts that do not meet the provisions of an existing NWP, the USACE would require an IP. An IP requires detailed analysis and compliance with the USACE formal review process. This process includes preparation of an alternatives analysis as required by EPA Section 404(b)(1) Guidelines and the National Environmental Policy Act (NEPA), and requires compliance with NEPA's environmental review process. This process provides opportunities for public notice and comment.

The USACE must comply with the federal Endangered Species Act and Section 106 of the National Historic Preservation Act when issuing a NWP or IP.

6.1.2 Regional Water Quality Control Board



The project area occurs in the Colorado River RWQCB (Region 7). Under Section 401 of the CWA, the RWQCB must certify that the discharge of dredged or fill material into WUS does not violate state water quality standards.

The RWQCB also regulates impacts to WSC under the Porter Cologne Water Quality Control Act through issuance of a Construction General Permit, State General Waste Discharge Order, or Waste Discharge Requirements, depending upon the level of impact and the properties of the waterway.

The project proponent would need to obtain a Water Quality Certification. In addition to the formal application materials and fee (based on area of impact), a copy of the appropriate California Environmental Quality Act (CEQA) documentation must be included with the application.

6.1.3 California Department of Fish and Wildlife

A 1602 Streambed Alteration Agreement is required for all activities that alter streams and lakes and their associated riparian habitat. In addition to the formal application materials and fee (based on cost of the project), a copy of the appropriate CEQA documentation must be included with the application.

Photo 4 – Looking south at Drainage 3 from the northern portion of the Project Site.

Photo 5 – Looking north at Drainage 3. Fence line marks the western property boundary.

Photo 6 – Looking north at Drainage 4 from the western portion of the main Project Site.

Photo 7 – Looking southeast at Drainage 5 near the northeastern corner of the project site.

Photo 8 – Looking north at Drainage 5 from the eastern portion of the Project Site.

Photo 9 – Looking west at Drainage 6 from the southeastern corner of the utility line.

Photo 10 – Looking east at Drainage 6 from the western extent of the utility line.

APPENDIX B

PLANT COMPENDIUM

Flora Compendia

Amaranthaceae		**Amaranth Family**
Amaranthus	*albus*	tumbling pigweed
Anacardiaceae		**Sumac or Cashew Family**
Schinus	*molle*	Peruvian pepper tree
Asteraceae		**Sunflower Family**
Ambrosia	*acanthicarpa*	annual bursage
Ambrosia	*psilostachya*	western ragweed
Ambrosia	*salsola*	cheese bush
Artemisia	*californica*	California sagebrush
Baccharis	*salicifolia*	mule fat
Centaurea	*solstitialis*	yellow star-thistle
Chaenactis	*sp.*	unknown pincushion species
Conyza	*canadensis*	horseweed
Corethrogyne	*filaginifolia*	California aster
Cotula	*coronopifolia*	brass-buttons
Encelia	*farinosa*	brittlebush
Ericameria	*linearifolia*	interior goldenbush
Gnaphalium	*californicum*	California everlasting
Helianthus	*annuus*	common sunflower
Hemizonia	*paniculata*	San Diego tarweed
Heterotheca	*grandiflora*	telegraphweed
Logfia	*californica*	California cottonrose
Senecio	*flaccidus*	threadleaf ragwort
Senecio	*vulgaris*	common groundsel
Stephanomeria	*virgata*	twiggy wreathplant
Tetradymia	*comosa*	hairy horsebrush
Boraginaceae		**Borage Family**
Amsinckia	*menziesii*	Menzies' fiddleneck
Heliotropium	*curassivicum*	saltmarsh heliotrope
Brassicaceae		**Mustard Family**
Brassica	*tournefortii*	Asian mustard
Hirschfeldia	*incana*	short-podded mustard
Cactaceae		**Cactus Family**
Cylindropuntia	*california var. parkeri*	cane cholla
Opuntia	*basilaris*	beavertail cactus
Chenopodiaceae		**Goosefoot Family**
Salsola	*tragus*	Russian thistle
Cucurbitaceae		**Gourd Family**
Cucurbita	*foetidissima*	calabazilla
Cucurbita	*palmata*	coyote gourd

Flora Compendia

Marah	*macrocarpus*	wild cucumber
Elaeagnaceae		**Oleaster Family**
Elaeagnus	*angustifolia*	oleaster
Euphorbiaceae		**Spurge Family**
Chamaesyce	*albomarginata*	rattlesnake weed
Croton	*californicus*	California croton
Fabaceae		**Legume Family**
Acacia	*greggii*	catclaw acacia
Lotus	*scoparius*	common deerweed
Lupinus	*hirsutissimus*	stinging lupine
Lupinus	*succulentus*	arroyo lupine
Geraniaceae		**Geranium Family**
Erodium	*botrys*	broadleaf filaree
Erodium	*cicutarium*	red-stemmed stork's bill
Lamiaceae		**Mint Family**
Salvia	*columbariae*	chia
Trichostema	*lanatum*	woolly bluecurls
Nyctaginaceae		**Four O'Clock Family**
Mirabilis	*laevis var. crassifolia*	California wishbone bush
Polygonaceae		**Buckwheat Family**
Eriogonum	*fasciculatum*	California buckwheat
Rhamnaceae		**Buckthorn Family**
Ceanothus	*sp.*	unknown ceanothus sp.
Salicaceae		**Willow Family**
Populus	*fremontii ssp. fremontii*	Fremont cottonwood
Salix	*gooddingii*	Goodding's willow
Salix	*lasiolepis*	arroyo willow
Simaroubaceae		**Quassia Family**
Ailanthus	*altissima*	tree of heaven
Solanaceae		**Nightshade Family**
Datura	*wrightii*	jimson weed
Nicotiana	*glauca*	tree tobacco
Tamaricaceae		**Tamarisk Family**
Tamarix	*sp.*	unknown tamarisk sp.
Agavaceae		**Agave Family**
Yucca	*schidigera*	Mohave yucca
Poaceae		**Grass Family**
Avena	*barbata*	slender oat
Avena	*fatua*	wild oat

Flora Compendia

Bromus	*diandrus*	ripgut brome
Bromus	*rubens*	red brome
Lamarckia	*aurea*	golden top grass
Themidaceae		**Brodiaea Family**
Dichelostemma	*capitatum*	blue dicks

MANAGEMENT SUMMARY

The Banning Distribution Center Project (Project) proposes to construct a high-cube warehouse and road on approximately 108 acres (ac) located just south of Interstate 10 (I-10) and the Southern Pacific Railroad in the City of Banning, Riverside County, California. Applied EarthWorks, Inc. (*Æ*) was retained by Albert A. Webb Associates to conduct a cultural resource investigation of the Project's Area of Potential Effects (APE) in accordance with Section 106 of the National Historic Preservation Act (NHPA) and the California Environmental Quality Act (CEQA).

A cultural resource literature and records search indicates that 197 cultural resources are present within a one-mile radius of the Project area. One resource, a historical refuse scatter (CA-RIV-3443H/33-003443), has been previously documented within the Project APE. *Æ* also requested a search of the *Sacred Lands File* (SLF) from the Native American Heritage Commission (NAHC), which was completed with negative results. The NAHC requested that Native American individuals and organizations be contacted to elicit information and/or concerns regarding cultural resource issues related to the Project. A letter describing the Project and asking these individuals and organizations for their input was sent on May 25, 2016. A second attempt at correspondence was made on June 8, 2016. Additional Native American outreach was conducted as part of the supplemental cultural resource investigation. A letter describing the off-site improvement areas associated with the Project was sent to the Morongo Band of Mission Indians on May 12, 2017. A second attempt at correspondence was made on May 26, 2017. No response to the supplemental Native American outreach has been received as of June 2, 2017.

An intensive cultural resource pedestrian survey of the Project APE was performed by *Æ* personnel on May 24, 2016 with supplemental surveys completed on May 9, May 24, and September 28, 2017. In total, six cultural resources were identified within the Project APE. Archaeological resources identified within the Project APE include two previously recorded historical refuse scatters (CA-RIV-3443H and CA-RIV-8364H). Four built-environment resources were also documented in the Project APE including the Banning Municipal Airport (33-024895), two historical road segments (East Westward Avenue [33-026821] and John Street [33-026822]), and a portion of a historical transmission line (33-026820). All six resources were researched and evaluated for historical significance as part of the cultural assessment. None of the resources appears eligible for listing on the National Register of Historic Places (NRHP) or the California Register of Historical Resources (CRHR) and therefore they are not considered "historic properties" under Section 106 of the NHPA or "historical resources" under CEQA.

Results of the cultural resource study indicate that the Project APE is unlikely to contain significant buried archaeological remains. Information obtained from the records search indicates that most the known prehistoric sites in the Project vicinity are concentrated almost a mile to the south along the foothills of the San Jacinto Mountains. Furthermore, the pedestrian survey found that the terrain throughout much of the Project APE has been disturbed extensively by mechanical grading activities. Taken together, the data suggest that is unlikely that any intact subsurface archaeological deposits will be encountered during construction. Therefore, no further cultural resource management of the Project APE is recommended at this time.

Field notes documenting the current investigation are on file at Æ's Hemet office. A copy of this report will be placed on file at the Eastern Information Center (EIC) of the California Historical Resources Information System (CHRIS), housed at the University of California, Riverside.

1
INTRODUCTION

On behalf of Albert A. Webb Associates (WEBB), Applied EarthWorks, Inc. (Æ) conducted a cultural resource investigation of approximately 108 acres (ac) of land for the Banning Distribution Center Project ("Project") in the City of Banning, Riverside County, California (Figure 1). The proposed Project is subject to Section 106 of the National Historic Preservation Act of 1966 (NHPA, 36 CFR, 63, and 800) and the California Environmental Quality Act (CEQA). The U.S. Army Corps of Engineers (USACE) is responsible for compliance with Section 106 of the NHPA; the City of Banning (City) is the lead agency for the purposes of CEQA. Tiffany Clark, Ph.D., RPA, served as Æ's Principal Investigator, Joan George served as Project Manager, and Dennis McDougall and Ken Moslak directed the field investigations.

1.1 PROJECT LOCATION AND DESCRIPTION

The proposed Project is situated south of Interstate 10 (I-10) and the Southern Pacific Railroad and north of the Banning Municipal Airport at the eastern edge of the City of Banning (Figure 2). Specifically, the Project is located in Sections 10, 11, and 14 (Township 3S / Range 1E; San Bernardino Baseline and Meridian [S.B.B.M.]) as depicted on the Cabazon 7.5' Series USGS topographic quadrangle. The Project areas slopes in the southeasterly direction with elevations ranging from 628 meters (m) (2,061 feet [ft]) to 691m (2,270 ft) above mean sea level (amsl).

The proposed Project involves development of a high-cube warehouse and offsite improvements. The Project property encompasses 64.1 ac. The offsite improvements to the Project include a road, fire access road, sewer and water lines. The proposed Project offsite roadways include a 5,688 linear ft extension of John Street from the Project's west property line to Lincoln Street and a 3,871 linear ft emergency fire access roadway at the southwestern corner of the property, cross a creek that flows to Smith Creek, and onto Banning Airport property. The offsite utility improvements include sewer line and associated lift station; the lift station is approximately 0.4 miles (mi) from the southern edge of the Project. A water line will start where the line will tie into the existing water line at the intersection of South Hathaway Street and East Barbour Street, then north on Hathaway and east on the extension of John Street. The remaining water line will be located east and south of the Project site, terminating at the intersection of Scott Street and East Westward Avenue. The offsite improvements encompass a total of 43.9 ac.

1.2 REGULATORY CONTEXT

This section discusses the relevant federal and state regulations that must be considered during the decision-making process for projects that have the potential to impact cultural resources. As previously stated, this report is prepared to manage historic properties as defined by the NHPA and historical resources consistent with CEQA Guidelines.

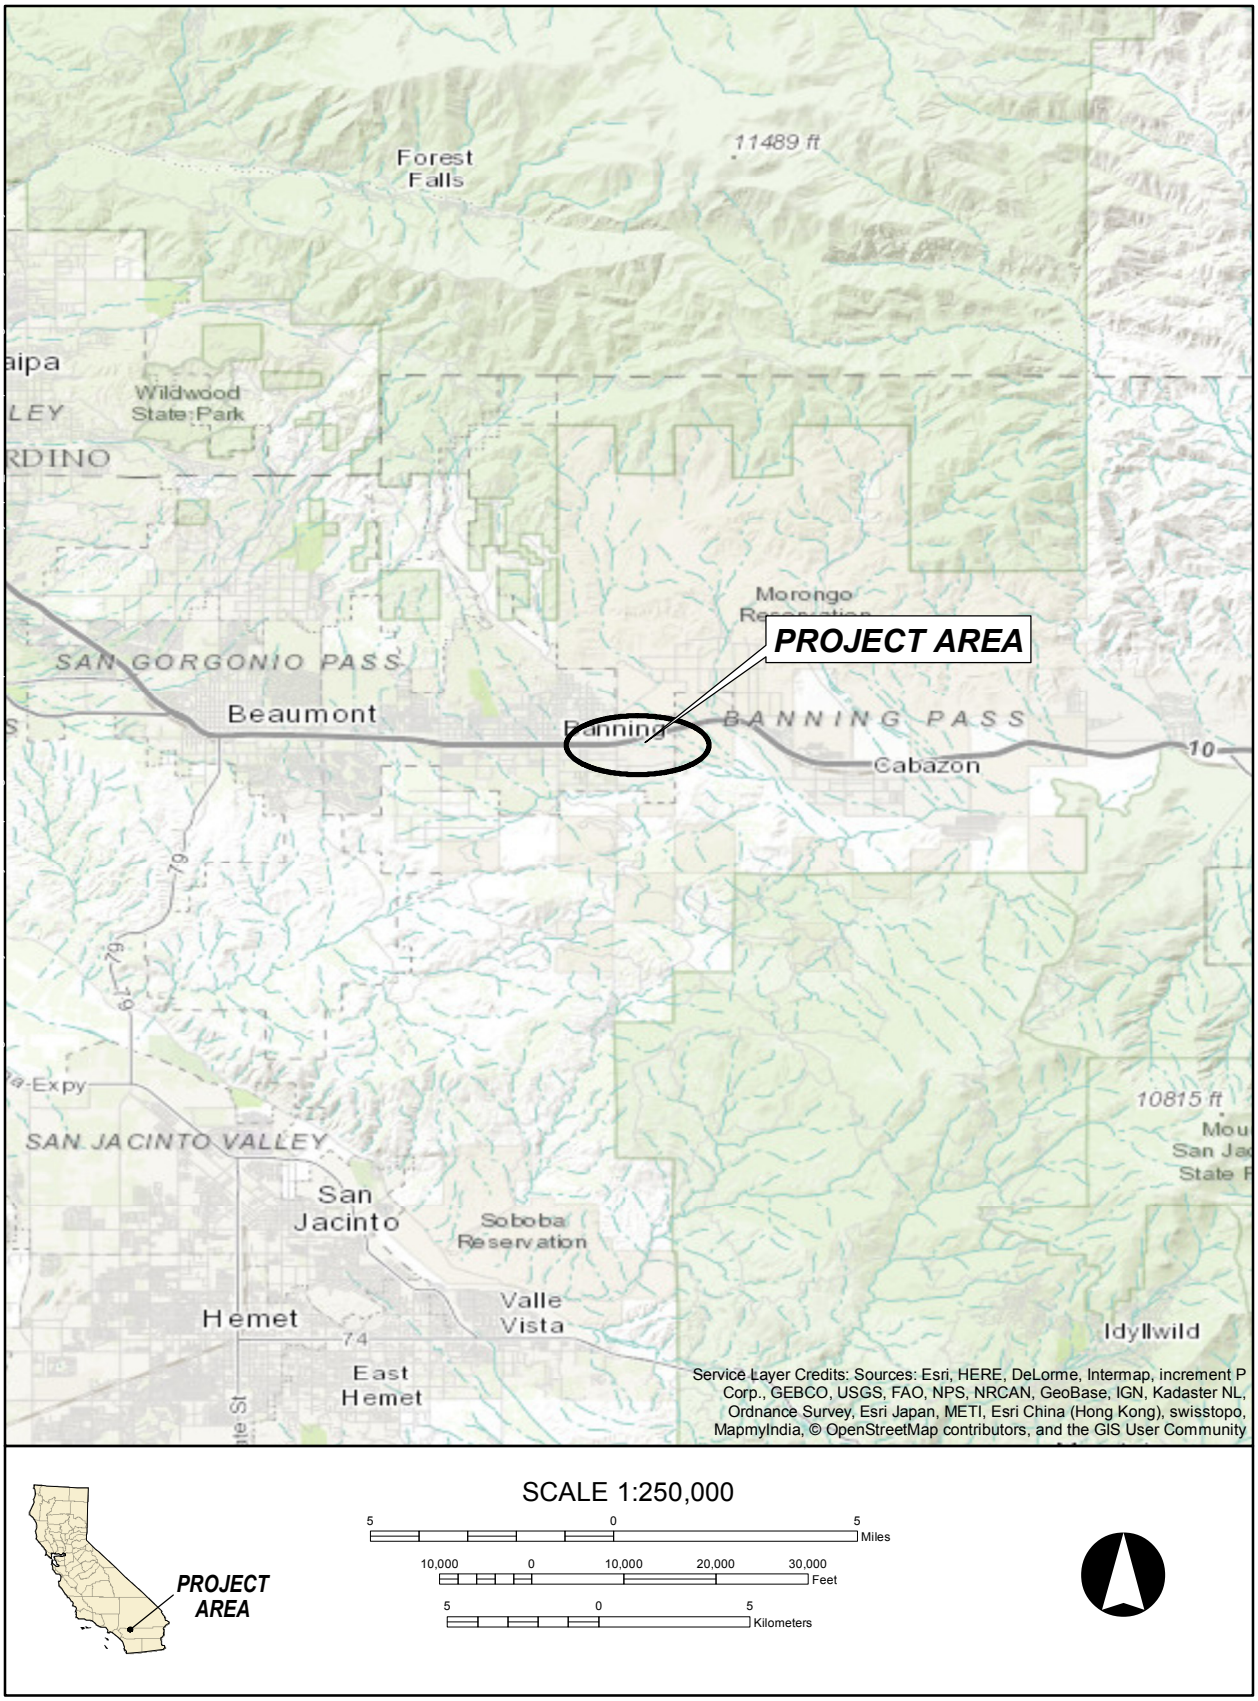

Figure 1 Project vicinity map.

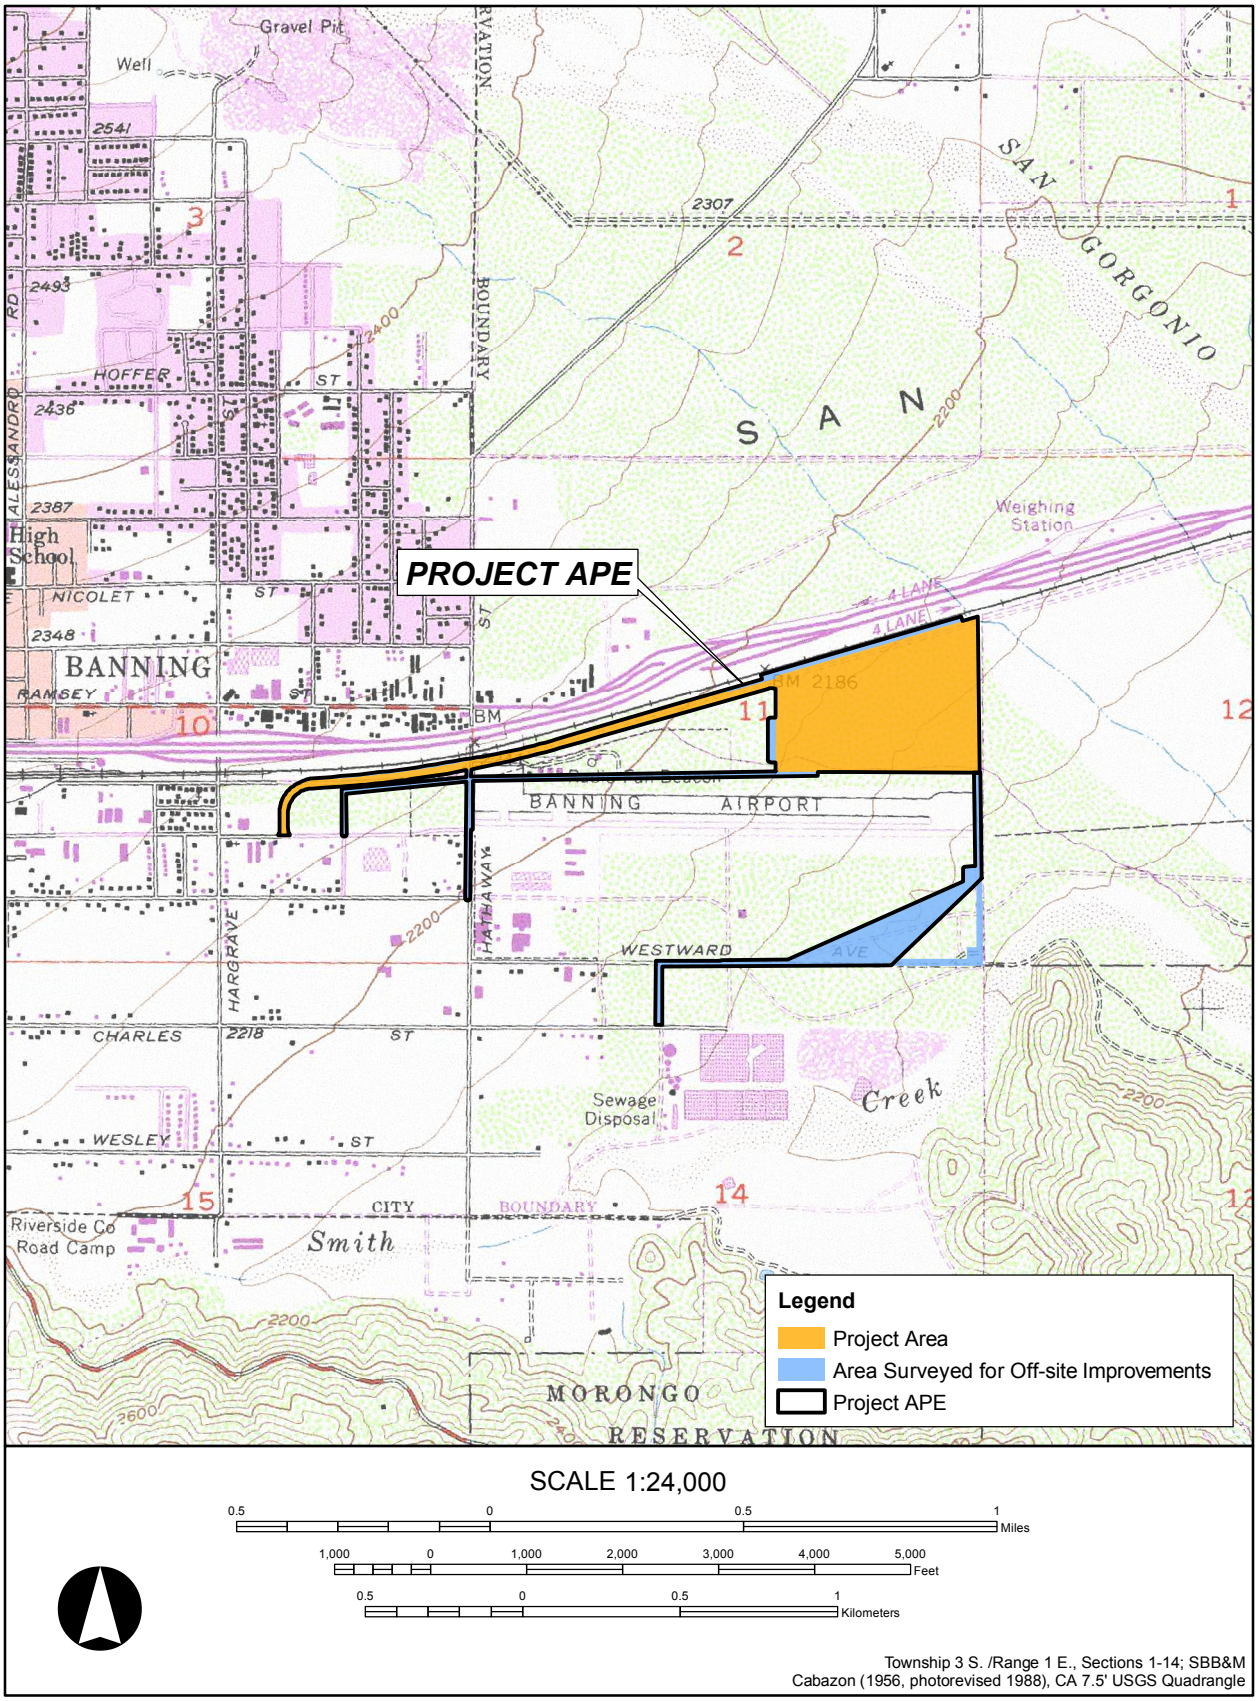

Figure 2 Project location map.

1.2.1 Federal

National Historic Preservation Act (NHPA)

It is anticipated that this Project will be considered a federally licensed "undertaking" per 36 CFR § 800.2 (o) and subject to compliance with Section 106 of the NHPA of 1966, as amended. Under these guidelines, federal agencies are required to identify cultural resources that may be affected by project actions, assess the significance of these resources and their eligibility for inclusion on the National Register of Historic Places (NRHP) as per 16 USC 470w (5), and consult with the Advisory Council on Historic Preservation (ACHP) regarding project effects on significant resources. Eligibility is based on criteria defined by the Department of the Interior. Generally, districts, archaeological sites, buildings, structures, and objects that possess integrity are potentially eligible for inclusion on the NRHP under the following criteria:

A) that are associated with events that have made a significant contribution to the broad patterns of our history; or

B) that are associated with the lives of persons significant in our past; or

C) that embody the distinctive characteristics of a type, period, or method of construction, or that represent the work of a master, or that possess high artistic values, or that represent a significant and distinguishable entity whose components may lack individual distinction; or

D) that have yielded, or may be likely to yield, information important in prehistory or history. [36 CFR § 60.4]

If a cultural resource is determined to be an eligible historic property under 36 CFR § 60.4, then Section 106 requires that the effects of the proposed undertaking be assessed and considered in planning the undertaking.

1.2.2 State

California Environmental Quality Act (CEQA)

As currently proposed, this Project was subject to compliance with CEQA, as amended. Therefore, cultural resource management work conducted as part of the proposed Project shall comply with the CEQA Statutes and Guidelines (California 2015), which directs lead agencies to first determine whether cultural resources are "historically significant" resources. A project with an effect that may cause a substantial adverse change in the significance of a historical resource is a project that may have a significant effect on the environment (California Code of Regulations [CCR], § 15064.5[b]). Generally, a cultural resource shall be considered "historically significant" if the resource is 45 years old or older, possesses integrity of location, design, setting, materials, workmanship, feeling, and association, and meets the requirements for listing on the California Register of Historical Resources (CRHR) under any one of the following criteria (Title 14 CCR, § 15064.5):

1) Is associated with events that have made a significant contribution to the broad patterns of California's history and cultural heritage;

2) Is associated with the lives of persons important in our past;

3) Embodies the distinctive characteristics of a type, period, region, or method of construction, or represents the work of an important creative individual, or possesses high artistic values; or,

4) Has yielded, or may be likely to yield, information important in prehistory or history [Title 14 CCR, § 15064.5].

The cited statutes and guidelines specify how cultural resources are to be managed in the context of CEQA-approved projects such as the Banning Distribution Center Project. Briefly, archival and field surveys must be conducted, and identified cultural resources must be inventoried and evaluated in prescribed ways. Prehistoric and historical archaeological resources, as well as built-environment features, such as standing structures deemed "historically significant" must be considered in project planning and development.

California Assembly Bill 52

Signed into law in September 2014, California Assembly Bill 52 (AB 52) created a new class of resources— tribal cultural resources—for consideration under CEQA. Tribal cultural resources may include sites, features, places, cultural landscapes, sacred places, or objects with cultural value to a California Native American tribe that are included or determined to be eligible for inclusion in the California Register of Historical Resources, included in a local register of historical resources, or a resource determined by the lead CEQA agency, in its discretion and supported by substantial evidence, to be significant and eligible for listing on the California Register of Historical Resources. AB 52 requires that the lead CEQA agency consult in good faith with California Native American tribes that have requested consultation for projects that may affect tribal cultural resources. The lead CEQA agency shall begin consultation with participating Native American tribes prior to the release of a negative declaration, mitigated negative declaration, or environmental impact report. Under AB 52, a project that has potential to impact a tribal cultural resource such that it would cause a substantial adverse change constitutes a significant effect on the environment unless mitigation reduces such effects to a less than significant level.

1.2.3 Local

City of Banning General Plan

The City of Banning General Plan (2006) includes the following goals, policies, and programs related to cultural resources.

Goal: Documentation, maintenance, preservation, conservation and enhancement of archaeological and historic sites, artifacts, traditions and other elements of the City's cultural heritage.

Policy 1 The City shall exercise its responsibility to identify, document and evaluate archaeological, historical and cultural resources that may be affected by proposed development projects and other activities.

Program 1.A All new development proposals, except single family dwelling on existing lots of record, shall submit a records search for historic and cultural resources as part of the planning process. Responsible Agency: Planning Department Schedule: 2005-2006, Ongoing

Program 1.B Development or land use proposals which have the potential to disturb or destroy sensitive cultural resources shall be evaluated by a qualified professional and, if necessary, comprehensive Phase I studies and appropriate mitigation measures shall be incorporated into project approvals.

Program 1.C The City shall implement the requirements of state law relating to cultural resources, including Government Code 65352.3, and any subsequent amendments or additions. Responsible Agency: Planning Department Schedule: Ongoing

Policy 2 The City shall expand and enhance its historic preservation efforts.

Program 2.A Prepare a historic preservation plan, which outlines the goals and objectives of the City's preservation programs and serves as an official historic context statement for the evaluation of cultural resources within the City boundaries. Responsible Agency: Planning Department Schedule: 2006-2007

Program 2.B The City shall consider participating in the Certified Local Government program so that it may benefit from historic preservation expertise, technical assistance, special grants, information exchange, and statewide preservation programs coordinated by the State Office of Historic Preservation. The evaluation of participation in the program shall be part of the historic preservation plan. Responsible Agency: Planning Department, Historical Society, City Council Schedule: 2006-2007

Program 2.C Encourage property owners and residents to nominate qualified properties to the City's inventory system and/or any federal and state registers. Responsible Agency: Planning Department, Morongo Band of Cahuilla Indians Schedule: Ongoing

Program 2.D Should the Saint Boniface School site be proposed for development, extensive analysis of the site shall be conducted, and mitigation proposed, to document its historic significance. Responsible Agency: Planning Department Schedule: 2005-2006, Ongoing

Policy 3 Establish and maintain a confidential inventory of archaeological and historical resources within the City, including those identified by the Eastern Information Center (EIC) at the University of California, Riverside and in focused cultural resources studies.

Policy 4 Sensitive archaeological and historic resources shall be protected from vandalism and illegal collection, to the greatest extent possible.

Program 4.A Mapping and similar information, which identifies specific locations of sensitive cultural resources, shall be maintained in a confidential manner, and access to such information shall be provided only to those with appropriate professional or organizational ties. Responsible Agency: Planning Department Schedule: Immediate; continuous

Policy 5 Encourage public participation in and appreciation of the City's cultural heritage.

Program 5.A Implement a systematic program to enhance public awareness of the City's heritage, generate broad support for its preservation, and enhance community pride. Responsible Agency: Planning Department, Historical Society, City Council, Morongo Band of Mission Indians Schedule: 2005-2006, Ongoing

Program 5.B Support the efforts of local cultural associations to acquire historical materials and artifacts, and to educate the public about the City's and region's cultural heritage.

Policy 6 Support the listing of eligible structures or sites as potential historic landmarks and their inclusion in the National Register of Historic Places.

Program 6.A Develop procedures for the designation of local landmarks and historic districts. Responsible Agency: Planning Department, Historical Society, Morongo Band of Mission Indians Schedule: 2005-2006

Policy 7 The City shall consider offering economic or other incentives, such as direct subsidies or application/permitting fee reductions or waivers, to property owners to encourage the maintenance and enhancement of significant cultural buildings and sites.

Program 7.A Develop an application process for City-sponsored incentives to maintain and enhance significant buildings and sites, and provide property owners with information and guidance on eligibility requirements.

1.3 AREA OF POTENTIAL EFFECTS (APE)

The Area of Potential Effects (APE) is defined as the geographic area within which the Project has the potential to directly or indirectly cause alterations to historic properties, per 36 CFR § 800.16(d). In defining the APE, both direct and indirect impacts anticipated by the proposed Project were considered. As the Project entails construction of a high-cube warehouse and access road within an area bounded by industrial development, indirect effects, such as visual intrusion or noise, are considered temporary. Thus, the APE for this Project is defined as the area of direct impacts, which encompasses approximately 108 ac (see Figure 2). In regard to the vertical limits of the Project APE, ground disturbance may reach a maximum depth of 33 ft below the current grade.

1.4 REPORT ORGANIZATION

This report documents the results of the cultural resource investigation of the Project area for the proposed Banning Distribution Center Project. Chapter 1 has introduced the scope of the work, stated regulatory context, and defined an APE. Chapter 2 synthesizes the natural and cultural setting of the Project area and surrounding region. Chapter 3 presents the results of the archaeological literature and records search conducted at the Eastern Information Center (EIC) of the California Historical Resource Information System (CHRIS), housed at the University of California, Riverside. Chapter 4 summarizes the *Sacred Lands File* (SLF) search with the Native American Heritage Commission (NAHC) and Native American communications. The archaeological survey methods employed during this investigation, as well as findings are outlined in Chapter 5. Resource evaluations are provided in Chapter 6. A summary of the findings and management recommendations are included in Chapter 7, followed by bibliographic references and appendices.

2
SETTING

This chapter describes the prehistoric, ethnographic, and historical cultural setting of the Project area to provide a context for understanding the nature and significance of cultural properties identified within the Project area. Prior to a discussion of the cultural setting, the environmental setting of the area is summarized below, as the nature and distribution of human activities in the region have been affected by such factors as topography and the availability of water and biological resources.

2.1 ENVIRONMENTAL SETTING

The Project area is situated on the interfluvial plain immediately north of Smith Creek. Annual precipitation in the area ranges from 18 to 20 inches (in.). Surrounding sediments are composed of older Quaternary Alluvium deposits, derived as fan deposits from the San Bernardino Mountains to the north and possibly from the San Jacinto Mountains to the south. The Project lies within the South Coast Bioregion, and is sparsely vegetated with scrub brush and grasses. A variety of reptiles, small mammals, birds, and insects coexist within the Project area.

The natural setting of the Project area has been summarized by McLean et al. (2006). The Project is located in the San Gorgonio Pass (elevation 2,616 ft), which forms a natural break between the San Bernardino Mountains to the north and the San Jacinto Mountains to the south. It is an east-west trending lowland between the two mountain ranges. The surface of the lowland is composed of alluvial fan deposits, mainly from the San Bernardino Mountains. The northern foothills are underlain by upper Cenozoic nonmarine and marine sedimentary deposits (Morton 1999).

The San Bernardino Mountains are in the Transverse Ranges geomorphic province (Norris and Webb 1990:330). The Transverse Ranges are an east-west trending mountain range at the northeast end of the Los Angeles Basin. This range has some of the highest peaks south of the Sierra Nevada range (Norris and Webb 1990:330). The San Bernardino Mountains are about 65 mi (105 kilometers [km]) long and 30 mi (48 km) wide at their widest point. The San Jacinto Mountains are the northernmost of the Peninsular Ranges, which run 900 mi (1,500 km) from southern California to the southern tip of the Baja California Peninsula. At an elevation of 10,834 ft, San Jacinto Peak is the highest peak in the range (California State Parks 2017).

2.2 PREHISTORIC SETTING

This section describes the prehistoric cultural setting of the Project study area to provide a context for understanding the types, nature, and significance of the prehistoric cultural resources identified within the study area. The data presented herein regarding the sequence of prehistoric use, adaptation, and occupation of the interior valleys and mountain localities that include the Project study area, are summarized from a synthesis of more than 10 years of archaeological research conducted as part of the ESRP (now known as Diamond Valley Lake), located approximately 15 mi southwest of the Project area (Goldberg et al. 2001). To further understand the types and nature of the prehistoric cultural deposits identified within the Project study area within the frame of a wider geographical context, a review of the coastal (Wallace 1955, 1978; Warren 1968) and desert (Warren

1980; Warren and Crabtree 1986) regional chronologies to which most researchers have subscribed is also provided.

The prehistory of inland southern California has been less thoroughly understood than that of the adjacent desert and coastal regions. Prior to the ESRP studies, no comprehensive synthesis had been developed specifically for the interior valley and mountain localities of cismontane southern California that include the Project study area. The lack of an adequate culture history for this portion of California can be attributed to at least three major factors: (1) the nature and scope of investigations in the region, where research has been concentrated for the most part at single sites or on specific problems; (2) the complex historical sequence of investigations and discoveries, combined with a tendency on the part of many authors to explain similarities in assemblages to cultural diffusion; and (3) the confusion of typological and chronological terminology, which has led to ill-defined units that alternately describe time periods, tool morphology, social groupings, or technological adaptations (see Goldberg and Arnold 1988).

Two regional chronologies are widely cited in the archaeological literature for the prehistory of the coastal regions of southern California (Wallace 1955, 1978; Warren 1968). These chronologies are generalized temporal schemes based on the presence or absence of certain artifact types; both chronologies span the known prehistoric occupation of coastal southern California. The units used by Wallace are "horizons" or "periods," which are extensive in space but restricted in time. The units employed by Warren are "traditions," which may be spatially restricted but display temporal continuity. A more recent chronological synthesis for coastal southern California has been provided by Koerper and Drover (1983). This synthesis employs Wallace's (1955) horizon terminology, but uses radiometric data to order stylistic changes observed in the artifact assemblages, which are interpreted as temporal indications of cultural change over time.

In the absence of absolute chronological indicators for most inland sites, researchers have generally employed typological cross dating of artifact types from either coastal or desert sequences, often as the sole means for assigning age to archaeological sites within the interior valleys, including the Project area. However, two large reservoir projects, first the Perris Reservoir Project (O'Connell et al. 1974), and then most recently, the Eastside Reservoir Project (Goldberg et al. 2001), generated large data sets that have built upon one another to provide a basis for resolving some of these regional discrepancies. Thus, the following discussion of the prehistoric cultural setting for the Project study region is drawn from the cultural sequence developed for the ESRP study area. This chronology was based first on artifact cross dating and geomorphological interpretations, and then refined with radiocarbon and obsidian hydration dates (Onken and Horne 2001; Robinson 1998, 2001). The resultant chronology draws heavily on a cultural sequence defined by Warren (1984) that is based largely on archaeological work conducted in the Colorado and Mojave deserts. However, because Warren's chronology used temporal period names that suggest links to the Mojave, these were replaced in the ESRP chronology by value neutral terms.

For purposes of this report, the discussion will begin at 9500 B.P., because no evidence of the earlier Paleo-Indian Period (ca. 12,000–9500 B.P.) has been found within the vicinity of the Project study area. It should be noted however, that an isolated burial, CA-RIV-5786, was found during excavation of a portion of Salt Creek Channel near ESRP; a single radiocarbon date from this burial yielded an uncalibrated date of 7380 ± 300 B.P. (McDougall 1995).

2.2.1 Early Archaic Period (ca. 9500 to 7000 B.P.)

The Early Archaic period saw a continuation of the interior deserts having considerably higher levels of effective moisture than present (Van Devender et al. 1987). Thus, the desert interior was apparently less arid than cismontane southern California during this period, and possessed an abundance of water sources and relatively productive ecosystems and the desert interior was apparently much more favorable for human occupation than the cismontane valleys of southern California. It has been postulated that small, highly mobile groups still traveled over a wide home range utilizing highly portable tool kits to procure and process critical resources, with brief and anticipated intervals of seasonal sedentism. However, because of the arid conditions within the interior valley areas, prehistoric use of the general study area would still have been negligible; populations would still have favored the coastal or interior desert regions. Nonetheless, those populations exploiting the interior valleys would still have been tethered to the few reliable, drought-resistant water sources such as Lake Elsinore, Mystic Lake, and possibly the Cajalco Basin (Goldberg et al. 2001).

Archaeological sites documented within the vicinity of the Project study area dating to the Early Archaic or containing meager evidence suggestive of sporadic use during this time period are rare, supporting the hypothesis of negligible prehistoric use of the inland valley areas of western Riverside County during this period. Within the ESRP study area, only two site components are firmly dated to the Early Archaic. One component includes a single human burial at CA-RIV-5786 dating to 7380 ± 300 B.P. and capped by several large, highly shaped metates (McDougall 1995). The second is the lower cultural component at CA-RIV-5086, a small temporary camp dated with obsidian hydration data and stratigraphic information to the Early Archaic; this component contained a relatively sparse scatter of flaked and ground stone artifacts and faunal remains, but no cultural features, suggesting that CA-RIV-5086 was initially utilized as a resource extraction locale, possibly situated adjacent to a wetlands environment during the Early Archaic period.

Although much of the data gathered during the ESRP studies seem to corroborate the notion of sporadic use of the study region by small, highly mobile bands utilizing highly portable tool kits during the Early Archaic, the data from CA-RIV-5786, and one other site (CA-RIV-6069) investigated recently, seem to contradict this theory. Identified during the Metropolitan Water District's Inland Feeder Pipeline Project, CA-RIV-6069 is situated on an alluvial fan emanating north from the Lakeview Mountains in western Riverside County, just above the floor of the San Jacinto Valley and south of Mystic Lake; numerous springs are present along the mountain front overlooking the embayment (Horne and McDougall 2008). The cultural deposits at CA-RIV-6069 were encountered at depths ranging from 1.5 m (5 ft) to 3.9 m (13 ft) below the modern ground surface; the vertical distribution of cultural materials and features documented indicates that two distinct cultural strata representing two periods of cultural occupation are present. A more intensive cultural occupation was encountered between approximately 2.7 m (9 ft) to 3.9 m (13 ft) below the modern ground surface; eight radiocarbon assays from cultural features identified in this lower component range from 7940 to 8370 B.P. A less intensive period of site use is represented by materials and features encountered between 1.5 (5 ft) to 2.4 m (8 ft) below the ground surface; charcoal recovered from an intact fire hearth within the upper component was assayed to 2230 B.P., or to the Late Archaic Period. These data suggest that the lower component at CA-RIV-6069 is the oldest prehistoric cultural deposit ever investigated in the greater San Jacinto Valley, and among the oldest deposits ever investigated in inland southern California.

Emergency data-recovery excavations in a portion of CA-RIV-6069 yielded an extensive assemblage of flaked and ground stone tools, marine and terrestrial faunal remains, and bone and shell tools and ornaments. Additionally, 15 discrete cultural features were identified, including intact fire hearths, ground stone artifact caches, and concentrations of artifacts, fire-altered rock, and unmodified manuported cobbles representing remnants of former activity areas; 12 of these cultural features were encountered within the lower cultural component. It should also be noted that the lower component identified at CA-RIV-6069 yielded 37 intentionally molded and fired ceramic objects, possibly the oldest ceramic industry identified to date in the Western Hemisphere (Horne and McDougall 2008). As well, the presence of numerous cultural features at CA-RIV-6069, and the extreme degree of fragmentation, fire alteration, and reuse/recycling of large, highly shaped ground stone implements suggests fairly intensive residential use (either repeated or long term) of CA-RIV-6069 during the Early Archaic. The presence of several artifact caches suggests that site reuse was anticipated. Thus, CA-RIV-6069 may have been a destination point with a predictable resource base that was located on a scheduled, seasonal collecting round. Resource predictability, and the planning depth and organizational characteristics necessary to take full advantage of it, fosters expectations of site reoccupation and longer-term residential occupations.

One other site containing an Early Archaic component worthy of note is CA-RIV-2798/H, or the Lake Elsinore Site. CA-RIV-2798/H is situated at the mouth of the outlet channel of Lake Elsinore, one of the only natural lakes in southern California. Data-recovery excavations at the site, conducted in 1993 by Statistical Research, Inc., revealed stratified cultural deposits attaining depths of nearly 3 m (10 ft) and containing a fairly large assemblage of flaked stone tools (bifaces, unifaces, projectile points, small flake tools, and crescents); a variety of ground stone implements were also collected (Grenda 1997). Documented features include several fire hearths and hearth clean-out refuse deposits, rock clusters, and ground stone caches. Of the eight radiometric assays available for the site, one assay of 8400 ± 60 B.P. from marine shell, coupled with the crescents, suggests that the initial occupation of the Lake Elsinore site may have occurred during the later portion of the Early Holocene (Grenda 1997:279). Two additional radiometric assays (4800 ± 60 B.P. and 4530 ± 80 B.P.) and six dart points, as well as several cultural features indicate that the site occupation intensified during the Middle Holocene; during subsequent periods of the Late Holocene, site occupation apparently became more sporadic and less intensive (Grenda 1997:279–284).

In summary, few sites dating to the Early Archaic have been documented within the regional study area, supporting the theory of negligible use of the inland areas of southern California at this time because of arid conditions. Many of these sites contain only scant evidence of Early Archaic use in the form of obsidian hydration rind measurements, suggesting ephemeral site use by small, highly mobile groups. However, some sites dating to this time period (e.g., CA-RIV-2798/H and the lower cultural component at CA-RIV-6069) do contain evidence of fairly sedentary residential occupations, and evidence that site reuse was anticipated, suggesting a predictable availability of water and other critical resources. These sites have been found invariably near large, drought-resistant, inland water sources, and may have been destination points on a scheduled, seasonal round.

2.2.2 Middle Archaic Period (ca. 7000 to 4000 B.P.)

The Middle Archaic saw a reversal of the weather patterns which had prevailed throughout much of cismontane southern California for several millennia. By about 6000 B.P., local environmental conditions ameliorated while conditions in the deserts deteriorated, reaching maximum aridity of the postglacial period (Antevs 1955; Hall 1985; Haynes 1967; Mehringer and Warren 1976; Spaulding

1991, 1995). Spaulding (2001) proposes that a westerly air flow pattern returned to southern California, while the monsoonal weather patterns in the deserts retreated. As a result, the inland areas may have seen increased effective moisture, while the interior deserts, no longer receiving moist monsoonal flow and now in the rainshadow of the Transverse and Peninsular ranges, became quite arid. This suggests that cismontane southern California, including the Project study region, may have been a relatively more hospitable environment than the interior deserts during the middle Holocene.

Due to both the amelioration of the local environmental conditions and the deterioration of the conditions in the interior deserts, it was postulated that the inland areas of cismontane southern California would see an increase in prehistoric use and occupation after about 6000 B.P. as compared to the earlier periods (Goldberg et al. 2001). This hypothesis appears to have been validated by the ESRP studies, where at least 19 archaeological localities were dated to the Middle Archaic. These Middle Archaic components include several intensively used residential bases and/or temporary camps containing abundant cultural debris including temporally diagnostic artifacts (Pinto and Silver Lake projectile points, crescents), at least nine complex lithic scatters which appear to have functioned as resource extraction and processing sites, and one human burial covered with large rocks and ground stone artifacts. In addition, evidence of ephemeral Middle Archaic use is present at several sites in the form of isolated radiocarbon-dated features and/or sparse scatters of obsidian debitage dated by obsidian hydration methods. The more intensively used residential locations occur along alluvial fan margins, while less intensively used areas tend to be situated on arroyo bottoms or upland benches (Goldberg et al. 2001).

In coastal southern California, the early traditions gave way to what Warren refers to as the "Encinitas Tradition" by about 7000 to 8000 B.P.; Wallace's "Period II: Food Collecting" also would be subsumed under this tradition. Inland San Diego County sites dating to this period have been assigned to the "La Jolla/Pauma Complex" by True (1958). This interval has been described frequently as the "Milling Stone Horizon" because of the preponderance of milling tools in the archaeological assemblages of sites dated to this era (Basgall and True 1985; Kowta 1969; Wallace 1955).

In the coastal and inland regions of southern California, this period of cultural development is marked by the technological advancements of seed grinding for flour and possibly the first use of marine resources, such as shellfish and marine mammals. The artifact inventory of this period is similar to that of the previous period and includes crude hammerstones, scraper planes, choppers, large drills, crescents, and large flake tools. This assemblage also includes large leaf-shaped projectile points and knives; manos and milling stones used for hard-seed grinding; and likely nonutilitarian artifacts, such as beads, pendants, charmstones, discoidals, spherical stones, and cogged stones (Kowta 1969; True 1958; Warren et al. 1961).

Although sites assigned to this stage of cultural development are similar in many respects, their content, structure, and age can vary. This variability is largely due to geographical differences between the coast and interior; the primary difference between the archaeological assemblages of coastal and inland sites appears to be related to subsistence. Coastal occupants gathered fish and plant resources, while hunting was generally less important (projectile points are rare). The inland occupants primarily collected hard seeds and hunted small mammals; therefore, projectile points are more common in inland assemblages. King (1967:66–67) suggests that the coastal sites probably

represent more permanent occupations than are found in the interior, since coastal inhabitants were sustained by more reliable and abundant food resources. A more mobile subsistence round was likely necessary for inland inhabitants. It is possible, too, that inland and coastal sites of this period represent seasonal movement by the same groups of people.

These inconsistencies in content, structure, and age of sites assignable to the "Milling Stone Horizon" have been reviewed by Goldberg and Arnold (1988:12–13, 46–50). In their discussion, the presence of a single technology (the milling stone and mano) to define a temporally meaningful analytic unit of cultural development is seen to be problematic and does not explain the variability in site assemblages and dates of this period. They argue that to assign all sites that contain milling stones and manos to the period from 8000 to 2000 B.P. implies a "cultural unity" among the peoples who deposited these artifacts. However, decades of research have documented significant variability in subsistence emphasis, mortuary practices, and nonutilitarian artifacts (e.g., cogged stones, discoidals, beads), notwithstanding great similarities in one element of the tool kit—the milling stone and the mano.

In the desert regions of southern California, the "Pinto Period" succeeded the "Lake Mojave Period," beginning at approximately 7000 B.P. and lasting to 4000 or 3500 B.P. Relatively recent paleoecological and paleohydrological evidence suggests maximum aridity in the desert regions between ca. 7000 and 5000 B.P., with amelioration beginning at approximately 5500 B.P. and continuing through 4000 B.P. (Spaulding 1991, 1995). As an adaptive response to these changing climatic conditions, the Pinto Period is characterized by necessary shifts in prehistoric subsistence practices and adaptations, with greater emphasis placed on the exploitation of plants and small animals than the preceding Lake Mojave Period, as well as a continued focus on artiodactyls (Warren 1980, 1984).

The distinctive characteristics of the "Pinto Basin Complex" as defined by Campbell and Campbell (1935) are projectile points of the Pinto series, described by Amsden (1935) as weakly shouldered, indented-base projectile points that are coarse in manufacture as well as form. Other diagnostic artifact types of this period include: large and small leaf-shaped bifaces; domed and heavy-keeled scrapers; numerous core/cobble tools; large blocky metates evincing minimal wear and small, thin, extensively used milling slabs; and shaped and unshaped manos. Throughout most of the California desert region, sites containing elements of the Pinto Basin Complex (e.g., those in the Pinto Basin, Tiefort Basin, Salt Springs, and Death Valley) are small and usually limited to surface deposits suggestive of temporary and perhaps seasonal occupation by small groups of people (Warren 1984:413).

Interestingly, one site discovered during the ESRP studies evinces purely Lake Mojave and Pinto period materials. This site, CA-RIV-5045, also known as the Diamond Valley Pinto Site, is very unique in that Pinto and Lake Mojave materials are found within well-stratified, radiometrically defined cultural deposits. In addition to the numerous dart projectile points recovered indicative of the Pinto period (i.e., Pinto-series and Silver Lake-series), these deposits contain abundant and diverse faunal assemblages, an extensive array of flaked stone tools and ground stone implements, as well as intact cultural features ascribable to specific periods of occupation. Radiometric data, feature types, and artifact/ecofact assemblage characteristics indicate that CA-RIV-5045 was occupied most intensively between 6200–5600 B.P., and functioned as a winter-time residential base during this period (McDougall 2001).

As was noted earlier, it was posited that cismontane southern California would see an increase in human activity after about 6000 B.P. in response to changing environmental conditions. At this time, local environmental conditions ameliorated and conditions in the interior deserts reached the maximum aridity of the postglacial period. The number of sites dating to the Middle Archaic documented at the ESRP certainly increased during this period, and it is plausible that the apparent increase in human use and occupation of the ESRP study area during the Middle Archaic is related to both the amelioration of the local environment and the deterioration of the desert interior (Goldberg et al. 2001).

The distribution of sites and variety of site types (i.e., residential bases, temporary camps, and a variety of ephemeral resource extraction and processing sites) dating to the Middle Archaic at the ESRP suggest that overall use of the study area likely conformed to a rest-rotation collecting strategy involving relatively brief intervals of sedentism during the midwinter ebb of yearly productivity, followed by warm-season residential movements through a series of resource procurement camps in a seasonal round (Goldberg and Horne 2001). A key feature of rest-rotation collecting is a reliance on stored foods during the interval of winter sedentism. Logistic mobility, or the collection and transport of critical resources to the home residential base, also played an important role in resource procurement, especially during the interval of seasonal sedentism and consumption of stored foods. Another key feature of this strategy is the regular rotation of settlements on a yearly or multi-yearly basis to new areas to avoid the declining rates of return associated with continuous exploitation of the same areas.

It is of interest that although the indices used to measure residential mobility for the Early and Middle Archaic components documented at the ESRP study area indicate that these early components evince a more mobile land-use strategy than later periods, and that the Middle Archaic strategy registers more mobile than the Early Archaic strategy, most data convincingly show that neither of these early periods can be characterized as fully mobile. The fragmentation of bottom grinding stones (i.e., metates, milling slabs), ranging between 80 and 100 percent for nearly all ESRP components throughout prehistory, clearly indicates that occupations were fairly sedentary or that sites were consistently reused, with ground stone being cached and reused until it was no longer functional (Klink 2001a). In addition, the occurrence of artifact and toolstone caches at several Middle Archaic sites suggests that site reuse was anticipated (Horne 2001).

While most chronometric data from the ESRP Middle Archaic components are too gross to confirm whether intensified use of the ESRP study area began after the posited ca. 6000 B.P. termination of the postglacial thermal maximum, some reliable radiocarbon assays support that proposition. Dates from three separate residential components, CA-RIV-4628/H Locus A, CA-RIV-4629/H Locus B, and CA-RIV-5045 Locus B, all postdate 6000 B.P. when tree-ring calibrations are taken into account. No reliable radiocarbon samples date Middle Archaic occupation to the postglacial thermal maximum in the ESRP study area (Goldberg 2001:570).

2.2.3 Late Archaic Period (ca. 4000 to 1500 B.P.)

The Late Archaic Period was one of cultural intensification in southern California. The beginning of the Late Archaic coincides with the Little Pluvial, a period of increased moisture in the region. Effective moisture continued to increase in the desert interior by approximately 3600 B.P., and lasted throughout most of the Late Archaic. This ameliorated climate allowed for more extensive

occupation of the region. By approximately 2100 B.P., however, drying and warming increased, perhaps causing resource intensification.

At the ESRP study area, 23 archaeological localities show evidence that their primary use was during the Late Archaic, while eight others yielded evidence of some activity during the period. Late Archaic site types documented within the ESRP study area include residential bases with large, diverse artifact assemblages, abundant faunal remains, and cultural features, as well as temporary bases, temporary camps, and task-specific activity areas. In general, sites showing evidence of the most intensive use tend to be on range-front benches adjacent to permanent water sources such as perennial springs or larger streams, while less intensively used locales occur either on upland benches or on the margins of active alluvial fans (Goldberg 2001).

Evidence from the ESRP also suggests increased sedentism during this period, with a change to a semi-sedentary land-use and collection strategy. The profusion of features, and especially refuse deposits in Late Archaic components, suggests that seasonal encampments saw longer use and more frequent reuse than during the latter part of the Middle Archaic, with increasing moisture improving the conditions of southern California after ca. 3100 B.P. (Horne 2001). Drying and warming after ca. 2100 B.P. likely exacted a toll on expanding populations, influencing changes in resource procurement strategies, promoting economic diversification and resource intensification, and perhaps resulting in a permanent shift towards greater sedentism (Goldberg 2001).

Technologically, the artifact assemblage of this period was similar to that of the preceding Middle Archaic; new tools were added either as innovations or as "borrowed" cultural items. Diagnostic projectile points of this period are still fairly large (dart point size), but also include more refined notched (Elko), concave base (Humboldt), and small stemmed (Gypsum) forms (Warren 1984). Late in the period, Rose Spring arrow points appeared in the archaeological record in the deserts, reflecting the spread of the bow and arrow technology from the Great Basin and the Colorado River region. However, this projectile point type was not found at the ESRP study area, and there is no evidence suggesting that the bow and arrow had come into use at this time in the inland regions of southern California.

Concerning the cultural sequences for Late Archaic coastal sites, for the period after about 5000 B.P., Warren (1968) and Wallace (1978) diverge in their chronological sequences for the coastal regions of southern California. Warren's "Encinitas Tradition" includes all areas outside the Chumash territory of the Santa Barbara coastal zone and continues until approximately 1250 B.P. Wallace, on the other hand, identifies a transition beginning approximately 5000 B.P., marking the onset of "Period III: Diversified Subsistence." In his original 1955 sequence, Wallace said this period, generally referred to as the "Intermediate Horizon," was largely based on changes in the archaeological assemblages of sites from the Santa Barbara coastal region. This horizon is characterized by a greater variety of artifacts, suggesting a greater variety of utilized food resources. Although this interval of human occupation in coastal southern California is poorly defined and dated because of the paucity of representative sites, many researchers in southern California have retained Wallace's original "Intermediate Horizon" as a classification for sites dating between 5000 and 1500 B.P.

The subsistence base during this period broadened. The technological advancement of the mortar and pestle may indicate the use of acorns, an important storable subsistence resource. Hunting also

presumably gained importance. An abundance of broad, leaf-shaped blades and heavy, often stemmed or notched projectile points have been found in association with large numbers of terrestrial and aquatic mammal bones. Other characteristic features of this period include the appearance of bone and antler implements and the occasional use of asphaltum and steatite. Most chronological sequences for southern California recognize the introduction of the bow and arrow by 1500 B.P., marked by the appearance of small arrow points and arrow shaft straighteners.

Some archaeologists have suggested that the changes in the coastal artifact assemblages dating to this period were the result of an influx or incursion of "Shoshonean" people from interior desert areas to the coastal regions (Rogers 1929; Wallace 1978). However, there is virtually no agreement among researchers as to the timing of the initial Shoshonean incursion into the study region; estimates generally range from 1,000 to more than 6,000 years ago, and few researchers acknowledge or question the assumption that Shoshoneans arrived to the study region and replaced some other cultural group (Goldberg and Arnold 1988:50–56). Other archaeologists suggest that cultural transition from the earlier "Milling Stone Horizon" to the succeeding "Intermediate Horizon" coastal and inland assemblages reflects progressive economic changes (e.g., trade) rather than population replacement (King 1982; Koerper 1981; Moratto 1984:164).

In general, cultural patterns remained similar in character to those of the preceding horizon. However, the material culture at many coastal sites became more elaborate, reflecting an increase in sociopolitical complexity and increased efficiency in subsistence strategies (e.g., the introduction of the bow and arrow for hunting). The settlement-subsistence patterns and cultural development during this period are not well understood because of a lack of data; however, the limited data do suggest that the duration and intensity of occupation at the base camps increased, especially toward the latter part of this period.

In the eastern desert regions of southern California, the "Gypsum Period" (ca. 4000 to 1500 B.P.) is generally coeval with Wallace's "Intermediate Horizon." A trend toward increasing effective moisture, which began in the late middle Holocene, culminated in a pronounced pluvial episode between approximately 3700 and 3500 B.P. At that time, a number of basins in the Mojave and Owens river drainages supported perennial lakes (Enzel et al. 1992). No comparable events are evident earlier in the paleohydrological record, developed largely since Warren's (1984) work, that date to 5000 to 4500 B.P., the dates that encompass Warren's so-called "Little Pluvial." After the end of pluvial conditions (ca. 3500 B.P.), conditions typified by greater effective moisture appear to have persisted until approximately 3,000 years ago. An episode of aridity exceeding that of the present may have occurred about 2500 B.P., but there is evidence for increased effective moisture again between approximately 2000 and 1400 years B.P. (Spaulding 1991, 1995).

In addition to diagnostic projectile points, Gypsum Period sites include leaf-shaped points, rectangular-based knives, flake scrapers, T-shaped drills and, occasionally, large scraper planes, choppers, and hammerstones (Warren 1984:416). Manos and milling stones are also common. A technological innovation introduced during this period was the mortar and pestle, used for processing acorns and hard seeds, such as those derived from the hollyleaf cherry and mesquite pod. This correlates with a warming and drying trend that began around 2100 B.P., which appears to have resulted in resource intensification. In addition, the frequencies of grinding tools show increasing importance of plant foods throughout the Late Archaic, with a substantially greater emphasis after 2000 B.P. (Goldberg 2001). Other artifacts include arrow shaft smoothers, incised slate and

sandstone tablets and pendants, bone awls, *Olivella* shell beads, and *Haliotis* beads and ornaments. A wide range of perishable items dating to this period was recovered from Newberry Cave, including atlatl hooks, dart shafts and foreshafts, sandals and S-twist cordage, tortoise-shell bowls, and split-twig animal figurines. The presence of both *Haliotis* and *Olivella* shell beads and ornaments and split-twig animal figurines indicates that the California desert occupants were in contact with populations from the southern California coast, as well as the southern Great Basin (e.g., Arizona, Utah, and Nevada).

Technologically, the artifact assemblage of this period is similar to that of the preceding Pinto Period; new tools also were added either as innovations or as "borrowed" cultural items. Included are the mortar and pestle, used for processing hard seeds (e.g., mesquite pods), and the bow and arrow, as evidenced by the presence of Rose Spring projectile points late in this period. Ritual activities became important, as evidenced by split-twig figurines (likely originating from northern Arizona) and petroglyphs depicting hunting scenes. Finally, increased contact with neighboring groups likely provided the desert occupants important storable foodstuffs during less productive seasons or years, in exchange for valuable lithic materials such as obsidian, chalcedonies, and cherts. The increased carrying capacity and intensification of resources suggests higher populations in the desert with a greater ability to adapt to arid conditions (Warren 1984:420).

2.2.4 Saratoga Springs Period (ca. 1500 B.P. to 750 B.P.)

Because paleoenvironmental conditions were little changed from the preceding period, cultural trends in the early portion of the Saratoga Springs Period were, in large part, a continuation of the developments begun during the end of the Late Archaic Period. However, the Medieval Warm, a period of even more persistent drought, began by 1060 B.P., and conditions became significantly warmer and drier. These climatic changes were experienced throughout the western United States (Jones et al. 1999; Kennett and Kennett 2000), although the inland areas of cismontane southern California may have been less affected than the desert interior. The Medieval Warm continued through the first 200 years of the Late Prehistoric Period until approximately 550 B.P. (Spaulding 2001).

Firm evidence of Saratoga Springs Period occupation was documented at seven site components within the ESRP study area, while three other sites exhibit evidence of ephemeral use at this time. Six other localities within the ESRP study area yielded either obsidian with hydration bands suggesting Saratoga Springs age or Saratoga Springs projectile points (a large triangular form associated with use of the bow and arrow which began to appear in the ESRP study area at this time) but without evidence of sustained site use during this period. The focal shift of prehistoric activity from alluvial fan margins to mountain-front benches adjacent to permanent water sources, which was initiated during the Late Archaic, is also evidenced in the Saratoga Springs site locations (Goldberg 2001).

Within the ESRP study area, the Saratoga Springs Period is seemingly marked by a reduction in the number of refuse deposits and, to a slightly lesser extent, hearths. Interestingly, when accounting for sample size, the frequency of artifact and toolstone caches was more than doubled during the Saratoga Springs Period from the preceding Late Archaic, while the frequency of human remains reached the highest point of any time in the archaeological record. Midden-altered sediments also appear for the first time during this period (Horne 2001).

However, it is of interest that most Saratoga Springs components identified within the ESRP study area actually date to the Medieval Warm Interval; only one component did not. When components dating to the Medieval Warm segment of the Saratoga Springs Period are segregated and combined with Medieval Warm components from the Late Prehistoric Period, it reveals that the frequency of refuse deposits and artifact and toolstone caches during the Medieval Warm is slightly higher than during the Late Archaic and much higher than during the latter portion of the Late Prehistoric Period. The frequency of human remains (all of which are unburned) during the Medieval Warm is also much higher than during the Late Archaic and Protohistoric Period; no human remains were found in components of the Late Prehistoric Period after the Medieval Warm Interval (Horne 2001).

During the ESRP studies, it was anticipated that intensive use of the inland areas of cismontane southern California during the Medieval Warm may have been curtailed altogether owing to inhospitable climate and concomitant decline in water and food sources. However, while land-use and procurement strategies experienced profound changes at this time, the response to deteriorating conditions was not abandonment of the inland areas, but rather intensification. Apparently, climatic conditions of warming and drying that may have begun ca. 2100 B.P., toward the end of the Late Archaic, had already triggered an intensification process that established productive strategies for dealing with resource stress. With the onset of the Medieval Warm, those strategies were further refined and intensified (Goldberg 2001).

Not only did the data indicate that the ESRP study area was used on at least a semi-permanent basis during the Medieval Warm Interval, but that residential bases show evidence (e.g., refuse deposits, midden development) that activities intensified at those settlements. People were also intentionally caching toolstone and ground stone tools, suggesting that they anticipated returning to the same locations. Characteristics of the ESRP ground stone assemblages from the Medieval Warm demonstrate that plant foods were more important than in any other period; plant processing intensified and acorns apparently became an important staple (Klink 2001a). The faunal assemblages also show that resource stress was accommodated with similar strategies by intensifying the use of lagomorphs and by further expanding diet breadth, adding animals (i.e. medium-sized carnivores) to the diet that were rarely consumed during other periods (McKim 2001). The most abundant evidence of trade also occurs in the Medieval Warm components identified at the ESRP, suggesting that this was another mechanism for dealing with resource stress (Goldberg 2001).

However, two factors identified during the ESRP studies indicate that these adaption strategies may not have been completely successful in dealing with the resource stress brought about by the Medieval Warm. First, the indices which differentiate degrees between planned and actual mobility indicate that occupations were considerably shorter than had been anticipated during the Saratoga Springs Period. Substantially long-term occupation at any given location may have been difficult given the presumably low levels of environmental productivity at this time. This suggests that not only were conditions harsh, they may also have been unpredictable. This may account for a larger number of residential locations than had been anticipated, a pattern in response to arid conditions that has also been identified on the central California coast (Lebow 2000). Second, while the burial population discovered throughout the ESRP study area was surprisingly small, the relative proportion of those from the Medieval Warm Interval is higher than any other time period (Horne 2001).

Throughout much of the California desert regions to the east, the Saratoga Springs Period saw essentially a continuation of the Gypsum Period subsistence adaptation. Unlike the preceding period, however, the Saratoga Springs Period is marked by strong regional cultural developments, especially in the southern California desert regions, which were heavily influenced by the Hakataya (Patayan) culture of the lower Colorado River area (Warren 1984:421–422). Specifically, turquoise mining and long distance trade networks appear to have attracted both the Anasazi and Hakataya peoples into the California deserts from the east and southeast, respectively, as evidenced by the introduction of Buff and Brown Ware pottery and Cottonwood and Desert Side-notched projectile points. The initial date for the first Hakataya influence on the southern Mojave Desert remains unknown; however, it does appear that by about 1000 to 1100 B.P. the Mojave Sink was heavily influenced, if not occupied by, lower Colorado River peoples.

Lake Cahuilla is believed to have refilled the Coachella Valley around 1450 B.P., and was the focus of cultural activities such as exploitation of fish, water fowl, and other lacustrine resources during this period. Desert people, speaking Shoshonean languages, may have moved into southern California at this time; the so-called "Shoshonean Intrusion." Brown and Buff Ware pottery first appeared on the lower Colorado River at about 1200 B.P., and started to diffuse across the California deserts by about 1100 B.P. (Moratto 1984:425). Associated with the diffusion of this pottery were Desert Side-notched and Cottonwood Triangular arrow projectile points dating to about 800 to 850 B.P., suggesting a continued spread of Hakataya influences.

However, about 1060 B.P., environmental conditions became notably warmer and drier. This period of intense drought, the Medieval Warm, extended throughout the Southwest, and led to the withdrawal of Native American populations from marginal desert areas to more reliable, drought-resistant water sources such as the Colorado River and Lake Cahuilla, the episodic presence of which was not climatically controlled but dependent upon natural discharges from the Colorado River, and which experienced two, if not three, high stands during the Medieval Warm Interval (Waters 1983).

Along the southern California coastal regions, reliance on the bow and arrow for hunting, along with the use of bedrock mortars and milling slicks, mark the beginning of the tradition denoted as the "Late Prehistoric Horizon" by Wallace (1955) and the "Shoshonean Tradition" by Warren (1968), dating from about 1500 B.P. to the time of Spanish settlement (approximately A.D. 1769). Late prehistoric coastal sites are numerous. Diagnostic artifacts include small triangular projectile points, mortars and pestles, steatite ornaments and containers, perforated stones, circular shell fishhooks, and numerous and varied bone tools, as well as bone and shell ornamentation. Elaborate mortuary customs, as well as generous use of asphaltum and the development of extensive trade networks, are also characteristic of this period.

In the Santa Barbara coastal region, the Late Prehistoric Horizon appears to represent increases in population size, economic complexity, social complexity, and the appearance of social ranking. King (1990) posits that the mortuary practices of the Intermediate and Late Horizons throughout Chumash territories evince social ranking and that beads were used to confer status. Similarly, craft specialization on the northern Channel Islands has been linked to expanding economic capacities and emerging social ranking during the Late Period (Arnold 1987). Although the motivating forces for such trends have yet to be identified with certainty, some researchers have suggested that economies controlled by social elites spurred increasing economic productivity and resultant population growth (Clewlow et al. 1978; King 1990). More recently, archaeologists have linked past changes in

subsistence, population, exchange, health, and violence to periods of drought and resource stress that occurred during the Medieval Warm Interval (Arnold 1992a, 1992b; Arnold et al. 1997; Jones et al. 1999; Larson 1987; Moratto et al. 1978).

2.2.5 Late Prehistoric Period (ca. 750 B.P. to 400 B.P.)

The Medieval Warm extended into the Late Prehistoric Period, ending about 550 B.P. The cultural trends and patterns of land use that characterized the Medieval Warm Interval, including that portion which extends into the earlier part of the Late Prehistoric Period, were discussed above. At the end of the Medieval Warm, however, and lasting throughout the ensuing Protohistoric Period (410–150 B.P.), a period of cooler temperatures and greater precipitation ushered in the Little Ice Age during which time ecosystem productivity greatly increased along with the availability and predictability of water (Spaulding 2001).

Also during this period, Lake Cahuilla began to recede (Waters 1983), and the large Patayan populations occupying its shores began moving eastward to the Colorado River basin or westward into areas such as Anza Borrego, Coyote Canyon, the Upper Coachella Valley, the Little San Bernardino Mountains, and the San Jacinto Plain (Wilke 1976: 172–183). The desiccation of Lake Cahuilla that occurred approximately 370 B.P. (A.D. 1580) resulted in a population shift away from the lakebed into the Peninsular Ranges and inland valleys to the west, and the Colorado River regions to the east.

With the return of more mesic conditions after approximately 550 B.P., resulting in less resource stress, the ESRP studies show that people returned to a less intensive, semi-sedentary land-use strategy similar to that identified for the Late Archaic Period. Within the ESRP study area, evidence of intensive occupation dating to the Late Prehistoric Period occurs at five residential sites comprising 16 separate components; all of these coincide with sites that were occupied during earlier periods, and all are situated on elevated bedrock benches near active springs and overlook the valley floor (Goldberg 2001).

By segregating those components dating to the Medieval Warm Interval from other Late Prehistoric components, the differences between land-use strategies for these periods can be demonstrated. The ESRP studies show that after the Medieval Warm Interval there was a quite unexpected reduction in the number and frequency of refuse deposits, as well as fire-altered rock weight and midden development. The number and frequency of artifact and toolstone caches were also reduced, while hearth features were slightly more common. Rock art also first appeared in association with Late Prehistoric components which post-date the Medieval Warm Interval. The decrease in the number of artifact and toolstone caches and the first appearance of rock art during this period suggests that residential sites may have been occupied year-round (Horne 2001).

Mortars and pestles and other grinding tools also declined in importance after the Medieval Warm in the ESRP site components, suggesting that the intensive procurement and processing of acorns and other plant foods was no longer as critical as previously; this pattern is further supported by a decline in the effort expended in shaping grinding tools (Klink 2001a). A reduction in emphasis on plant foods, and especially acorns, which require intensive preparation, likely accounts for the reduction in refuse deposits, fire-altered rock weights, and midden development at the end of the Late Prehistoric. It is possible that the portable milling toolkit was supplemented substantially by bedrock milling features which are ubiquitous throughout the study area; however, since bedrock features cannot be

dated, they cannot be assigned to any particular time period(s). Percentages of projectile points also increased somewhat after the Medieval Warm (Cottonwood Triangular points began to appear in inland assemblages at this time, and Obsidian Butte obsidian became much more common), suggesting increased focus on large mammals, but the lower ratio of late-stage bifaces indicates that hunting methods returned to random-encounter strategies, rather than the logistical forays of the preceding period (Klink 2001b). Of particular note, faunal assemblages produced an anomalously high lagomorph index after the Medieval Warm, suggesting a very wet climatic regime with dense undergrowth well suited to cottontails (McKim 2001). Finally, the percentage of nonutilitarian artifacts declined considerably, suggesting that trade was no longer critical for assuring food supplies (Klink 2001c).

2.2.6 Protohistoric Period (ca. 400 to 150 B.P.)

The ameliorated, productive conditions of the Little Ice Age continued throughout the Protohistoric Period. Generally speaking, sedentism intensified during the Protohistoric Period, with small, but apparently fully sedentary villages forming. Increased hunting efficiency (through use of the bow and arrow) and widespread exploitation of acorns and other hard nuts and berries (indicated by the abundance of mortars and pestles) provided reliable and storable food resources. This, in turn, promoted greater sedentism. Related to this increase in resource utilization and sedentism are sites with deeper middens, suggesting central-based wandering or permanent habitation. These would have been the villages, or *rancherias*, noted by the early nonnative explorers (True 1966, 1970).

Within the ESRP study region, the most striking change in material cultural in this period was the local manufacture of ceramic vessels and ceramic smoking pipes. Although pottery was known in the Colorado Desert as long ago as 800 B.P., ceramic technology in the Project region appears to date to around 350 B.P. Also during this interval, abundant amounts of obsidian were imported into the region from the Obsidian Butte source which was exposed by the dessication of Lake Cahuilla. In addition, Cottonwood Triangular points were supplemented by Desert Side-notched points during this period. Late in this period, some European trade goods (i.e., glass trade beads) were added to the previous cultural assemblages (Meighan 1954).

Based on work in the San Luis Rey River Basin in northern San Diego County, Meighan (1954), True (1970), and True et al. (1974, 1991) have defined two Late Prehistoric/Protohistoric Period complexes that are worthy of mention. The "San Luis Rey I Complex" existed from approximately 600 to 250 B.P., and is typified by grinding implements, small (Cottonwood) triangular projectile points with concave bases, stone pendants, *Olivella* shell beads, quartz crystals, and bone tools. The "San Luis Rey II Complex," lasting from about 250 to 150 B.P., is very similar, but with the addition of ceramic vessels (including cremation urns), red and black pictographs, glass beads, metal knives, and steatite arrow straighteners. True et al. (1974) believe that the San Luis Rey complexes developed out of the earlier La Jolla/Pauma cultural substratum, and are the prehistoric antecedents to the historically known Luiseño Indians.

The Hakataya influence in coastal and inland southern California regions appears to have diminished during the late Protohistoric Period when the extensive trade networks along the Mojave River and in Antelope Valley appear to have broken down, and large village sites were abandoned (Warren 1984:427). Warren (1984:428) suggests that the apparent disruption in trade networks may have been caused by the movement of the Colorado River basin Chemehuevi populations southward across the trade routes during late Protohistoric Period.

Within the ESRP study area, all five village clusters located on elevated bedrock surfaces near active springs and overlooking the valley floor that were occupied during the Late Prehistoric saw continued occupation in the Protohistoric Period. Most archaeological data from the ESRP Protohistoric site components indicate that a fully sedentary land-use strategy was adopted during this period. Given the spatial coincidence of the Protohistoric villages with residential sites of the Late Prehistoric Period, this sedentism appears to have been a further intensification of patterns established in the earlier period. At that time, resource stress did not appear to have been an issue; resource niche widths were expanded, and intensive resource processing that had been required during the Medieval Warm Interval appeared not to have been necessary. However, even though the climatic conditions of the Little Ice Age afforded a very productive environment during both the Late Prehistoric and Protohistoric periods, land-use strategies intensified during the later period. The use of plant food increased, as did the intensity of the processing effort. The Protohistoric Period exhibited the highest ranks for fire-altered rock and midden development, as well as rock ring foundations for brush dwellings, storage facilities, and ceremonial areas with rock art and rock enclosures; overall, there was a fluorescence of feature types and numbers at this time (Horne 2001). The faunal data for this period indicate a decrease in faunal diversity, and signify a reduction in diet breadth as well as greater intensification (McKim 2001).

The intensification in land use during the Protohistoric Period seen in the ESRP assemblages mirrors changes that occurred at the end of the Late Archaic when it is hypothesized that the collecting strategy evolved from rest-rotation to semi-sedentary. Climatic degradation causing resource stress beginning about 2100 B.P. is thought to have triggered that shift. If the environment during the Protohistoric Period was just as productive as during the earlier portion of the Little Ice Age (Late Prehistoric Period), what then accounts for land-use intensification at this time? Apparently resources were stressed again, but not by deteriorating productivity of the environment. Rather, population growth probably led to competition for food, and possibly water and fuel resources. While preceding periods of stress could have been relieved by expansion of territory and diet breadth, increasing populations would have precluded the opportunity for territory expansion. Therefore, it is hypothesized that the shift to a fully sedentary strategy was brought about by population stress, which itself was initiated during the Late Prehistoric Period when the environment was productive and populations were very successful at exploiting that productivity (Goldberg 2001).

Other archaeological patterns exhibited by the ESRP Protohistoric components were likely a result of sedentism and protection of territories. As it is today, logistical mobility would have become essential for provisioning fully sedentary communities. With lower temperatures during the Little Ice Age but no source of fuel wood in or near the ESRP study area, procurement of fuel may have become an increasingly important element of logistical provisioning. Although there was a fluorescence of feature types and numbers at the ESRP sites dating to the Protohistoric Period, the number of artifact and toolstone caches reached an all-time low; toolstone and artifact caches would no longer have been required because there were year-round occupants at residential bases. Due to increased territoriality, resource intensification would have been required because territorial and resource niche-width expansion was no longer viable. Likewise, along with increasing territorial circumscription would have come the inevitable fact that residential bases were occupied longer than the inhabitants had originally anticipated; moving the residential base may no longer have been an option. As well, trade and ceremonial gatherings with other groups would have helped maintain social relationships and ensure food resources. Finally, sedentism and the need to protect critical resources from competitors may have eventually led to conflict. Protohistoric patterns of raw

material procurement indicate that desert materials (obsidian and chert) gained prominence, while other relatively closer sources of exotic raw materials from the west (basalt, andesite, rhyolite, metavolcanic rock, and Piedra de Lumbre "chert") were little used, suggesting that territorial boundaries, at least to the west, had become established. While there was no direct evidence of physical conflict at any of the ESRP sites, the locations of villages on elevated bedrock surfaces overlooking the valley may have been designed to afford views of intruders; an increase in projectile points may reflect a need for defensive weapons (Goldberg et al. 2001).

2.3 ETHNOGRAPHIC SETTING

The Project area lies immediately west and north of the Morongo Indian Reservation. The Morongo Band of Mission Indians are a mixture of several different groups of California Native Americans, including Cahuilla, Serrano, and Cupeño. The native languages spoken by these groups are all part of the larger Takic family of Uto-Aztecan languages. An ethnographic overview of each of these groups if provided below.

2.3.1 Cahuilla

Ethnographically, the Project area lies within the traditional territory of the Pass (or *Wanakik*) Cahuilla. A wealth of information exists regarding traditional and historic Cahuilla society and culture (Bean 1978; Bean and Toenjes 2011). The Cahuilla language, divided into Desert, Pass, and Mountain dialects, has been assigned to the Cupan subfamily of the Takic branch of the Uto-Aztecan linguistic family. Territory traditionally claimed by the Cahuilla was topographically complex, including mountain ranges, passes, canyons, valleys, and desert. Bean (1978:375) described it as, "…from the summit of the San Bernardino Mountains in the north to Borrego Springs and the Chocolate Mountains in the south, a portion of the Colorado Desert west of Orocopia Mountain to the east, and the San Jacinto Plain near Riverside and the eastern slopes of Palomar Mountain to the west."

The Cahuilla in precontact times had nonpolitical, nonterritorial patrimoieties that governed marriage patterns, as well as patrilineal clans and lineages. The Cahuilla words for these moieties mean "Coyote" and "Wildcat." The Cahuilla had "political-ritual-corporate units (clans) composed of 3 to 10 lineages, dialectically different, named, claiming a common genitor, with one lineage recognized as the founding one" (Bean 1978:580). Clans owned a large territory in which each lineage owned a village site with specific resource areas. Clan lineages cooperated in defense, in large communal subsistence activities, and in performing rituals. Founding lineages often owned the office of ceremonial leader, the ceremonial house, and a ceremonial bundle (Bean 1978:580). Settlements, occupied by one or more lineages, could be politically autonomous or allied with several villages under one chief. The hereditary chiefs had religious, economic, and military power and were role models for their people. They were aided in their duties by one or more assistants. The chiefs and their families, along with the very wealthy, were the elites of the society. The acquisition of wealth was important, but the acquisition of extreme material wealth was prevented by the custom of burning or burying the possessions of the deceased.

The Cahuilla were, for the most part, hunting, collecting, harvesting, and protoagricultural peoples. Clans were apt to own land in valley, foothill, and mountain areas, providing them with the resources of many different ecological niches. Individual lineages or families owned specific resource areas within the clan territory. Although any given village had access to a wide array of necessary

resources, briskly flourishing systems of trade and exchange gave them access to the resources of their neighboring villages and of distant peoples. Rules that forbade marriage to anyone related within five generations or belonging to the same moiety ensured that everyone had relatives living in many ecozones, an important arrangement because relatives were invited to ceremonies. The ceremonial exchange of gifts between hosts and guests under the direction of the chiefs and shamans at such events provided a way for drought-stricken groups to get food in exchange for treasure goods. Thus, oscillations in the subsistence goods supply were dampened by "banking" human effort in the production of treasure goods.

As in most of California, acorns were a major staple, but the roots, leaves, seeds, and fruit of many other plants also were used. Fish, birds, insects, and large and small mammals were available. Mountain sheep, deer, and antelope were some of the large mammals hunted. When filled, Lake Cahuilla was on the Pacific Flyway for migratory birds; hence, ducks, geese, and other migratory birds would have been caught. Mountain lion, black bear, grizzly bear, deer, and wild boar also were hunted in historic times.

To gather and prepare various food resources, the Cahuilla had an extensive inventory of equipment. Bows and arrows were the most important hunting tools, but traps, nets, disguises, blinds, throwing sticks, and slings were also part of the hunting technology. For fishing; nets, traps, spears, hooks and lines, and fish poisons were used. Gathering required few tools: poles for shaking down pine nuts and acorns, cactus pickers, chia hooks, seed beaters, digging sticks, weights for digging sticks, and pry bars. Materials associated with transportation mainly were used to move food and include burden baskets, carrying nets, game bags, and saddle pads. Some food was stored in large baskets. Pottery ollas and baskets treated with asphaltum were used to store and carry water and seeds. Wood, clay, and steatite were used to make jars, bowls, and trays. Skin and woven grass were used to make bags. Food processing required hammers and anvils for cracking nuts; mortars and pestles for grinding acorns; manos and metates for grinding seeds and berries; winnowing shells and baskets; strainers; leaching baskets and bowls; knives of stone, bone, wood, and carrizo cane; bone saws; and drying racks made of wooden poles to dry fish. Basket mortars, with asphaltum or pine pitch used to attach an open-bottomed basket to a mortar, were important for food processing. Food was served in wooden and gourd dishes and cups and in basket bowls that were sometimes tarred. Wood, shell, and horn were used for spoons.

Cahuilla shelters were often made of brush, fan palm fronds, or arrowweed. In prehistoric times they were dome-shaped; later they tended to be rectangular. Near such dwellings usually stood brush-covered ramadas under which domestic chores were done. Earth-covered sweathouses for purification and curing rituals and ceremonial houses with fenced areas for ceremonial use were found in most villages. The chief's house was the largest and was usually next to the ceremonial house. Each village also had several granaries (Bean 1978:578).

The Cahuilla, like other California Indians, understand the universe in terms of power. They assume power to be the principal causative agent for all phenomena. Power is believed to be sentient and to have will. Unusual natural phenomena are viewed as especially sacred, being the repositories of concentrations of power. Mountaintops, and especially particular mountaintops, are held sacred, as are unusual rock formations, springs, and streams. Rock art sites are sacred, having been the sites of ceremonies. Burial and cremation sites are also sacred, as are many other places of residual power. Various birds, especially eagles, condors, hawks, and other birds of prey are revered as sacred beings

of great power and sometimes were killed ritually and mourned in mortuary ceremonies similar to those for important individuals. For this reason, bird cremation sites are sacred.

As part of his doctoral research, Wilke (1976) examined Cahuilla oral tradition as it related to the prehistoric lakeside adaptation of Lake Cahuilla. Ethnographic sources indicate that during the 1853 Pacific Railroad Survey expedition, W. P. Blake, while encamped at a Cahuilla village about 10 mi south of the present City of Indio, inquired if the Indians had any knowledge of the lake that formerly stood in the Salton Basin. The head man of the village related to Blake a tradition of a great water which filled the basin and abounded in fish and waterfowl (Wilke 1976:7). The head man stated that his people's ancestors then lived in the mountains (presumably the Santa Rosa Mountains to the west) and came down to the lake to fish and hunt. After a time the water receded, and they moved their villages down from the mountains onto the exposed lakebed (Wilke 1976:8). Later the Cahuillas told ethnographer Stephen Bowers that their ancestors had formerly caught fish in the lake with "stone fish traps" along the foot of the San Jacinto and Santa Rosa mountains (Wilke 1976:8). As well, Bowers was informed that when the lake receded, Coyote (a mythical character to many Native American groups) came down from the mountains and planted mesquite beans on the lakebed so that mesquite thickets would grow and help feed the people (Wilke 1976:9). These fragments of oral literature, coupled with archaeological data collected over the years, attest to the economically rich resource base that Lake Cahuilla offered to the local inhabitants of the region.

European contact with the Cahuilla was by the Juan Bautista de Anza expedition, which passed through the region in 1774. Initially, the Indians were hostile to the Europeans. Subsequently, the Europeans used sea routes to populate California because the land route had been closed by the Quechan Indians in 1781. The Cahuilla, therefore, had little direct contact with Europeans except for those baptized at missions in San Gabriel, San Luis Rey, and San Diego and, thus, integrated into the mission system. In 1819, several *asistencias* were established near the Cahuilla area; Cahuillas became partially involved with the Spanish and adopted some Spanish economic practices such as cattle raising, agriculture, trade, and wage labor, as well as cultural traits such as clothing styles, language, and religion. Some Cahuilla worked seasonally for the Spaniards and lived for the remainder of the year in their villages. At the time of the American invasion of California, the Cahuilla still maintained their political and economic autonomy.

2.3.2 Serrano

The Project area lies within the ethnographic territory of the Serrano. The name Serrano comes from a Spanish word meaning "mountaineer" or "highlander." The Serrano language is considered part of the Takic subfamily of the larger Uto-Aztecan language family that includes a number of language groups. Other Takic speakers include the Gabrielino, Luiseño, and Cahuilla, whose territories share borders with the Serrano. The Serrano culture area extends from the San Bernardino Mountains, south to Yucaipa Valley, east to the Mojave River watershed, and north to the Twentynine Palms region (Bean and Smith 1978:570). Most Serrano village sites were located in the foothills of the upper Sonoran zone with a few outliers located near permanent water sources on the desert floor, or in the forest transition zone.

Traditional Serrano territory includes areas occupied by three clan groups, the Kitanemuk, Allikik and the Vanyume. The Kitanemuk were located on the upper Tejon and Paso creeks near the Tehachapis and extended into the western portion of the Mojave Desert. The Allikik were located on the upper Santa Clara River and the Vanyume were located along the Mojave River (Johnston

1965:1). These politically independent clan groups also belonged to one of two basic subdivisions or exogamous moieties, the Coyotes and Wildcats. The clans were divided into land holding lineages. Each of these lineages had a chief determined by heredity called the *kika*. The chief's assistant was the *paha*, who assisted him in ceremonial, political and economic affairs (Bean and Smith 1978:572).

The Serrano traded with the Mojave to the east and the Gabrielino to the west. They also traded with their close neighbors, the Cahuilla and Chemehuevi. Obsidian source analysis has shown that traders traveled from the California coast to Arizona, probably reaching Nevada, and areas north of the Mojave Desert. Family members usually exchanged goods at trade feasts, social events, and ceremonial occasions (Bean and Vane 2002:14).

Prior to European contact, the Serrano were primarily hunters and gatherers. Women were responsible for most of the gathering and acorns, piñon nuts, and mesquite beans were collected as staple foods. Other resources included roots, bulbs, shoots, and seeds. Digging sticks were frequently used to dig for plants and roots for subsistence and medicinal purposes (Johnston 1965:8). One main seed resource was chia. Stands of chia were periodically burned in order to increase yield. Desert groups moved seasonally from the desert into the foothills to collect nuts and trade for resources that were not available in the desert (Bean and Smith 1978:570; Bean and Vane 2002:13). The Serrano also hunted large game animals such as deer, mountain sheep and antelope. Hunting was usually done by men using bows and arrows, although smaller game like rabbits, rodents, and various birds, were hunted with throwing sticks, nets, and snares.

When the Spanish arrived in 1769, Serrano population levels were fairly high. By 1790, the westernmost Serrano groups began to enter Mission San Gabriel. After an attempted revolt in 1810, most of the San Bernardino Mountains and the western Mojave Desert Native groups were brought into the mission. The Serrano in the easternmost desert, beyond the San Bernardino Mountains and Little San Bernardino Mountains, were beyond the reach of the mission, and absorbed a number of those who fled the missions (Bean and Vane 2002:18). It has been suggested that the Serrano left the area in the early 1860s when a smallpox epidemic struck the Indians of southern California, although the isolation of the area should have protected them.

The Maringa were the most important Serrano clan and they occupied a large area in the Morongo Valley. The Maringa exerted a powerful ceremonial influence in the region (Johnston 1965:4). The Maringa were presumably living in the Mission Creek area before the 1870s. According to Cahuilla traditions, the Maringa replaced the Cahuilla who had been living there. Members of the Maringa clan intermarried with the Gabriel family (the ceremonial leader of the Wanikik Cahuilla), and had moved to the Potrero, or Malki, by the 1870s. John Morongo, a leader of the group, played a leading role in the affairs of the newly established Morongo Indian Reservation. It is believed that the Serrano left the Mara (Twentynine Palms) area because of pressure from settlers and miners. Many Serrano settled in Mission Creek and Potrero, on what is now the Morongo Indian Reservation. These areas were relatively richer in plant and animal resources than areas farther east in the desert. They were also closer to job opportunities with Anglo employers (Bean and Vane 2002:18).

2.3.3 Cupeño

The Cupeño are considered one of the smallest linguistic groups in southern California (Bean and Smith 1978). The traditional territory of the Cupeño is located near the headwaters of the San Luis

Rey River in northern San Diego County. Today, there are several Native American groups (Pala Band of Luiseño Indians, the Morongo Band of Mission Indians, and the Los Coyotes Band of Cahuilla and Cupeño Indians) that include Cupeño members.

As discussed by Bean and Smith (1978:588), Cupeño social organization reflects an amalgamation of several different groups that dates back at least 800 years. Cahuilla elements of social organization found among the Cupeño include exogamous moieties, patrilineal clans, and ceremonial exchange parties. The Cupeño also practice some Chingichngish religious rituals that were acquired from the Luiseño, with additional ceremonies adopted from the Ipai.

Ethnographic information on the Cupeño indicates that clans owned the most productive food-gathering spots with communal ownership of intervening areas for hunting and gathering. The head of each clan lived in the clan's ceremonial dance house and was responsible for keeping the clan bundle. A hereditary office that usually passed from father to eldest son, the duties of the clan leader included controlling trade with non-Cupeño groups, overseeing the production and distribution of goods, regulating intra- and interclan relationships, and organizing ceremonies (Bean and Smith 1978:588-589). Clan leaders could also be shamans.

In terms of ritual, the most significant ceremonies for the Cupeño were those held in connection with deaths in the clan. Immediately following the death of an individual, the body was burned. This was followed by the burning of the deceased's possession a few weeks to several months later. An annual or biannual image-burning ceremony was held at a later point in which images of all those who had died since the last ceremony were burned (Bean and Smith 1978:589). Another ceremony held in memory of the dead was the eagle-killing ritual, which was held once a year.

2.4 HISTORICAL SETTING

This historic context focuses on the exploration, settlement, and development of the region since the Spanish period of occupation in Southern California beginning in 1769 and continuing through the American Period which began in 1848. From there, the discussion turns to a more localized historical background focused specifically on the Banning area where the Project is located. The following discussion is primarily based on Brackett (1939), Dallas (1955), Gunther (1984), Holtzclaw and Fox (2007), Rawls and Bean (1998), Robinson (1957), and Rolle (1978).

2.4.1 Spanish Period, 1769 to 1822

The Historical Period in California formally began in 1769 with the Spanish occupation of Alta California and the founding of the San Diego de Alcala mission in San Diego when written records began to be compiled. The years 1769 to 1822 represent the Spanish Period in California.

Exploration of the California coastline by ship during the sixteenth and seventeenth centuries was the basis for the Spanish claim to most of Alta and Baja California at that time. While a number of explorers and their men came ashore periodically, they did not venture a great distance inland. In the eighteenth century, Spain recognized that to strengthen its claim to the region, it would have to establish settlements along the northern coastline of Alta California to preclude encroachment by the Russian and British fur-traders entering the region from the north. Therefore, in the latter half of the eighteenth century, Spain and the Franciscan Order founded a series of presidios, or military camps, and missions along the California coast, beginning with the founding of Mission San Diego de

Alcala in 1769. They proceeded to establish a military presidio at Monte Rey (present-day Monterey) in northern California in 1770, their fourth mission at San Gabriel in 1771, and a fifth mission at San Luis Obispo by 1772. However, providing supplies, animals, and colonists to the Spanish missions and presidios by way of ship was difficult, time-consuming, expensive, and dangerous. Thus, an overland route was necessary to initiate a strong colonizing effort in Alta California.

In 1774, Captain Juan Bautista de Anza crossed the San Jacinto plains with a small party of soldiers and servants. Anza's expeditionary force crossed the Cahuilla Valley, skirted the Santa Rosa Mountains, made their way up through Coyote Canyon, descended into the San Jacinto Valley via Bautista Creek, and trekked northwest across the San Jacinto Valley into Moreno Valley. From there, the expedition passed through the Riverside area and crossed the Santa Ana River near present-day Jurupa, then continued on northwest to reach the mission at San Gabriel.

Riverside County lacked a mission proper, but remained connected to the California presidio and mission system through Franciscan outposts known as ranchos and *asistencias*. The Riverside area was considered to be a part of the San Diego District, a military designation associated with the San Diego presidio; most of the territory fell under the authority of the Mission San Luis Rey. Founded in 1798, Mission San Luis Rey was the 18th of California's 21 missions. During much of the Spanish Period, European settlement in Riverside County was slow and sporadic. By the end of the Spanish Period, few Europeans had settled permanently within the region. The cattle grazing lands associated with Mission San Luis Rey encompassed most of the San Jacinto Valley. The broad grasslands of these areas were used to graze the Mission's livestock.

The San Timoteo Canyon and San Gorgonio Pass were once under the jurisdiction of the Mission San Gabriel's San Bernardino Rancho (Gunther 1984:458, 487–488). The Canyon and Pass areas provided fresh water and grassland ideal for cattle grazing. An outpost, or *estancia*, for cattle grazing activities was established near the mouth of San Timoteo Canyon in 1819. Native American labor was used to dig an irrigation ditch, or *zanja*, to divert water from Mill Creek to the outpost to support farming and horticulture. The majordomo Juan Alvarado relocated the *estancia* to a new site approximately one mile to the east in 1830, where he constructed a 14 room complex of adobe and timber.

2.4.2 Mexican Period, 1822 to 1848

In 1821, after 10 years of intermittent rebellion and warfare, Mexico and the territory of California won independence from Spain. On December 15 of that same year, the Mexican *Cortes* (the legislative body of the Mexican government) ended the older regime's strict isolationist policies that were designed to protect the traditional Spanish monopoly on trade and decreed that California ports (namely San Diego and Monterey) be open to foreign merchants (Dallas 1955:14).

Following the Secularization Act of 1833, which called for the immediate privatization of Franciscan lands, the Mexican government secularized all of the California missions. During the two-year period of 1834 to 1836, this radical process quickly and effectively reduced the missions to parish churches. Although the original secularization schemes called for redistribution of mission lands to those Native Americans who were responsible for the physical construction of the mission empire, the vast mission land and livestock holdings were redistributed by the Mexican government into several hundred land grants privately owned by Mexican citizens (Langum 1987:15–18). These

landowners subsequently released their neophyte Native American "workers" to fend for themselves. During the resultant Mexican Rancho Period (1834–1848), livestock and horticulture dominated the economics of Southern California. Ranchos were predominately devoted to the cattle industry and large tracts of land were used for grazing.

The City of Banning was never part of any Mexican Rancho; the nearest occurrence of these Rancho lands was at nearby San Timoteo Canyon and in the San Jacinto Valley; the San Gorgonio Pass area was never claimed under Mexican rule. The vast grazing lands of the Mission San Luis Rey, comprising over 133,000 ac covering the San Jacinto Valley and beyond, were divided among members of the Estudillo family into three Mexican Ranchos: Rancho San Jacinto Viejo was granted to José Antonio Estudillo in 1842; Rancho San Jacinto Sobrante to his daughter, María del Rosario Estudillo, in 1846; and Rancho San Jacinto Nuevo y Potrero to his son-in-law, Miguel Pedrorena, in 1846 (Robinson 1997:143–161).

Jose del Carmen Lugo, Jose Maria Lugo, Vincente Lugo, and Diego Sepulveda were granted title to the Mission San Gabriel's San Bernardino Rancho by the Mexican Governor of California in 1842. Jose del Carmen Lugo repaired the abandoned *estancia* near Redlands, which included the adobe and timber residence, a grist mill, a tile kiln, and a lime kiln, and resided there until 1851 (San Bernardino County Museum 2014). James "Santiago" Johnson, an Englishman, requested and received the grant of the lands in San Timoteo Canyon from Mexican Governor Manuel Micheltorena in 1843 (Gunther 1984:488). The 4,440-ac area was known as the Rancho San Timoteo or "Rancho San Jacinto y San Gorgonio." Johnson sold the land two years later to Louis Rubidoux, although local cattle ranchers Isaac "Julian" Williams and Powell "Paulino" Weaver applied to the grant themselves in 1845, arguing to Governor Pio Pico that Johnson was not making proper use of the land; never occupying it and never improving it (Gunther 1984:459).

2.4.3 American Period, 1848 to Present

With the signing of the Treaty of Guadalupe Hidalgo in 1848, which ended the Mexican-American War, California entered into the American Period and, in 1850, became a recognized state in the United States. During the late 1840s, there began the decline of old California's cattle ranching industry, which for over half a century represented the currency and staple of the rancho system. By the 1850s to 1860s, cattle ranching in the general region had greatly declined, and ranchos changed ownership regularly. Through the years, settlement continued to develop across the inland valleys of what would eventually become western Riverside County. With the influx of new settlers and decline of the cattle industry, some of the larger ranchos were subsequently subdivided into smaller parcels. In 1852, San Diego organized into a county; in 1853, San Bernardino followed suit. Riverside County would be formed in 1893, carved out of portions of San Bernardino and San Diego counties.

The completion of the Southern Pacific (SP) Railway's transcontinental railroad in 1869 opened California to agricultural settlement and brought the previous era of large-scale ranching to a close. The arrival of the SP across the San Gorgonio Pass and into the San Bernardino Valley resulted in a dramatic influx of new settlers into what is now western Riverside County. The Riverside Colony was founded in 1870, and agricultural lands in the region quickly began to be settled by homesteaders. The Riverside Land and Irrigating Company soon established a series of canal systems, tapping water from the Santa Ana River. With this much-needed water supply, the settlers could focus on irrigation and agriculture. Perhaps one of the most influential early settlers in western

Riverside County during this period was Eliza Tibbets who planted the first two navel orange trees, acquired from Brazil, in the Riverside Colony. Mrs. Tibbets' oranges flourished and provided the bud grafts for the Washington Navel Orange, setting the foundation for western Riverside County's highly successful citrus industry.

During the 1880s and 1890s, similar to the phenomena occurring in the area surrounding the Riverside Colony, irrigation canals were built and the regional citrus industry took root in the fertile valleys of the surrounding region. The arrival of reliable water sources coincided with the arrival of a second transcontinental railroad; in 1882, construction of a competing rail line into Southern California was underway, financed by the Atchison, Topeka, and Santa Fe Railway Company. The line of a Santa Fe subsidiary, the California Southern, was built from San Diego to the site of Perris and on to Riverside and San Bernardino in 1882. A second Santa Fe subsidiary, the Atlantic and Pacific Railroad, extended a line west from Albuquerque, then connected San Bernardino and Los Angeles; this connection was opened as of May 1887. The eastern United States was now readily accessible via Los Angeles. The establishment of a second competing railway line from the Midwest to Los Angeles in 1886 triggered a land boom in southern California during the late 1880s, which finally brought substantial settlement to the region.

Population rose dramatically as railroads, citriculture, ranching, and readily available land enticed more Americans and Europeans to settle in southern California. By the late 1880s and early 1890s, conflicts and discontent between the cities of Riverside and San Bernardino led to the establishment of a new county. Portions of the Temecula and San Jacinto valleys, then in San Diego County, joined with the residents of Riverside to form a new county seat in May 1893, leading to the formation of Riverside County.

During the years from about 1908 through American entry into World War I in 1917, there was renewed interest in farm settlement and farming in California and elsewhere in the western U.S. This was reflected in a sharp surge in Homestead filings on remaining public lands in rural California at that time. There was an increase in the turnover of property during that time, including the purchase of farms by individuals making a move from the city to the country. Two factors that helped contribute to this kind of move were the increased use of the automobile, which decreased the isolation of rural living, and the brighter financial prospects for farming during the World War I years. The outbreak of war in Europe in 1914 drove international commodity prices sharply upward, providing a bonanza for grain farmers.

The decade of the 1920s offered regional urban growth in southern California that was helpful to many farmers in the region. However, it also brought sustained national declines in the prices of many agricultural commodities due to major increases in agricultural production in the U.S. and elsewhere. Turnover in land ownership during the 1930s and the eventual recovery of agricultural prices by the eve of World War II (WWII) was followed by the disruptions of the exodus of younger people into military service or leaving to work in urban areas. Water from the Colorado River Aqueduct was piped to the region beginning in the early 1940s. Alfalfa, potatoes, watermelons, and sugar beets soon after became the mainstay of farming in many parts of the region.

The post-WWII era ushered in a boom in commercial, industrial, and residential development in and near the region's urban centers, followed by the construction of several freeways linking urban areas to one another. As urban areas were spread outward by development, once-rural areas took on a

more semi-rural character, dotted by small "mini-ranch" subdivisions. In more recent years, housing and urban development have spread outward from urban areas and swallowed up former agricultural land at an exponential rate, forever changing the character of the region. Substantial growth over the last few decades has necessitated the construction of numerous artificial lakes, reservoirs, and other forms of municipal water storage. During the first decade of 2000, inexpensive land and housing transformed many of the towns in southwestern Riverside County into "bedroom" communities for those working in Los Angeles and San Diego Counties. Increased population and automobile traffic has resulted in the need for construction of new roads, as well as expansion and improved safety of many of the pre-existing roads throughout the region. The over-expansion of the housing market, and ultimate crash in 2007, led to a shift in the region's development trend in recent years to increase infrastructure projects to support the population growth.

2.4.4 City of Banning

Banning is located in the San Gorgonio Pass, the principle opening in the Coast Range (between the San Bernardino Mountains to the north and the San Jacinto Mountains to the south) that allows east/west travel between the coast and desert regions. As such, it was the route of early trails and stage roads, as well as the Southern Pacific Railroad and US Interstate Highway 10.

The Land Office survey map from 1855 depicts no settlement in the area, but a wagon road is shown traversing Sections 9 and 10 and joins an "Old Indian Trail" in the southwest corner of Section 12, just north of what is now Smith Creek. One habitation, labeled as Holt's House, was located to the northwest of the area where Banning would later be located (GLO 1880).

In the 1870s, the construction of the Southern Pacific Railroad through the San Gorgonio Pass drew further settlement to the area (see Section 2.4.5). In 1875, Milton Sanders Hall contracted with the Southern Pacific to grade the railroad route through the San Gorgonio Pass. In the same year, he agreed to provide the wood needed for the railroad ties, and also to power the steam engines used by the construction crews. Timber was available in the San Jacinto Mountains. Hall found a location for a lumber camp (Hall's Camp) near what is now called Hurley Flats. He laid out a road from the camp to the base of the mountain, which became Hall's Grade. It was a steep, narrow road with several switchbacks. A small town, Hall's City, was established at the base of the road. The lumber operation was initially successful, but the road was extremely dangerous for the men and teams hauling the logs down the mountain:

> Several teamsters hauled lumber down the grade to the railroad. This was rather a daredevil job, for besides the regular brakes and roughlocks they had to tie logs and trees on behind loads to drag in the dirt and thus keep the loads off the rumps of the horses. Yet even then there were accidents. At least two men lost their lives on the downward trip, and several teams and wagons were dashed to destruction [Hughes, in Lech 2004:252].

Ultimately the operation failed. The costs to harvest and transport the timber were too high for any profits to be made. Hall then began a second venture, the San Gorgonio Fluming Company, to bring lumber to the railroad from Moore Canyon, approximately 12 mi north of the railroad grade. A "massive, eighteen-inch V-shaped flume" was constructed to bring the lumber to the railroad (Lech 2004:253).

Banning, originally Moore City, was founded in early 1877, near the "confluence" of the railroad and the flume (Lech 2004:254). By July of the same year, the name was changed to Banning. In 1884,

the Banning Water Company was formed; it constructed a flume along San Gorgonio Street from Water Canyon to Banning (Hughes 1938:203).

The 1886 Land Office map clearly shows Banning located north of the Southern Pacific Railroad, as a town of about four blocks east/west and three blocks north/south. The Banning Land and Water Company flume is depicted traveling north from town along what is now San Gorgonio Avenue. Grain fields and isolated cabins and houses are depicted around Banning, particularly southwest of town. The Bradshaw Stage Route, which was located north of Banning, is no longer shown on the map (GLO 1886). The first commercial grain crop was barley; subsequently both oats and wheat were also successful cash crops (Hughes 1938:205). At the same time that farmers and ranchers settled in Banning, it also became known as a health resort. In 1888, the town was described as "unsurpassed" as a resort, with water "as pure as ever flowed from Nature's fountain" (quoted in Lech 2004:259). In 1890, the Sisters of St. Joseph founded the St. Boniface Indian School near Banning (Deferrari 1942:541).

Incorporated in 1913, Banning was similar to many other small towns throughout California and the country, proud of every achievement, eager for further growth and development in a positive way, and full of hope for the future. Banning continued to grow both as an agricultural area and as a resort. In the 1920s, Banning population was around 3,000 (Banning Chamber of Commerce 1927:np). In that decade, almond trees, at the peak of their success in California, were grown on approximately 1,000 ac in and around Banning; the area was considered the largest almond-growing region in southern California (Holtzclaw 2005:25, 41). At the same time, Banning had maintained its reputation as a "health haven…as attested by the sanitariums and private rest homes in and near the city" (Hughes 1938:205).

The news of the construction of the Colorado River Aqueduct by the Metropolitan Water District (MWD) was well received in Banning. In anticipation of the economic boost the city would receive, "Banning staged a victory jubilee in celebration of the voting of bonds for aqueduct construction" (Hughes 1938:59). The MWD field headquarters were located at the intersection of San Gorgonio Avenue and the Union Pacific Railroad. Construction work for MWD headquarters began in 1932.

Through the years of the Great Depression, Banning was home to the MWD engineer's field office. In addition the concrete testing laboratory was located in Banning. Boring the San Jacinto Tunnel began in 1933 and continued until the "holing through" on November 18, 1938. The tunnel was then lined with concrete; on October 14, 1939, a ceremony marking the official completion of the aqueduct was held at the West Portal of the San Jacinto Tunnel (Gruen 1998). During these seven years, the headquarters provided a boost to the local economy, as did the construction workers who lived in the town and commuted to work.

At the beginning of WWII, General George C. Patton established a Desert Training Center in the Mojave Desert in eastern Riverside and San Bernardino counties. In Banning, a 1,000-bed hospital, aid station, and artillery range contributed to the training effort. During the war, 1.6 million people moved to California to work in war industries, and many of the servicemen trained in the state settled here after the war was over (Starr 2005:237). By 1962, California had the highest population of any state. The region experienced a boom in housing subdivisions, commerce, and industry. The city of Banning, positioned along the Southern Pacific Railroad and U.S. Highway 60/70/99, grew substantially during the post-war boom period (USGS 1956). Banning also appealed to the elderly

and became known as a retirement community during the 1960s. Sun Lakes Country Club, a large retirement village, is home to about 6,000 residents (Holtzclaw 2005:8).

2.4.5 Rail Line Development and the Southern Pacific Railroad

As industry began to boom in southern California, transportation needs to ship the products to consumer markets also grew. In conjunction with a few backers, Theodore Judah formed the Central Pacific Railroad Company in 1860 in an effort to establish a shorter railroad from Sacramento to the mines in Nevada through the Sierra Nevada (Orsi 2005). Collis P. Huntington, Mark Hopkins, Charles Crocker, and Leland Stanford, known as the "Big Four," joined forces with Judah in 1861 to finance and establish the company (Orsi 2005). The Big Four eventually ousted Judah from the Board of Directors of the Central Pacific Railroad, and successfully completed the construction of the Central Pacific Railroad. The Union Pacific Railroad was constructing tracks from the east at that time, with the intent to join the Central Pacific Railroad in the Great Basin. On May 10, 1869, Stanford drove the "golden spike" in the railroad, which successfully completed the first transcontinental railroad (Orsi 2005). Other companies were formed and other routes were sought in an effort to break up the monopoly established by the Big Four.

Through acquisition and mergers of several small local railroads, the Central Pacific Railroad allowed for comprehensive travel within the state. The Big Four acquired the rights to the Southern Pacific Railroad in 1868, thus securing a southern transcontinental railroad and eliminating a competing route. The proposed Southern Pacific Railroad line would run from Los Angeles to Yuma, through Colton, Indio and the San Gorgonio Pass, eventually meeting with a line coming from the eastern seaboard (Orsi 2005). Construction of the railroad in the Banning area began in 1875. Much of the workforce on the railroad was composed of men of Chinese and Mexican descent, many of whom were housed in Banning. The influx of laborers spurred the development of commercial ventures of the downtown Banning area.

Although the Southern Pacific Railroad did not initially establish a depot at Banning, small stations and telegraph offices were built in the nearby communities of San Gorgonio (Beaumont) and Cabazon. In 1878, the railroad built a station southwest of downtown Banning and installed an agent and telegraph operator. Around 1890, the Southern Pacific Railroad began running a local train between Los Angeles and Banning called the "Banning Flyer." The Banning Southern Pacific Railroad depot burned down in 1963.

2.4.6 Banning Municipal Airport

In 1927, the Banning Kiwanis Club established an airport for Banning on approximately 70 ac of land purchased from the Southern Pacific Railroad (Bitetti and Bitetti 2013:27). The airport was named Rodgers Airport after Cal Rodgers, who landed his plane in Banning during the first transcontinental flight in 1911 (Bitetti and Bitetti 2013:27). Tickets for the dedication held on July 4, 1928, advertised an air circus and auto races (Williams 2007:np). Events included "a non-stop race from Los Angeles to Banning, a 50-mi race around the airport, balloon fighting, [and] parachute spot landing" (Hughes 1938:202). Following its annexation by the City of Banning in the mid-1930s, the airport was improved and enlarged to 127 ac.

During WWII, the Army Air Forces controlled the airport (http://www.militarymuseum.org/BanningAP.html). While under military control, the facility was known as Banning Landing Strip. In 1943, the U.S. Army conducted a training program in airport construction at the Banning Landing Strip for Army engineers. Known as *Project X: How to Build an Air Field in Italy*, the program

resulted in improvements to the runway with the extension of the paved landing strip to 5,200 ft. Aside from the landing area, no other facilities appear to have been present at the airport at this time. Following the end of WWII, control of the airport reverted back to the municipal government. In the following decade, the City of Banning made a number of infrastructural improvements to the airport. The 1956 USGS topographic quadrangle map for Cabazon, California (1:24,000) depicts an aircraft parking apron, communication fan beacon, two buildings, and a road in the northwest corner of the airport. A historical aerial photograph indicates that by 1967, taxiways, the terminal building, and four aircraft hangars were constructed on the property south of the runway (NETR Online 2016). Several additional hangars appear to have been built at the airport in the late 1980s and early 1990s.

3
SOURCES CONSULTED

Various sources were consulted as part of cultural resource study. A detailed discussion of the sources consulted and results of these investigations are provided below, as well as in subsequent sections of this report that discuss the historical development of the Project APE.

3.1 CULTURAL RESOURCES LITERATURE AND RECORDS SEARCH

Prior to implementing the cultural resources survey of the Project APE, a cultural resources literature and records search of the CHRIS was conducted on May 4, 2016, at the EIC, housed at the University of California, Riverside. The objective of the records search was to determine whether any prehistoric or historic-period resources had been previously recorded within or near the Project APE. The scope of the records search included the Project APE and all the land within a one-mile radius of the Project APE. Results of this search indicate that no less than 40 cultural resource investigations have been conducted within a one-mile radius of the Project APE between 1978 and 2015 (Table 1). Five of these previous studies encompass portions of the Project APE, and one of these studies (RI-08449) included the entire Project APE, accounting for 100 percent of the APE being previously surveyed (Table 1).

*Studies within the Project APE

As a result of these and other similar studies, no less than 197 cultural resources have been documented within a one-mile radius of the Project APE (Table 2). The vast majority of these (n = 150) are built-environment resources that consist of historical residences and other standing buildings in the City of Banning. Additional historical built-environment resources include power transmission and telecommunications lines, the Southern Pacific & Union Pacific Railroad, and the old Banning-Idyllwild Road. A total of 34 historical archaeological resources has been recorded within the record search area and include refuse scatters, USGS survey markers, building foundations, water conveyance features, corrals and fence lines, roads, and quarries.

Twelve prehistoric archaeological resources have been documented within a one-mile radius. These resources include two "Indian Villages" that were documented in 1966 southwest of the current Project area; recorders noted that the resource was probably destroyed by residential development in the area (Johnstons 1966a; Johnstons 1966b). Other known prehistoric resources include five

isolated bedrock milling sites, one bedrock milling site with petroglyphs, one rockshelter with an associated isolated mano, and three isolated artifacts (olla, metate, and mano). One multi-component site consisting of a prehistoric bedrock milling slick and historical refuse scatter was also documented within the one-mile radius. Most of the prehistoric sites are located south of the Project area along the foothills of the San Jacinto Mountains, where bedrock outcrops are abundant, suggesting that the larger village site was surrounded by specialized resource procurement sites.

Table 2
Cultural Resources within One-Mile of the Project APE

Primary	Trinomial	Resource	Description
P-33-000254	CA-RIV-254	Prehistoric Archaeology	Isolated artifact - olla
P-33-000372	CA-RIV-372	Prehistoric Archaeology	"Indian Village"
P-33-000373	CA-RIV-373	Prehistoric Archaeology	"Indian Village"
P-33-001401	CA-RIV-1401	Prehistoric Archaeology	Bedrock milling slick
P-33-001403	CA-RIV-1403	Prehistoric Archaeology	Bedrock milling site with 2 basins and 11 slicks
P-33-007885	CA-RIV-5847	Prehistoric Archaeology	Bedrock milling site with milling features and petroglyph
P-33-015104	CA-RIV-9191	Prehistoric Archaeology	Bedrock outcrop with one milling slick
P-33-015655	—	Prehistoric Archaeology	Bedrock milling slick
P-33-015760	—	Prehistoric Archaeology	Isolated artifact – metate
P-33-016964	—	Prehistoric Archaeology	Rockshelter with mano
P-33-017592	CA-RIV-9120	Prehistoric Archaeology	Bedrock milling site with three slicks
P-33-020324	—	Prehistoric Archaeology	Isolated artifact – granitic mano
P-33-015102	CA-RIV-9192	Prehistoric & Historical Archaeology	Multicomponent site with prehistoric bedrock milling slick and historic refuse scatter
P-33-003443	CA-RIV-3443	Historical Archaeology	Refuse scatter
P-33-003444	CA-RIV-3444H	Historical Archaeology	Refuse scatter, foundation, grove; possible Banning Station
P-33-012626	—	Historical Archaeology	Isolated artifact – scatter of amethyst glass
P-33-015293	—	Historical Archaeology	Isolated artifact – 11 pieces of amethyst glass
P-33-015294	—	Historical Archaeology	Isolated artifact – 5 pieces of amethyst glass
P-33-015847	CA-RIV-8227	Historical Archaeology	Building foundations
P-33-015848	CA-RIV-8228	Historical Archaeology	Building foundations
P-33-016025	—	Historical Archaeology	Rock and cement-lined flood control channel

Of the resources noted above, only one historical archaeological site (CA-RIV-3443H/33-003443) has been recorded within the Project APE. The site was originally described in 1988 as a diffuse scatter of historical refuse measuring 100 by 60 m (328 x 197 ft) located along both sides of the railroad tracks and within the alignment of a dirt frontage road (Apple and Wooley 1988). Cultural materials recorded in the scatter include 10 pieces of ceramics, three pieces of sun-colored amethyst glass dating between ca. 1880s to the 1920s, two pieces of olive-colored glass, and two or more pieces of thick colorless glass. Apple et al. (1988) noted that ceramics on the site exhibit the same dish pattern as artifacts recovered from archaeological deposits at the Cabazon Station (CA-RIV-3442H/33-003442). Based on this finding, they concluded that the refuse deposits composing

CA-RIV-3443H are likely associated with the Southern Pacific Railroad. A high degree of disturbance was observed within the site boundaries including the grading of a dirt road and bulldozer activities. Due to the site's poor integrity, Apple et al. (1988) recommended no further cultural resource management work at CA-RIV-3443H.

Additional sources consulted during the cultural resource literature and records search include: the *National Register of Historic Places* (NRHP); the *Office of Historic Preservation Archaeological Determinations of Eligibility* (ADOE); and the *Office of Historic Preservation Historic Property Directory* (HPD*)*. No eligible historic properties or significant historical resources have been recorded or listed within the Project APE.

3.2 ARCHIVAL RESEARCH

Historical maps consulted during the cultural resource literature and records search include: the General Lands Office plat survey maps for Township 3 South, Range 1 East which date to 1856, 1880, and 1886; the 1901 USGS San Jacinto, CA 30' quadrangle; the 1942 U. S. Army Corp of Engineers Banning, CA 15' quadrangle (1:62,500); the 1956 USGS Banning CA 15' quadrangle (1:62,500); and the 1956 USGS Cabazon, CA 7.5' quadrangle (1:24,000).

The GLO plat survey maps dating to 1856 and 1880 both depict two parallel "Road" systems crossing the Project APE through Sections 10 and 11 from west-northwest to east-southeast. The latter map labels one of these roads as a "Wagon Road." In addition, the 1880 GLO plat survey maps depicts an "Indian Trail" crossing through Sections 15, 14, and 11 from the west-southwest to east. The GLO plat survey map dating to 1886 shows the Southern Pacific Railroad north of the Project APE with the two early road alignments replaced by several east-to-west running roads. Farther to the south in Section 14, the map depicts a forked road that leads to two houses located south of Smith Creek.

The 1901 USGS San Jacinto, CA 30' quadrangle shows the railroad alignment and east-west road systems in Sections 10 and 11. In Section 14, only one house is depicted south of the Smith Creek. An east-west oriented road is shown running from the western section line to the house; a second road runs from the house in a northeasterly direction along the base of the San Jacinto Mountains.

The U. S. Army Corp of Engineers Banning, CA 15' quadrangle (1942) depicts the same railroad alignment, but the east-west road systems in Sections 10 and11 are absent suggesting these roads are no longer in use. The map also shows several east-west running dirt roads in Section 14; these roads roughly follow the modern alignments of East Westward Avenue, Charles Street, and Westley Street. Finally, the 1956 USGS Banning, CA 15' quadrangle and the 1956 USGS Cabazon, CA 7.5' quadrangle maps depict both the railroad and the Banning Airport. The maps indicate that although portions of East Westward Avenue, Charles Street, and Westley Street have been improved, the section of East Westward Avenue located within the Project APE remains an unimproved dirt road.

4
NATIVE AMERICAN COMMUNICATION

As part of the cultural resource investigation, Æ contacted the NAHC on March 27, 2016 for a review of the SLF, to determine if any known Native American cultural properties (e.g., traditional use or gathering areas, places of religious or sacred activity, etc.) are present within or adjacent to the Project APE. The NAHC responded on May 2, 2016 stating that the SLF search was completed with negative results. The NAHC requested that Native American individuals and organizations be contacted to elicit information and/or concerns regarding cultural resource issues related to the proposed Project. A letter describing the Project and asking these individuals and organizations for their input was sent via United States Postal Service (USPS) and electronic mail on May 25, 2016. A copy of the letters sent, the list of contacts, and responses received are included in Appendix B. A second attempt at correspondence was made on June 8, 2016. It should be noted that this outreach was not related to AB 52 or Section 106 consultation. Rather, these efforts were part of the inventory process to identify and document all cultural resources within the Project APE.

Individuals/organizations contacted include: Joseph Ontiveros, Cultural Resource Department with the Soboba Band of Luiseño Indians; Patricia Garcia-Plotkin, Tribal Historic Preservation Office Director for the Agua Caliente Band of Cahuilla Indians; Amanda Vance, Chairperson of the Augustine Band of Cahuilla Indians; Michael Mirelez, Cultural Resource Coordinator for the Torres-Martinez Desert Cahuilla Indians; Judy Stapp, Director of Cultural Affairs for the Cabazon Band of Mission Indians; Denisa Torres, Cultural Resource Manager for the Morongo Band of Mission Indians; Shane Chapparosa, Chairman of the Los Coyotes Band of Mission Indians; Terry Hughes, Tribal Administrator of the Santa Rosa Band of Mission Indians; John Gomez, Environmental Coordinator for the Ramona Band of Cahuilla Mission Indians; Luther Salgado, Chairperson of the Cahuilla Band of Indians; Goldie Walker, Chairperson of the Serrano Nation of Mission Indians; and Daniel McCarthy, CRM Department Director for the San Manuel Band of Mission Indians.

As of June 14, 2016, three responses were received. The Cabazon Band of Mission Indians stated that the Project is located outside of the Tribe's current reservation boundaries, but within an area that may be considered a traditional use area. The Tribe has no specific archival information indicating that the Project area may be a sacred/religious site or other site of Native American traditional cultural value. However, the Cabazon Band suggests there be an archaeologist on site during all ground-disturbing activities to monitor for the discovery of unknown cultural resources. The San Manuel Band of Mission Indians noted that the Project is outside of the boundaries of the Tribe's ancestral territory. The Tribe deferred to the Morongo Band of Mission Indians for review and comment on the Project. The Agua Caliente Band of Cahuilla Indians had no concerns regarding the Project area, and deferred further consultation to the Morongo Band of Mission Indians. The Morongo Band of Mission Indians was contacted as part of the initial and follow-up effort; however, to date, no response has been received from the Morongo Band.

Additional Native American outreach was conducted as part of the supplemental cultural resource investigation. A letter describing the Project's off-site improvement areas was sent to Raymond Huaute, Cultural Resource Specialist for the Morongo Band of Mission Indians and Denisa Torres, Cultural Resource Manager for the Morongo Band of Mission Indians via electronic mail on May 12,

2017. A second attempt at correspondence was made on May 26, 2017. No response was received from the additional Native American outreach with the Morongo Band as of June 2, 2017.

5
CULTURAL RESOURCE SURVEY METHODS AND RESULTS

5.1 SURVEY METHODS

An intensive cultural resources pedestrian survey of the Project property was completed on May 24, 2016 by Æ's Field Supervisor Dennis McDougall with the assistance of Field Technician Evan Mills. The pedestrian survey of this area was conducted by the surveyors walking parallel transect spaced at 15 m (50 ft) intervals oriented north-to-south. The survey of the offsite improvement areas was undertaken on May 9, May 24, and September 28, 2017 by Æ's Field Archaeologists Ken Moslak and Patrick Moloney. The offsite areas were carefully inspected by the archaeologists walking parallel transects spaced no more than 15 m (50 ft) apart. All areas likely to contain or exhibit archaeologically or historically sensitive cultural resources were inspected carefully to ensure that visible, potentially significant cultural resources were discovered and documented. Additionally, surveyors investigated any unusual landforms, contours, soil changes, features (e.g., drainages), and other potential cultural site markers. A Daily Work Record was completed that documented survey personnel, hours worked, ground surface visibility, and any cultural resources identified.

For purposes of this Project, one or more cultural feature or three or more artifacts greater than 45 years of age within a 30 m (100 ft) radius was considered to constitute a cultural resource (or site). Cultural features or clusters of artifacts more than 30 m away from the nearest known cultural resource were generally considered a separate site area. Less than three prehistoric or historical artifacts within a 30 m radius, but outside of a known site, were considered an isolated find.

When encountered, newly identified cultural resources were recorded on State of California Department of Parks and Recreation Primary Records and Archaeological Site Forms (DPR 523 [1995]). Systematic efforts were made to characterize and define the boundaries of the cultural resource, as well as any discrete activity loci and features. Site locations were plotted on the Cabazon CA 1:24,000 scale USGS 7.5' quadrangle using a Trimble GeoXH hand-held GPS unit using real-time satellite based augmentation system (SBAS) corrections achieving sub-meter accuracy. No artifacts were collected during survey.

Æ personnel also attempted to re-identify the one cultural resource (CA-RIV-3443H /33-003443) that had been previously recorded within the Project APE. Given that the archaeological site had been recorded more than 10 years ago, the site record for the resource was updated appropriately using the methods described above.

5.2 SURVEY RESULTS

Ground visibility ranged from good to excellent (60–75 percent of ground surface was visible) throughout the Project APE. Soils consisted of sandy-silt alluvial deposits with subrounded to rounded gravels and cobbles of granite and schist. Vegetation observed during the pedestrian survey of the APE included creosote, mesquite, brittle bush, rabbit brush, ephedra, buckwheat, datura, pencil cholla, beavertail cactus, fiddle neck, foxtail, mustard, and widely scattered yucca. The northern portion of the APE exhibits extensive mechanized disturbance with introduced gravel piles

observed throughout the survey area. The southern portion of the APE is also extensively disturbed by road construction and maintenance, the installation of an underground gas pipeline, and agricultural pursuits to the south and east.

No prehistoric archaeological resources were identified during the pedestrian survey. However, two historical archaeological sites and four historical built-environment resources were identified within the Project APE. The historical archaeological resources include portions of two previously recorded refuse scatters (CA-RIV-3443H/33-003443 and CA-RIV-8364H/P-33-016208). Historical built-environment resources include the Banning Municipal Airport (33-024895), two road segments (East Westward Avenue [33-026821] and John Street [33-026822]), and a portion of a historical transmission line (33-026820). The locations of the identified resources are shown in Figure 3. It should be noted that due to access issues, only the portions of the cultural resources situated within the Project APE were subject to the intensive pedestrian survey and documentation. DPR 523 recording forms were completed for the six identified cultural resources (see Appendix A); a description of each resource is provided below.

5.2.1 CA-RIV-3343H (33-003343)

As previously discussed, CA-RIV-3443H was originally recorded by Apple et al. (1988) as a sparse scatter of historical railroad-related refuse measuring approximately 100 x 60 m (E-W x N-S). A revisit to CA-RIV-3443H found that the portion of the site located within the Project APE measures approximately 45 x 27 m (E-W x N-S). In this area, CA-RIV-3443H is bounded to the south and west by an ephemeral creek drainage and to the north by the fenceline that delineates the southern edge of the railroad right-of-way (Figure 4); the site extends an unknown distance to the north. CA-RIV-3343H consists of a diffuse scatter of historical domestic refuse that includes highly fragmented ceramics, bottle glass, highly-eroded ferrous metal cans, and other ferrous metal objects. The artifacts appear to date from ca. post-1904 into the 1920s. An extensive level of disturbance was noted within the portion of CA-RIV-3343H in the Project APE; these disturbances include mechanical activities, disturbances from grazing cattle, and what appears to be one "pot-hole" dug by illicit artifact collectors. Examination of sediments exposed in the pot-hole suggests that site is limited to a surface scatter with little potential for buried cultural deposits.

5.2.2 CA-RIV-8364H (33-016208)

This site was originally documented in July 2007 as a low-density scatter of historical refuse that measured 70 x 50 m (230 x164 ft) located on both sides of Charles Street (Smallwood 2007) approximately 200 ft south of East Westward Avenue. The site was described as consisting of domestic household refuse that included consumer and kitchen items such as glass, ceramic, and tin canister fragments. Based on the presence of sun-colored amethyst glass and diagnostic markers' marks, Smallwood (2007) dated the site to the 1920s and/or 1930s.

In November 2007, George (2007) revisited CA-RIV-8364H and found that the refuse scatter was significantly larger than originally recorded by Smallwood (2007). As a result of the revisit, the site boundaries were expanded to 176 x 79 m (580 x 260 ft) (N-S x E-W) with the northern boundary located approximately 50 ft south of Westward Avenue. Examination of the surface artifacts confirmed Smallwood's (2007) earlier observations that the bulk of the remains consisted of domestic refuse that included fragmented bottles, ceramics, tableware, and metal cans. George

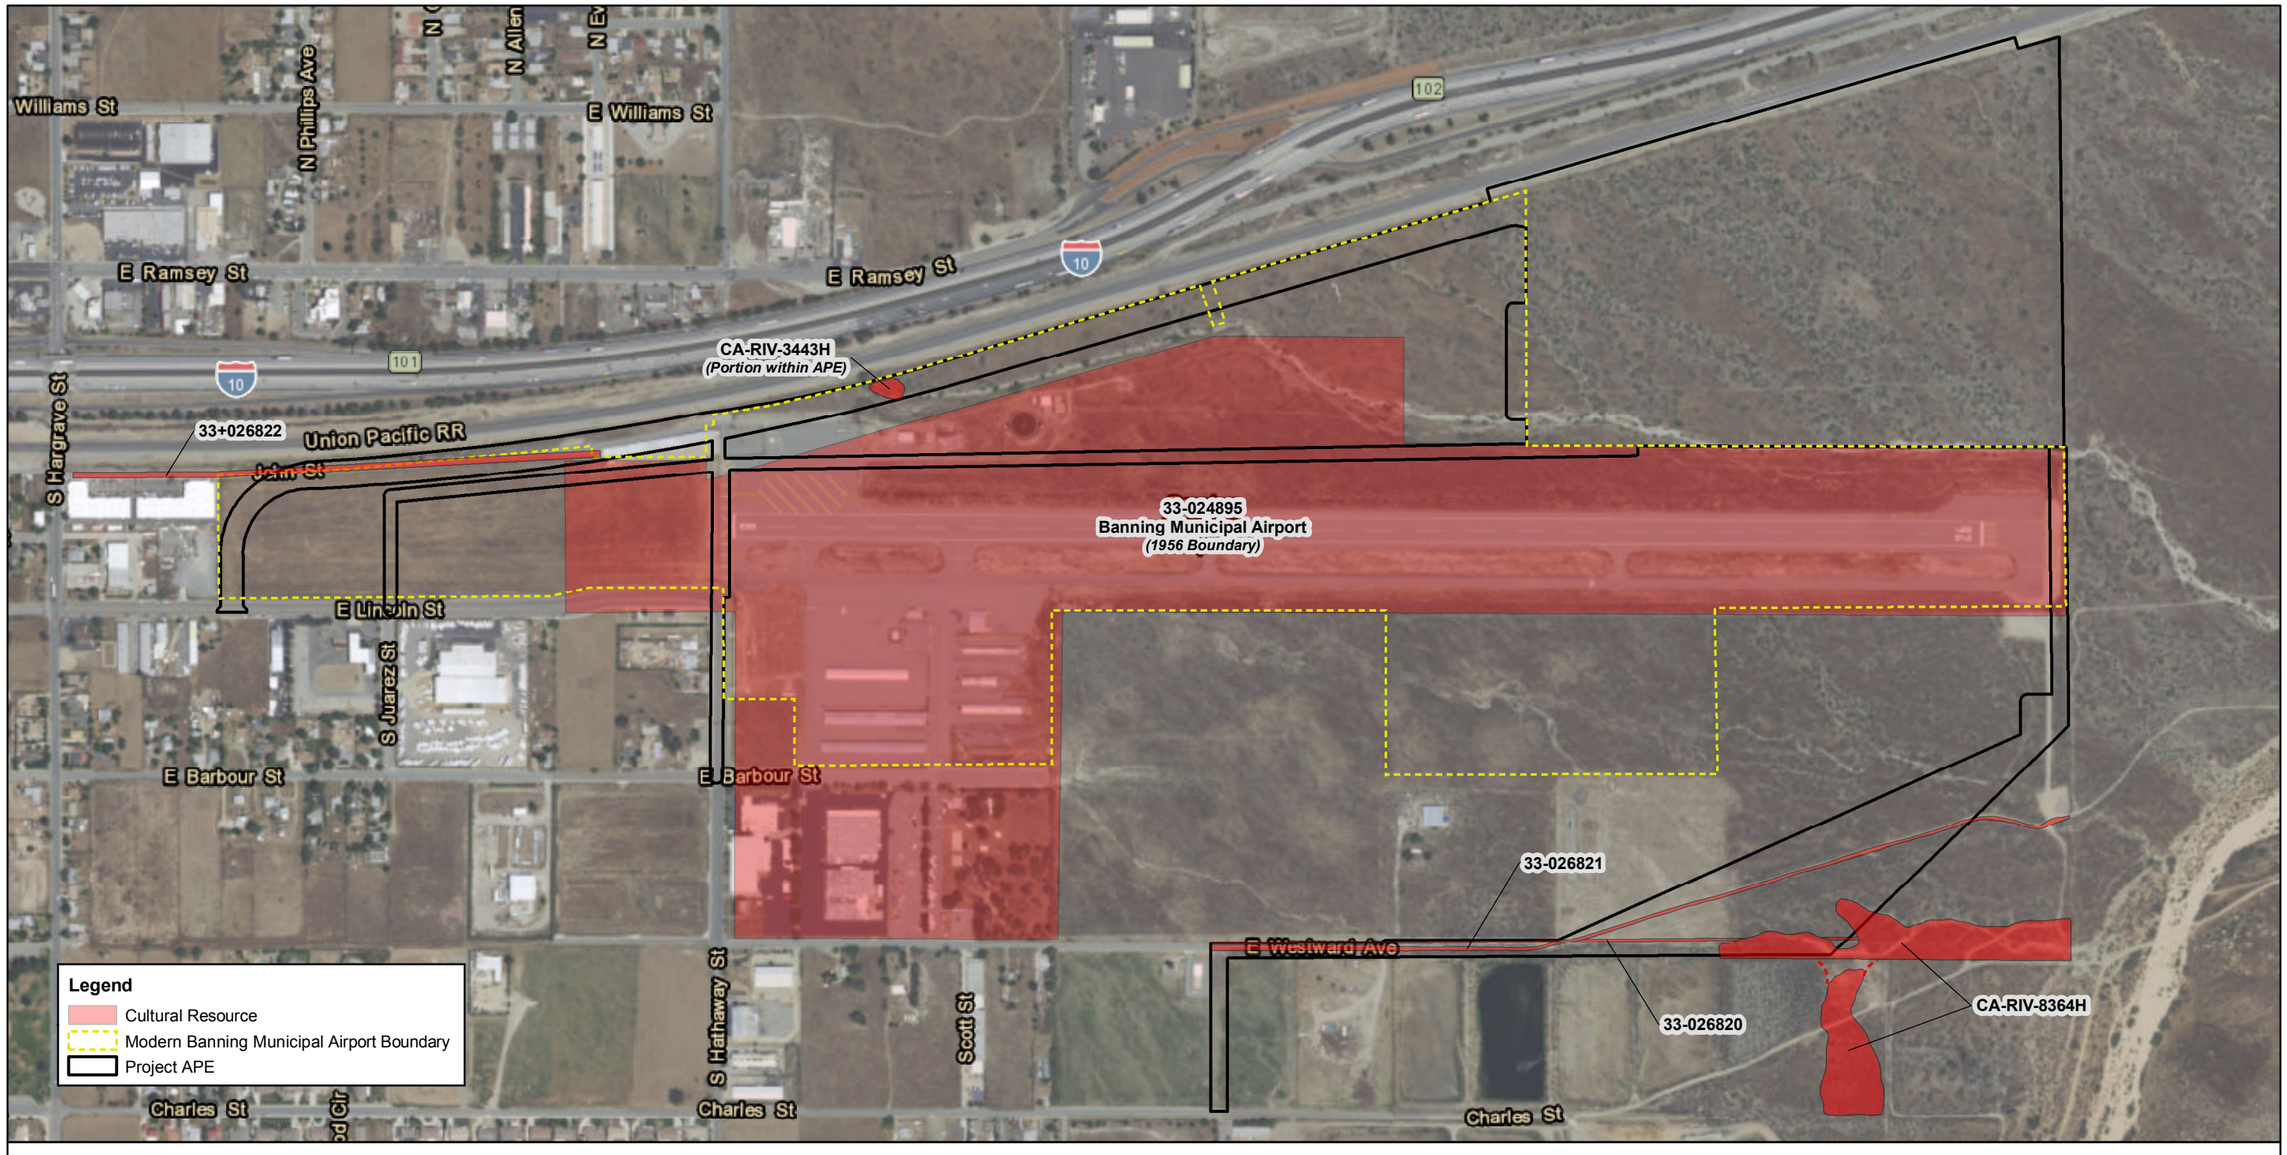

Figure 3 Cultural resources within the Project APE.

Figure 4 Overview of CA-RIV-3443H showing ephemeral creek on the south and Southern Pacific fenceline to the north (view to the west).

(2007) noted that the site appeared to be limited to surficial deposits with no evidence of buried refuse or potential for subsurface deposits.

During the survey of the offsite improvement areas, historical refuse was observed in the Project APE that appears to represent an extension of CA-RIV-8364H (Figure 5). While access to the south of the Project APE was restricted, artifacts within the APE were located less than 30 m from CA-RIV-8364, and therefore were considered to be part of the previously documented site. During the current recordation, the character of the site proved to be a continuation of the previous records with similar artifacts and ages.

Within the Project APE, the eastern extent of the site is dominated by post-World War II (WWII) debris which consists of dumps of bulky items and construction/demolition debris including milled lumber, concrete, asphalt, tires, clay and cinder bricks, plumbing fixtures, stucco, ceramic drain pipes, and sheep fencing. The majority of artifacts in this area appear to date to the 1960s–1980s. The remainder of the site is heavily disturbed with pre-WWII artifacts in secondary contexts due to grading, erosion, and pipeline installation. Pre-WWII items include domestic household refuse and consumer/kitchen items dating to ca. 1920s–1930s.

The expanded portion of the site shows a high level of disturbance. Originally, the site was likely a series of trash dumps and scatters along the side of East Westward Avenue which ran east-west along the section line. By the late 1960s, this segment of East Westward Avenue was abandoned and

Figure 5 Overview of the portion of CA-RIV-8364H located within the Project APE (view to the west).

destroyed by grading, pipeline installation, and erosion. Many artifacts appear in secondary context due to disturbances and washing down recent arroyos. Disturbance is less evident in the portion of CA-RIV-8364H located north of the former East Westward Avenue alignment although artifacts in this area are also highly fragmented. After abandonment of East Westward Avenue, the eastern portions of the site were apparently being used as an illicit dump site of bulky items and construction demolition debris.

5.2.3 Banning Municipal Airport (33-024895)

A portion of the Banning Municipal Airport (33-024895) is located within the Project APE (see Figure 3). The airport encompasses approximately 295 ac, of which approximately 145 ac is developed. In addition to runways and taxiways, several facilities are located within the airport boundaries including a terminal building, one facility capable of housing a fixed base operator, nine hangars, a helipad, and fuel facilities (C&S Engineers, Inc. 2007) (Figure 6).

Much of the Banning Municipal Airport located within the Project APE is undeveloped. However, portions of a paved area of asphalt measuring 500 ft (E-W) by 55 ft (N-S) were found to extend into the APE. The asphalt is in relatively poor condition with grasses and weeds growing between cracks in the paved surface. Examination of historical aerials suggests that the paved area was part of an old aircraft parking apron or possible road that ran along the northern edge of the airport. The paved area is located immediately north of the helipad and is restricted from the rest of the airport by a chain-link fence.

Figure 6 Overview of the Banning Municipal Airport from the northern edge of property showing the runway and hangars (view to the southwest).

5.2.4 East Westward Avenue (33-026821)

The Project APE also includes an approximately 3,500-ft-long section of the historical East Westward Avenue (Figure 7). The western 690-ft-long section of the roadway is a well-maintained asphalt-concrete paved road; the width of the roadbed in this area is 22 ft. The eastern extent of the original road alignment (2,810 ft) is much narrower (12 ft) and is constructed of a rudimentary pavement of coarse gravels and asphalt. No historic-period signage, guardrails, or other historical roadway features were observed along this road segment.

Historic maps indicate that the section of East Westward Avenue located east of South Hathaway Street has been in use since at least the early 1940s (U.S. Army Corp of Engineers 1942). As originally constructed, the east-west oriented road ran for one mile between Sections 11 and 14, Township 3S / Range 1E. Historic aerial photographs suggest that by the late 1960s, the easternmost portion of the road, which measured approximately 0.4 mi (2,100 ft) in length, had been realigned farther to the north (NETROnline 2017). The only evidence of the eastern portion of the original road observed in the Project APE was a faint two track in the western portion of old alignment. Erosion from the nearby Smith Creek appears to have destroyed the remaining portions of the road alignment.

Figure 7 Overview of East Westward Avenue (view to the west).

5.2.5 John Street (33-026822)

The Project APE includes a portion of John Street, a historic-period road that parallels I-10 and the Southern Pacific Railroad (Figure 8). The segment of John Street within the Project APE is paved with a width of approximately 20 ft. From its intersection with South Hargrave Street, the roadway runs in an east to northeast direction for approximately 2,620 ft at which point it terminates at the western end of the Banning Airport. The road appears to be regularly maintained. No historic-period signage, guardrails, or other historical roadway features were observed along this road segment.

Historical maps indicate that the section of John Street that ran between South Hargrave and South Hathaway streets has been in use since the mid-1950s (USGS 1956). Historic aerial photographs suggest that this segment of road was paved by at least 1967 (NETROnline 2017). The eastern extent of the roadway appears to have been realigned following the construction of an airport hanger sometime in the 1970s or 1980s.

Figure 8 Overview of John Street (view to the west).

5.2.6 Transmission Line (33-026820)

An approximate 1,253-ft-long segment of a local power transmission line was documented along the southern portion of the Project APE (Figure 9). The transmission line runs in an east-west direction north of the original alignment of East Westward Avenue. The subject segment of the transmission line consists of seven wooden utility poles. Date nails showing pole construction dates range from 1958–1971 for the main transmission line with a 1929 date on an accessory pole (guy-line support). The wide range of manufacture dates suggests that the line may have been constructed of reused poles in the early 1970s. A metal tag labeled "City of Banning 4040" was observed on one of the poles. The easternmost pole has been cut and the line rerouted to the north. Inspection tags show the line is still in use.

Archival research found little information on the construction date of the transmission line. However, an aerial image dating to the late 1960s shows a series of recently cleared areas in the location of the utility poles along the southern boundary of Section 11, Township 3S / Range 1E. This finding, along with the 1971 date nail, suggests that the transmission line may have been constructed in the early 1970s. Although the historical aerial also depicts a series of cleared areas along the eastern boundary of Section 11, no evidence of a transmission line was found during the pedestrian survey of this area. Based on the fact that the easternmost pole at 33-026820 has been cut with the line rerouted to the north, it is possible that this section of the transmission line has been removed. No evidence of the transmission line was observed on any of the USGS topographic quadrangle maps of the area.

Figure 9 Overview of transmission line (view to the west).

6
RESOURCE EVALUATION

This chapter provides an assessment of the historical significance of the six cultural resources identified within the Project APE in order to evaluate the eligibility of these resources for listing on the NRHP and CRHR.

6.1 CA-RIV-3343H (33-003343)

The artifacts comprised by the refuse scatter at CA-RIV-3343H appear to date from ca. post-1904 into the 1920s. An examination of historical maps indicates that aside from the Southern Pacific Railroad and a parallel-running road, no buildings or other structures are present in the vicinity of CA-RIV-3443 during this time. This finding, along with data obtained from previous investigations at CA-RIV-3343H, indicates that the refuse scatter is most likely associated with the Southern Pacific Railroad (Apple et al. 1988).

While the artifacts that compose this site may be associated with railroad history and development of the region, there is no indication that this association is significant. Mere association of the refuse scatter with historic events is not enough to meet NRHP Criterion A/CRHR Criterion 1, in and of itself; the property's specific association must be considered important as well. No evidence was found to indicate that the refuse scatter is an important physical expression of specific events or periods of significance in the railroad's history. As such, CA-RIV-3343H does not appear to meet NRHP Criterion A or CRHR Criterion 1. In addition, there is no indication that the remains are directly associated with the productive life of an important historical person (NRHP Criterion B/CRHR Criterion 2) or embody distinctive characteristics of a type, period, or method of construction, are an important work of a master architect, or possess high artistic value (NRHP Criterion C/CRHR Criterion 3). Finally, the historic artifact scatter does not appear to contain subsurface remains and has limited research potential. Because CA-RIV-3343H does not have the potential to yield important historical information, it is not recommended eligible under NRHP Criterion D/CRHR Criterion 4.

6.2 CA-RIV-8364H (33-016208)

The artifacts that compose CA-RIV-8364H represent domestic refuse that dates to the 1920s and 1930s with later use indicated by post-WWII dumps of bulky items and construction/demolition debris. The site appears to represent a series of secondary refuse scatters located in the vicinity of an abandoned segment of East Westward Avenue. A high level of disturbance is observed at CA-RIV-8364H with evidence of artifact redeposition as a result of grading, pipeline installation, and erosion.

Previous archival research conducted by George (2008) found no clear association between the refuse scatter and documented historical land use practices. An examination of assessor's records and historical maps indicates that there were no dwellings or structures in the immediate area surrounding CA-RIV-8364H in the 1920s or 1930s. The nearest building was a homestead that was established in the late 1800s approximately 0.5 mi to the south (George 2008: Appendix D). As previously discussed, the 1901 San Jacinto 30-Minute Quadrangle map (U.S. Geological Survey

1901) depicts a road running eastward along Smith Creek to the homestead; a second road runs in a northeasterly direction from the homestead to Westward Avenue. This latter road is located approximately 500 ft east of the CA-RIV-8364H. Based on these findings, George (2008:17) concluded that the refuse scatter is likely the result of periodic dumping, with no apparent association other than its proximity to the road. Because CA-RIV-8364H cannot be associated with a specific property or individuals, the site was recommended as ineligible for listing on the CRHR (George 2008).

Results of the current cultural resource assessment confirm the earlier findings and indicate that the site does not meet any of the four criteria for listing on the NRHP or the CRHR. The portion of the site within the Project APE consists of a series of trash dumps and scatters along an abandoned section of East Westward Avenue that cannot be clearly associated with a particular property. No additional data were obtained from CA-RIV-8364H that link the refuse scatter to events that have made a significant contribution to the broad patterns of history or to the lives of persons significant in the past. Therefore, the site is not recommended as eligible for listing under NRHP Criterion A/CRHR Criterion or NRHP Criterion B/CRHR Criterion 2, respectively. CA-RIV-8364H does not embody the distinctive characteristics of a type, period, or method of construction, and thus is not recommended eligible under NRHP Criterion C/CRHR Criterion 3. Finally, the historical artifact scatter does not appear to contain subsurface remains and has limited research potential. Because CA-RIV-8364H does not have the potential to yield important historical information, it is not recommended eligible under NRHP Criterion D/CRHR Criterion 4.

6.3 BANNING MUNICIPAL AIRPORT (33-024895)

The Banning Municipal Airport is one of a number of municipal airports built in Riverside County in the early decades of the twentieth century. Although the airport is broadly associated with the regional development of aviation-related transportation networks, it is not directly associated with any pattern of events or historical trends in local, state, or national history. The Banning Landing Strip was used as a training facility during WWII. However, it did not play a pivotal role in any historical events in U.S. Army or WWII history and there is no indication that this association is significant. As such, the Banning Municipal Airport does not appear to meet NRHP Criterion A or CRHR Criterion 1.

The airport was originally named Rodgers Airport after Cal Rodgers, who landed his plane in the Banning area during the first transcontinental flight in 1911. As the establishment of the Banning Municipal Airport postdates Rodger's flight by 16 years, the construction of the landing strip has no direct association with this aviation pioneer. No other information has been found to suggest that the Banning Municipal Airport directly associated with the productive life of an historical person of importance in local, state, or national history under NRHP Criterion B or CRHR Criterion 2. Furthermore, the airport does not exhibit any architectural or engineering merits that would set it apart from other municipal airports in the region. The landing strip and associated buildings are of standard design and construction. As such, the Banning Municipal Airport does not meet the criteria for listing under NRHP Criterion C or CRHR Criterion 3.

Finally, the Banning Municipal Airport does not appear to meet NRHP Criterion D /CRHR Criterion 4 for any potential to provide information important to the study of municipal airport development or

WWII-era U.S. Army landing strips. This criteria is typically reserved for archaeological resources, ruins, or rare built-environment resources of which little is already known, and that are considered to be the sole source of historical data. The Banning Municipal Airport is unable to yield any information important to the study of municipal airports of similar vintage in local, state, or national history. The Banning Municipal Airport is not the primary source of information, but rather, the physical manifestation of the knowledge and practice of a construction technique, which has been widely applied to airports throughout southern California and the nation. Thus, Banning Municipal Airport does not provide any important information or data potential that would meet NHRP Criterion D or CRHR Criterion 4.

6.4 EAST WESTWARD AVENUE (33-026821)

Historical maps indicate that the section of East Westward Avenue located east of South Hathaway Street has been in use since at least the early 1940s. Within the Project APE, the western portion of the structure (690-ft-long segment) consists of a 22-ft-wide asphalt-concrete paved road. The eastern extent (2,810-ft-long segment) of the roadway is 12 ft in width and is constructed of a rudimentary pavement of coarse gravels and asphalt. Both sections of the road are completely modern in appearance, design, and construction, and lack any historical features. Only the alignment itself appears historic in age based upon its depiction on historical maps. The road is one of several that were built in the area in the 1940s. Although the road is broadly associated with the development of the city of Banning, it is not directly associated with any pattern of events or historical trends in local, state, or national history. Thus, there is no evidence that it is directly associated with any events of recognized historical significance (NRHP Criterion A/CRHR Criterion 1). The road was likely built by the City of Banning, and not a specific individual. Therefore, the structure is not directly associated with the productive life of an important historical figure (NRHP Criterion B/CRHR Criterion 2). The road does not represent the work of a prominent architect, designer, or builder, nor does it qualify as an important example of its type, period, region, or method of construction (NRHP Criterion C/CRHR Criterion 3). Finally, the East Westward Avenue does not have the potential to yield any information important to the study of our local, state, or national history and is thus not eligible for listing under NRHP Criterion D/CRHR Criterion 4.

6.5 JOHN STREET (33-026822)

Historical maps indicate that John Street has existed as a local road since at least the mid-1950s. The subject segment is a 20-ft-wide asphalt-concrete paved road that is completely modern in appearance, design, and construction, and lacks any historical features. Only the alignment itself appears historic in age based upon its depiction on historical maps. The road was likely built to access the Banning Municipal Airport and may have been part of the infrastructure improvements made by the City to the airport in the 1950s. Although the road is broadly associated with the development of the City of Banning, and the airport in particular, it is not directly associated with any pattern of events or historical trends in local, state, or national history. Thus, there is no evidence that it is directly associated with any events of recognized historical significance (NRHP Criterion A/CRHR Criterion 1). The road was built by the City of Banning, and not a specific individual. Therefore, the structure is not directly associated with the productive life of an important historical figure (NRHP Criterion B/CRHR Criterion 2). The road does not represent the work of a prominent architect, designer, or builder, nor does it qualify as an important example of its type, period, region, or method of construction (NRHP Criterion C/CRHR Criterion 3). Finally, John

Street does not have the potential to yield any information important to the study of our local, state, or national history (NRHP Criterion D/CRHR Criterion 4).

6.6 TRANSMISSION LINE (33-026820)

The segment of the wooden pole transmission line located within the Project APE was constructed of reused wooden poles by the City of Banning in the early 1970s. It does not appear to be eligible for inclusion in the NRHP or the CRHR. It is among numerous transmission lines located within the City of Banning, and it has never achieved any recognition as an important electric utility line. In addition, it does not exhibit any architectural or engineering merits that would set it apart from the many similar transmission lines in the region. The electrical transmission line was likely constructed to meet the electricity demands of customers at a time when the City of Banning's population and development was beginning to expand. The transmission line itself is not responsible for the growth and development of the City of Banning, but merely the attempt to electrify the city and keep up with consumer demand. Thus, there is no evidence that it is directly associated with any events of recognized historical significance (NRHP Criterion A/CRHR Criterion 1). The transmission line was built by the City of Banning, a municipality, and not individuals. Therefore, the structure is not directly associated with the productive life of an important historical figure (NRHP Criterion B/CRHR Criterion 2). The transmission line does not represent the work of a prominent architect, designer, or builder, nor does it qualify as an important example of its type, period, region, or method of construction (NRHP Criterion C/CRHR Criterion 3). Finally, the transmission line does not have the potential to yield any information important to the study of our local, state, or national history (NRHP Criterion D/CRHR Criterion 4).

7
MANAGEMENT RECOMMENDATIONS

As the result of the intensive-level cultural resource survey, two historical archaeological sites (CA-RIV-3443H/33-003443, CA-RIV-8364H/33-016208) and four built-environment resources (Banning Municipal Airport [33-024895], East Westward Avenue [33-026821], John Street [33-026822], and a portion of a transmission line [33-026820]), were identified within the Project APE. The historical significance of these six resources was assessed within the contexts of the development of the City of Banning and regional transportation networks in Riverside County. None of the resources appears to meet any criteria for listing on the NRHP or CRHR. As such, there are no historic properties or historical resources in the Project APE for the purposes of NHPA or CRHR, respectively. No further management of the six resources is recommended.

No prehistoric archaeological remains were encountered within the Project APE during the pedestrian survey. Furthermore, information obtained from the records searches indicates that most of the known prehistoric sites in the Project vicinity are concentrated farther south along the foothills of the San Jacinto Mountains. While the lack of surface evidence of prehistoric archaeological resources does not preclude their subsurface existence, the extant data suggest that this area is characterized by a relatively low level of cultural sensitivity. Results of the cultural resource survey also found that the sediments throughout much of the Project APE are highly disturbed and as such, it is unlikely that any intact prehistoric subsurface archaeological deposits will be encountered during construction. No further cultural resource management of the Project APE is recommended at this time.

In the unlikely event that potentially significant archaeological materials are encountered during Project-related ground-disturbing activities, all work must be halted in the vicinity of the archaeological discovery until a qualified archaeologist can visit the site of discovery and assess the significance of the archaeological site. Additionally, Health and Safety Code section 7050.5, CEQA Guidelines section 15064.5(e), and Public Resources Code section 5097.98 mandate the process to be followed in the unlikely event of an accidental discovery of any human remains in a location other than a dedicated cemetery.

Finally, if the Project area is expanded to include areas not covered by this survey or other recent cultural resource studies, additional cultural resource studies may be required.

c. Address: **City** **Zip**

d. Zone 11, NAD 83, 513206 **mE/** 3753752 **mN** (central point)

e. Other Locational Data (e.g., parcel #, legal description, directions to resource, additional UTMs, etc., when appropriate): Access: From the intersection of Hargrave Street and John Street in the City of Banning, go east on John Street 0.5 m to the entrance gate for the Banning Airport. After obtaining access through the gate, proceed approximately 0.25 mi further east to the airport's Radio Fan Beacon. There will be a minor drainage just to the north (across a fence) from the parking spot. The site is located approximately 100 m back to the west between the drainage and the fence delineating the Railroad right-of-way a short distance further to the north from the drainage.

P3a. Description (Describe resource and its major elements. Include design, materials, condition, alterations, size, setting, and boundaries): CA-RIV-3443H was originally recorded in 1988. At that time, the site was described as a sparse scatter of historical debris measuring approximately 100 x 60 m (E-W x N-S) along both sides of the railroad tracks and within the alignment of a dirt frontage road. Cultural materials noted include 10+ pieces of ceramics (at least 3 different patterns represented), three pieces of sun-colored amethyst glass, two pieces of olive colored glass, and two pieces of thick, clear glass. Site integrity is described as "minimal" based on surface evidence (site area impacted by dirt road and bulldozing of materials into berms).

In May 2016, personnel from Applied EarthWorks, Inc. (Æ) re-identified a portion of CA-RIV-3443H within an approximate 30 m wide (N-S) linear Area of Potential Effects (APE) for the proposed Banning Industrial Project. This update for CA-RIV-3443H describes that portion of the site area found within the Project APE; other portions of the site originally recorded outside of the Project APE were not inspected, and could not be verified during the current survey.

Within the Project APE, CA-RIV-3443H measures approximately 45 x 27 m (E-W x N-S). The portion of the site examined is bound to the south and west by an ephemeral creek drainage, and to the north by the fenceline delineating the southern edge of the railroad right-of-way. The eastern boundary was defined by the horizontal extent of the cultural materials found within the APE. The site consists of a diffuse scatter of historical domestic refuse (fragments of various types of ceramics, glass bottles and bottle fragments, highly-eroded fragments of ferrous metal cans, and other ferrous metal objects) that appear to date from ca. post-1904 into the 1920s (see A5). Disturbances noted within the site area include mechanical activities, disturbances from grazing cattle, and what appears to be one "pot-hole" dug by illicit artifact collectors.

P3b. Resource Attributes (List all attributes and codes): AH 4: Refuse Scatter.

P4. Resources Present: □ Building □ Structure □ Object ☒ Site □ District □ Element of District □ Other:

P5. Photograph or Drawing: (Photograph required for buildings, structures, and objects.) Roll AE3477-1-dm, image 005. Overview of CA-RIV-3443H from western site boundary looking east (see Page 2 of Primary Record).

P6. Date Constructed/Age and Source: □ Prehistoric ☒ Historic □ Both

P7. Owner and Address: Unknown

P8. Recorded by (Name, affiliation, address): D. McDougall, E. Mills, Applied EarthWorks, Inc., 3550 E. Florida Ave., Suite H, Hemet, CA 92544.

P9. Date Recorded: May 24, 2016.

P10. Type of Survey: ☒ Intensive □ Reconnaissance □ Other
Describe: Maximum of 15-m pedestrian transects.

P11. Report Citation (Provide full citation or enter "none"): Tiffany Clark, Dennis McDougall, Joan George (2017): Cultural Resource Assessment of 96 Acres for Banning Industrial Project, City of Banning, Riverside County, California. Applied EarthWorks, Inc., Hemet, CA.

Attachments: □ None ☒ Location Map □ Site Map ☒ Continuation Sheet □ Building, Structure, and Object Record ☒ Archaeological Record □ District Record □ Linear Feature Record □ Milling Station Record □ Rock Art Record □ Artifact Record ☒ Photograph Record Other:

A1. **Dimensions: a. Length:** 45 m (E-W) **x** **b. Width:** 27 m (N-S) (Portion of Site located in Project Area)
Method of Measurement: □ Paced □ Taped □ Visual estimate ☒ Other Trimble GPS

Method of Determination (Check any that apply): ☒ Artifacts □ Features □ Soil □ Vegetation □ Topography □ Cut bank □ Animal burrow □ Excavation ☒ Property boundary □ Other (explain):

Reliability of Determination: ☒ High □ Medium □ Low Explain: Reliability of Determination is high within the Project APE (see discussion within P3a, and Limitations below); ground visibility is approximately 70–80 percent.

Limitations (Check any that apply): ☒ Restricted access □ Paved/built over □ Disturbances ☒ Site limits incompletely defined □ Other (Explain): Æ only inspected that portion of CA-RIV-3443H within the approximate 30 m wide (N-S) linear Area of Potential Effects (APE) for the proposed Banning Industrial Project. Other portions of the site originally recorded outside of the current Project APE were not inspected, and could not be verified during the current survey.

A2. **Depth:** ☒ None □ Unknown Method of Determination: Examination of exposed sediments in looter's pot-hole suggests that CA-RIV-3443H is surface scatter is a low potential for containing buried archaeological deposits.

A3. **Human Remains:** □ Present ☒ Absent □ Possible □ Unknown (Explain): None noted and presence is unlikely.

A4. **Features** (Number, briefly describe, indicate size, list associated cultural constituents, and show location of each feature on sketch map): None observed.

A5. **Cultural Constituents** (Describe and quantify artifacts, ecofacts, cultural residues, etc., not associated with feature): The site consists of a diffuse scatter of historical domestic refuse (fragments of various types of ceramics, glass bottles and bottle fragments, highly-eroded fragments of ferrous metal cans, and other ferrous metal objects) that appear to date from ca. post-1904 into the 1920s. Two complete bottles (Artifacts 1 and 2 [A1 and A2]) were point-provenienced during the current survey. A1 is a small, Automatic Bottle Machine (ABM) made (post 1904) clear glass patent medicine bottle with "17" embossed on the base located at UTMs 513211/3753748. A2 is a small ABM (post 104) brown glass patent medicine bottle with "C" embossed on the base at UTMs 513213/3753745. Other materials noted on site include: 7 fragments of porcelaineous stoneware (white w/ black interior; all white; and white with green floral transfer pattern); 2 pieces of white porcelain; 7 fragments of terra cotta; 15 fragments of sun-colored amethyst (ca. 1880s-1920s) bottle glass (including 2 fragments of a "barrel" mustard jar); 1 clear glass patent medicine bottle finish; 25+ pieces of aqua bottle glass (including 1 canning jar fragment and 1 "Coca Cola" bottle fragment); 11 pieces of purple glass; 13 fragments of cobalt glass; 13 fragments of brown glass;17 fragments of clear glass; 35 small fragments of highly-eroded ferrous metal (likely deteriorated can fragments); 1 ferrous metal band 3-in. wide; and 1 ferrous metal pipe segment.

A6. **Were Specimens Collected?** ☒ No □ Yes (If yes, attach Artifact Record or catalog and identify where specimens are curated.)

A7. **Site Condition:** □ Good □ Fair ☒ Poor (Describe disturbances): Site integrity appears to be impaired. Most glass and ceramic items are highly fragmented; cans are highly degraded. Other disturbances include mechanized activities, cattle grazing, and what appears to be one "pot-hole" dug by illicit artifact collectors.

A8. **Nearest Water** (Type, distance, and direction): A small interment creek drainage defines the southern and western site boundary.

A9. **Elevation:** 2,240 ft amsl.

A10. Environmental Setting (Describe vegetation, fauna, soils, geology, landform, slope, aspect, exposure, etc., as appropriate): The site is situated on a narrow, relatively flat, east-west trending terrace bordered to the south and west by an interment creek channel, and to the north by railroad tracks. Soils consist of sandy-silt alluvium. Exposure is open, 360 degrees. Vegetation consists of sparse creosote, brittle bush, rabbit brush, and buckwheat.

A11. Historical Information (Note sources and provide full citations in Field A15 below): None.

A12. Age: □ Prehistoric □ Pre-Colonial (1500–1769) □ Spanish/Mexican (1769–1848) □ Early American (1848–1880) ☒ Turn of century (1880–1914) ☒ Early 20th century (1914–1945) □ Post WWII (1945+) □ Undetermined Factual or estimated dates of occupation (explain): Refuse appears to date from approximately ca. post 1904 (based on ABM bottles) to the 1920s (based on sun-colored amethyst glass).

A13. Interpretations (Discuss scientific, interpretive, ethnic, and other values of site, if known): The site appears to represent a single, random event of the disposal of domestic debris dating from ca. post 1904 to the 1920s. Given its proximity to the Southern California Railroad tracks, it is likely that the scatter is related to the operation or maintenance of the railway.

A14. Remarks: None.

A15. References (Give full citations including the names and addresses of persons interviewed, if possible): None.

A16. Photographs (List subjects, direction of view, and accession numbers or attach a Photograph Record): See Photograph Record attached.

A17. Form Prepared by: D. McDougall **Date:** May 25, 2016
Affiliation and Address: Applied EarthWorks, Inc., 3550 E. Florida Ave., Suite H, Hemet, CA 92544.

e. Other Locational Data (e.g., parcel #, legal description, directions to resource, additional UTMs, etc., when appropriate): This site is bisected by Charles Street (dirt) within the Banning Wastewater Treatment Plant property within Section 14. It extends northward into Southeast ¼ of Section 11

***P3a. Description** (Describe resource and its major elements. Include design, materials, condition, alterations, size, setting, and boundaries): This site was originally recorded in July 2007 as a historic-period refuse scatter. It was then updated in November 2007. These earlier recordings were limited to Section 14, T3S, R1E. The current update extends the site to the north, into Section 11 and includes two items recorded as isolated historical artifacts (33-015293 & 33-015293) within Section 11 which were recorded in April 2006. Previously recorded artifacts were described as domestic household refuse, including consumer, kitchen items and demolition debris.

During the current recordation, the character of the site proved to be a continuation of the previous records with similar artifacts and ages. The expanded portion of the site is heavily disturbed by several agents. Originally, the site was likely a series of trash dumps and scatters along the side of East Westward Avenue which ran east-west along the south edge of Section 11. In the late 1960s, this segment of East Westward Avenue was abandoned and destroyed by grading, pipeline installation and erosion. Many artifacts appear in secondary context due to disturbances and washing down recent arroyos up to 10 ft deep. North of former East Westward Avenue disturbances are less evident although artifacts are also highly fragmented. After abandonment of East Westward Avenue, the eastern portions of the site were apparently being used as an illicit dump site of bulky items and construction demolition debris.

ARCHAEOLOGICAL SITE RECORD

***A1. Dimensions: a. Length:** 1,410 ft (E-W) **b. Width:** 583 ft (N-S) (at widest point)
Method of Measurement: □ Paced □ Taped □ Visual estimate ☒ Other: GPS mapping
Method of Determination (Check any that apply): ☒ Artifacts □ Features □ Soil □ Vegetation □ Topography □ Cut bank □ Animal burrow □ Excavation □ Property boundary □ Other (explain):
Reliability of Determination: ☒ High □ Medium □ Low Explain:
Limitations (Check any that apply): ☒ Restricted access □ Paved/built over □ Disturbances ☒ Site limits incompletely defined □ Other (Explain): Access to parcels to the south and east was restricted during the current update.

A2. Depth: □ None ☒ Unknown Method of Determination: Surface examination only. Artifacts have been redeposited by erosion and/or grading disturbance.

***A3. Human Remains:** □ Present ☒ Absent □ Possible □ Unknown (Explain):

***A4. Features** (Number, briefly describe, indicate size, list associated cultural constituents, and show location of each feature on sketch map): None observed.

***A5. Cultural Constituents** (Describe and quantify artifacts, ecofacts, cultural residues, etc., not associated with feature): See artifact descriptions in the original site record and first update.
The current update recorded one discrete concentration of artifacts measuring 82 x 36 ft (E-W x N-S). Artifacts are highly fragmented, likely by trampling by cows. Concentration 1 artifacts include: one aqua canning jar base (A1), a small cobalt jar base (A2), one frosted aqua jar base embossed "A S Hinds, Portland, Me" (1890–1930), one rectangular clear glass base (Illinois Glass Company, 1916–1929), one quart jar aqua base embossed "WEBER," one amethyst milk bottle rim, one clear condiment jar base with faceted sides, one rectangular clear bottle base with maker mark (ca. 1910–1935), one unmarked clear quart bottle base, one clear pressed glass serving bowl (fragmentary), one fragmentary pressed clear drinking glass, and approximately 30 fragments of 1/8 in. clear window glass. Ceramic items include fragments of an 8-in. diameter stoneware crock with gray interior and brown exterior glazes and a 10-in. diameter stoneware crock with interior and exterior glaze. Fragments of a white earthenware wash basin are also present. Metal items include: seven sanitary-seam food cans, one hole-in-cap can, one gallon hole-in-cap can lid, and one vent-hole milk can. All cans are smashed. Other metal items five 10 in. diameter wooden cask hoops, auto seat springs, five scraps of sheet metal, one piece of ¼ in. hardware mesh, a smashed one gallon pale, and one 3/8 in. diameter carbon battery rod.

The east end of the site is dominated by post-World War II (WWII) debris which includes dumps of bulky items and construction/demolition debris including milled lumber, concrete, asphalt, tires, clay and cinder bricks, plumbing fixtures, stucco, ceramic drain pipes, and sheep fencing. The majority of dumping appears to have occurred ca. 1960s–1980s.

The remainder of the site is heavily disturbed with most pre-WWII artifacts in secondary contexts due to grading, erosion, and pipeline installation. Items include: one clear bottle base with Sierra Club makers mark (A4, 1930–1950), one aqua bottle base showing a standing figure with "PLUTO" embossed below (A5), one brown bottle base (A6) with Parke Davis & Co. maker mark (since 1875), one ca. 1940s–1950s Packard Bell record player (A7), one aqua bottle base base (Illinois Glass Company, 1900–1916), one clear octagonal bottle base with embossed chess piece or monument (A9). The central and western portions of the site are similar to Concentration 1, dominated by ca. 1920s–1930s domestic household refuse and consumer/kitchen items. These include aqua canning jar fragments, white earthenware tableware, milk glass canning jar inserts and cosmetic jars, stoneware crockery fragments, Pacific Coast Glassworks bottle base (ca.1902–1924), amethyst milk bottle fragments, brown jar and bottle fragments, small rectangular medicinal bottle fragments in clear, brown, cobalt, and aqua glass, condiment bottles and jars in various colors.

Metal and other items include a black and gray enameled cooking pot and frying pan, barrel hoops, auto seat spring sets, unidentified furniture machinery hardware, a trowel blade, metal frame to a handbag or satchel, auto leaf spring, 10-in. diameter wooden cask hoops, 5-gallon steel bucket, assorted scraps of sheet metal and a variety of smashed cans, primarily sanitary seam food cans but also present are a few hole-in-cap cans, 5-gallon rectangular liquid can, and upright pocket tobacco tins.

ARCHAEOLOGICAL SITE RECORD

***A6. Were Specimens Collected?** ☒ No □ Yes (If yes, attach Artifact Record or catalog and identify where specimens are curated.)

***A7. Site Condition:** □ Good ☒ Fair ☒ Poor (Describe disturbances): The site is heavily disturbed by several agents. Originally, the site was likely a series of trash dumps and scatters along the side of East Westward Avenue which ran east-west along the south edge of Section 11. Between 1956 and1971, this segment of East Westward Avenue was abandoned and destroyed by grading, pipeline installation and erosion. Grading has fragmented and crushed most artifacts. Many artifacts appear in secondary context due to disturbances and washing down recent arroyos up to 10 ft deep. North of the power lines, grading disturbances are less evident although artifacts are also highly fragmented. After abandonment of East Westward Avenue, the eastern portions of the site were apparently being used as an illicit dump site of bulky items and construction demolition debris. The site has also been subject to cattle grazing.

***A8. Nearest Water** (Type, distance, and direction): Smith Creek is located approximately 1/8 mi to the south.

***A9. Elevation:** ~2,080 ft amsl.

A10. Environmental Setting (Describe vegetation, fauna, soils, geology, landform, slope, aspect, exposure, etc., as appropriate): The site is situated at the toe of a southeast sloping alluvial fan. Slope is 2º and aspect is to the southeast. Sediments are poorly sorted coarse sand loams with ca. 30% poorly sorted rounded to subangular granite and gneiss gravels and cobbles. Vegetation is Riversidian Sage Scrub with California buckwheat, catclaw acacia, fiddleneck, foxtail grass, Datura, mustard and unidentified annual grasses and weeds.

A11. Historical Information (Note sources and provide full citations in Field A15 below): None known.

***A12. Age:** □ Prehistoric □ Pre-Colonial (1500–1769) □ Spanish/Mexican (1769–1848) □ Early American (1848–1880) □ Turn of century (1880–1914) ☒ Early 20th century (1914–1945) ☒ Post WWII (1945+) □ Undetermined Factual or estimated dates of occupation (explain): Diagnostic artifacts suggest the site dates to the 1920s–1930s for most of the household consumer and kitchen waste. Demolition debris (lumber, concrete, asphalt, bricks) appears to date mostly to a later period, ca1950s–1980s

A13. Interpretations (Discuss scientific, interpretive, ethnic, and other values of site, if known): CA-RIV-8364H appears to contain largely surficial deposits with no evidence of buried refuse (privy) and limited potential for subsurface deposits. Due to lack of historical ownership information, no association can be made between the artifacts and a homestead. Therefore, it is very likely that CA-RIV-8364H is a random historical refuse scatter with items dumped to the side of former East Westward Avenue and current Charles Street. The site likely represents the opportunistic disposal of residential refuse by local residents.

A14. Remarks: None.

A15. References (Give full citations including the names and addresses of persons interviewed, if possible):

P3a. **Description:** Located east of downtown Banning, the Banning Municipal Airport is situated immediately south of the Southern Pacific Railroad and Interstate 10. The airport was established by the Banning Kiwanis Club in 1927 on approximately 70 acres of land purchased from the Southern Pacific Railroad (Bitetti and Bitetti 2013:27). The facility was originally named Rodgers Airport in memory of Cal Rodgers who had landed in Banning in the first transcontinental flight in 1911. Following its annexation by the City of Banning in the mid-1930s, the airport was improved and enlarged to 127 acres.

During World War II, the Army Air Forces controlled the airport (http://www.militarymuseum.org/BanningAP.html). While under military control, the facility was known as Banning Landing Strip. In 1943, the U.S. Army conducted a training program in airport construction at the Banning Landing Strip for Army engineers. Known as *Project X: How to Build an Air Field in Italy*, the program resulted in improvements to the runway with the extension of the paved landing strip to 5,200 feet. Aside from the landing area, no other facilities appear to have been present at the airport at this time.

Following the end of World War II, control of the airport reverted back to the municipal government. In the following decade, the City of Banning made a number of infrastructural improvements to the airport. The 1956 USGS topographic quadrangle map for Cabazon, California (1:24,000) depicts an aircraft parking apron, communication fan beacon, two buildings, and a road in the northwest corner of the airport. A historical aerial photograph indicates that by 1967, taxiways, the terminal building, and four aircraft hangars were constructed on the property south of the runway (NETR Online 2016). Several additional hangars appear to have been built at the airport in the late 1980s and early 1990s.

Today the airport encompasses approximately 295 acres of which 145 acres are developed (C&S Engineers, Inc. 2007). In addition to runways and taxiways, several facilities are located within the airport boundaries including the terminal building, one facility capable of housing a fixed base operator, nine hangars, and fuel facilities. Photographs of the current condition of the airport were taken on May 24, 2016 to document their appearance, design, and construction (see Figures 1 through 7 on the attached Continuation Sheets). Satellite imagery was used to create a Sketch Map of the air field.

Aviation and the Banning Municipal Airport

Located east of downtown Banning, the Banning Municipal Airport is situated immediately south of the Southern Pacific Railroad and Interstate 10. The airport was established by the Banning Kiwanis Club in 1927 on approximately 70 acres of land purchased from the Southern Pacific Railroad (Bitetti and Bitetti 2013:27). The facility was originally named Rodgers Airport in memory of Cal Rodgers who had landed in Banning in the first transcontinental flight in 1911. Following its annexation by the City of Banning in the mid-1930s, the airport was improved and enlarged to 127 acres.

During World War II, the Army Air Forces controlled the airport (http://www.militarymuseum.org/BanningAP.html). While under military control, the facility was referred to as the Banning Landing Strip. In 1943, the U.S. Army conducted a training program in airport construction at the Banning Landing Strip for Army engineers. Known as *Project X: How to Build an Air Field in Italy*, the program resulted in improvements to the runway with the extension of the paved landing strip to 5,200 feet. Aside from the landing area, no other facilities appear to have been present at the airport at this time.

Following the end of World War II, control of the airport reverted back to the municipal government. In the following decade, the City of Banning made a number of infrastructural improvements to the airport. The 1956 USGS topographic quadrangle map for Cabazon, California (1:24,000) depicts an aircraft parking apron, communication fan beacon, two buildings, and a road in the northwest corner of the airport. A historical aerial photograph indicates that by 1967, taxiways, the terminal building, and four aircraft hangars were constructed on the property south of the runway (NETR Online 2016). Several additional hangars appear to have been built at the airport in the late 1980s and early 1990s.

The Banning Municipal Airport is one of a number of municipal airports located in Riverside County. Historical background research indicates that the Banning Municipal Airport never achieved any prominence as a municipal or military airport throughout the historic period. As such, it does not appear to meet any of the criteria of the NRHP or the CRHR. It is not directly associated with an important historical event (NRHP/CRHR Criterion A/1), or directly associated with the productive life of an important historical person (NRHP/CRHR Criterion B/2); it does not embody distinctive characteristics of a type, period, or method of construction, is not an important work of a

(This space reserved for official comments.)

master architect, or possess high artistic value (NRHP/CRHR Criterion C/3); and it does not possess data potential important to the study of our local, state, or national history (NRHP/CRHR Criterion D/4), as explained in further detail below.

NRHP/CRHR Criterion A/1: No information has been found to suggest that the Banning Municipal Airport is directly associated with any historical events of importance in local, state, or national history under NRHP/CRHR Criterion A/1. Although Cal Rodgers landed his plane in the Banning area during the first transcontinental flight in 1911, the airport was not established until 1927. As such, the Banning Municipal Airport is not associated with this important event. The airport was converted to a military landing strip during World War II and used to train Army engineers in airport construction. However, the airport does not appear to have played a pivotal role in any historical events in the U.S. Army or WWII history. While the Banning Municipal Airport is associated with the development of the region and WWII era history, there is no indication that association is significant. Mere association with historic events is not enough to meet NRHP/CRHR Criterion A/1, in and of itself; the property's specific association must be considered important as well.

NRHP/CRHR Criterion B/2: The airport was originally named Rodgers Airport after Cal Rodgers, who landed his plane in the Banning area during the first transcontinental flight in 1911. As the airport had not yet been constructed at the time of his historic flight, there is no direct association with the aviation pioneer. No information has been found to suggest that the Banning Municipal Airport is directly associated with the productive life of an historical person of importance in local, state, or national history under NRHP/CRHR Criterion B/2.

NRHP/CRHR Criterion C/3: No information has been found to suggest that the Banning Municipal Airport exhibits any architectural or engineering merits that would set it apart from other airports in the region. The landing strip and associated buildings are of standard design and construction. The airport runway and associated facilities do not embody the distinctive characteristics of a type, period, or method of construction important in aviation history. Further, the airport is not the work of a master and does not display high artistic value. As such, the Banning Municipal Airport does not meet the criteria for listing under NRHP/CRHR Criterion C/3.

NRHP/CRHR Criterion D/4: The Banning Municipal Airport does not appear to meet NRHP/CRHR Criterion D/4 for any potential to provide information important to the study of aviation and municipal airport development. This criteria is typically reserved for archaeological resources, ruins, or rare built environment resources of which little is already known, and that are considered to be the sole source of historical data. The Banning Municipal Airport is unable to yield any information important to the study of municipal airports of similar vintage in local, state, or national history. The Banning Municipal Airport is not the primary source of information, but rather, the physical manifestation of the knowledge and practice of a construction technique, which has been widely applied to airports throughout southern California and the nation. Thus, Banning Municipal Airport does not provide any important information or data potential that would meet NHRP/CRHR Criterion D/4.

e. Other Locational Data: This 1,460 ft long segment of East Westward Ave is situated along the extreme south edge of Section 11, extending eastward to the corner of that Section.

P3a. Description: The recorded segment is a wide paved modern paved road measuring 12–22 ft. The western half of the recorded segment is a well-maintained modern local road while the eastern half, east of a restricted access gate, consists of a narrower road constructed of a rudimentary pavement of coarse gravels and asphalt mixed and roughly spread in a 12 ft wide path. On 1943 and 1956 quadrangle maps (USGS 1943, 1956), East Westward Avenue is shown as an east-west oriented road that ran for one mile between Sections 11 and 14, Township 3S / Range 1E. Historic aerial photographs suggest that by the late 1960s, the easternmost portion of the road, which measured approximately 0.4 mi (2,100 ft) in length, had been realigned further to the north (NETROnline 2017). The only evidence of the eastern portion of the original road observed in the Project APE was a faint two track in the western portion of old alignment. Erosion from the nearby Smith Creek appears to have destroyed the remaining portions of the road alignment.

BUILDING, STRUCTURE, AND OBJECT RECORD

 NRHP Status Code
Resource Name or # Æ-3477-2H, segment of East Westward Ave

B1. Historic Name: East Westward Ave **B2. Common Name:** same
B3. Original Use: Local road
B4. Present Use: Local road
B5. Architectural Style: 12-22 ft wide paved road
B6. Construction History: Historic maps indicate that the section of East Westward Avenue located east of South Hathaway Street has been in use since at least the early 1940s (U.S. Army Corp of Engineers 1942). The subject segment today is completely modern in appearance, design, and construction on its western half but retains some of its earlier character in the eastern half. East of the subject segment, the road was rerouted and the older portion abandoned and destroyed by the late 1960s (NETROnline 2017).

B7. Moved? ☒ No Yes Unknown **Date:** **Original Location:**
B8. Related Features: None
B9a. Architect: Unknown **b. Builder:** Unknown
B10. Significance: Theme Twentieth century automobile roads
Area Banning Pass **Period of Significance** None
Property Type Automobile road **Applicable Criteria** None
The road does not appear to be eligible for listing on the National Register of Historic Places (NRHP) or the California Register of Historical Resources (CRHR). Historical maps indicate that the section of East Westward Avenue located east of South Hathaway Street has been in use since at least the early 1940s. The western portion of the structure consists of a 22-ft-wide asphalt-concrete paved road. The eastern extent of the roadway is 12 ft in width and is constructed of a rudimentary pavement of coarse gravels and asphalt. Both sections of the road are completely modern in appearance, design, and construction, and lack any historical features. Only the alignment itself appears historic in age based upon its depiction on historical maps. The road is one of several that were built in the area in the 1940s. Although the road is broadly associated with the development of the city of Banning, it is not directly associated with any pattern of events or historical trends in local, state, or national history. Thus, there is no evidence that it is directly associated with any events of recognized historical significance (NRHP Criterion A/CRHR Criterion 1). The road was likely built by the City of Banning, and not a specific individual. Therefore, the structure is not directly associated with the productive life of an important historical figure (NRHP Criterion B/CRHR Criterion 2). The road does not represent the work of a prominent architect, designer, or builder, nor does it qualify as an important example of its type, period, region, or method of construction (NRHP Criterion C/CRHR Criterion 3). Finally, the East Westward Avenue does not have the potential to yield any information important to the study of our local, state, or national history and is thus not eligible for listing under NRHP Criterion D/CRHR Criterion 4.

East end of recorded segment: 512859 **mE /** 3753673 **mN**
e. Other Locational Data: This 2,083 ft long segment of John Street is situated between the Banning Municipal Airport to the south and railroad tracks and Interstate 10 to the north. The subject segment lies east of Hargrave St.

P3a. Description: The recorded segment is a well maintained modern paved road measuring approximately 20 ft wide. From its intersection with South Hargrave Street, the roadway runs in an east to northeast direction for approximately 2,620 ft at which point it terminates at the western end of the Banning Airport. The road appears to be regularly maintained. No historic-period signage, guardrails, or other historical roadway features were observed along this road segment. Historical maps indicate that the section of John Street that ran between South Hargrave and South Hathaway streets has been in use since the mid-1950s (ACOE 1941, USGS 1956). It appears that the subject segment was constructed to provide secondary access to the north side of Banning Municipal Airport, replacing an older airport access at the northwest corner of the airport property. Historic aerial photographs suggest that this segment of road was paved by at least 1967 (NETROnline 2017). The eastern extent of the roadway appears to have been realigned following the construction of an airport hanger sometime in the 1970s or 1980s.

e. Other Locational Data: This 1,253-ft-long segment of local power transmission line is situated running east-west along the southern edge of Sec. 11, T3S, R1E. The subject segment consists of seven poles which pass through site CA-RIV-8364H, as updated in May 2017.

P3a. Description: The subject segment consists of seven poles which pass through site CA-RIV-8364H, as updated in May 2017. The segment formerly ran along the north shoulder of historical East Westward Avenue which has since been abandoned and destroyed. Date nails indicate most poles were manufactured from 1958–1971 with one pole replaced recently. Inspection tags show the line is still in use.

B1. Historic Name: **B2. Common Name:** same
B3. Original Use: Local electrical transmission
B4. Present Use: Local electrical transmission
B5. Architectural Style:
B6. Construction History: The subject segment does not appear on historical USGS topographic quadrangle maps (USGS 1956, USGS 1972). However, an aerial image dating to the late 1960s shows a series of cleared areas in the approximate location of the utility poles; these cleared areas are located north of an abandoned segment of East Westward Avenue (NETROnline 2017). Date nails showing pole construction dates range from 1958–1971 for the main transmission line and a 1929 date on an accessory pole (guy-line support). The wide range of manufacture dates suggests that the line may have been constructed of reused poles in the early 1970s, which substantiates the historical aerial imagery. The easternmost pole has been cut and the line rerouted to north from there in recent times.

B7. Moved? ☒ No □ Yes Unknown **Date:** **Original Location:**
B8. Related Features: None
B9a. Architect: Unknown **b. Builder:** City of Banning

B10. Significance: Theme
Area City of Banning **Period of Significance** None
Property Type **Applicable Criteria** None
The subject segment of this local transmission line does not appear to be eligible for inclusion in the National Register of Historic Place (NRHP) or the California Register of Historical Resources (CRHR). It is among numerous transmission lines located within the City of Banning (City), and it has never achieved any recognition as an important electric utility line. In addition, it does not exhibit any architectural or engineering merits that would set it apart from the many similar transmission lines in the region. The electrical transmission line was likely constructed to meet the electricity demands of customers at a time when the City's population and development was beginning to expand. The transmission line itself is not responsible for the growth and development of the City, but merely the attempt to electrify the city and keep up with consumer demand. Thus, there is no evidence that it is directly associated with any events of recognized historical significance (NRHP Criterion A/CRHR Criterion 1). The transmission line was built by the City, a municipality, and not individuals. Therefore, the structure is not directly associated with the productive life of an important historical figure (NRHP Criterion B/CRHR Criterion 2). The transmission line does not represent the work of a prominent architect, designer, or builder, nor does it qualify as an important example of its type, period, region, or method of construction (NRHP Criterion C/CRHR Criterion 3). Finally, the transmission line does not have the potential to yield any information important to the study of our local, state, or national history (NRHP Criterion D/CRHR Criterion 4).

Re: Cultural Resource Investigation for the Banning Industrial Project, Riverside County, California

Dear Ms. Torres:

Applied EarthWorks, Inc. (Æ) is conducting a supplemental cultural resource study of the Banning Industrial Project (Project). The Project proposes to construct an industrial warehouse and road on approximately 55 acres immediately north of the Banning Airport. The Project is located just south of the I-10 Freeway and the Southern Pacific Railroad in the City of Banning, Riverside County, California. As indicated on the attached map, the Project is located on the Cabazon, CA 7.5' USGS map within Sections 10 and 11, Township 3 South, Range 1 East, San Bernardino Baseline and Meridian (SBBM). The supplemental study involves offsite improvement areas (see attached map)

The initial cultural resource study, conducted in June of last year, identified one historical refuse scatter within the Project boundaries. Æ performed an intensive-level archaeological survey of the offsite improvement areas on May 9, 2017. During the pedestrian survey, close attention was paid to soils, vegetation, and natural and human-modified landforms. No prehistoric cultural resources were observed during the survey. However, five historic-era resources (2 roads, 2 refuse scatters, and 1 utility line) were identified during the survey.

Should your records show that cultural properties exist within or near the Project area, or the offsite improvement areas shown on the enclosed map, or if you have any concerns regarding Native American issues related to the overall Project, please contact me at (951) 766-2000 or via letter expressing your concerns. You may also e-mail me at jgeorge@appliedearthworks.com. If I do not hear from you within in the next two weeks, I will contact you with a follow-up phone call or email.

Your comments are very important to us, and to the successful completion of this Project. I look forward to hearing from you in the near future. Thank you, in advance, for taking the time to review this request.

Respectfully yours,

Joan George

LIST OF NATIVE AMERICAN CONTACTS AND RECORD OF RESPONSES

Name	Date & Time of Calls	Responses
Patricia Garcia-Plotkin Director Tribal Historic Preservation Office Agua Caliente Band of Cahuilla Indians	May 25, 2016 Letter dated June 7, 2016	Scoping letter sent via email. The Agua Caliente Band of Cahuilla Indians (ACBCI) noted that the Project is not located within the ACBCI Reservation, however it is within the Tribe's Traditional use Area (TUA). The Tribe has no concerns regarding the Project and defers to the Morongo Band of Mission Indians.
Amanda Vance Chairperson Augustine Band of Cahuilla Indians	May 25, 2016 June 8, 2016	Scoping letter sent via United States Postal Service (USPS). E-mailed follow-up effort for correspondence. No response received.
Judy Stapp Director of Cultural Affairs Cabazon Band of Mission Indians	May 25, 2016 Letter dated May 31, 2016	Scoping letter sent via email. Received letter from Ms. Stapp via email. Ms. Stapp stated that the Project is located outside of Tribe's current reservation boundaries, but within an area that may be considered a traditional use area. The Tribe has no specific archival information indicating that the Project area may be a sacred/religious site or other site of Native American traditional cultural value. However, the Tribe recommends there be an archaeologist on-site during all ground disturbing activities to monitor for unanticipated discoveries.
Luther Salgado Chairperson Cahuilla Band of Indians	May 25, 2016 June 1, 2016 June 8, 2016	Scoping letter sent via USPS. Letter returned to sender. E-mailed a copy of the scoping letter. E-mailed follow-up effort for correspondence. No response received.

RE: Proposed Webb Associates – Banning Industrial Project, City of Banning, Cabazon USGS Quadrangle, Riverside County, California

Dear Ms. Clark:

Attached is a consultation list of tribes with traditional lands or cultural places located within the boundaries of the above referenced counties. A search of the SFL was completed for the USGS quadrangle information provided with negative results.

Our records indicate that the lead agency for this project has not requested a Native American Contact List for the purposes of consultation. Please note that the intent of the referenced codes below is to mitigate impacts to tribal cultural resources, as defined, for California Environmental Quality Act (CEQA) projects.

As of July 1, 2015, Public Resources Code Sections 21080.3.1 and 21080.3.2 **require public agencies** to consult with California Native American tribes identified by the Native American Heritage Commission (NAHC) for the purpose mitigating impacts to tribal cultural resources:

> **Within 14 days** of determining that an application for a project is complete or a decision by a public agency to undertake a project, the lead agency shall provide formal notification to the designated contact of, or a tribal representative of, traditionally and culturally affiliated California Native American tribes that have requested notice, which shall be accomplished by means of at least one written notification that includes a brief description of the proposed project and its location, the lead agency contact information, and a notification that the California Native American tribe has 30 days to request consultation pursuant to this section. (Public Resources Code Section 21080.3.1(d))

The law does not preclude agencies from initiating consultation with the tribes that are culturally and traditionally affiliated with their jurisdictions. The NAHC believes that in fact that this is the best practice to ensure that tribes are consulted commensurate with the intent of the law.

In accordance with Public Resources Code Section 21080.3.1(d), formal notification must include a brief description of the proposed project and its location, the lead agency contact information, and a notification that the California Native American tribe has 30 days to request consultation. The NAHC believes that agencies should also include with their notification letters information regarding any cultural resources assessment that has been completed on the APE, such as:

1. The results of any record search that may have been conducted at an Information Center of the California Historical Resources Information System (CHRIS), including, but not limited to:

   - A listing of any and all known cultural resources have already been recorded on or adjacent to the APE;
   - Copies of any and all cultural resource records and study reports that may have been provided by the Information Center as part of the records search response;
   - If the probability is low, moderate, or high that cultural resources are located in the APE.

- Whether the records search indicates a low, moderate or high probability that unrecorded cultural resources are located in the potential APE; and
- If a survey is recommended by the Information Center to determine whether previously unrecorded cultural resources are present.

2. The results of any archaeological inventory survey that was conducted, including:

   - Any report that may contain site forms, site significance, and suggested mitigation measurers.
   - All information regarding site locations, Native American human remains, and associated funerary objects should be in a separate confidential addendum, and not be made available for pubic disclosure in accordance with Government Code Section 6254.10.

3. The results of any Sacred Lands File (SFL) check conducted through Native American Heritage Commission.

4. Any ethnographic studies conducted for any area including all or part of the potential APE; and

5. Any geotechnical reports regarding all or part of the potential APE.

Lead agencies should be aware that records maintained by the NAHC and CHRIS is not exhaustive, and a negative response to these searches does not preclude the existence of a cultural place. A tribe may be the only source of information regarding the existence of a tribal cultural resource.

This information will aid tribes in determining whether to request formal consultation. In the case that they do, having the information beforehand well help to facilitate the consultation process.

The results of these searches and surveys should be included in the "Tribal Cultural Resources" subsection of the Cultural Resources section of the environmental document submitted for review.

If you receive notification of change of addresses and phone numbers from tribes, please notify me. With your assistance we are able to assure that our consultation list contains current information.

If you have any questions, please contact me at my email address: gayle.totton@nahc.ca.gov.

Sincerely,

Gayle Totton, M.A., PhD.

Re: Cultural Resource Investigation for the Banning Industrial Project, Riverside County, California

Dear Mr. Chapparosa:

Applied EarthWorks, Inc. (*Æ*) is conducting a cultural resource study of the Banning Industrial Project (Project). The Project proposes to construct an industrial warehouse and road on approximately 55 acres immediately north of the Banning Airport. The Project is located just south of the I-10 Freeway and the Southern Pacific Railroad in the City of Banning, Riverside County, California. As indicated on the attached map, the Project is located on the Cabazon, CA 7.5' USGS map within Sections 10 and 11, Township 3 South, Range 1 East, San Bernardino Baseline and Meridian (SBBM).

A cultural resource literature and records search conducted at the Eastern Information Center (EIC) housed at the University of California, Riverside, indicates that as many as 41 cultural resource studies have been conducted within a one-mile radius of the Project area; one of these studies involved the Project area specifically. The records search also indicated that 197 cultural resources have been identified within a one-mile radius of the Project area. One of these resources, a historical refuse scatter, is documented within the Project boundaries. *Æ* performed an intensive-level archaeological survey of the Project area on May 24, 2016. During the pedestrian survey, close attention was paid to soils, vegetation, and natural and human-modified landforms. No prehistoric cultural resources were observed during the survey. However, the previously documented historic refuse scatter was identified during the survey.

As part of the cultural resource assessment of the Project area, *Æ* requested a search of the Native American Heritage Commission's (NAHC's) *Sacred Lands File*. The NAHC responded on May 2, 2016 stating that the *Sacred Lands File* search was completed with negative results. Should your records show that cultural properties exist within or near the Project area shown on the enclosed map, or if you have any concerns regarding Native American issues related to the overall Project, please contact me at (951) 766-2000 or via letter expressing your concerns. You may also e-mail me at jgeorge@appliedearthworks.com. If I do not hear from you within in the next two weeks, I will contact you with a follow-up phone call or email.

Your comments are very important to us, and to the successful completion of this Project. I look forward to hearing from you in the near future. Thank you, in advance, for taking the time to review this request.

Respectfully yours,

Re: Cultural Resource Investigation for the Banning Industrial Project, Riverside County, California

Dear Ms. Stapp:

Applied EarthWorks, Inc. (*Æ*) is conducting a cultural resource study of the Banning Industrial Project (Project). The Project proposes to construct an industrial warehouse and road on approximately 55 acres immediately north of the Banning Airport. The Project is located just south of the I-10 Freeway and the Southern Pacific Railroad in the City of Banning, Riverside County, California. As indicated on the attached map, the Project is located on the Cabazon, CA 7.5' USGS map within Sections 10 and 11, Township 3 South, Range 1 East, San Bernardino Baseline and Meridian (SBBM).

A cultural resource literature and records search conducted at the Eastern Information Center (EIC) housed at the University of California, Riverside, indicates that as many as 41 cultural resource studies have been conducted within a one-mile radius of the Project area; one of these studies involved the Project area specifically. The records search also indicated that 197 cultural resources have been identified within a one-mile radius of the Project area. One of these resources, a historical refuse scatter, is documented within the Project boundaries. *Æ* performed an intensive-level archaeological survey of the Project area on May 24, 2016. During the pedestrian survey, close attention was paid to soils, vegetation, and natural and human-modified landforms. No prehistoric cultural resources were observed during the survey. However, the previously documented historic refuse scatter was identified during the survey.

As part of the cultural resource assessment of the Project area, *Æ* requested a search of the Native American Heritage Commission's (NAHC's) *Sacred Lands File*. The NAHC responded on May 2, 2016 stating that the *Sacred Lands File* search was completed with negative results. Should your records show that cultural properties exist within or near the Project area shown on the enclosed map, or if you have any concerns regarding Native American issues related to the overall Project, please contact me at (951) 766-2000 or via letter expressing your concerns. You may also e-mail me at jgeorge@appliedearthworks.com. If I do not hear from you within in the next two weeks, I will contact you with a follow-up phone call or email.

Your comments are very important to us, and to the successful completion of this Project. I look forward to hearing from you in the near future. Thank you, in advance, for taking the time to review this request.

Respectfully yours,

Joan George

Re.: Cultural Resource Investigation for the Banning Industrial Project
Riverside County, California

Dear Ms. George,

Thank you for contacting the Cabazon Band of Mission Indians concerning cultural resource information relative to the above referenced project.

The project is located outside of the Tribe's current reservation boundaries but within an area that may be considered a traditional use area. The Tribe has no specific archival information on the site indicating that it may be a sacred/religious site or other site of Native American traditional cultural value within the project area. The Cabazon Band suggests, however, there be an archaeologist on site during all ground disturbing activities to monitor for the discovery of unknown cultural resources.

We look forward to continued collaboration in the preservation of cultural resources or areas of traditional cultural importance.

Best regards,

Judy Stapp
Director of Cultural Affairs

Re: Cultural Resource Investigation for the Banning Industrial Project, Riverside County, California

Dear Ms. Joan George,

The Agua Caliente Band of Cahuilla Indians (ACBCI) appreciates your efforts to include the Tribal Historic Preservation Office (THPO) in the Banning Industrial project. A records check of the ACBCI cultural registry revealed that the project area is not located within the boundaries of the ACBCI Reservation. However, it is within the Tribe's Traditional Use Area (TUA).We currently have no concerns regarding this project. This letter shall conclude our consultation efforts.

*At this time ACBCI has no concerns and defers to the Morongo Band of Mission Indians. This letter shall conclude our consultation efforts.

Again, the Agua Caliente appreciates your interest in our cultural heritage. If you have questions or require additional information, please call me at (760)699-6981. You may also email me at vharvey@aguacaliente.net.

Cordially,

V. Harvey

CONCEPTUAL GRADING PLAN

SECTION 1 - SUMMARY

PURPOSE

Albert A. Webb Associates (WEBB) was contracted by Banning Industrial, LP to prepare a preliminary drainage study for the Banning Distribution Center project. The purpose of this study is to address the hydrological and hydraulic design aspects of the proposed Banning Distribution Center. The City of Banning Stormwater regulations require at a minimum all developments will make provisions to store runoff from rainfall events up to and including the 100-year 3-hour storm (Municipal Code 13.24). In addition post-development peak urban runoff discharge rates shall not exceed pre-development peak urban runoff discharge rates.

In order to comply with City of Banning stormwater regulations, two onsite retention basins are proposed, which will capture the entire 100-year 3-hour storm runoff volume and infiltrate into the underlying soils within a 48 hour period. Onsite runoff will be intercepted and conveyed through the site by means of conventional catch basins, swales and an underground storm drain system discharging to the retention basins. Offsite runoff will be intercepted, conveyed through the site, and discharged at/ or near its original location in order to avoid any downstream drainage issues to adjacent properties.

The scope of this report will include the following:

- Determine and analyze the onsite 100-year 3-hour storm event for post-project conditions.
- Determine the required retention basin sizes to contain the 100-year 3-hour storm flood volume and treat onsite flows for water quality.
- Determine the required basin bottom area to drain the 100-year 3-hour storm flood volume within 48 hours.
- Determination of offsite areas impacting the site.
- Preparation of a preliminary report summarizing the hydrology and hydraulic results.

DESCRIPTION OF WATERSHED

The proposed project includes the development of an industrial building, associated parking lot, and two stormwater retention basins on a 63.9 acre parcel. The project includes the development of a warehouse/ distribution building with 1,000,000 square feet of warehouse space, 10,000 square feet of office space, 392 truck and trailer parking spaces, 223 automobile parking spaces and 205 loading docks.

The project is located north of the Banning Municipal Airport, south of I-1o freeway, east of Hargrave Street, and west of San Gorgonio River. The project site is currently undeveloped, consisting mostly of desert type vegetation dominated by non-native grasslands with sparse sage scrubs. The northern boundary of the site parallels the Interstate 10 (I-10) Freeway and Union Pacific Railroad (UPRR). There are several offsite drainages that flow onto the site originating from the north. These offsite flows are conveyed beneath the existing railroad tracks through underground box and/ or corrugated metal culverts (CMPs) and flow in a southeasterly direction onto the site. Runoff from the site generally flows southeast to Ramsey Street Wash, which runs for approximately a half mile in the same direction before entering Smith Creek. Flows continue in Smith Creek for 1.5 miles before flowing into the San Gorgonio River, which then empties into the Whitewater River (11.5 miles to the East). Refer to the end of this section for more information on the project location.

There may be several jurisdictional waters, wetlands and associated riparian habitats potentially impacted by construction of the proposed project. These areas may be subjected to regulations by U.S. Army Corps of Engineers (USACE) under Section 404 of the Clean Water Act (CWA), Regional Water Quality Control Board under Section 401 of the CWA and Porter Cologne water Quality Control Act, and California Department of Fish and Wildlife (CDFW) under Section 1602 of the California Fish and Game Code. Permanent impacts will need to be assessed based on final project design and may require authorizations from the USACE, RWQCB and CDFW agencies.

OFFSITE DRAINAGE

The largest offsite drainage entering the site (see Offsite Drainage Map) is from the Ramsey Street Storm Drain (O1 Watershed). Flows are conveyed from north to south beneath the I-10 and UPRR through a series of culverts into an unimproved channel (Ramsey Street Wash) that enters at the lower west boundary of the project. This unimproved channel runs in an easterly direction along the south project boundary and exits the site at the southeast corner. The project will deviate away from these off-site flows by avoiding adding improvements in this area.

The second offsite drainage (O2 Watershed) enters the western site boundary and runs in a southeasterly direction and joins with the Ramsey Street Wash at the site southwest corner. The offsite O2 Watershed tributary area is approximately 10 acres consisting of the area between the I-10 and UPRR right-of-ways.

The third offsite drainage (O3 Watershed) also enters the western site boundary just above where O2 Watershed enters. The O3 Watershed tributary area is approximately 83 acres in size consisting of the area east of Hathaway Street and north of the I-10 Freeway. Flows are conveyed across the 1-10 and UPRR through a series of culverts into an unimproved channel (wash) that enters at the mid-western site boundary. This wash runs in a southeasterly direction through the site for a short distance and joins with the O2 Watershed wash. The combined flows from O2 and O3 Watersheds then enter the Ramsey Street Wash near the southwestern property boundary.

The fourth offsite drainage (O4 Watershed) enters at the northeast corner of the project site. The O4 Watershed tributary area is approximately 19 acres in size consisting of the area between the I-10 freeway and UPRR. Flows are conveyed across the railroad tracks through several culverts into an earthen channel along the south side of the railroad tracks. The O4 Watershed drainage flows onto the site near the northeastern boundary and exits the project boundary on the eastern boundary mostly as shallow sheet flow.

All offsite flows are proposed to be collected and bypassed through the project site via a separate bypass storm drain system without comingling with the on-site flows and without entering the proposed retention basins. The bypassed off-site flows will be discharged at/ or near their original discharge location into the Ramsey Street Wash.

PROPOSED CONDITIONS

The City of Banning Stormwater regulations require at a minimum all developments will make provisions to store runoff from rainfall events up to and including the 100-year 3-hour storm (Municipal Code 13.24). Two retention basins are proposed to store the required 100-year 3-hour runoff volume during post-development conditions. The basins are located along the southerly project boundary just north of the Ramsey Street Wash. The retention basins will be required to treat on-site flows for water quality and retain the 100-year 3-hour storm event, mitigating all storm events below the 100-year storm. Refer to the Preliminary WQMP Report for further details.

The onsite watershed areas tributary to the two proposed retention basins were based on the Banning Distribution Center Conceptual Grading Plan (See Section 4). The project site was subdivided into two watersheds. Watershed AREA-1 consists of 20.1 acres and drains into the retention Basin 1. Watershed AREA-2 consists of 37.4 acres and drains into retention Basin 2 (See Section 2). The remaining 6 acres of the project will be pervious areas draining away from the project and are considered to be self-treating.

Onsite runoff will be intercepted and conveyed through the site by means of conventional catch basins, grate inlets, swales and an underground storm drain system discharging to the retention basins. Offsite runoff will be intercepted, conveyed through the site via a separate bypass storm drain system, and discharged at/ or near its original discharge locations into the Ramsey Street Wash.

For the purpose of this preliminary drainage study, both basins volume capacities and bottom footprint areas were summarized and the basins drawdown time calculations were performed for both basins together. The means of equalizing and distributing the on-site flows into the proposed basins so their capacity is utilized in the most efficient way will be a subject of the final design stage for the proposed development.

The retention basins design considerations, storage curves and drawdown time calculations are provided in Section 3.

METHODOLOGY

HYDROLOGY

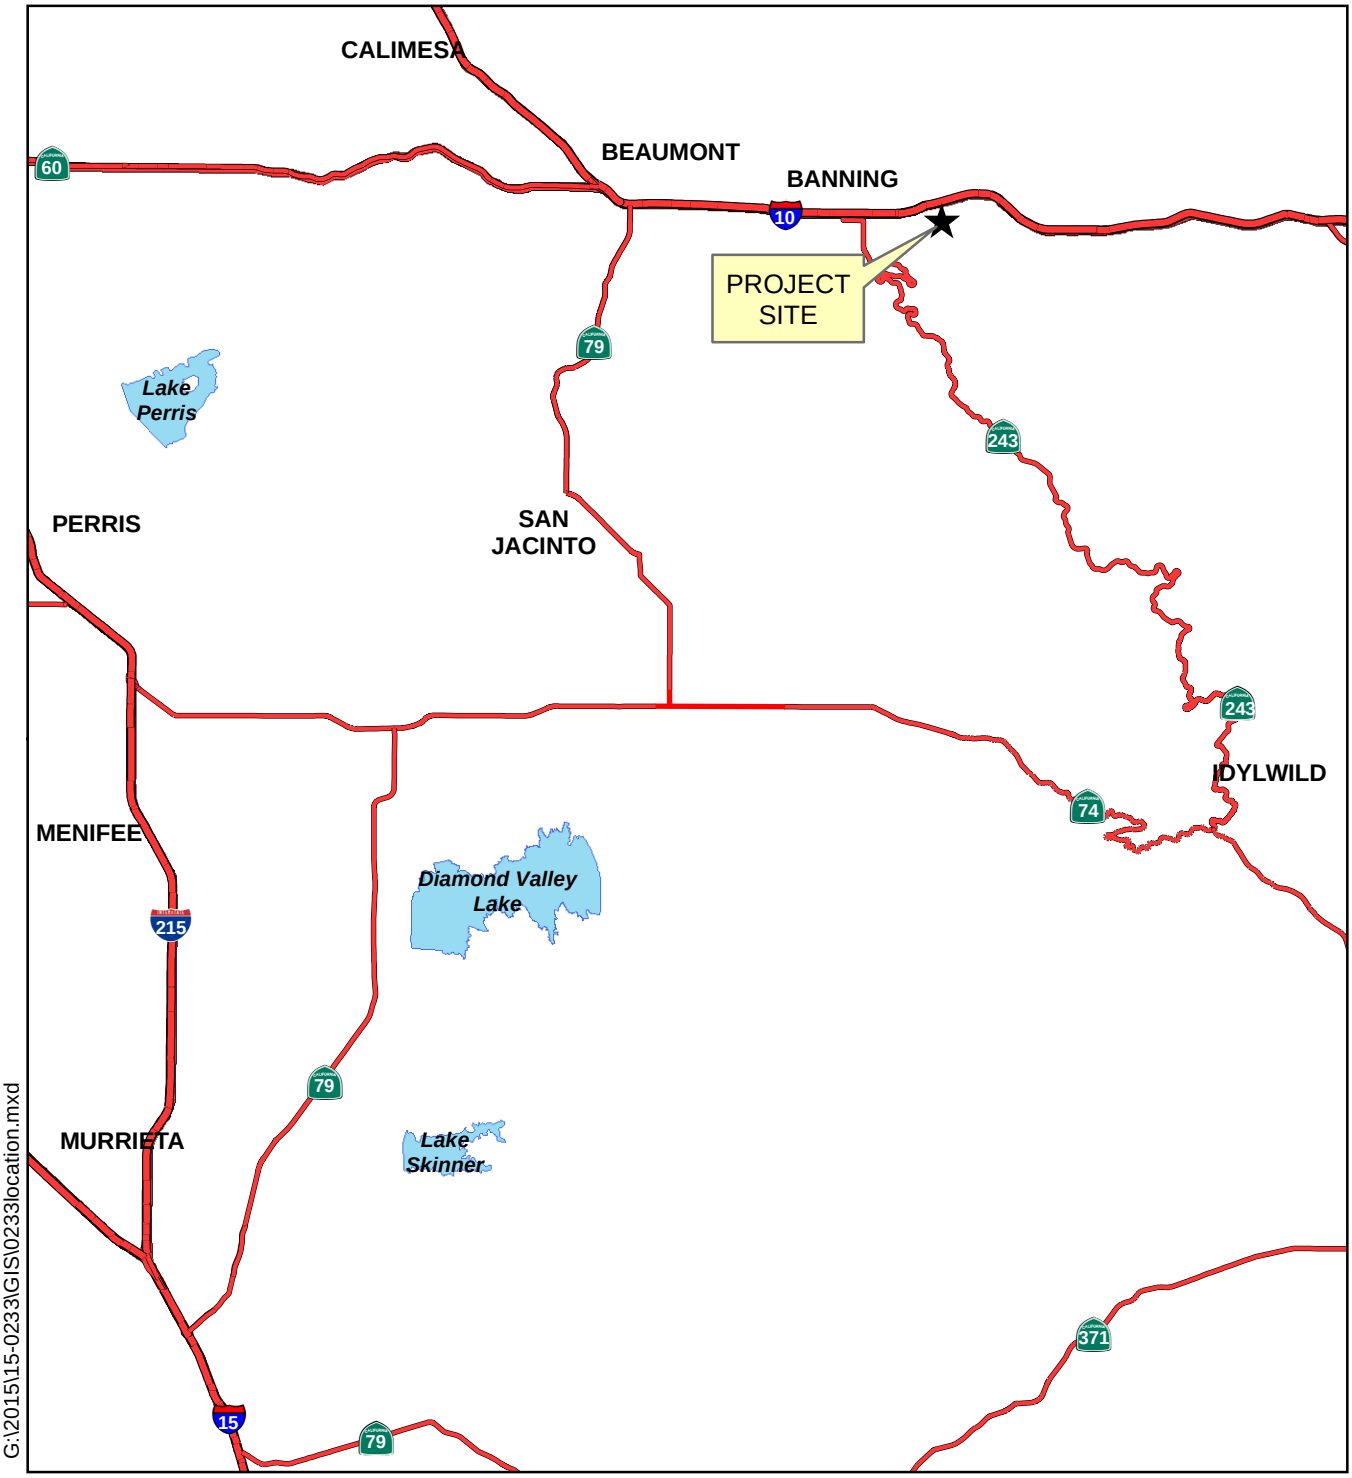
Hydrologic calculations were performed in accordance with the RCFC&WCD Hydrology Manual, dated April 1978. The Synthetic Unit Hydrograph Method was used to determine peak flood volumes and peak flow rates.

The hydrological parameters, including rainfall values and soil types were derived from the RCFC&WCD Hydrology Manual. The isohyetal maps and soil map have been included in Section 2

Synthetic Unit Hydrograph Method calculations were performed using a computer program developed by CivilDesign Corporation and Joseph E. Bonadiman and Associates Inc. The computer program is commonly referred to as CivilD which incorporates the hydrological parameters outlined in the RCFC&WCD Hydrology Manual.

The Synthetic Unit Hydrograph Method was used to determine the necessary flood volume to size the infiltration basins. The peak flow rates were computed by determining the centroid of the drainage area, the longest water path that drained into the infiltration basins, and the length of the water path downstream to the centroid.

HYDRAULICS



Normal depth calculations and inlet calculations were performed using the Hydraulic Toolbox 4.1 Software developed by Federal Highway Administration (FHWA) in cooperation with Aquaveo. For preliminary results, see Section 4.

Water quality basin calculations were performed using spreadsheets that were created by RCFC&WCD. Preliminary calculations and additional details can be reviewed in the P-WQMP.

SECTION 2 - HYDROLOGY ANALYSIS

HYDROLOGY PARAMETERS

The RCFC&WCD Hydrology Manual was used to determine several of the hydrological parameters. The following rainfall depths were utilized in the hydrology analyses, which were obtained from the isohyetal maps provided in the RCFC&WCD Hydrology Manual:

Table 1 – Precipitation Values

	Duration
Storm Event	3-Hour (inches)
2-Year	0.98
100-Year	2.20

The value for slope intensity was determined to be 0.53. The isohyetal maps have been included in at the end of this section.

Based on the Plate C-1.20 (Cabazon) in the RCFC&WCD Hydrology Manual, the project site is classified as soil type A and B. A composite RI number was used for each sub-area. The soils map is also included at the end of this section.

The cover type was determined based on the existing land cover and the proposed land use of the site. Run-Off Index numbers were taken from the RCFC&WCD Hydrology Manual. The commercial landscaping cover type was used to represent the developed condition and chaparral/ narrowleaf cover type was used to represent the existing condition. The table below summarizes the runoff index values and values for percentage each category of impervious cover:

Table 2 – Cover Type

	Cover Type	Soil Group A	Soil Group B	Soil Group C	Soil Group D	Percentage of Impervious Cover (AREA-1)	Percentage of Impervious Cover (AREA-2)
Developed	Commercial Landscaping	32	56	69	75	78	92
Existing	Chaparral, Narrowleaf	55	72	81	86	0	0

ON-SITE UNIT HYDROGRAPH METHOD HYDROLOGY

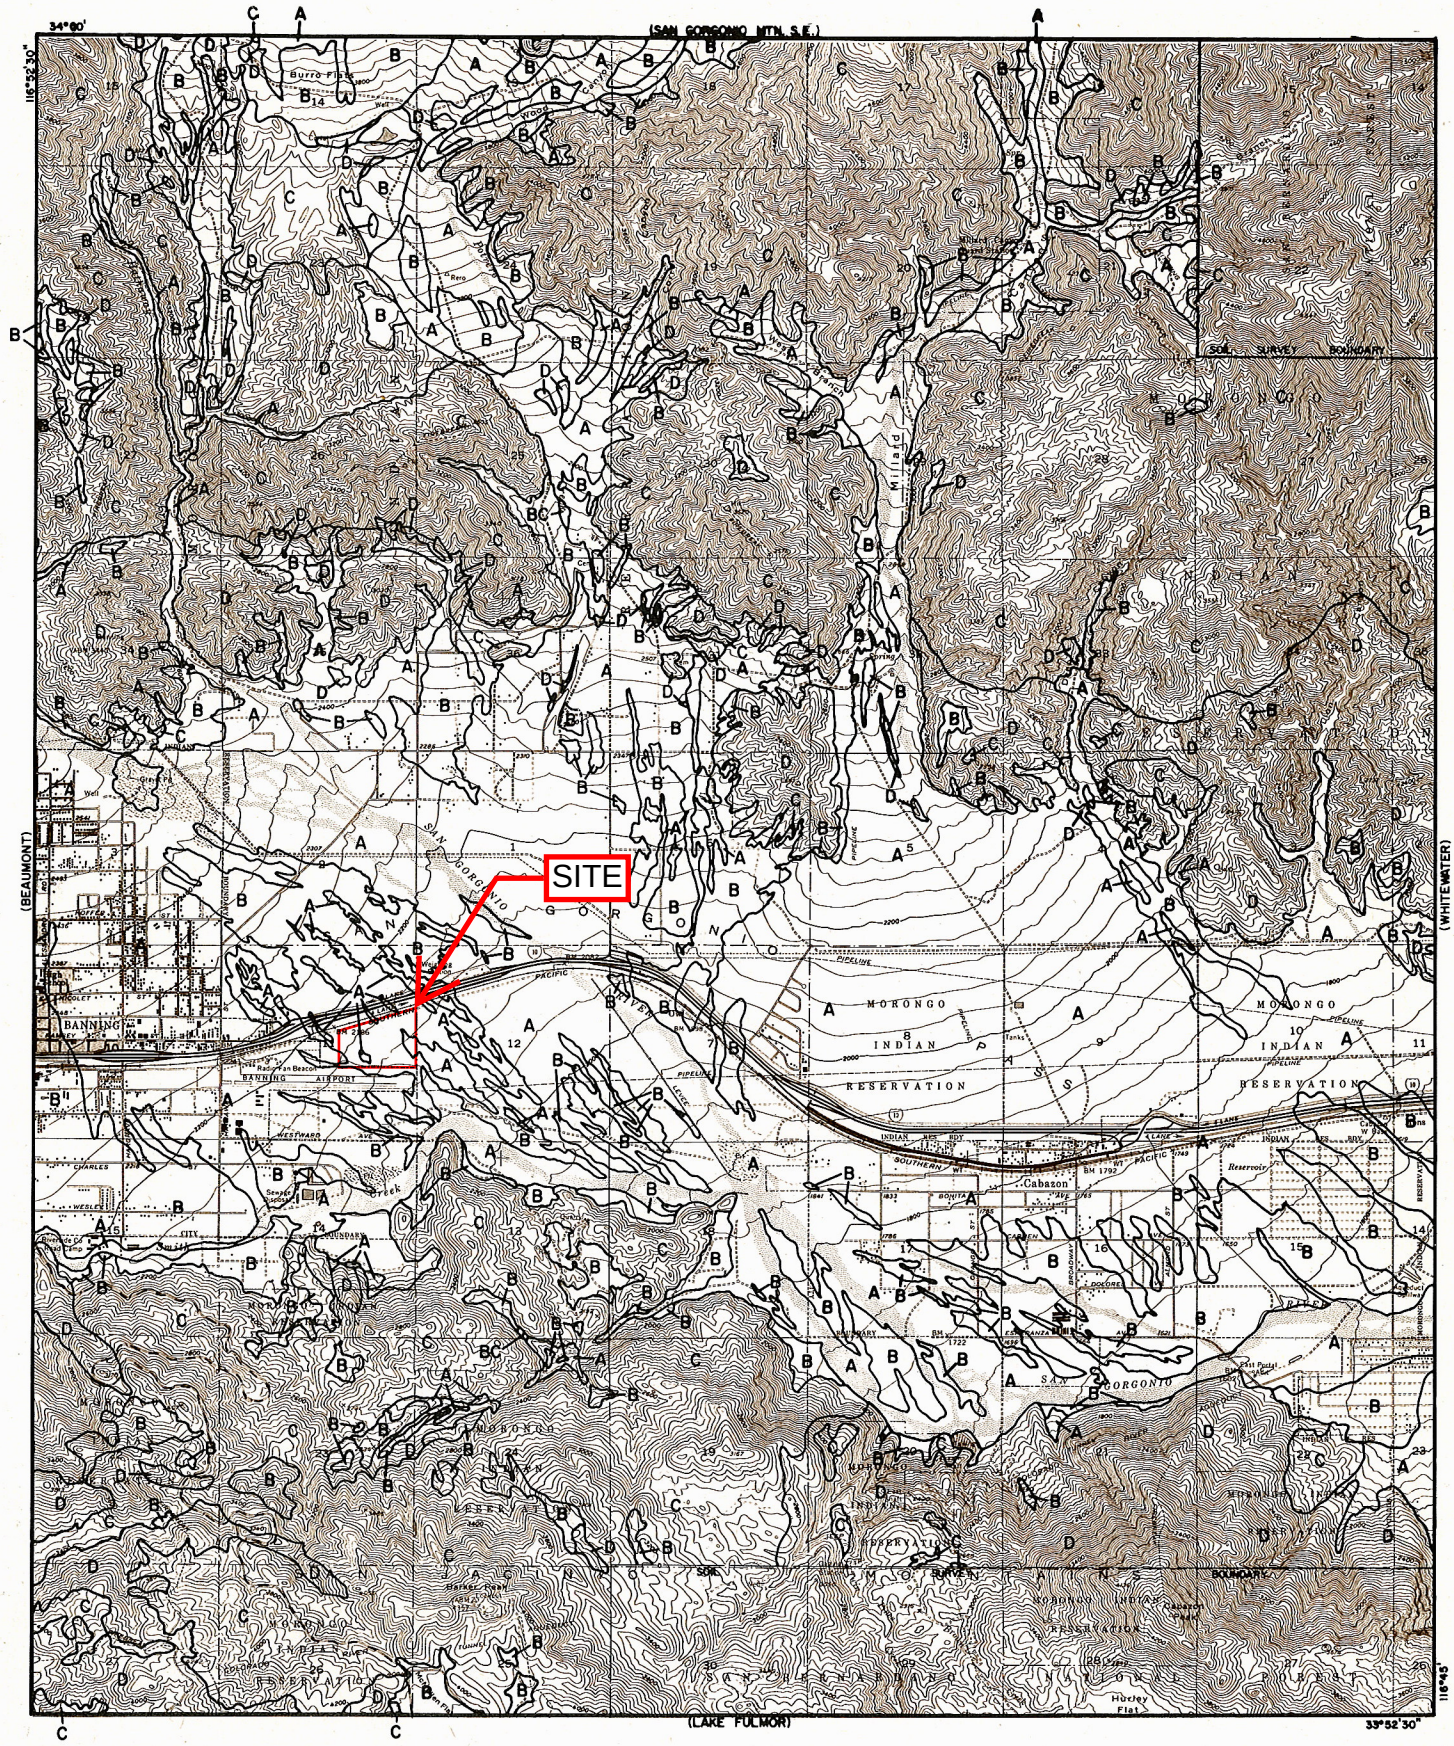
The unit hydrograph method was used to determine peak flood volumes for the 100-year 3-hour. The City of Banning requires the project site to retain the entire runoff volume from the 100-year 3-hour storm event and mitigate all flowrates down to existing flowrate values. The unit hydrographs were used to determine the 100-year 3-hour storm event flood volume. The results of the hydrologic calculations are summarized in Table 3. The flood volume results will be used to determine the required retention basin sizes. The total required flood volume for 100-year 3-hour storm event is 389,971 ft^3 or 8.95 acre-ft. The entire flood volume must be retained on-site.

The unit hydrograph calculations and Unit Hydrograph Exhibit are included in the following pages.

Table 3 – On-site Unit Hydrograph Results

Watershed ID	Drainage Area (Acres)	100-year 3-hour Peak Discharge (cfs)	100-year 3-hour Peak Volume (ac-ft)
Area-1	20.1	37.0	2.89
Area-2	37.8	68.8	6.06
*Total	57.9		

*The project site is 63.9 acres but there is approximately 6 acres of pervious area that drain away from the site and directly to pervious landscape and/ or the blue stream line area.



OFF-SITE UNIT HYDROGRAPH METHOD HYDROLOGY

As previously stated, the O3 (Off-site Area 3) Watershed enters the western site boundary just above where O2 Watershed enters. The O3 Watershed tributary area is approximately 83 acres in size. This is the biggest watershed that impacts the project site and the results were utilized to estimate the discharge and volumes for the other watersheds for preliminary purposes. The Unit Hydrograph methodology was used to analyze the O1 and O3 watersheds to determine the associated peak flow rates and volumes. Watershed O1 resulted in a Based on the results of the O3 analysis, a yield was calculated to determine for the flowrates and volumes of the remaining watersheds. This analysis resulted in a peak flow rate yield of 2.2 cfs/ acre and a volume yield of 0.094 acre-ft/ acre. Refer to Table 4 for results .A rational method analysis will be used during final engineering to determine more precise flow rates.

Table 4 – Off-site Unit Hydrograph Results

Watershed ID	Drainage Area (Acres)	100-year 3-hour Peak Discharge (cfs)	100-year 3-hour Peak Volume (ac-ft)
O1	802	856.0	78.766
O2	10.2	22.4	0.893
O3	82.9	182.0	7.257

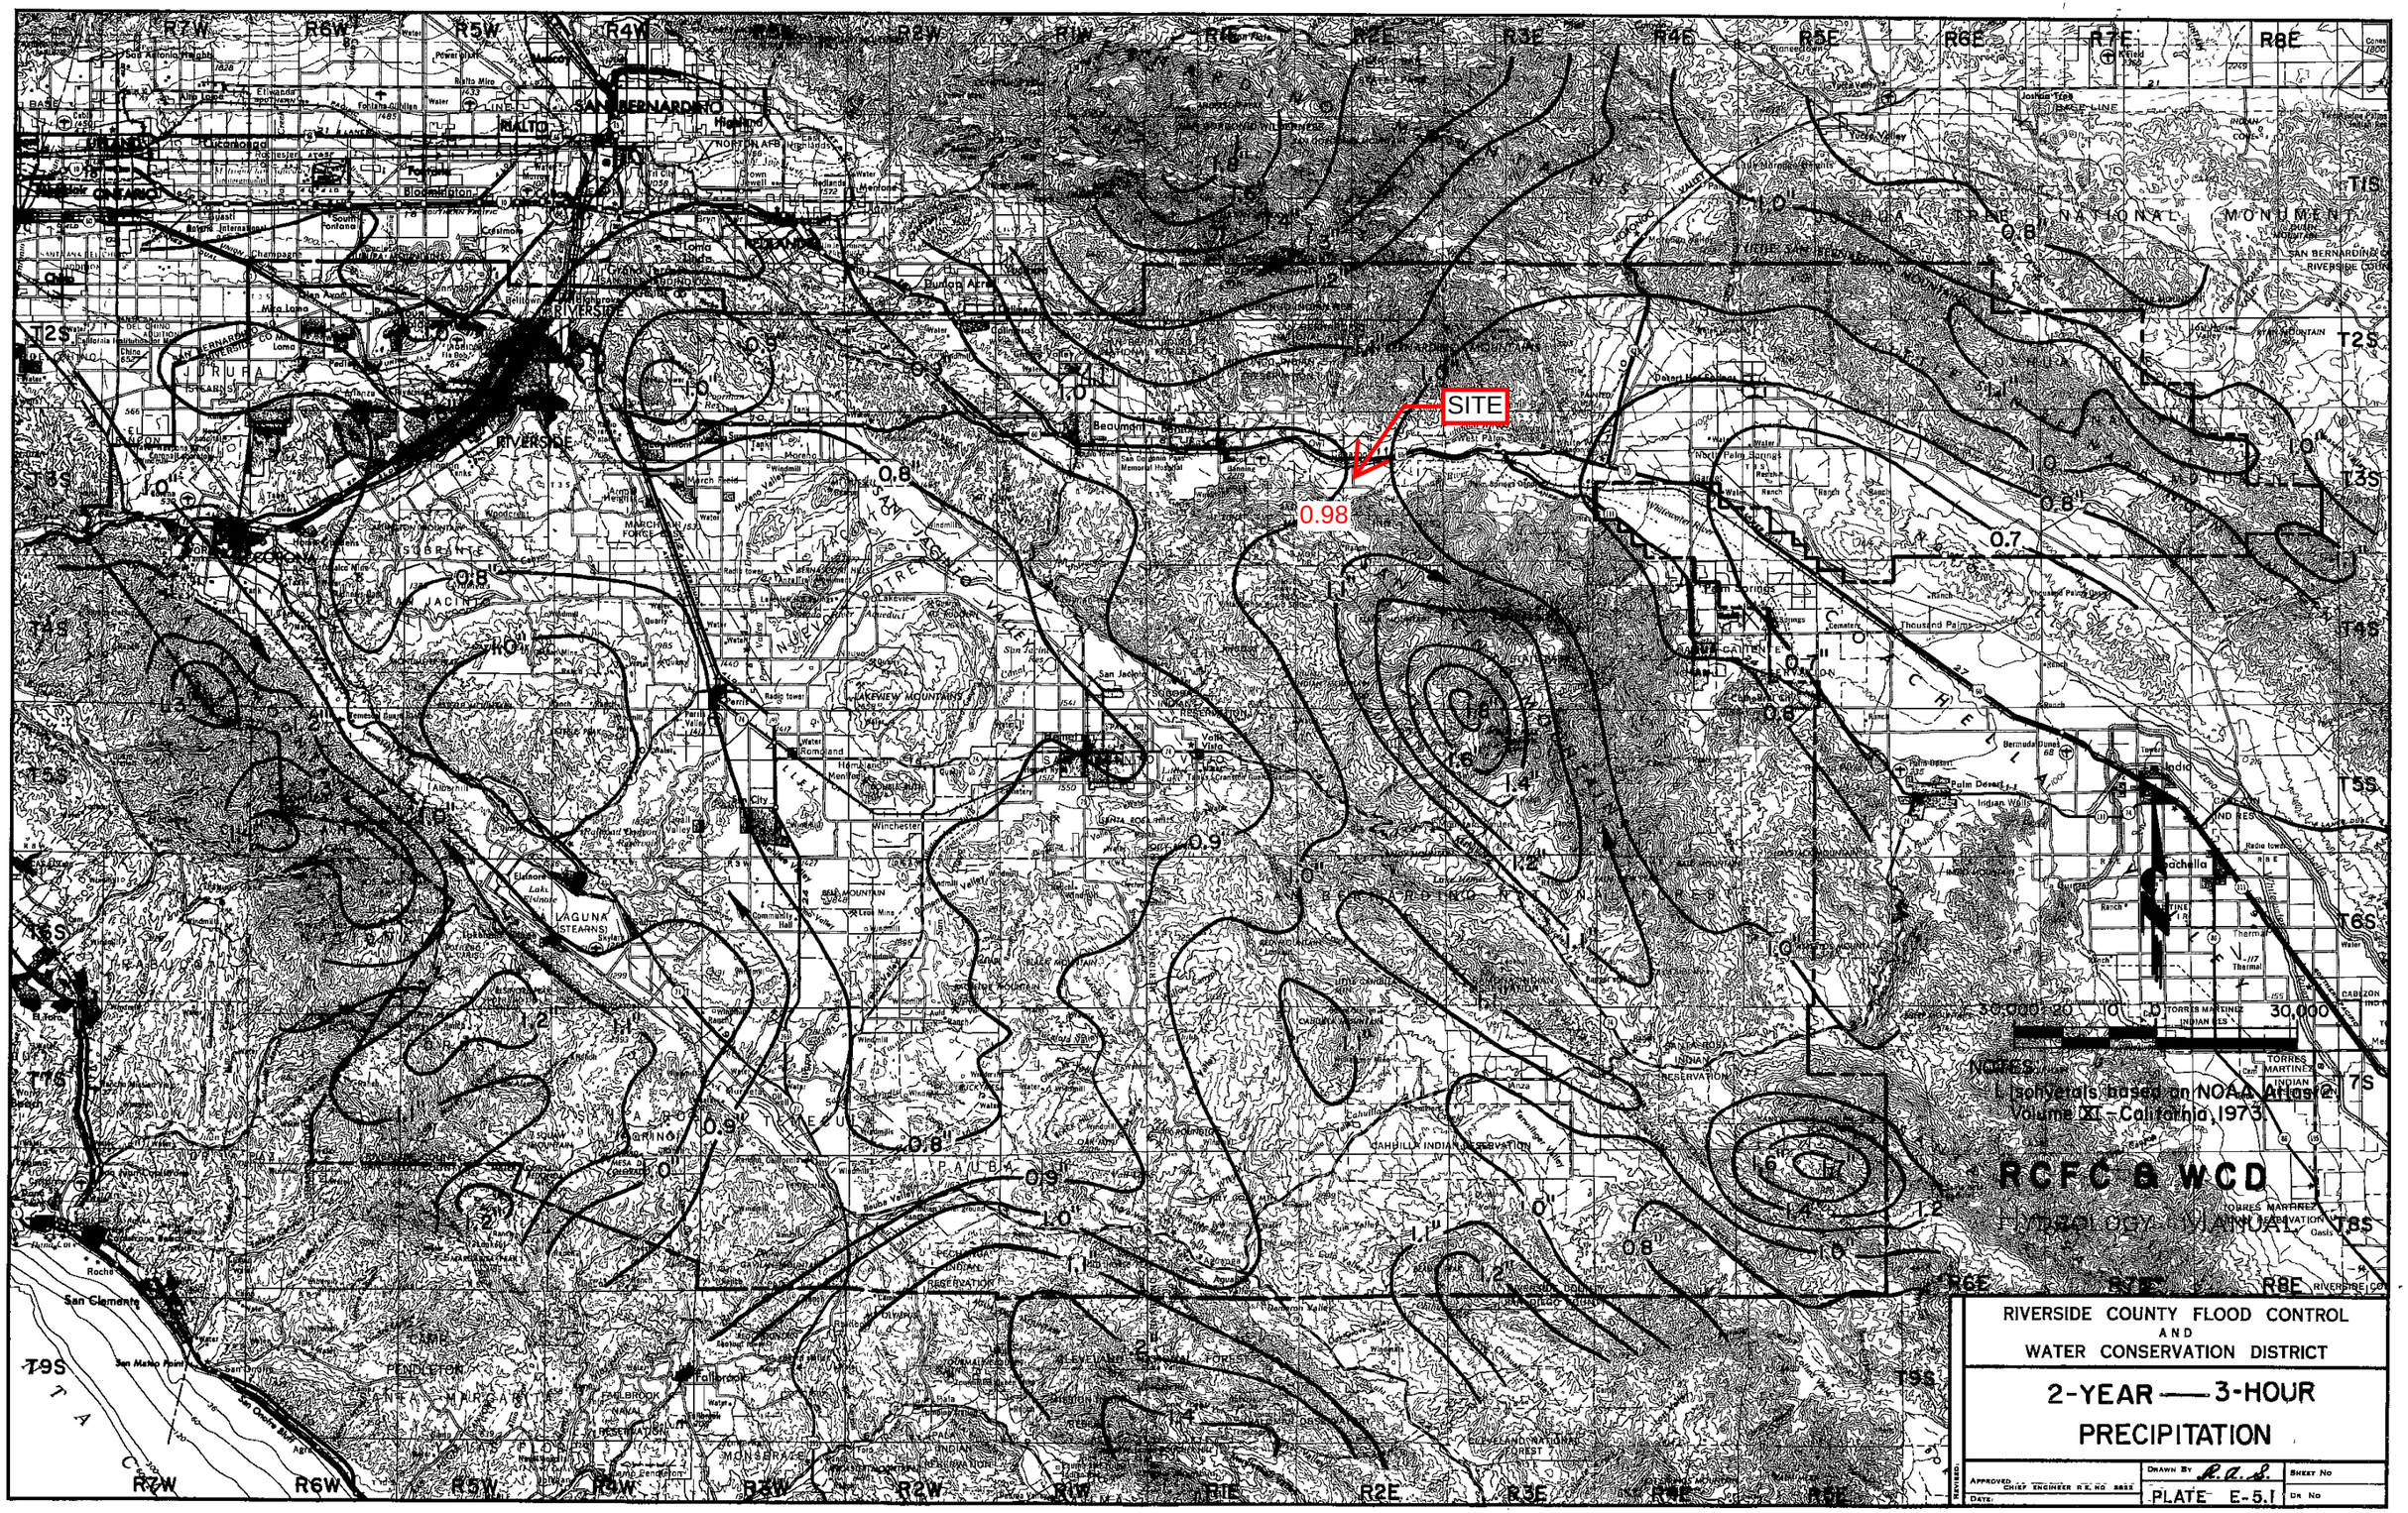
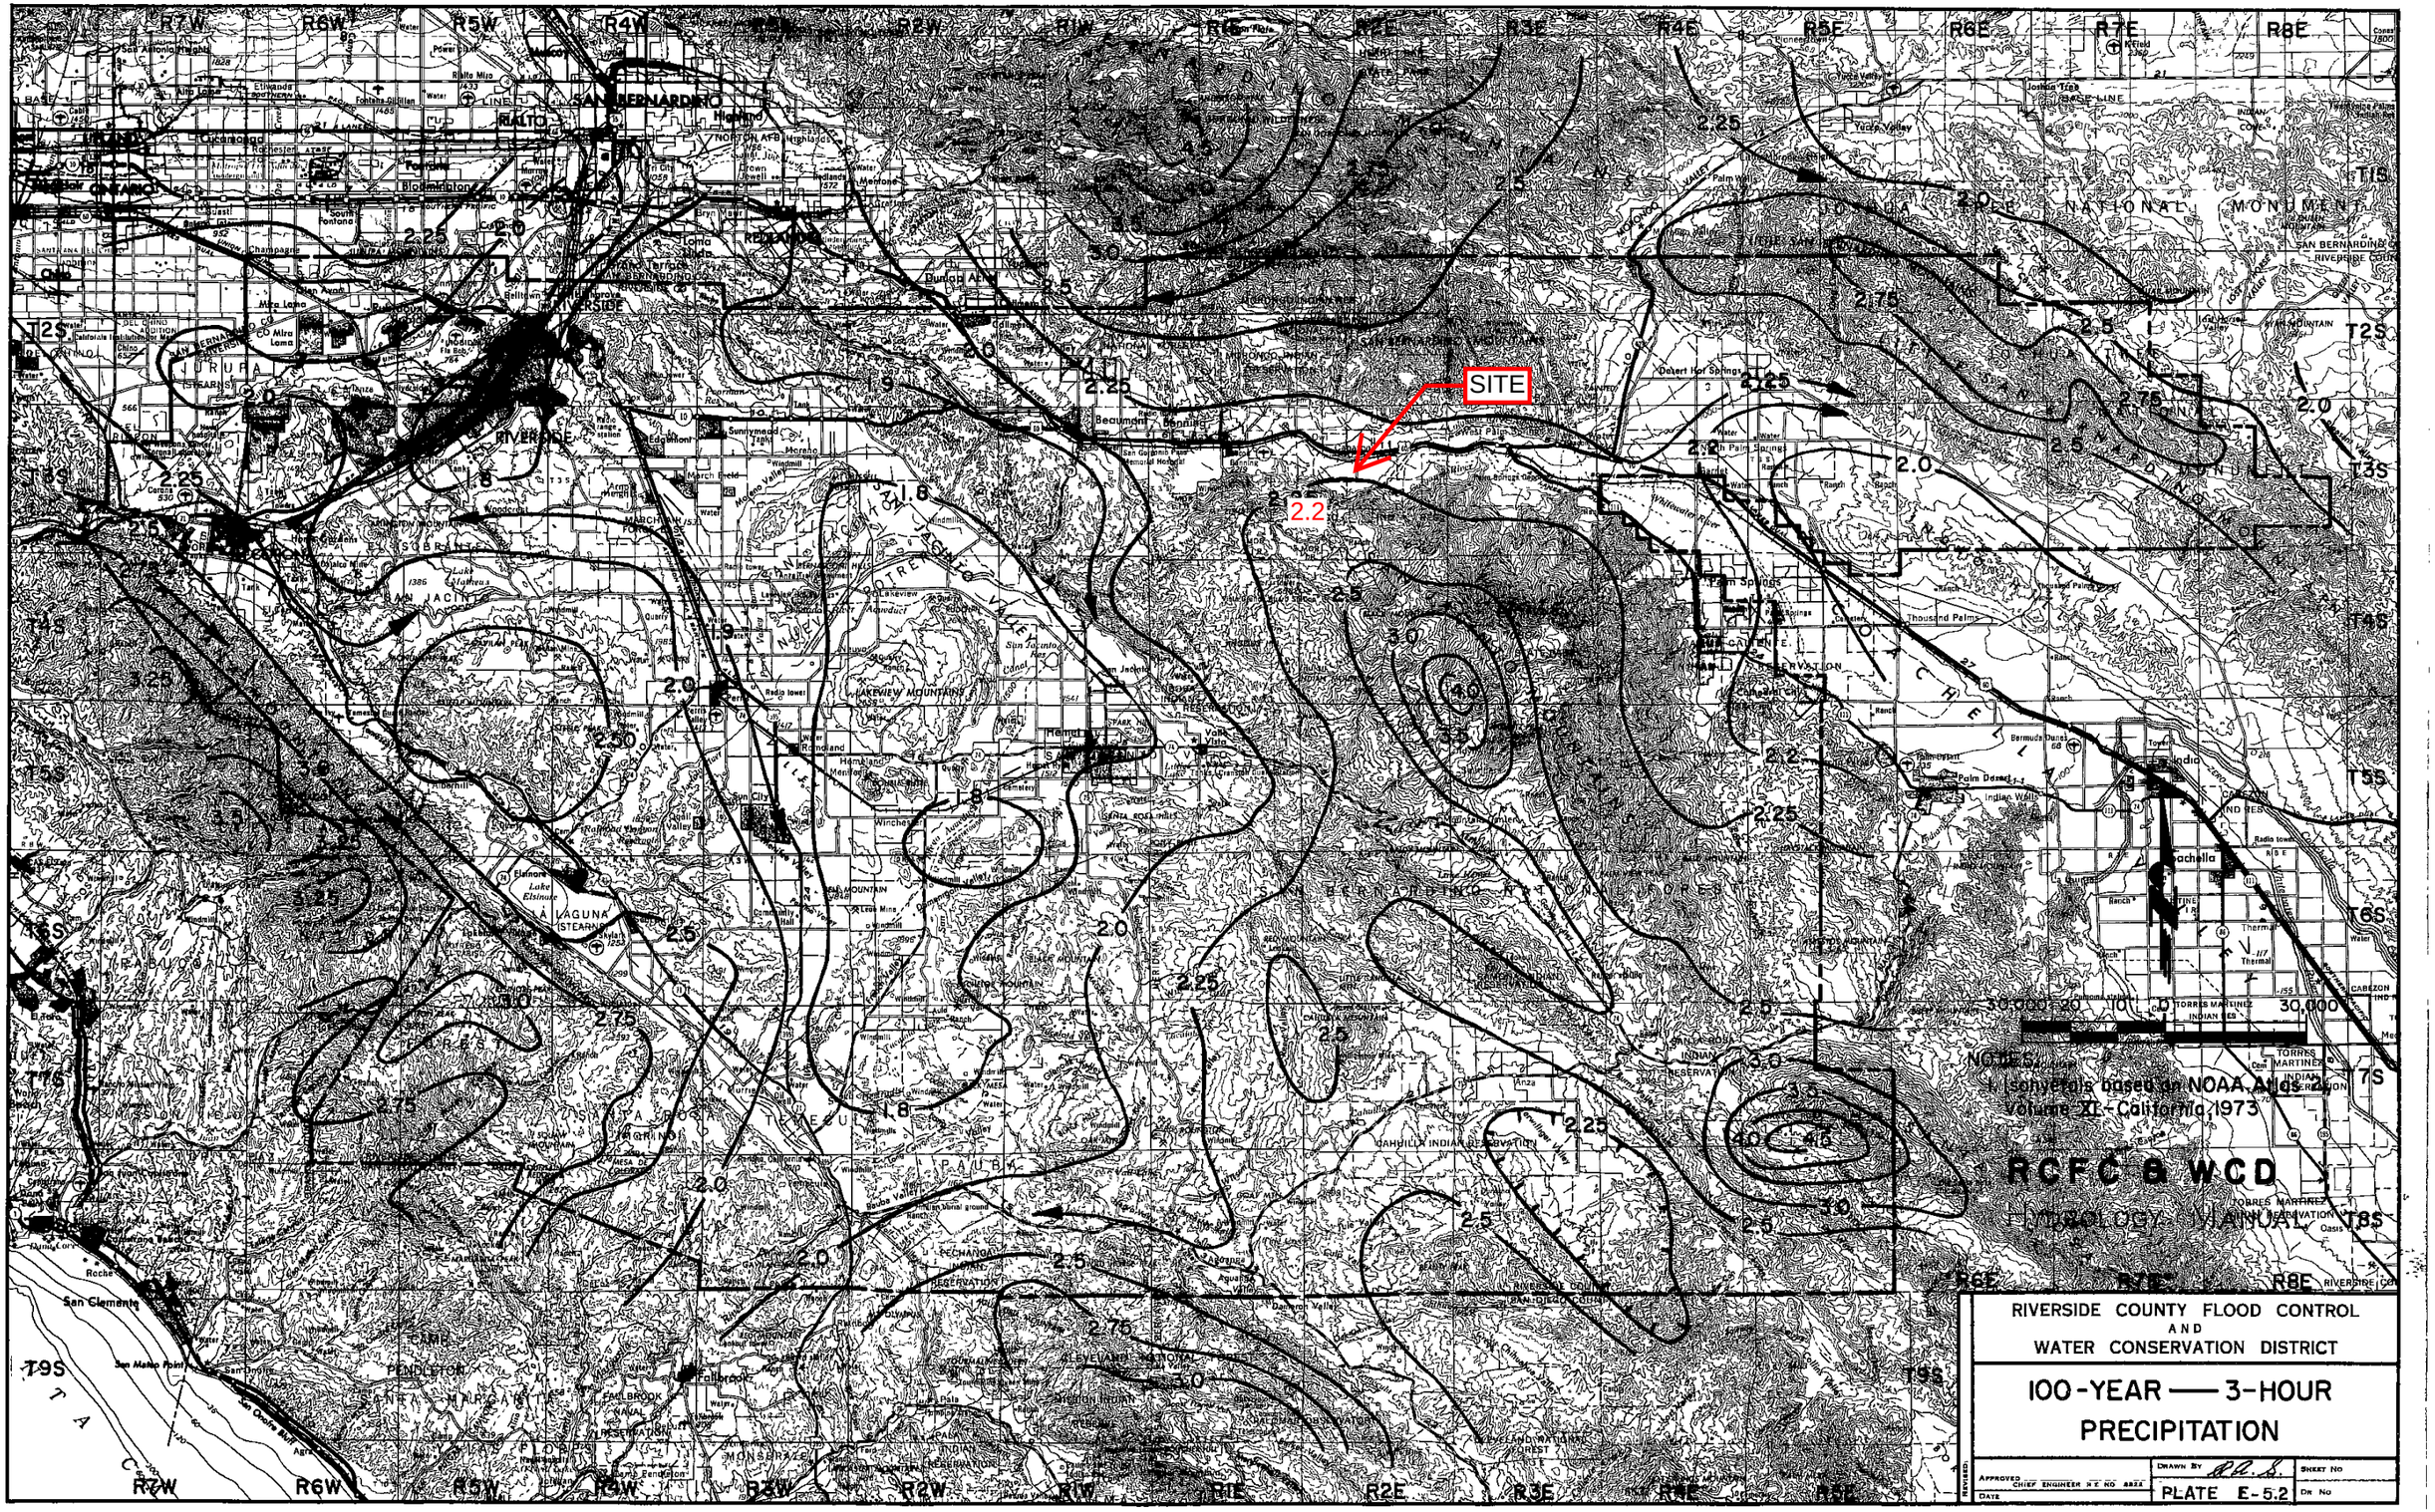
HYDROLOGIC SOILS GROUP MAP FOR CABAZON

PLATE C-1.20

LAND USE COVER PLATE D-5.5



RUNOFF INDEX NUMBERS OF HYDROLOGIC SOIL-COVER COMPLEXES FOR PERVIOUS AREAS-AMC II



Cover Type (3)	Quality of Cover (2)	Soil Group A	B	C	D
NATURAL COVERS -					
Barren (Rockland, eroded and graded land)		78	86	91	93
Chaparrel, Broadleaf (Manzonita, ceanothus and scrub oak)	Poor	53	70	80	85
	Fair	40	63	75	81
	Good	31	57	71	78
Chaparrel, Narrowleaf (Chamise and redshank)	Poor	71	82	88	91
	Fair	55	72	81	86
Grass, Annual or Perennial	Poor	67	78	86	89
	Fair	50	69	79	84
	Good	38	61	74	80
Meadows or Cienegas (Areas with seasonally high water table, principal vegetation is sod forming grass)	Poor	63	77	85	88
	Fair	51	70	80	84
	Good	30	58	72	78
Open Brush (Soft wood shrubs - buckwheat, sage, etc.)	Poor	62	76	84	88
	Fair	46	66	77	83
	Good	41	63	75	81
Woodland (Coniferous or broadleaf trees predominate. Canopy density is at least 50 percent)	Poor	45	66	77	83
	Fair	36	60	73	79
	Good	28	55	70	77
Woodland, Grass (Coniferous or broadleaf trees with canopy density from 20 to 50 percent)	Poor	57	73	82	86
	Fair	44	65	77	82
	Good	33	58	72	79
URBAN COVERS -					
Residential or Commercial Landscaping (Lawn, shrubs, etc.)	Good	32	56	69	75
Turf (Irrigated and mowed grass)	Poor	58	74	83	87
	Fair	44	65	77	82
	Good	33	58	72	79
AGRICULTURAL COVERS -					
Fallow (Land plowed but not tilled or seeded)		76	85	90	92

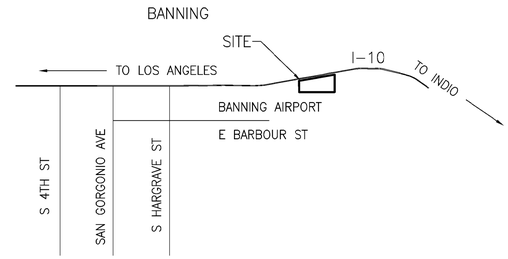
PROPOSED ONSITE UNIT HYDROGRAPH MAP



LEGEND

- DRAINAGE AREA BOUNDARY
- FLOWLINE
- 101 / 400 — NODE NUMBER / NODE ELEVATION (FT.)
- WATERSHED CENTROID

DRAINAGE AREA BREAK DOWN	
AREA-1	20.1 ACRES
AREA-2	37.8 ACRES
SELF-TREATING AREA	6.0 ACRES
TOTAL AREA	63.9 ACRES

NOTE:
1. THE PROJECT AVOIDS ADDING IMPROVEMENTS IN THE LIMITS OF THE BLUE STREAM. THIS CAUSED APPROXIMATELY 6 ACRES OF THE PROJECT AREA TO REMAIN UNIMPROVED.
2. THE CHANNEL THAT RUNS THROUGH THE SITE CONVEYS OFF-SITE FLOWS TO THE EAST SIDE OF THE PROJECT. THESE FLOWS WILL NOT COMMINGLE WITH ON-SITE FLOWS. CHANNEL AREA WAS INCLUDED IN AREA-2 FOR CONSERVATIVELY SIZING BASIN-2.
3. ALL ON-SITE FLOWS WILL BE TREATED FOR WATER QUALITY USING THE INFILTRATION BASINS. REVIEW THE PWQMP REPORT FOR FURTHER DETAILS.
4. ALL ON-SITEFLOWS DRAINING AWAY FROM THE SITE WILL SHEET FLOW THROUGH PERVIOUS AREAS ALLOWING SELF-TREATMENT. REVIEW THE PWQMP REPORT FOR FURTHER DETAILS.

SECTION 3 - HYDRAULIC ANALYSIS

ON-SITE STORM DRAIN FACILITIES

The project proposes two subsurface storm drain systems to convey on-site flows towards infiltration basins, which are designed to retain the 100-year 3-hr storm event. Basin-1 will receive all of the discharge from Drainage Management Area 1 (AREA-1), which consists of 20.1 acres. Basin-2 will receive all of the discharge from Drainage Management Area 2 (AREA-2), which consists of 37.8 acres. The runoff will be retained but there will be an emergency spillway located on the south side of each basin. The calculations for these systems shall be provided during final engineering.

A brief summary of each system will be provided and the results of the preliminary hydraulic analyses will be included at the end of the section. The peak flow rates determined by a100-year Rational Method on-site hydrology analysis will be utilized to evaluate the proposed storm drain systems.

Line-1

Line 1 starts collecting runoff from the north-easterly side of the project site. Line-1 conveys flows towards Basin-1. Line-1 shall be sized using the WSPGW software and the 100-year peak flowrate. Calculations shall be provided during final engineering.

Line-2

Line 2 starts collecting runoff from the north-easterly side of the project site. Line-1 conveys flows towards Basin-2. Line-2 shall be sized using the WSPGW software and the 100-year peak flow rate. Calculations shall be provided during final engineering.

Basin Sizing

A preliminary basin capacity evaluation shows that at depths of 3.75 feet in Basin 1 and 3.7 feet in Basin 2 will result in storing 5.45 ac/ ft in Basin 1 and 3.49 ac/ ft in Basin 2. Both of the basins are proposed to be 6 feet deep. In case of maximum water depth of 5 feet and 1 feet of freeboard are considered, the total available storage is 12.52 acre-ft. The total available basin storage is more than the total 100-year 3-hour runoff volume of 8.95 acre-ft. Refer to stage storage tables at the end of this section.

Emergency Spillways

There will be an emergency spillway available. The spillway will be designed using the 100 year peak flow. The design for the spillway will be provided during final engineering.

Drawdown Time

Infiltration testing for the two retention basins was performed by SCST Engineering date August 24, 2015. Three double ring infiltrometer tests were performed at the basin location. An average infiltration rate of 3.9 inches per hour was used to determine the drawdown time for the basins. (See infiltration results at the end of this section.)

The basin drawdown time was evaluated for combined runoff volumes, basin storage and available bottom area for infiltration for both basins. The means of equalizing and distributing the on-site flows into the proposed basins so their capacity is utilized in the most efficient way will be a subject of the final design stage for the proposed development.. The available basin bottom area for infiltration is 55,900 ft2 for Basin 1 and 34,540 ft2 for Basin 2.

The results of these analyses are provided at the end of this section.

SCST No. 150390N
Report No. 1

Ms. Sue Smith
Pacific Newport Properties, Inc.
17842 Mitchell North, Suite 100
Irvine, California 92614

Subject: INFILTRATION TESTING
BANNING AIRPORT INDUSTRIAL PARK
BANNING, CALIFORNIA

Dear Ms. Smith:

This report presents our findings of the infiltration testing performed for the design of water quality facilities associated with the subject project in Banning, California. This testing was performed in accordance with our proposal number 15-0202 dated June 4, 2015.

SCOPE OF WORK

Southern California Soil and Testing, Inc. (SCST) performed three double-ring infiltrometer tests within the location identified on the project Conceptual Site Plan as the detention basin and obtained samples for examination and laboratory testing. The laboratory testing consisted of particle size analysis. Results of the testing are summarized in this report with field and laboratory test data.

SITE DESCRIPTION

The subject site encompasses approximately 65 acres located just north of the Banning Municipal Airport in Banning, California. The site is currently undeveloped and is fenced on the south, east, and west sides. The site is bound on the south by the Banning Municipal Airport, on the north by the Union Pacific Railroad, and to the east and west by undeveloped land. Figure 1 shows the general location of the project location. The site slopes gently down to the south and east, with shallow northwest-southeast trending drainages randomly distributed across the site. Much of the site is covered with low lying grasses and scrub brush.

FIELD AND LABORATORY TESTING

An SCST engineer performed double ring infiltration tests and obtained soil samples at 3 locations on August 13, 2015. Figure 2 shows the infiltration testing locations. Figures I-1 through I-3 present the field test results. Laboratory tests consisted of particle size analysis, and a brief description of the laboratory test procedures and the test results are presented in Appendix II. Soils were classified according to the Unified Soil Classification System (USCS). The results of the infiltration testing are summarized in Table 1. These values do not include a factor of safety, which is appropriately evaluated by the civil engineer based on factors of the design.

Table 1
Infiltration Testing Results

Location	Soil Type (USCS)	Infiltration Rate (inches/hour)
I-1 West End	SM	2.3
I-2 Center	SW-SM	4.7
I-3 East End	SM	3.9

LIMITATIONS

SCST should be advised of any changes in the project scope so that the data contained in this report can be evaluated with respect to the revised plans. The findings in this report are valid as of the date of this report. Changes in the condition of the project location can, however, occur with the passage of time, whether they are due to natural processes or work in this or adjacent areas. In addition, changes in the standards of practice and government regulations can occur. Thus, the findings in this report could be invalidated wholly or in part by changes beyond our control. This report should not be relied upon after a period of two years without a review by us verifying the suitability of the data to site conditions at that time.

In the performance of our professional services, we comply with that level of care and skill ordinarily exercised by members of our profession currently practicing under similar conditions and in the same locality. The client recognizes that subsurface conditions may vary from those encountered at the test pit locations, and that our data, interpretations, and recommendations are based solely on the information obtained by us. We will be responsible for those data and interpretations but will not be responsible for interpretations by others of the information developed. Our services consist of professional consultation and observation only, and no warranty of any kind whatsoever, express or implied, is made or intended in connection with the work performed or to be performed by us, or by our proposal for consulting or other services, or by our furnishing of oral or written reports or findings.

If you have any questions, please call our office at (619) 280-4321.

Respectfully Submitted,
SOUTHERN CALIFORNIA SOIL AND TESTING, INC.

Vincent A. Uhde, EIT 151458
Staff Engineer

APPENDIX II
LABORATORY TESTING

The laboratory test program was design to fit the specific need of this project and was limited to testing on-site materials. A brief description of each type of test is presented below. Results are given on the following pages.

- **CLASSIFICATION:** Field classifications were verified in the laboratory by visual examination. The final soil classifications are in accordance with the Unified Soil Classification System.
- **GRAIN SIZE DISTRIBUTION:** The grain size distribution was determined for two samples in accordance with ASTM D 422. The results are presented on Figures II-1 and II-2.

DRAWDOWN CALCULATION

Infiltration Basin
Drawdown Calculation

Designer:	MJS
Date:	11/2/2017
Project:	Banning Distribution Center
Location:	North of the Banning Municple Airport and South of I-10 Freeway
Area:	DMA 1 & DMA 2

(1)	Combined $V_{100Y\text{-}3H}$ =	389,971	ft^3
(2)	Combined Basin Bottom Area=	90440	ft^2**
(3)	Infiltration Rate =	1.21	in/hr ***

$$Drawdown = \frac{V_{100Y-3H}\ (ft^3)}{Infiltration\ Rate\left(\frac{in}{hr}\right) \times \left(\frac{1ft}{12in}\right) \times Bottom\ Area\ (ft^2)}$$

Drawdown Time= 42.8 hr

***The Geotechnical Infiltration Test Report shows acceptable soil infiltration capability. The average measured infiltration rate is 3.63 in/hr at the expected depth at the bottom of the underground system, used a safety factor of 3 to achive 1.21 in/hr.

**For preliminary purposes, the combined basin bottom areas for both Basin-1 and Basin-2 were used to prove that the basins will drain within 48 hours. The basin bottoms will be indivdually analyzed during final engineering and a drawdown calculation will be submitted for each basin. The basin bottoms will be finalnized during final engineering.

SECTION 4 - CONCLUSION

Based on the results of the unit hydrograph calculations and the provided basin volumes per the conceptual grading plans, Basins 1 and 2 have enough volume capacity to contain the 100-year 3-hour storm volumes and enough bottom footprint area to drawdown the volume within the required 48 hours.

Because the site is located within the sphere of influence of the Banning Municipal Airport, the Riverside County Airport Land Use Commission (ALUC) is requiring a maximum 48 hour retention time for the onsite retention basins.

Onsite runoff will be intercepted and conveyed through the site by means of conventional catch basins, grate inlets, swales and an underground storm drain system discharging to the retention basins. Offsite runoff will be intercepted, conveyed through or around the site via separate bypass storm drain system, and discharged at/ or near its original discharge locations into the Ramsey Street Wash.

Because of the full onsite retention of the design runoff volumes, post-development peak urban runoff discharge rates and volumes will not exceed pre-development peak urban runoff discharge rates and volumes. The project preserves flow patterns and directions and does not cause flow diversion or flow concentration and adverse drainage impacts on the downstream properties. Based on the results of this report, the proposed facilities will convey, store and release flows safely through the site in accordance with Riverside County Flood Control and Water Conservation District and City of Banning Municipal Codes requirements.

In summary of the analyses and results of this report, the following conclusions were derived from the hydrology and hydraulic results:

- The proposed on-site subsurface storm drain systems will adequately convey flows to the basin and provide flood protection for the 100-year storm event.
- The proposed basins will adequately treat on-site flows and retain the 100-year 3-hour storm flood volume.
- The proposed basin will infiltrate the 100-year 3-hour storm flood volume within 48 hours.
- The proposed project will not impact flooding condition to upstream or downstream properties

APPENDIX 1 – FLOODPLAIN ANALYSIS

ALBERT A. WEBB ASSOCIATES

15-0233

Memorandum

To: DJ Arellano, PE

From: Joseph Caldwell, PE / CPSWQ / CPESC

Date: February 2, 2018

Re: Existing and Proposed Flooding Southerly of Banning Distribution Center

The following Technical Memorandum is prepared to document the existing and post project condition floodplain southerly of the proposed Banning Distribution Center. Under current conditions the Ramsey Street Storm Drain collects runoff from the north side of Interstate 10 and discharges it into a natural drainage feature on the southerly side of the freeway. This natural drainage features traverses in an east west direction and is located along the southerly side of the proposed Banning Distribution Center. Three other smaller drains also discharge to the natural drainage feature.

To analyze the existing and proposed flooding in the natural drainage feature, 100-Year flow rates were calculated using the Riverside County Flood Control and Water Conservation District's Synthetic Unit Hydrography methodology. Detailed backup for the hydrological calculations are contained the hydrology report prepared for the Banning Distribution Center. It was determined that the peak 100-Year flow rate for the natural drainage feature is 856 cfs.

The U.S. Army Corps of Engineer's HEC-RAS v. 5.0.3 program was used to model the existing and proposed condition floodplain of the natural drainage feature. A two-dimensional finite volume grid was developed and existing and proposed surfaces were used to populate the hydraulic routing parameters in the grid. Existing and proposed 100-Year conditions were simulated for the project.

Exhibits 1 and 2 show the pre-project and the post project results. These results show that the proposed Banning Distribution Center Project will not be subject to flooding from the existing drainage feature to the south. It should be noted that the modeled velocities in the natural drainage feature are relatively high. Due to this it is recommended that adequate slope protection be implemented into the final design of the Banning Distribution Center in order to protect against lateral streambed migrations onto the site.

SECTION 1 - INTRODUCTION

1.1 Purpose

In October of 2001, Senate Bill 610 (SB 610) was signed into California state law with an effective date of January 1, 2002. SB 610 amended existing legal requirements for confirmation of water supply sufficiency as a condition of approval for development projects. The confirmation of water supply sufficiency is achieved through an analysis of the water purveyor's existing and future water sources and existing and projected water demand in relation to a "project" as defined by SB 610, resulting in the production of a project-specific Water Supply Assessment ("WSA" or "Assessment"). The WSA also requires additional analysis if any portion of the water purveyor's water supplies include groundwater.

Section 1 of this Assessment describes the existing and proposed land use designations of the project site, the proposed project's relation to the water supplier's Urban Water Management Plan (UWMP), a review of statewide conservation requirements and Assessment methodology. Section 2 provides the water demand analysis of both the project site and the City, Section 3 reviews the projected water supplies for the project and the City; Section 4 contains the required discussion of the City's groundwater supplies; and Section 5 concludes the Assessment by answering the primary question at hand.

The SB 610 Assessment is triggered for projects that are subject to the California Environmental Quality Act (CEQA) and that meet the definition of "project" as defined in Water Code Section 10912.

Law

> Water Code Section 10910: *(a) Any city or county that determines that a project, as defined in Section 10912, is subject to the California Environmental Quality Act (Division 13 (commencing with Section 21000) of the Public Resources Code) under Section 21080 of the Public Resources Code shall comply with this part.*

Water Code Section 10912: *For the purpose of this part, the following terms have the following meanings:*

(a) "Project" means any of the following:

(1) A proposed residential development of more than 500 dwelling units.

(2) A proposed shopping center or business establishment employing more than 1,000 persons or having more than 500,000 square feet of floor space.

(3) A proposed commercial office building employing more than 1,000 persons or having more than 250,000 square feet of floor space.

(4) A proposed hotel or motel, or both, having more than 500 rooms.

(5) A proposed industrial, manufacturing, or processing plant, or industrial park planned to house more than 1,000 persons, occupying more than 40 acres of land, or having more than 650,000 square feet of floor area.

(6) A mixed-use project that includes one or more of the projects specified in this subdivision.

(7) A project that would demand an amount of water equivalent to, or greater than, the amount of water required by a 500 dwelling unit project.

1.2 Proposed Project

The "Banning Distribution Center" ("Project") proposes to develop 63.9 acres (gross) into industrial use, which would result in a maximum cumulative building area of 1,000,000 square feet. Therefore, the proposed floor area square footage of this project triggers the need for preparation of a WSA pursuant to SB 610.

The Project will be supplied by a public water system operated by the City of Banning. As CEQA Lead Agency and water supplier for the Project, the City of Banning commissioned this Assessment from Albert A. Webb Associates on August 9, 2017 to answer the following key question per SB 610: whether the projected supply for the next 20 years, based on normal, single dry and multiple dry years, will meet the demand projected for the project plus existing and planned future uses, including agricultural and manufacturing uses.

Project Location

The Banning Distribution Center is located in the City of Banning within Riverside County. Specifically, the Project site is located immediately north of the Banning Airport and immediately south of Interstate 10 (I-10) and the Union Pacific Railroad line (UPRR). The Project site consists of three existing parcels (APNs 532-110-006, 532-130-001, and 532-130-002), which will be combined into one new parcel as part of the applications submitted to the City by the project developer. Please refer to **Figure 1-1**, "Regional Location."

Existing Site Description

The Project site consists of 63.75 acres (net) that are currently vacant with low-lying grasses and scrub brush. The area directly to the south and west of the Project site consists of the Banning Municipal Airport facility, which is a city-owned facility zoned as Public Facilities consisting of approximately 295 acres. The property to the east of the Project is owned by the Morongo Band of Mission Indians and is currently vacant; it is not within the City's sphere of influence. The area north of the Project is the UPRR line and I-10 freeway. Please refer to **Figure 1-2**, "Project Vicinity."

The site topography is relatively flat and slopes gently to the south and east. Current elevations range from about 2,179 feet above mean sea level (msl) on the northwest corner of the site to about 2,101 feet msl on the southeast corner of the site. Please refer to **Figure 1-3**, "Site Topography."

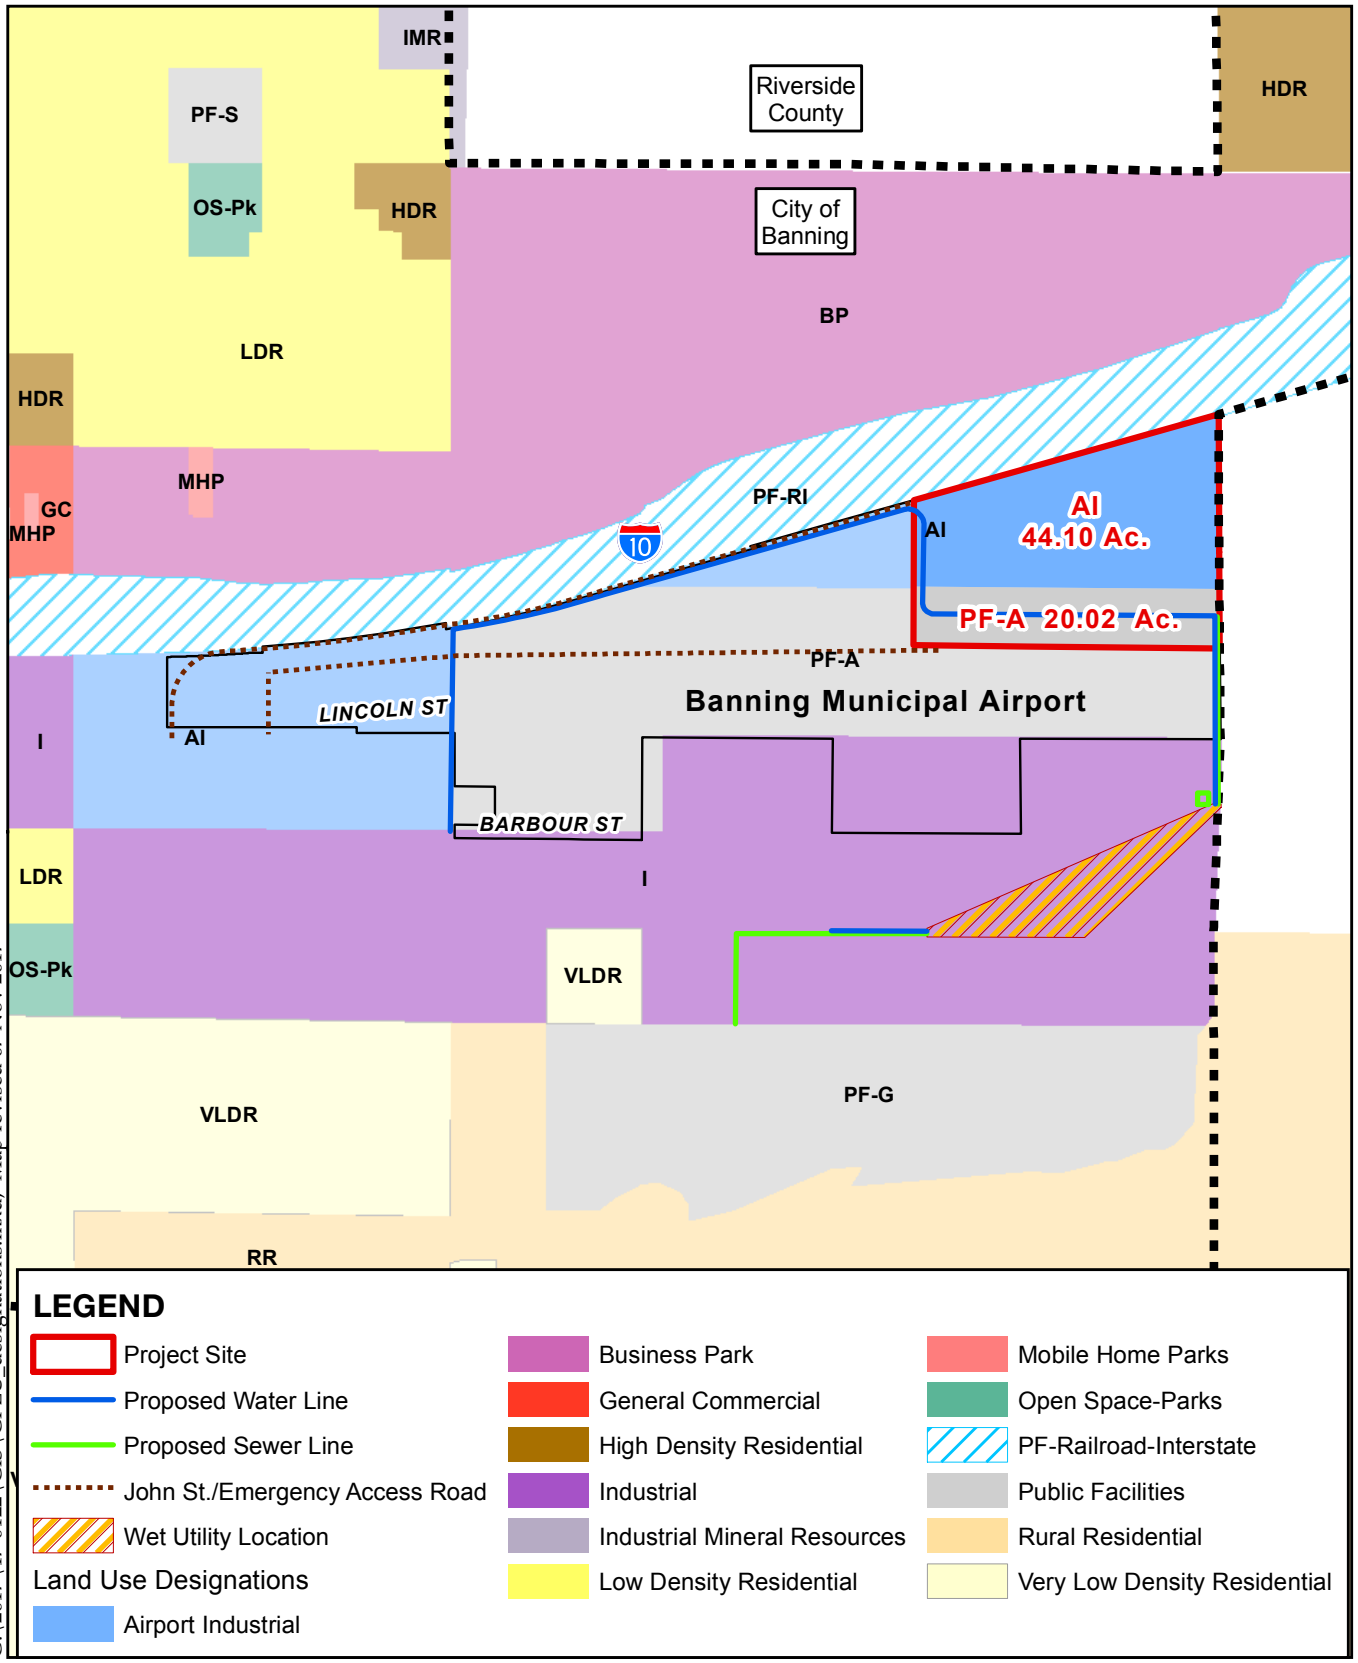
Project Land Use Designations

The City's General Plan (2006), has designated the Project site as mostly Airport Industrial (44 acres) and partly Public Facilities-Airport (20 acres). Surrounding land use designations include Business Park, Industrial, and Airport Industrial. The existing land use designations for the Project site are shown on **Figure 1-4.**

The Project includes a General Plan Amendment to change the land use designation for 20 acres of the site from Public Facilities-Airport to Airport-Industrial. The proposed land use plan for the project site is shown on **Figure 1-5.**

According to the City's General Plan (2006), the Airport-Industrial land use designation allows airport-related and transportation-related functions such as machining, manufacturing, warehousing, flight schools, restaurants and office uses (p. III-8).



The Banning Distribution Center will consist of 1,000,000 square feet of industrial warehouse (non-refrigerated high-cube warehouse) that includes approximately 10,000 square feet of office space on 63.9 acres (gross) of vacant land. It can be assumed that the future tenant of the building will not be "e-commerce." The proposed warehouse is consistent with the site's existing land use and zoning designations.

The land use details for each proposed Planning Area are summarized in **Table 1-1**.

Table 1-1: Banning Distribution Center Land Use Summary

Existing Land Use	Existing Site Acreage	Proposed Land Use	Proposed Floor Area (SF)	Proposed Acreage gross (net)	Proposed Floor-to-Area Ratio (FAR)
Airport-Industrial	44	Airport - Industrial	1,000,000	63.90 (63.75)	0.36
Public Facilities-Airport	20				

Notes:
Data from City of Banning, *Initial Study for Banning Distribution Center,* updated June 12, 2017, Draft Screencheck 1.
Definitions: FAR = floor area ratio, which is the amount of building square feet in relation to the size of the lot. SF = square feet.

The project also includes offsite utility improvements in order to connect the proposed warehouse to the City's sanitary sewer and potable water systems. Two stormwater detention basins are proposed on-site that are designed to contain a maximum combined volume of 12.52 acre-feet.[1]

The proposed development plans that were used for this Assessment are shown in **Figure 1-6** and the proposed landscaping plans that were provided for this Assessment are provided in **Figure 1-7.** Landscaping is provided over approximately 19% of the site (530,091 square feet or 12.2 acres) with the remainder of the site consisting of the building and hardscape (2,252,052 square feet or 51.7 acres).[2]

1.3 Project Relation to Urban Water Management Plan

Law

Water Code Section 10910. *(c) (1) The city or county, at the time it makes the determination required under Section 21080.1 of the Public Resources Code* [CEQA]*, shall request each public water system identified pursuant to subdivision (b) to determine whether the projected water demand associated with a proposed project was included as part of the most recently adopted urban water management plan adopted pursuant to Part 2.6 (commencing with Section 10610).*

(2) If the projected water demand associated with the proposed project was accounted for in the most recently adopted urban water management plan, the public water system may incorporate the requested information from the urban water management plan in preparing the elements of the assessment required to comply with subdivisions (d), (e), (f), and (g).

(3) If the projected water demand associated with the proposed project was not accounted for in the most recently adopted urban water management plan, or the public water system has no urban water management plan, the water supply assessment for the project shall include a discussion with regard to whether the public water system's total projected water supplies available during normal, single dry, and multiple dry water years during a 20-year projection will meet the projected water demand associated with the proposed project, in addition to the public water system's existing and planned future uses, including agricultural and manufacturing uses.

(4) If the city or county is required to comply with this part pursuant to subdivision (b), the water supply assessment for the project shall include a discussion with regard to whether the total projected water supplies, determined to be available by the city or county for the project during normal, single dry, and multiple dry water years during a 20-year projection, will meet the projected water demand

associated with the proposed project, in addition to existing and planned future uses, including agricultural and manufacturing uses.

The City of Banning, through its Public Works Department and Water Division provides municipal water to its service area of approximately 16,908 acres, which includes the area within the City's boundary as well as some unincorporated areas of Riverside County (Appendix A, p. 2-1). The City of Banning is the water supplier for the Project and has prepared a 2015 Urban Water Management Plan (UWMP, **Appendix A**), that was adopted by City Council on June 14, 2016 and deemed complete by the California Department of Water Resources on April 26, 2017.

Banning's 2015 UWMP references a *Recycled Water Master Plan* (prepared by Carollo Engineers, dated September 2006 and included in Appendix A). The City anticipates implementing upgrades by 2025 at the City's wastewater treatment plant that will produce effluent that meets recycled water standards (Appendix A, Standardized Table 6-6). Therefore, recycled water will not be considered for the Project in this Assessment, which is consistent with the current development plan.

The City has also recently updated its *Sewer System Management Plan* (revised 6/30/16),[3] and is in the process of preparing an integrated master plan for sewer, water, and recycled water. The City has also developed a *Chromium-6 Compliance Plan* (dated December 2015 and located in Appendix M of the City's 2015 UWMP) that outlines treatment options that are expected to be built in early 2020; however the State Water Resources Control Board has very recently rescinded the chromium-6 maximum contaminant level (MCL) of 10 parts per billion (ppb) for drinking water. Until a new MCL for chromium-6 is adopted, the previous MCL of 50 ppb for Total Chromium is currently in effect.[4]

[3] Available at City's Web site: http://www.ci.banning.ca.us/DocumentCenter/View/1006 or from City of Banning Public Works Department.
[4] As of May 31, 2017, the Superior Court of Sacramento County issued a judgment invalidating the hexavalent chromium MCL and as of August 1, 2017, the State Water Resources Control Board directed staff to start the process of adopting a new MCL that properly considers the economic feasibility of complying with the MCL. Estimated to take 18-24 months.

The City of Banning and Beaumont-Cherry Valley Water District (BCVWD) jointly own and operate three groundwater wells in accordance with an agreement between the two parties, dated December 23, 2003 (**Appendix B**). The City also purchases imported water from the San Gorgonio Pass Water Agency (SGPWA), which is a State Water Project contractor.

BCVWD has prepared a 2015 UWMP (**Appendix C**) that discusses its relationship with the City of Banning. Likewise, SGPWA has prepared a 2015 UWMP (**Appendix D**) that incorporates Banning's projections for population growth and future demands for purchased imported water.

1.4 Statewide Mandatory Water Conservation Requirements

The Governor proclaimed a statewide State of Emergency due to ongoing drought conditions on January 17, 2014. Since then, the Governor has issued at least six Executive Orders and other Proclamations in response to impacts from extended statewide drought conditions. Executive Order B-37-16 issued on May 9, 2016, established a new water use efficiency framework for California. The order established longer-term water conservation measures that include permanent monthly water use reporting, new urban water use targets, reducing system leaks and eliminating wasteful practices, strengthening urban drought contingency plans and improving agricultural water management and drought plans.

The City of Banning adopted Ordinance No. 1489 on June 9, 2015 in response to the Emergency Conservation Regulations mandated by the State Water Resources Control Board. The Ordinance updated the City's Water Conservation Plan that is codified in Chapter 13.16 of the City's Municipal Code. The ordinance outlines stringent prohibitions and penalties, a voluntary conservation stage that is always in effect, and mandatory water shortage stages 1 through 4 that target a strict enforcement of water conservation routines following a water crisis. In addition, the City's Water Shortage Contingency Plan describes the methods to achieve and the implications of reducing water supplies up to 50% (Appendix A, Chapter 7). Lastly, the City implements various

programs to reduce water consumption, identified as Demand Management Measures in the UWMP. According to May 22, 2017 data reported to the state, cumulative water savings by the City since June 2015 is at 24.8%.[5]

On April 7, 2017 the Governor issued Executive Order B-40-17 that ended the drought state of emergency in all California counties except Fresno, Kings, Tulare, and Tuolumne. The Executive Order maintains the mandatory water reporting requirements and prohibitions on wasteful practices contained in Executive Order B-37-16, as described previously.[6] In a related action, state agencies released a plan to implement Executive Order B-37-16 titled, "Making Water Conservation a California Way of Life."[7]

1.5 Methodologies of Analysis

This Assessment follows the report outline suggested by the California Department of Water Resources' *Guidebook for Implementation of Senate Bill 610 and Senate Bill 221 of 2001*. The projected potable water demands published in the City's 2015 UWMP were determined based upon population growth projections from Southern California Association of Governments (SCAG), a City demand factor of 220 gpcd (gallons per capita per day) and the proportion of actual historical water use by industrial properties (Appendix A, p. 4-2). The UWMP used a population growth-based approach to estimating future water demand as opposed to a land use-based approach that follows the current and ultimate land uses shown in the General Plan.

SECTION 2 - WATER DEMAND ANALYSIS

The purpose of this section is to evaluate whether the proposed Project was considered in the water supplier's planning for water demand. This section will: 1) identify the various water use sectors, 2) identify water demand by those sectors for the next twenty years, and 3) compare the Banning Distribution Center's water demand to the water demand for the Project site that was included in the Banning 2015 Urban Water Management Plan (UWMP, Appendix A).

Law

Water Code Section 10910: *(c) (2) (2) If the projected water demand associated with the proposed project was accounted for in the most recently adopted urban water management plan, the public water system may incorporate the requested information from the urban water management plan in preparing the elements of the assessment required to comply with subdivisions (d), (e), (f), and (g).*

(3) If the projected water demand associated with the proposed project was not accounted for in the most recently adopted urban water management plan, or the public water system has no urban water management plan, the water supply assessment for the project shall include a discussion with regard to whether the public water system's total projected water supplies available during normal, single dry, and multiple dry water years during a 20-year projection will meet the projected water demand associated with the proposed project, in addition to the public water system's existing and planned future uses, including agricultural and manufacturing uses.

2.1 Citywide Demographic Factors

A variety of demographic factors may affect water use. The Urban Water Management Planning Act lists several demographic factors to be detailed including climate, current

and projected population, density, and the mix of customer types (or sectors).[1] As suggested by the Department of Water Resources' *Guidebook for Implementation of Senate Bill 610 and Senate Bill 221 of 2001*, these data are provided herein are taken generally from the City's latest UWMP.

The City of Banning is located in the San Gorgonio Pass; a geologically-unique valley between the Peninsular Range province (San Jacinto Mountains) to the south and the Transverse Range province (San Bernardino Mountains) to the north. The local climate is characterized by hot, dry summers and short, mild winters. According to the 2015 UWMP, "The area receives an average annual precipitation of 19.7 inches, most of which takes place between December and March. Evapotranspiration in the area ranges from 7.88 inches in July to 1.94 inches in December (p. 2-3)." The average annual high temperature is approximately 77°F, and the average annual low temperature is 47°F (ibid, Table 2-1).

As of 2015, the population of Banning was estimated at 30,500 persons. The City currently provides water through 10,650 metered connections (Appendix A, p. 2-4). Most of the anticipated growth in the City will occur through two planned Specific Plan developments: Butterfield and Rancho San Gorgonio, which are summarized below.

[1] California Water Code Sections 10631 (e)(1) and (2).

Table 2-1: Summary of Significant Proposed Developments

Butterfield Specific Plan	Rancho San Gorgonio Specific Plan
1,543 acres	831 acres
4,900 residential units	3,385 residential units
Two elementary schools	-
Two commercial sites	-
Clubhouse	-
Community parks and trails	49 acres of park land, 160 acres of paseos and open space
-	81 acres of right-of-way and utility easements
Constructed in 5 phases over 30 years	Constructed in 6 phases over 18 years

Notes:
From 2015 UWMP (Appendix A) p. 2-5.

Based on these two development proposals, approximately 8,285 new dwelling units (26,194 people) are anticipated by 2040 (3.16 people per residential connection). The year of ultimate buildout of the City has been estimated at 2061, when the City reaches a population of 80,226 persons (2010 Banning UWMP, p. 61).

The City's estimated population growth over the next 25 years, with and without the previously mentioned Specific Plan developments is shown in **Table 2-2.**

Table 2-2: City of Banning Population Estimates, 2010-2040

Population	2010	2015	2020	2025	2030	2035	2040
Without Proposed Specific Plans	29,603	30,491	31,913	33,335	34,757	36,179	37,700
With Proposed Specific Plans	-	30,491	35,730	40,969	46,207	51,446	56,685

Notes:
2010 data from Banning 2010 UWMP, Table 2-3.
2015-2040 data reproduced from 2015 UWMP Table 2-2 (Appendix A).

The projected rate of population growth beginning in 2015 is approximately 5,239 more people every five years, or about 1,050 people (approximately 3%) every year. In comparison, the rate of growth over the five year period from 2010 to 2015 was 3%.

2.2 City of Banning's Current and Future Water Demand

The City of Banning categorizes its water customers into five categories: residential, commercial, industrial, public and irrigation. The Irrigation category consists of one irrigation account that receives non-potable water from one City well located in the Beaumont Basin.

The City also provides water to the Banning Heights Mutual Water Company on an emergency or as-needed basis which generally occurs during the summer time. Banning Heights Mutual Water Company currently serves 200 domestic customers in the Banning Bench community (BHMWC Web site, 7/21/17).[2] The City also provides water to High Valleys Water District, which is located in the San Jacinto Mountains and has no natural water source. High Valleys Water District pumps the water purchased from the City of Banning up the mountain to serve approximately 225 residential customers located in the Twin Pines and Poppet Flats communities (HVWD Web site,

[2] Banning Heights Mutual Water Company Web site: http://www.bhmwco.com/

7/31/17).[3] The City of Banning has included a 1% annual growth rate in the number of residential connections for both of these agencies in their water demand projections.

According to the water loss audit prepared as part of the 2015 Banning UWMP (Appendix A), the City estimates that 11% of produced water is lost and has assumed that rate into the future (p. 3-2).

The City of Banning's total water use in 2015 was 6,709 AFY, which includes water provided to other agencies and system losses as previously discussed (Appendix A, Table 3-3). The current and future water demands by customer category are reproduced below in **Table 2-3**.

Table 2-3: City of Banning Current and Future Water Demand (AFY)

Customer Category	2015	2020	2025	2030	2035	2040
	Actual	Projected				
Residential [a]	3,300	4,382	4,578	4,772	4,966	5,173
Proposed Specific Plan Developments (residential)	-	1,609	1,983	2,288	2,649	2,988
Commercial	1,705	2,281	2,382	2,484	2,586	2,694
Industrial	92	94	99	103	107	111
Public	53	63	66	69	71	74
Irrigation (potable)	524	739	779	818	859	903
Irrigation (non-potable)	202	205	207	210	211	212
Sales/Transfers/Exchanges to other agencies [b]	95	100	105	110	116	122
Losses (11%)	738	1,042	1,122	1,194	1,272	1,351
Sub-Total	**6,709**	**10,515**	**11,321**	**12,048**	**12,837**	**13,628**
Effluent for Cabazon Storage Unit	2,207	2,869	1,409	1,607	1,823	2,039
Recycled Water for Irrigation	-	-	1,680	1,680	1,680	1,680
TOTAL WATER DEMAND	**8,916**	**13,384**	**14,410**	**15,335**	**16,340**	**17,347**

Notes: Data from Appendix B to 2015 Banning UWMP (standardized Tables 4-1, 4-2, 4-3, and 6-4).
(a) Includes single-family detached residences, condominiums, apartments, and mobile homes.
(b) Water provided to High Valleys Water District and Banning Heights Mutual Water Company, assuming a 1% growth rate per year.

[3] High Valleys Water District Web site: http://www.highvalleyswater.com/index.html

By far, the most common land use in the City is residential, at 92% of the City's water customer accounts and consuming 57% of the City's 2015 water deliveries (Appendix A, p. 3-2). Included in the residential category are single-family residences, condominiums, apartments, and mobile homes. The second most common customer type are commercial accounts that make up 7% of customers and use 29% of the City's 2015 water deliveries. Industrial customers make up 1% of water customers and consumed roughly 2% of water delivered in 2015. Public customers and irrigation accounts are nominal; however irrigation consumed 12% of water delivered in 2015. Agricultural accounts within the City are included in the residential sector accounts, and additional agricultural activities are not expected to develop in the future (ibid, p. 3-4). On the other hand, the City does expect growth in the residential, commercial, industrial, and public sector accounts.

2.3 Project Water Demand

Water service to the Project will be provided by the City of Banning. As shown in **Figure 1-4**, the Project site is currently designated by the City General Plan as mostly Airport-Industrial (44 acres) and partly Public Facilities-Airport (20 acres). The Project proposes a General Plan Amendment to change 20 acres currently designated Public Facilities-Airport to Airport-Industrial (**Figure 1-5**). Because the City has not established unit water demand factors for each land use category, we are unable to state with certainty whether the anticipated water use rate between Public Facilities-Airport and Airport-Industrial differs, and if so, by how much.

According to data provided by the City for this Assessment, approximately one-third of the properties designated for industrial development have been developed, as shown in **Table 2-4**. The Industrial-Mineral areas (i.e., Robertson's Ready Mix plant) have been excluded because it is distinctly unique from the other industrial designations. Although they have a well on-site, it is unreliable and the City provides them water as needed through a two-inch service.

Table 2-4: Current Level of Industrial Development

General Plan Land Use	Developed (acres)	Vacant (acres)	Total (acres)	Percent Developed
Industrial	147	274	421	35%
Airport-Industrial	42	94	136	31%
Sub-Total	**189**	**368**	**557**	**34%**
Industrial-Mineral [a]	189	28	217	87%
Total	**378**	**396**	**774**	**49%**

Notes: Values are rounded to nearest whole number. Data provided by City Staff via email (July 25, 2017).
(a) Distinctly unique compared to other industrial properties in the City..

A water unit demand factor was calculated for the Project using the industrial water demand in 2015 of 92 AFY (shown in **Table 2-3**), divided by the developed industrial area of 189 acres (shown in **Table 2-4**). The calculated Project water demand factor is shown in **Table 2-5.**

Table 2-5: Water Demand Factor for Project

Land Use	Annual Water Demand (AFY)	Developed Industrial Area (acres)	Industrial Water Demand (AFY per acre)
Industrial	92	189	0.5

Notes:
Values rounded to nearest whole number.

A draft Conceptual Landscape Plan for the Project (dated November 9, 2016, prepared by Land Concern Landscape Architecture) was provided for this Assessment (**Figure 1-7**). The conceptual landscape plan provides an Estimated Annual Water Use (EAWU) rate of 21 AFY (rounded) for the landscaping proposed over 530,091 square feet (12.2 acres) of the site. Using the Project water demand factor of 0.5 AFY per acre

multiplied by the remaining area of the site (51.7 acres) gives an estimated water demand of 26 AFY (rounded). The total water demand for the Project is then the sum of the EAWU of 21 AFY and 26 AFY, as shown below in **Table 2-6**.

Table 2-6: Estimated Water Demand of Project

Landscape Demand (AFY) [a]	Industrial Water Demand (AFY/acre)	Hardscape/Other Area (acres)	Total Water Demand for Project (AFY)
21.2	0.5	51.7	47

Notes:
(a) From Land Concern Landscape Architecture, *Conceptual Landscape Plan*, dated November 9, 2016.

We have estimated the Project's potable water demand at 47 AFY based on the information and guidance provided by the City.

As shown in **Table 2-3**, the City expected an increase in water demand by industrial customers of 19 AFY (from 92 AFY to 111 AFY) between 2015 and 2040, which is roughly a 0.8 AF per year increase. The estimated water demand of the Project is significantly more than the City had anticipated in their 2015 UWMP demand projections for industrial properties.

However, based on information provided by the City for this Assessment that commercial and industrial developments often are accounted for by the City in a combined way, the Project's water demand will be compared to the combined commercial and industrial demand projections. As shown in **Table 2-7**, water demands from commercial land uses are projected to increase 989 AFY from 2015 to 2040, or roughly 198 AF every five years. When combined with industrial, this increases to 1,008 AFY increase in water demands from 2015 to 2040, or roughly 202 AF every five years for commercial/industrial.

Table 2-7: Combined Demand Projections of Industrial and Commercial (AFY)

	2015	2020	2025	2030	2035	2040
Commercial	1,705	2,281	2,382	2,484	2,586	2,694
Industrial	92	94	99	103	107	111
Sum	**1,797**	**2,375**	**2,481**	**2,587**	**2,693**	**2,805**

Considering the City has not seen any significant new developments in either the commercial or industrial sectors since the 2010 UWMP was prepared, the Project's estimated water demand of 47 AFY is well within the water demand projections of the commercial/industrial sectors.

The following two sections of the Assessment describe the supplies projected to be available to the City of Banning from 2015 to 2040, as according to the 2015 UWMP. Based on the findings therein, the water supply available to the City is more than adequate to meet the Project's estimated needs.

This Page Intentionally Blank

SECTION 3 - WATER SUPPLY ANALYSIS

This section identifies the sources of potable water that are available to and utilized by the City of Banning. The purpose of this section is to evaluate the water supplies that could be utilized by the proposed Project during normal, single-dry and multiple-dry water years during a 20-year projection. Section 4 – Groundwater Analysis contains additional required information regarding the City's groundwater supplies.

Law

Water Code Section 10910 (d)(1)*: The assessment required by this section shall include an identification of any existing water supply entitlements, water rights, or water service contracts relevant to the identified water supply for the proposed project, and a description of the quantities of water received in prior years by the public water system, or the city or county if either is required to comply with this part pursuant to subdivision (b), under the existing water supply entitlements, water rights, or water service contracts.*

(2) An identification of existing water supply entitlements, water rights, or water service contracts held by the public water system, or the city or county if either is required to comply with this part pursuant to subdivision (b), shall be demonstrated by providing information related to all of the following:

(A) Written contracts or other proof of entitlement to an identified water supply.

(B) Copies of a capital outlay program for financing the delivery of a water supply that has been adopted by the public water system.

(C) Federal, state, and local permits for construction of necessary infrastructure associated with delivering the water supply.

(D) Any necessary regulatory approvals that are required in order to be able to convey or deliver the water supply.

3.1. Documenting Wholesale Water Supplies

Many retail water suppliers in California, including the City of Banning, receive supplies from one or more water wholesalers. SB 610 requires this Assessment to document wholesale supplies received by: i) describing the quantities of water received from each wholesaler in prior years; ii) identifying existing entitlements, water rights, and/or water service contracts held by the City for the wholesale supply; iii) provide proof of entitlements, water rights, service contracts, relevant capital outlay programs, and construction permits for necessary infrastructure to deliver wholesale supplies, if any; and iv) regulatory approvals required to convey or deliver the wholesale supply.

Wholesale Supplies Received

Wholesale imported water is available to the City and neighboring entities to purchase from the San Gorgonio Pass Water Agency (SGPWA or "Agency"), the local wholesaler of State Water Project water and participant in the Yuba Accord Agreement.

State Water Project water is imported from northern California and available as stipulated by the Department of Water Resources (DWR) in response to hydraulic conditions in the Sacramento/San Joaquin delta, environmental regulations and the local hydrology.[1] Therefore, imported water supplies to southern California can be highly variable; in 2014 for example, the allocation of State Water Project water reached the lowest proportions on record due to persistent drought conditions.

The Agency began importing State Water Project water into the region in 2003, when Phase 1 of the East Branch Extension (EBX) of the California Aqueduct was completed. Since that time, deliveries of State Water Project water within the region increased steadily until the recent drought, as shown in **Table 3-1**.

[1] Department of Water Resources, *State Water Project Delivery Capability Report*, published every 2 years as well as "Notice to State Water Project Contractors" issued as often as needed.

Table 3-1: Imported Water Deliveries to SGPWA

Calendar Year	Actual Volume Delivered (AF)	Proportion of Maximum Allocation Available
2003	116	90%
2004	814	65%
2005	687	90%
2006	4,420	100%
2007	4,815	60%
2008	4,905	35%
2009	6,609	40%
2010	8,403	50%
2011	10,730	80%
2012	10,974	65%
2013	9,695	35%
2014	5,131	5%
2015	3,930	20%
Sum	**71,229**	**-**
Median	**4,905**	**60%**
Mean	**5,479**	**57%**

From San Gorgonio Pass Water Agency, *Report on Water Conditions Reporting Period 2015*, January 2017, Table 4. Available at the SGPWA Web site: http://www.sgpwa.com/wp-content/uploads/2017/07/2015-Final-Report-on-Water-Conditions.pdf [cited as Report, 2015]

SGPWA's maximum allocation (or contract amount) of State Water Project water ("Table A") is 17,300 AFY. As shown in **Table 3-1,** the average allocation that has been made available to SGPWA from 2003 to 2015 is 57% of their Table A contract amount. It is rare that an agency receives their entire Table A allocation.

DWR prepares a biennial report to assist State Water Project contractors in assessing the near and long-term availability of supplies from the State Water Project to use in their planning efforts and for use in their UWMP's. DWR issued its most recent update,

the 2015 State Water Project Delivery Capability Report (DCR) in July 2015.[2] To evaluate supply availability under future conditions, the 2015 DCR included four model studies that used the following assumptions to model current conditions: existing facilities, hydrologic inflows based on 82 years of historical inflows (1922 to 2003) that were adjusted to reflect current levels of development in the supply source areas, current regulatory and operational constraints, and contractor demands for State Water Project water at maximum Table A amounts. The first of the future-conditions studies, the Early Long Term (ELT) scenario, was based on these assumptions but reflected changes expected to occur from climate change (a 2025 emission level and a 15 cm sea level rise). The 2015 SGPWA UWMP uses the ELT scenario to estimate future State Water Project supply availability because of the model assumptions and because it is consistent with the studies DWR has used in previous DCR's for supply availability under future conditions. Based on the ELT scenario, DWR estimates in the 2015 DCR that for all contractors combined, the State Water Project can deliver on a long-term basis a total Table A supply of 62% of total maximum Table A amounts. During the single dry year, DWR also estimates that a total Table A supply of 11% of total maximum Table A amounts can be delivered. Likewise, DWR estimates that during a four-year dry period the State Water Project can deliver 33% of total maximum Table A amounts. Notably, the 2015 DCR does not include the extremely dry period that occurred in 2013 and 2014; however, it is anticipated the next update of the DWR models will include these years for the next update of the biennial DCR. (Appendix D, p. 3-6).

SGPWA has therefore assumed in their 2015 UWMP supply projections that 62% of their Table A amount will be available on average during normal precipitation years; 11% during a single dry year, 5% during a worst-case single dry year and 33% during a multiple dry year period based on DWR's 2015 Final DCR (Appendix D, p. 3-1).

Sales of imported water from SGPWA to local retail agencies, specifically Beaumont Cherry Valley Water District (BCVWD), City of Banning, and Yucaipa Valley Water

[2] Delivery Capability Report can be found at DWR Web site: http://baydeltaoffice.water.ca.gov/swpreliability/

District (YVWD) currently account for all of SGPWA's water demands (Appendix D, p. 2-1). Additional smaller agencies may potentially request supplies in the future. When the SGPWA is able to obtain water in excess of customer demands, they can store it in the groundwater basins for future use. The volumes delivered to member agencies of SGPWA in 2010 and 2015 are listed in **Table 3-2**. Note the decrease in demands between the two time periods, as well as each agency's two-year average proportion of total deliveries.

Table 3-2: Past and Current Water Demands on SGPWA (AF)

Retail Agency Name	2010 (AF)	2015 (AF)	Percent Change from 2010 to 2015	Average Percent of Total
Beaumont Cherry Valley Water District	5,727	2,773	-52%	73%
City of Banning	1,338	694	-48%	17%
Yucaipa Valley Water District	713	454	-36%	10%
Total [a]	**7,778**	**3,921**	-	-

Notes: From Appendix D, Table 2-2.
(a) Total deliveries received by retail customers shown here are slightly less than volume delivered to SGPWA in Table 3-1, likely due to system loss during conveyance.

The City of Banning purchases imported water from SGPWA for the purpose of groundwater replenishment within the Beaumont Storage Unit (aka Beaumont Basin). Replenishment of the basin on behalf of the City occurs at BCVWD's Noble Creek spreading facility. Future recharge volumes of imported water in the Beaumont Basin will be dependent on the availability of State Water Project water and the availability of basin storage capacity. Pursuant to the Beaumont Basin Judgment (**Appendix E**), the City is entitled to the water it purchases and replenishes in the Beaumont Basin. Like a bank account, the volume to which the City is entitled but does not pump can be credited to the City's storage account. The volumes purchased from SGPWA and recharged to the Beaumont Based from 2010 to 2015 are provided in **Table 3-3**.

Table 3-3: Imported Water Purchased by City, 2010-2015 (AF)

2010	2011	2012	2013	2014	2015
1,338	800	1,200	1,200	608	694

Notes:
From Appendix A, Table 5-1.

In addition to State Water Project water, SGPWA purchases imported water supplies from Yuba County. SGPWA entered into the Yuba Accord Agreement, which allows for the purchase of water from the Yuba County Water Agency through DWR. Yuba Accord water comes from north of the Delta, and as such the water purchased under this agreement is subject to losses associated with transporting it through the Delta. SGPWA receives approximately 300 AFY on average under this Agreement, and has recently signed a time extension to the Agreement (Appendix D, p. 3-9).

In its 2015 UWMP, SGPWA has projected adequate supplies to meet the projected water demands from BCVWD, City of Banning, YVWD and "others" that may join in the future, which cannot be met from each agency's other water supply sources. SGPWA's future supplies to meet future demand include a combination of existing and planned sources (beginning in 2020), during average precipitation years and multiple-dry years through 2040. Planned supplies are discussed below and include purchasing supply from San Bernardino Valley Municipal Water District, exchanges with other contractors and/or other sources. SGPWA has also projected that additional supplies will be required to meet the projected demands from current and future customer agencies during a single dry year beginning around 2025 (Appendix D, Table 3-4 and pp. 5-1 to 5-4).

SGPWA plans to purchase up to 5,000 AF of San Bernardino Valley Municipal Water District's (Valley District's) Table A amount in years when Valley District's Board declares a surplus. SGPWA expects this to occur two years out of every five, or on average, 2,000 AFY (Appendix D, p. 3-10). In addition, SGPWA has signed on as an owner of capacity in the proposed Sites Reservoir Project, and completed design of a

conjunctive use storage facility for additional supplies, including Article 21 water from the State Water Project when available (Appendix D, p. 3-11).[3]

SGPWA has exchanged imported water with a neighboring wholesale agency, Crestline Lake Arrowhead Water Agency (CLAWA) on three different occasions. In 2010, SGPWA received 1,000 AF of CLAWA's Table A amount in exchange for a like amount to be returned by 2020. Likewise, in 2013, SGPWA received 2,000 AF of CLAWA's Table A amount in exchange for 1,300 AF to be returned by 2023. Lastly, in 2016, SGPWA received 1,200 AF of CLAWA's Table A amount in exchange for 600 AF to be returned by 2026 (Appendix D, p. 3-10). Therefore, future exchanges are possible though no details have been provided.

SGPWA's 2015 UWMP states the following in terms of future water supply acquisitions (Appendix D, p. 3-11):

> *The Agency's Board has committed to keeping ahead of the regional water demand curve and implementation of the capacity fee will enable it to do so financially. The Agency has updated a study identifying additional supplemental supplies that are for sale around the state, particularly south of the Delta, and will move quickly to negotiate a deal for one or more of these sales in 2016 or early 2017.*

The actual supplies and the projected wholesale water supplies that are expected to be available to SGPWA through 2040 are shown in **Table 3-4**.

[3] The Article 21 Program with DWR provides water supplies to SWP Contractors when water in excess of the current SWP need is available.

Table 3-4: SGPWA Actual and Projected Wholesale Water Supplies (AF)

Source of Supply	2015	2020	2025	2030	2035	2040
	Actual	Projected				
Existing Imports						
Imported SWP [a]	10,700	10,700	10,700	10,700	10,700	10,700
Yuba Accord	300	300	300	300	300	300
Sub-Total Existing Supplies	**11,000**	**11,000**	**11,000**	**11,000**	**11,000**	**11,000**
Planned Purchases						
Valley District	-	2,000	2,000	2,000	2,000	2,000
Other	-	1,500	3,800	7,700	11,700	15,000
Sub-Total Planning Supplies		**3,500**	**5,800**	**9,700**	**13,700**	**17,000**
Total Supplies	**11,000**	**14,500**	**16,800**	**20,700**	**24,700**	**28,000**

Notes: From Appendix D, Table 3-1.
(a) Assumes future imported supplies at 62% of SGPWA's Table A amount (17,300 AFY).

*

Although the supply from the SWP that was available to SGPWA in 2015 was 11,000 AF (Appendix D, Table 3-1), the actual volume provided to customer agencies (BCVWD, Banning and YVWD) was significantly less at 3,921 AF as shown previously in **Table 3-2**.

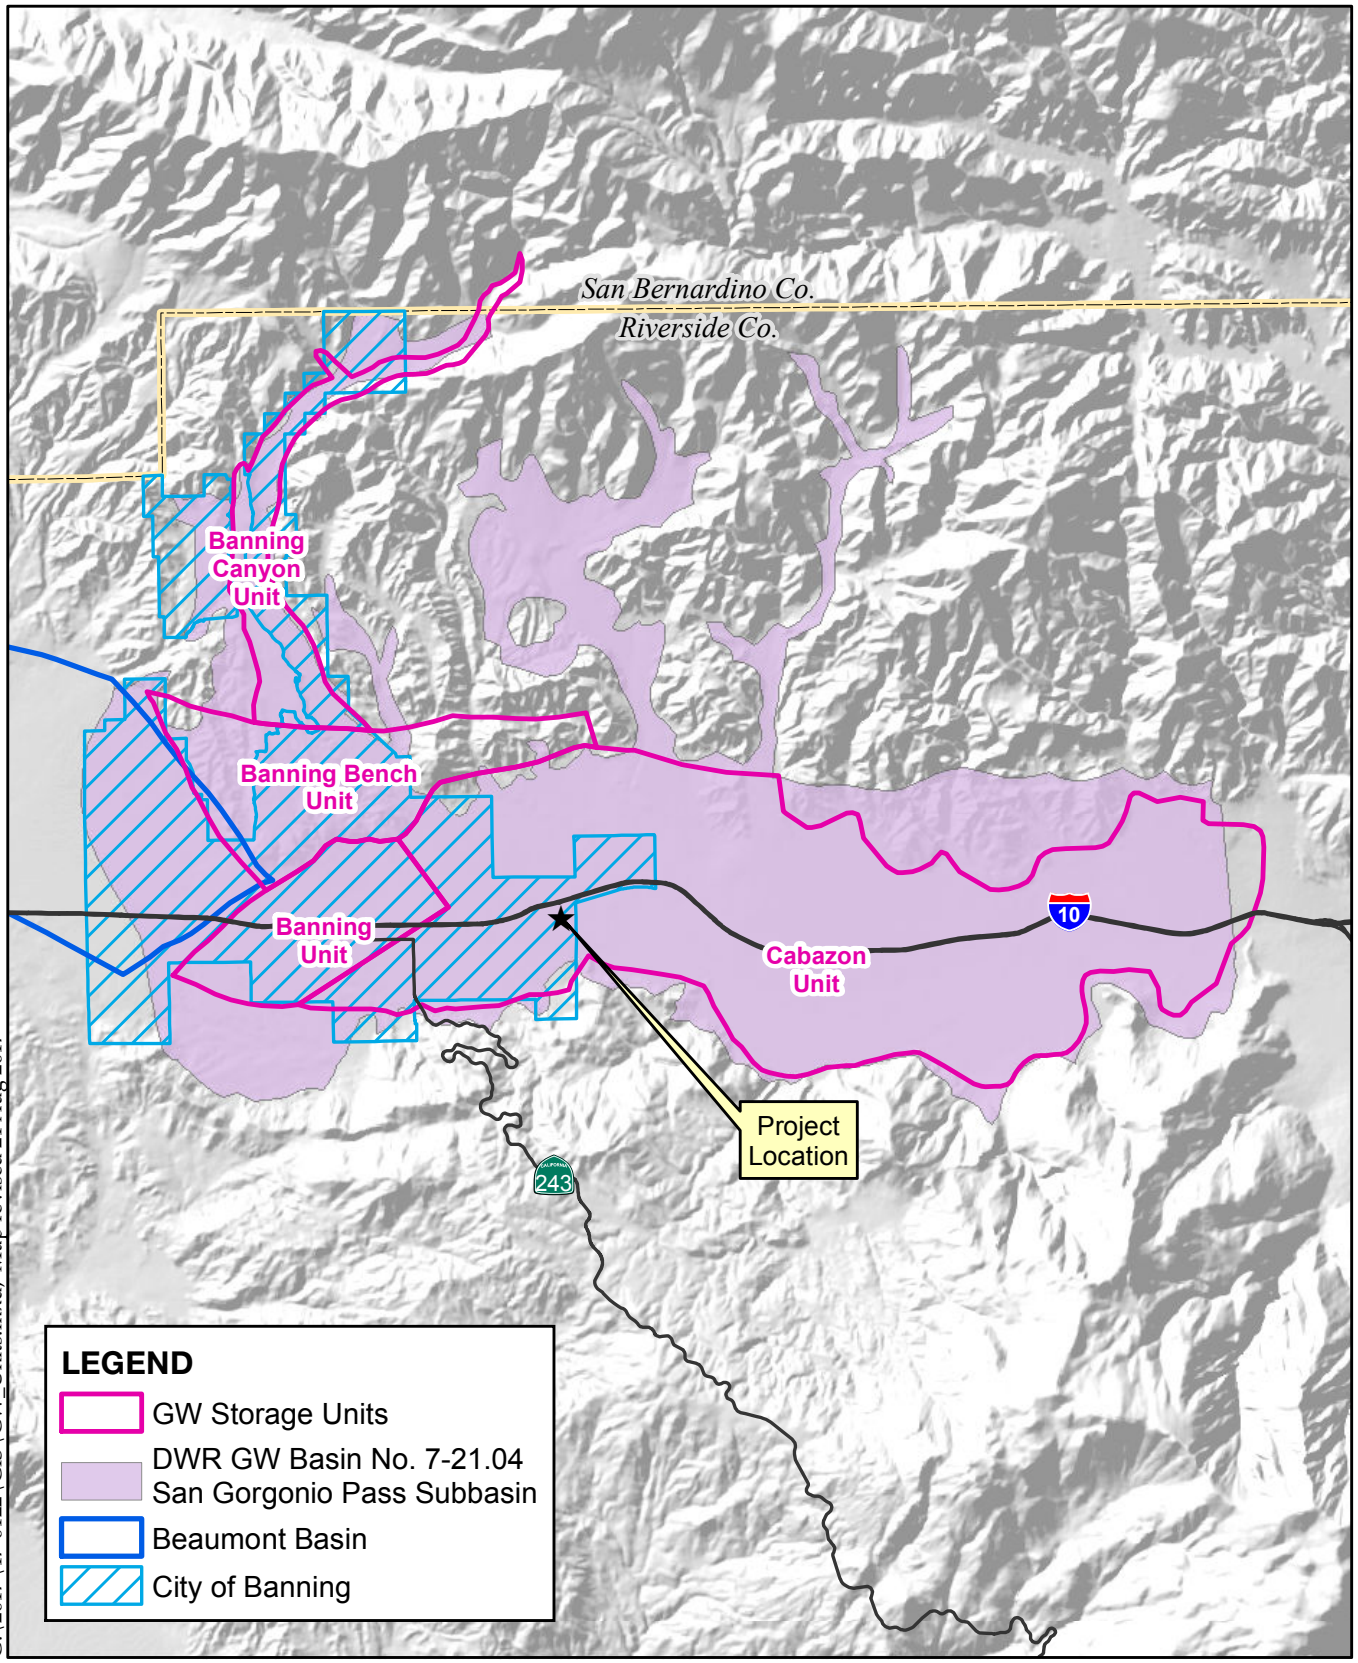
SGPWA adopted Ordinance No. 10 to establish procedures for allocating reduced deliveries of water to its Purchasers (including Banning) during a drought or other water shortage event. The ordinance established a Water Shortage Contingency Plan with rationing and reduction goals to be conducted by the retail water agencies, which includes Banning (Appendix D, Table 7-1).

Approximately 27% of the SGPWA service area contains the City of Banning and the City's sphere of influence. In its 2015 UWMP, the City has taken this percentage as the proportion of SGPWA's supplies they are entitled to (Appendix A, p. 5-4), and presented this to SGPWA in a draft agreement. This agreement remains unsigned, as wholesale water suppliers typically do not commit to delivering a set volume or

proportion of their supply. SGPWA can be expected however, to provide water when their customer agencies make a request.

Nonetheless, the City of Banning has assumed in their supply projections that a set proportion of SGPWA's Table A allocation will be available for purchase based on the following parameters, which come from the previously mentioned unsigned agreement:

- 17,300 AFY – SGPWA Table A allocation;
- 58% - proportion of Table A allocation to be available; and
- 27% - Banning's portion of SGPWA service area.



Based on the above, the estimated annual recharge quantity that could be purchased was determined by the City as follows (Appendix A, p. 5-4):

17,300 AFY x 57.5% x 27.3% = 2,718 AFY

Although the percentage of the SGPWA Table A allocation that SGPWA has used in its planning projections is 62%, the City opts for a more conservative proportion of 58% as reasoned in the City's 2015 UWMP (p. 6-4).

3.2. Documenting Water Supplies

The City of Banning obtains all of its water supply from groundwater, but there are three sources of water that provide the majority of the City's groundwater supply: 1) replenishment credits from purchasing and infiltrating imported water from SGPWA within the Beaumont Basin (as previously discussed), 2) diverted surface water from the Whitewater River that recharges the Banning Canyon Storage Unit, and 3) other City wells in the surrounding groundwater basins (also called "storage units, "as discussed in Section 4 – Groundwater Analysis). Refer to **Figure 3-1** for locations of the storage units accessed by the City.

ALBERT A. WEBB ASSOCIATES

Whitewater River Diversion

Since 1913, surface water (snowmelt) from the Whitewater River has been diverted into Banning Canyon by way of "the Flume," which was originally used to generate hydroelectric power by predecessor companies of Southern California Edison (SCE). Although the water still flows through two hydroelectric power plants, SCE no longer generates power and is in the process of withdrawing its license. The City of Banning is currently seeking a Special Use Permit from the U.S. Forest Service for the continued operation and maintenance of the Flume. After passing through the power plants, water delivered by the Flume stops at a reservoir within Banning Canyon that is owned by the Banning Heights Mutual Water Company (BHMWC). Approximately 1,000 AFY is used by BHMWC (Appendix A, p. 5-9). The Flume/reservoir system is the only water source for customers of BHMWC. Excess water then flows to the San Gorgonio River and adjacent recharge basins to recharge the Banning Canyon Storage Unit. The City estimates that an average of 1,500 AFY has been diverted into Banning Canyon since 1961 (ibid). Based on historical pumping rates, the Banning Canyon Storage Unit provides the largest supply of water for the City.

City Wells

As of 2015, the City owns and operates 21 groundwater wells outright, and shares ownership of three wells with BCVWD. A copy of the Agreement between the City of Banning and BCVWD dated December 23, 2003 is provided in **Appendix B**. All of the wells pump groundwater from five sub-units ("Storage Units") of the San Gorgonio Pass Basin, which are not totally independent from each other: Beaumont, Banning, Banning Bench, Cabazon, and Banning Canyon. Depending on the source, the City maintains different types of water rights, as follows:

- **Beaumont Basin:** Appropriative Water Right (defined in the Judgment as, "each Appropriator's share of Appropriative Water, such share expressed as a percentage as shown on Exhibit C"). The City of Banning's share of the Safe

Yield allocated to Appropriators is 31.43%.[4] Based on the five-year format used in the Rules and Regulations of the Judgment, the Appropriative Water estimated in 2010 is allocated to Appropriators during 2015. A copy of the Beaumont Basin Judgment is provided in **Appendix E.**

- **Banning Storage Unit:** This storage unit is not adjudicated. The City is the only remaining large user of water, after it acquired the Mountain Water Company.
- **Banning Bench Storage Unit:** This storage unit is not adjudicated. The City and Banning Heights Mutual Water Company rely on this basin to serve a portion of their respective water demands.
- **Cabazon Storage Unit:** This storage unit is not adjudicated. The City of Banning, Mission Springs Water District, Morongo Band of Mission Indians and Cabazon Water District rely on this basin to serve a portion of their respective water demands (Appendix D, p. 3-17).
- **Banning Canyon Storage Unit:** See **Appendix F** for a copy of the "Whitewater River Adjudication Proceedings, April 23, 1928" that documents the following rights in reverse chronological order:
    1. Joint entitlement between The Banning Water Company (to which the City of Banning is a successor), BHMWC and the San Gorgonio Power Company (a predecessor of SCE) to "…divert from the natural flow of the South Fork of Whitewater River, through the Consolidated Reservoir and Power Company Canal ["the Flume"] a total of 13.26 cubic feet per second - priority October 31, 1906…and subject to the provisions of an Agreement dated January 10, 1913, an Instrument dated December 30, 1913, and a Deed dated August 7, 1922" (see page 6 of Appendix F).
    2. Entitlement of The Banning Water Company (City of Banning) to "…divert from the natural flow of San Gorgonio River and its tributaries, through its system of spreading [diversion] ditches an amount of 20,000 acre-feet per annum, with a priority date of January 1, 1887…provided that said

[4] Judgment (2004) defines Safe Yield as, "The maximum quantity of water which can be produced annually from a Groundwater Basin under a given set of conditions without causing a gradual lowering of the groundwater level leading eventually to depletion of the supply in storage."

water is subsequently withdrawn from said underground storage and applied to beneficial use by said Banning Water Company…" (see page 9 of Appendix F).
