1. During the term of this Agreement, on or before April 1 each year, the Buyer will pay to Yuba up to $250,000.00 to pay a portion of Yuba's annual costs for implementing the Yuba River Accord. On or before February 1, Yuba will submit to DWR invoices with documentation of costs incurred by Yuba to implement the Yuba River Accord, up to $250,000 per year. The Buyer will pay Yuba the amount of such invoice, but not more than $250,000 per year, pursuant to this Section and Section 10 ("Invoicing") of this Agreement. Yuba will provide to the Buyer, for payments made under this subsection, a credit against future payments due for Components 2, 3 and 4 Water. Yuba will record and accrue these credits from year to year until Yuba makes Component 2, 3 or 4 Water available, in which time such credits will be applied toward payments due.

2. Under separate agreements among them, Yuba, DWR and Reclamation have paid the costs of environmental compliance for implementing the Yuba River Accord, which is referred to in Section 16 ("Environmental Compliance") of this Agreement.

C. Payments for Adjustments in Groundwater O&M Costs.

During the term of this Agreement, the Buyer will pay Yuba, based on itemized invoices of work done and costs incurred, an amount to compensate for any annual increases above actual 2006 Groundwater O&M Costs using the Consumer Price Index, including those costs necessary for upkeep, power, and operation of those fixed assets that are dedicated to making Water available to the Buyer under this Agreement from groundwater sources, and recurring costs or payments required to obtain consents necessary to make Water available under this Agreement from groundwater sources. Groundwater O&M Costs will exclude general district overhead charges. Yuba will submit to the Technical Committee for a thirty-day review the documentation of work done and costs incurred prior to submitting invoices to the Buyer in accordance with the payment and invoicing provisions for Components 2, 3, or 4 Water under this Agreement. The Technical Committee will review invoices to ensure that payments made under the payment and invoicing provisions for Components 1 through 4 Water do not duplicate payments made under this subsection. Annual increases above the 2006 baseline will be computed based on the Consumer Price Increase as provided by the United States Department of Labor, Bureau of Labor Statistics.

13. Certain Payments Contingent on Appropriation or Allotment of Funds.

A. General.

In consideration of Yuba's eight-year commitment to deliver Component 1 Water, the Buyer confirm that the funds required to pay Yuba for Component 1 Water during that period have been appropriated, and DWR will encumber the funds to pay Yuba for Component 1 Water during that period on the schedule provided for in Section 5C1 of this Agreement. The Buyer intend that the payments due to Yuba under this Agreement for Components 2, 3, and 4 Water that is made available to the SWP and the San Luis & Delta-Mendota Water Authority will be paid from DWR funds received from the SWP and/or the San Luis & Delta-Mendota Water Authority. The Buyer will make contractual arrangements with the SWP and the San Luis & Delta-Mendota Water Authority under which the SWP and the San Luis & Delta-Mendota Water Authority would have an opportunity to make payments due to Yuba under this Agreement, in the event that the Buyer fails to make such payments when due, in order to avoid an interruption in Yuba making Water available to the Buyer under this Agreement. To the extent that the Buyer defaults in making the payments due to Yuba under this Agreement, then: (1) Yuba's obligation to make Water available to the Buyer under this Agreement will be excused to the extent and for the duration of the Buyer' default; (2) Yuba may attempt to mitigate its damages by selling Component 3 and Component 4 Water made available under this Agreement to other parties to the extent and for the duration of the Buyer'

default; and (3) the Buyer will be obligated to pay Yuba to the extent that Yuba is unable to mitigate Yuba's damages resulting from the Buyer' default.

B. State Funding Contingency.

Except to the extent that DWR uses funds from sources that do not require legislative budgetary appropriation, DWR's payment obligations under this Agreement are contingent on appropriation or allotment of funds through the State Budget process.

14. Technical Committee and Management Committee

A. Technical Committee.

The Technical Committee will: (1) collect, review and analyze information relevant to accounting for Water consistent with Exhibits 1 through 3, and information related to advances, payments and cost adjustments; (2) identify and attempt to resolve technical implementation issues; (3) periodically report to the Management Committee on the information gathered and any technical implementation issues identified; and (4) make recommendations to the Management Committee for resolution of any policy issues that arise or for any required factual determinations. If the Technical Committee is unable to agree on a recommendation to the Management Committee, the Technical Committee will cooperate to provide a balanced presentation of the facts, opinions and other information underlying the various positions on the issue to be determined.

B. Management Committee.

The Management Committee will: (1) provide policy guidance in implementing this Agreement; (2) make any factual determinations required to implement this Agreement; (3) consider information provided by the Technical Committee, if applicable, when making decisions; and (4) identify and resolve any policy-related implementation issues. If agreement among the representatives to the Management Committee cannot be reached on any issue necessary to the ongoing implementation of the Agreement, the Buyer and Yuba will meet and confer in a good faith effort to reach agreement. In the event that agreement cannot be reached among the Buyer and Yuba on an issue, that issue will be subject to Section 22 ("Remedies and Dispute Resolution") of this Agreement.

C. Interaction with River Management Team.

DWR will designate a representative to actively participate in the River Management Team established under the Fisheries Agreement. Reclamation may also designate a representative to participate in the River Management Team established under the Fisheries Agreement.

15. Quantities of and Pricing Provisions for Water During a FERC Annual License and During the FERC Long-Term License.

A. Intent of the Parties.

1. Yuba expects that, upon the expiration of the term of the FERC License, FERC will issue to Yuba one or more FERC Annual Licenses, before it issues to Yuba the FERC Long-Term License.

2. The Parties desire that Yuba continue to deliver, and the Buyer continue to pay for, additional quantities of Components 1 through 4 Water in accordance with Section 11 ("General Provisions Applicable to Water") of this Agreement during any Water Year beginning after September 30, 2015 for which either the FERC License or a FERC Annual License is in effect, if: (a) these quantities of Water can be delivered by Yuba consistent with the terms of the FERC License or any FERC Annual License; and (b) subject to a pricing agreement between the Parties. The Parties further intend that, other than the pricing provisions, there will be no change in the other provisions of this Agreement (including the provisions regarding the annual quantities of Components 1 through 4 Water delivered by Yuba, and paid for by the Buyer) during any Water Year beginning after September 30, 2015 that includes all or part of the term of any FERC Annual License, if the terms of the FERC Annual License do not significantly affect Yuba's ability to make these water supplies available.

3. The Parties desire that Yuba continue to deliver, and the Buyer continue to pay for, additional quantities of Components 1 through 4 Water in accordance with Section 11 ("General Provisions Applicable to Water") of this Agreement during any Water Year that is within the term of a FERC Long-Term License, and not within the term of any FERC Annual License, if these quantities of Water can be delivered by Yuba consistent with: (a) the terms of the FERC Long-Term License; (b) the water supply needs within the service area of Yuba; and (c) the ability of the Buyer and Yuba to agree to pricing provisions. The Buyer and Yuba further intend that, other than the quantity and pricing provisions, there will be no change in the other provisions of this Agreement during any Water Year that is within the term of a FERC Long-Term License.

B. Quantities of Water and Pricing Provisions Applicable During the Term of the FERC Annual Licenses.

During any Water Accounting Year beginning after December 31, 2015 during which either the FERC License or any FERC Annual License is in effect, Yuba will deliver, and the Buyer will pay for, additional quantities of Components 1 through 4 Water, in accordance with Section 11 ("General Provisions Applicable to Water") of this Agreement, subject to the following: (1) Yuba may adjust the quantities of Water that Yuba will deliver to the Buyer (but the quantity will not be less than 20,000 acre-feet of Water in each such Water Accounting Year, other than a Conference

Year), but only to the extent needed to reflect the ability of Yuba to deliver these quantities of Water consistent with the terms of the FERC Annual License; and (2) the Buyer and Yuba intend to negotiate in good faith the quantity and pricing provisions applicable to Components 1 though 4 during such Water Accounting Years, but under no circumstance will the price for the Water be less than the pricing provisions applicable to Components 1 through 4 Water, as set forth in Sections 5 through 8 of this Agreement.

C. Quantities of Water and Pricing Provisions Applicable During the Term of the FERC Long-Term License.

During any Water Accounting Year that is within the term of the FERC Long-Term License, and for which no part of the Water Accounting Year is within the term of any FERC Annual License, Yuba will deliver, and the Buyer will pay for, additional quantities of Components 1 through 4 Water, in accordance with Section 11 ("General Provisions Applicable to Water") of this Agreement, subject to the following: the Buyer and Yuba reach agreement as to the quantities of Components 1 through 4 Water that Yuba will deliver to the Buyer (but which quantities will not be less than 20,000 acre-feet of Water in any Water Accounting Year through December 31, 2025, other than during a Conference Year), to reflect the ability of Yuba to deliver these quantities of Water consistent with: (a) the terms of the FERC Long-Term License; (b) the water supply needs within the service area of Yuba; and (c) the Buyer and Yuba's intent to negotiate in good faith the quantity and pricing provisions applicable to Components 1 through 4 Water during the term of the FERC Long-Term License.

16. Environmental Compliance.

Yuba, as lead agency under CEQA has approved and filed a notice of determination concerning the implementation of the Yuba River Accord and its environmental effects. DWR as a responsible agency under CEQA will file a notice of determination concerning its responsibilities as to environmental effects of implementing this Agreement for the Yuba River Accord.

17. Approvals and Conditions Precedent to Performance of this Agreement.

A. Section 5.2 of the Yuba Act.

Yuba represents that Yuba has complied with the provisions of Section 5.2 of the Yuba Act, which requires that, prior to entering into this Agreement, the Board of Directors of Yuba to: (1) determine that water to be purchased under this Agreement would be surplus to the amount of water available to meet the contractual requirements of Member Units; (2) hold a public hearing to receive and consider comments on and objections to this Agreement; (3) confirm that a majority in number of registered voters residing within Yuba County have not filed written protests against this Agreement; and (4) find that the long-term purchase of water under this Agreement may be carried

out without injuring any legal user of water, without unreasonably affecting fish, wildlife or other instream beneficial uses, and without unreasonably affecting the overall economy of Yuba County.

B. Compliance with Water Code Section 1745.10.

Yuba represents that Yuba has complied with the provisions of Water Code Section 1745.10.

C. Other Approvals by Yuba.

Yuba will be responsible for obtaining approval of the State Board as necessary to enable this Agreement to be fully implemented, and for obtaining any other permits and approvals necessary for Yuba to make Water available for diversion by the Buyer under this Agreement. Pursuant to Section 24H of this Agreement, the Buyer will provide reasonable assistance to Yuba in Yuba's actions to obtain any permits or approvals that may be necessary for Yuba to make Water available for diversion by the Buyer under this Agreement.

D. Other Approvals by Buyer.

Except as otherwise addressed in this Agreement, the Buyer will be responsible for complying with State and Federal laws necessary for the Buyer to divert and use the Water made available under this Agreement. Pursuant to Section 24H of this Agreement, Yuba will provide reasonable assistance to the Buyer in the Buyer's actions to obtain any permits or approvals that may be necessary for the Buyer to divert and use Water that Yuba will make available under this Agreement.

18. Place of Use of Water.

Water made available under this Agreement will be not used outside of the place of use specified in the State Board order approving this delivery of Water from Yuba to the Buyer, without the written consent of Yuba.

19. Hold Harmless.

A. DWR will not assert that Yuba, its officers, agents or employees, are liable for damages of any nature whatsoever arising out of any actions or omissions by DWR, its officers, agents or employees, related to DWR's performance of this Agreement, where such liability is caused by an act, error or omission of DWR, its officers, agents or employees.

B. Yuba will not assert that DWR, its officers, agents or employees, are liable for damages of any nature whatsoever arising out of any actions or omissions by Yuba, its officers,

agents or employees, related to Yuba's performance of this Agreement, where such liability is caused by an act, error or omission of Yuba, its officers, agents or employees.

C. To the extent permitted by California law, Yuba will indemnify, defend and hold DWR and its officers, agents and employees safe and harmless from any and all claims, judgments, damages, penalties, costs, liabilities and losses (including without limitation, sums paid in settlement of claims, actual attorney's fees, paralegal fees, consultant fees, engineering fees, expert fees and any other professional fees) that arise from or are related in any way to Yuba's activities under this Agreement that are under the exclusive control of Yuba, including but not limited to the release, conveyance, use or distribution of water released by Yuba from the Yuba Project for purposes of this Agreement.

D. To the extent permitted by California law, DWR will indemnify, defend and hold Yuba and its officers, agents and employees safe and harmless from any and all claims, judgments, damages, penalties, costs, liabilities and losses (including without limitation, sums paid in settlement of claims, actual attorney's fees, paralegal fees, consultant fees, engineering fees, expert fees and any other professional fees) that arise from or are related in any way to DWR's activities under this Agreement that are under the exclusive control of DWR, including but not limited to the conveyance, use or distribution of water made available by Yuba from the Yuba Project for purposes of this Agreement.

E. Yuba and its officers, agents, employees and insurers will not be responsible for the quality of water made available by Yuba from the Yuba Project for purposes of this Agreement.

20. *Force Majeure Event.*

A. A *Force Majeure* Event will excuse or suspend performance as provided in this section for the duration of the *Force Majeure* Event. To the extent that *Force Majeure* Event prevents the Buyer from using the Water delivered by Yuba, then: (a) the Buyer will be excused from paying for Components 2 through 4 Water during the duration of the *Force Majeure* Event; and (b) Yuba will retain the payments received for Component 1 Water with no obligation to deliver this Component 1 Water again at some later time.

B. To the extent that a *Force Majeure* Event prevents Yuba from providing Components 1 through 4 Water, then: (a) Yuba's performance will be excused during the duration of the *Force Majeure* Event; (b) Yuba will not be required to refund payments for Component 1 Water; and (c) Yuba will deliver this Component 1 Water supply at some later time on a schedule that is acceptable to the Buyer and Yuba.

C. During a *Force Majeure* Event, each of the Parties will, to the extent practicable, take actions to minimize the impacts of the *Force Majeure* Event on the other Parties.

21. Regulatory Action.

In the event of a Regulatory Action during the term of this Agreement: (a) the affected Party will promptly notify the other Parties of the Regulatory Action and the manner in which it affects performance under this Agreement; and (b) the Parties will proceed under the process provided for in Section 22 ("Remedies and Dispute Resolution"), to the extent applicable. This section does not affect the other rights and remedies of the parties under this Agreement.

22. Remedies and Dispute Resolution.

A. Should any material disputes arise concerning any provision of this Agreement, or the rights and obligations of the Parties thereunder, including those involving possible termination or those that might cause the initiation of any administrative or judicial proceeding to enforce or interpret this Agreement, the Parties will present the issue to the Management Committee (which may request assistance from the Technical Committee) for a recommendation for resolving the dispute.

B. If the Process described in the preceding subsection fails to resolve the dispute within thirty days, the Parties will submit the dispute to a mediator who has experience in water-related disputes. The costs of any such mediation will be borne one-third each by the Parties. Initiation of this mediation process will be through written notice by one Party to the other Parties. The Parties reserve all of their other remedies that may be provided by law or equity in the event that such mediation fails to resolve a dispute. The Parties, in consultation with the mediator, will use their best efforts to resolve the dispute within thirty days. Under no circumstances, however, will mediation under this Section 22 result in a requirement that diminishes, limits or contravenes the discretion, authority or any delegated authority of the Director of DWR under State law.

C. If mediation fails to resolve the dispute, and prior to commencing any legal action to resolve the dispute, the Party proposing to commence legal action will provide the other Party thirty days' written notice of such action, provided that such notice will not be required where a delay in commencing an action would prejudice the interests of the Party that intends to file suit. During the thirty-day notice period, the Parties will continue to attempt to resolve the dispute.

23. Effect of this Agreement on other Matters.

A. As a Precedent.

Nothing in this Agreement is intended or will be construed as a precedent or other basis for any argument that the Parties have waived or compromised their rights that may be available under State or federal law, except as to matters addressed in this Agreement.

B. As to Water Rights.

The only rights granted to the Parties as a result of this Agreement are those expressly set forth in this Agreement. The providing of water by Yuba under this Agreement will not confer any appropriative, public trust or other right to water on any person or entity. Nothing in this Agreement is intended or will be construed to act as a forfeiture, diminution or impairment of any water right of Yuba. Consistent with the provisions of California Water Code sections 109, 475, 1011, 1014 through 1017, 1244 and 11961, the delivery of water under this Agreement will not be evidence of or used to demonstrate either the existence of surplus water after this Agreement expires, or the lack of beneficial use of the water supplies referred to in this Agreement, and the Parties will not contend otherwise. In accordance with Water Code section 1016, and other applicable provisions of California law, at the conclusion of the term of the water transfers provided for under this Agreement, all rights in, and the use of, the water supplies referred to in this Agreement will revert back to Yuba, and DWR or any beneficiary of this Agreement, will not do either of the following: (1) bring any claim for continuation of the water supply made available by this Agreement; or (2) claim any right to a continued supply of water made available under this Agreement, based on reliance, estoppel, intervening public use, prescription, water shortage emergency, or unforeseen or unforeseeable increases in demand, or any other cause.

C. As to the Phase 8 Settlement

Nothing contained in this Agreement affects the Parties' respective rights and obligations under the Short-Term Phase 8 Agreement. The Parties agree that water provided by Yuba under the Short-term Phase 8 Agreement will be accounted for and delivered on a higher priority than water delivered under this Agreement.

D. As to Termination of the EWA Program

1. DWR intends that Component 1 Water will be dedicated to the EWA, and that in the future, upon completion of environmental documentation for a long-term EWA, the EWA would be sized sufficiently to accommodate the proposed South Delta Improvement Program, including the proposal to increase the maximum diversion rate into Clifton Court Forebay for the SWP Bank's Pumping Plant. If the EWA terminates, DWR agrees that Component 1 Water remaining to be delivered under this Agreement will be managed annually, as follows: (a) Component 1 Water in any year will be used to enhance water supply reliability of the Delta export facilities by off-setting new mandatory restrictions imposed on the CVP and SWP, including those imposed by the federal court order in *NRDC v. Kempthorne,* or through a subsequent biological opinion for conservation or protection of fish, and (b) if any Component 1 Water remains after off-setting the restrictions set forth in subsection (a) above, then the remaining Component 1 Water will be used as determined by DWR in close coordination with the California Department of Fish and Game and consistent with the water supply reliability project requirements of the funding source

from which this water was purchased (Chapter 7(d) of Proposition 50, California Water Code Section 79550(d)).

2. Except as provided in the previous subsection, none of the rights and obligations of the Parties under this Agreement will be affected in the event that the EWA program terminates prior to the expiration of the term of this Agreement.

E. As to the Fisheries Agreement.

None of the rights and obligations of the Parties under this Agreement will be affected in the event that the Fisheries Agreement terminates prior to the expiration of the term of this Agreement.

F. As to the Application of Section 27 of the Federal Power Act.

Section 27 of the Federal Power Act limits the licensing authority of FERC with respect to a law regarding the control, appropriation, use or distribution of water used in irrigation or for municipal or other uses. The Parties, and the SWP and the San Luis & Delta-Mendota Water Authority, will not contend or bring any claim that any provision of this Agreement is a law regarding the control, appropriation, use or distribution of water used in irrigation or for municipal or industrial uses, as these terms are used in Section 27 of the Federal Power Act.

24. General Contracting Provisions.

A. Notices.

The time for providing any notices specified in this Agreement may be extended within the term of this Agreement with the consent of the Parties, confirmed in writing, without requiring an amendment to this Agreement. All notices and other communications required under this Agreement will be in writing, and will be deemed to have been duly given upon the date of service, if: (a) served personally on the Party to whom notice is to be given; (b) sent by electronic mail, and the Party to whom notice is to be given confirms receipt; or (c) on the third day after mailing, if mailed to the Party to whom notice is to be given by first-class mail, postage prepaid, and properly addressed to the designated representatives of the Parties set forth below. A Party may notify the other Parties in writing of a change in its designated representatives, without requiring an amendment to this Agreement.

DWR: Director
Department of Water Resources
1416 Ninth Street, Room 1115-1
P.O. Box 942836
Sacramento, CA 94236-0001

With Copy to:
Chief, State Water Project Analysis Office
1416 Ninth Street, Room 1620-A
P.O. Box 942836
Sacramento, CA 94236-0001

Yuba: General Manager
Yuba County Water Agency
1402 D Street
Marysville, CA 95901

B. Signatories' Authority.

The signatories to this Agreement represent that they have authority to execute this Agreement and to bind the Party on whose behalf they execute this Agreement. Yuba will provide to DWR a copy of a resolution or minute order authorizing execution of this Agreement.

C. Counterparts of this Agreement.

This Agreement may be signed in any number of counterparts by the Parties, each of which will be deemed to be an original, and all of which together will be deemed to one and the same instrument. This Agreement, if executed in counterparts, will be valid and binding on a party as if fully executed all in one copy.

D. Binding on Successors/Assignment.

This Agreement will bind and inure to the benefit of the respective successors and assigns of the Parties, except that, none of the obligations of the Parties set forth in this Agreement will be assigned without the prior, written approval of the other Parties, which approval will not unreasonably be withheld.

E. No Third-Party Beneficiaries, Except as Expressly Provided.

This Agreement will not be construed to create any third-party beneficiaries, except as set forth in this section. This Agreement is for the sole benefit of the Parties, their respective successors and assigns, and no other person or entity will be entitled to rely on or receive any benefit from this Agreement or any of its terms.

F. Amendments.

This Agreement may be amended or modified only by a subsequent written agreement

approved and executed by the Parties.

G. Opinions and Determinations.

Where the terms of this Agreement provide for action to be based upon the opinion, determination, approval or review of either Party, such terms are not intended to be, and will not be construed as permitting such actions to be arbitrary, capricious or unreasonable. Any opinion, determination, approval or review required of a Party under this Agreement will be provided in a timely manner.

H. Reasonable Cooperation.

The Parties will reasonably cooperate with each other, including the execution of all necessary documents and providing assistance in obtaining approvals and permits from regulatory agencies required to perform the obligations under this Agreement and to carry out the purpose and intent of this Agreement.

I. Construction and Interpretation.

This Agreement is entered into freely and voluntarily. This Agreement has been arrived at through negotiation, and each Party has had a full and fair opportunity to revise the terms of this Agreement. Consequently, the normal rule of construction that any ambiguities are to be resolved against the drafting party will not apply in construing or interpreting this Agreement.

J. Complete Contract.

This Agreement constitutes the sole, final, complete, exclusive and integrated expression and statement of the terms of this Agreement among the Parties concerning the subject matter, and supersedes all prior negotiations, representations or agreement, either oral or written, that may be related to the subject matter of this Agreement, except as to those other agreements that are expressly referred to in this Agreement.

K. Determination of Unenforceable Provisions.

If any term or provision of this Agreement is deemed invalid or unenforceable by any court of final jurisdiction, the Parties will meet and attempt to address this situation pursuant to the provisions of Section 22 ("Remedies and Dispute Resolution") of this Agreement.

L. Waiver.

The waiver at any time by a Party of its rights with respect to a default or other matter arising in connection with this Agreement will not be deemed a waiver with respect to any other

default or matter.

M. Time.

Time is of the essence in this Agreement. Any date specified in this Agreement may be changed with the written consent of the Parties.

N. Applicable Law.

This Agreement will be construed under and will be deemed to be governed by the laws of the United States and the State of California.

O. Venue.

Any appropriate County under California law will be venue for any state court litigation concerning the enforcement or interpretation of this Agreement.

P. Remedies Not Exclusive.

The remedies provided in this Agreement are cumulative and not exclusive, and are in addition to any other remedies that may be provided by law or equity. The exercise by the Party of any remedy under this Agreement will be without prejudice to the enforcement of any other remedy.

Q. Officials Not To Benefit.

No member or delegate to Congress, Resident Commissioner, or Federal or State official will be admitted to any share or part of this Agreement or to any benefit that may arise therefrom.

R. Standard Clauses.

Yuba will comply with the State of California, Department of Water Resources, Standard Clauses as shown on Exhibit 4 ("State of California, Department of Water Resources, Standard Clauses") to this Agreement.

S. Exhibits Incorporated.

Each exhibit to which reference is made is deemed incorporated in this Agreement, whether or not actually attached.

The foregoing is hereby agreed to by the Parties.

IN WITNESS WHEREOF, the Parties hereto have executed this Agreement on the date first written above.

Approved as to legal form
and sufficiency:

Exhibit 4 **State of California, Department of Water Resources, Standard Clauses**

EXHIBIT 1

Scheduling and Accounting Principles

OVERVIEW

Monitoring, measuring, and accounting of the water that will be transferred under the this Agreement can be generally described as consisting of two fundamental parts: (1) measuring the flows at the Marysville Gage resulting from increased releases from storage in New Bullards Bar Reservoir that are greater than the baseline, without-transfer flows; and (2) measuring the ability of the Projects and the EWA to apply these flows to beneficial uses. The amounts of increased releases will be determined by measuring the outflow of the Yuba River at the Marysville Gage, and by measuring groundwater substitution pumping associated with this Agreement. The Projects' ability to use the water will be determined by the ability of the Projects to export the water at the Projects' Delta pumping facilities or to put the water to other beneficial uses. That is, water accounted for as transfer water under this Exhibit will include Released Transfer Water that is deemed to be Delivered Transfer Water, as those terms are defined in this Exhibit.

1. DEFINITIONS

Terms used in this Exhibit have the same definitions as the definitions listed in Section 1 of this Agreement. When used in this Exhibit, the following terms have the following definitions:

"Accord Flows" mean the schedule of instream flows listed in Exhibit 1 of the Fisheries Agreement.
"**Accounting Year**" means January 1 to December 31.
"Agreement" means the "Agreement for the Long-Term Purchase of Water from Yuba County Water Agency by the Department of Water Resources."
"Balanced Conditions" mean the hydrologic condition of the Delta as defined in the November 24, 1986 "Agreement between the United States of America and the State of California for Coordinated Operations of the Central Valley Project and the State Water Project." ("COA")
"Baseline Conditions" mean the conditions deemed under this Exhibit to represent the conditions that would have occurred without implementation of this Agreement or the Fisheries Agreement. "Baseline Conditions" define the without-transfer conditions and would result in the Baseline Flows.
"Baseline Diversions" mean the diversions that are defined in section 2.3.1.1 of this exhibit.
"Baseline Flows" mean the flows that would have been present at the Marysville Gage under the Decision 1644 interim instream flow requirements and all other Baseline Conditions, without implementation of the Yuba River Accord.

"Baseline Storage" means the amount of water that would have been stored in New Bullards Bar Reservoir under Baseline Conditions.

"Baseline Storage Target" means the storage targets that are defined in section 2.4 of this exhibit.

"Carriage Water" means the water losses due to increased Delta outflow necessary to maintain baseline Delta salinity conditions as determined by DWR, that are associated with Delivered Transfer Water or Stored Released Transfer Water that is exported at the Projects' Delta pumping facilities.

"Delivered Transfer Water" means Released Transfer Water that is accounted as being exported by the Projects, or contributing to exports, as described in Section 5 of this exhibit.

"**Delta Export Facilities**" means the Banks and Jones pumping facilities as determined to be available for export by the Projects

"Flow Fluctuation Operations" means operations driven by flow fluctuation criteria rather than minimum flow requirements or storage operations.

"Groundwater Substitution Component" means the quantity of Released Transfer Water that Yuba makes available from releases from New Bullards Bar Reservoir as a result of Yuba's groundwater substitution pumping program, and that is not related to releases for the Storage Component of Released Transfer Water. Groundwater Substitution Component water will be made available under the Conjunctive Use Agreements by Member Units forgoing surface water deliveries and instead pumping groundwater as a replacement water supply for local irrigation needs.

"Marysville Gage" refers to USGS Gaging Station No. 11421000, Yuba River near Marysville.

"Minimum Flows" is the required minimum instream flows specified in Decision 1644 page 176 table titled "Interim Instream Flow Requirements"

"Negative Transfer Flows" means the additional amount of flows above the Accord Flows that would have been released as part of a Baseline Flows when the Baseline Conditions Decision 1644 interim instream flow requirement is greater than the Accord Flows. "Negative Transfer Flows" are further defined in Section 4.4 of this exhibit.

"North Yuba Index" means the index used to determine the applicable Fisheries Agreement flow schedule for the Lower Yuba River. This index is defined in Exhibit 4 of the Fisheries Agreement.

"Percent Inflow Diversion Loss" means the amount of Released Transfer Water that is lost due to the restrictions imposed by the "maximum percent of Delta inflow diverted" standard as described in the SWRCB Revised Decision 1641 when that standard is generally 35% from February 1 to April 30.

"Projects" mean the CVP and the SWP.

"Refill" is a condition of reduced releases from New Bullards Bar Reservoir as compared with the releases that would occur under Baseline Conditions. These reduced releases could result from diversions to storage to fill storage space evacuated as a result of releases that created the Storage Component of Released Transfer Water.

"Released Transfer Water" means the average daily flows measured at the Marysville Gage that are greater than the Baseline Flows. "Released Transfer Water" is further described in Section 4.2 of this exhibit.

"Section" refers to sections of this Exhibit, unless otherwise stated.

"**Smartville Gage**" refers to USGS Gaging Station No. 11418000, Yuba River below Englebright Dam, near Smartville

"Storage Component" means the quantity of Released Transfer Water that Yuba makes available from storage releases from New Bullards Bar Reservoir, and which storage is not a result of storage releases resulting from Groundwater Substitution Component operations.

"Stored Released Transfer Water" means the stored water in Project upstream reservoirs. "Stored Released Transfer Water" is further defined in Section 4.3 of this Exhibit.

"Total Uncontrolled Flows" mean the total amount of flows entering Englebright Reservoir, other than from releases from the New Colgate Powerhouse, plus flows from Deer Creek and Dry Creek into the lower Yuba River downstream of Englebright Reservoir.

2. BASELINE CONDITIONS

Baseline Conditions are the controlling constraints and criteria for operation of the Yuba Project that determine Baseline Flows for the accounting of Released Transfer Water during the term of this Agreement. Baseline Conditions include the following:

2.1. **Regulatory Instream Flow Requirements:**

2.1.1. Decision 1644 interim instream flow requirements.

2.1.2. FERC License 2246 instream flow requirement of 400 cfs at the Marysville Gage (below Daguerre Point Dam) for the period of October 1-14, including the dry year reductions of this flow requirement that are authorized in the License.

2.1.3. Flow reduction restrictions required by FERC License 2246.

2.1.4. Flow fluctuation restrictions specified in the November 22, 2005 FERC Order Modifying and Approving Amendment of License (at page 11 of that order).

2.2. **Operational Agreements:**

2.2.1. The PG&E Power Contract, as modified by the July 16, 2002 Agreement Concerning Power Purchase Contract of 1966 and Consolidated Operations of the Narrows I and

Narrows II Powerhouses. The 2002 Agreement removed the generation quota terms of the PG&E Power Contract for the months of January to June.

2.3. **Water Supply Agreements:**

2.3.1. Water supply agreements between Yuba and the following Member Units: Browns Valley Irrigation District, Hallwood Irrigation Company, Cordua Irrigation District, Ramirez Water District, Brophy Water District, South Yuba Water District, Dry Creek Mutual Water Company and Wheatland Water District.

2.3.1.1. Baseline Diversions that are made under the agreements listed in Section 2.3.1 are the measured diversions as reported by Yuba, including any reduced diversions that are made to provide water for the Groundwater Substitution Component, and including other reduced diversions that are implemented as part of defined water efficiency or conservation programs or projects.

2.4. **Baseline Storage Target Line** is a graphical line of the maximum storage levels during the year at which Yuba would normally operate New Bullards Bar Reservoir under Baseline Conditions.

2.4.1. These levels are:

- September 30: 705,000 acre-ft;
- October 1 to October 31: linearly ramped from 705,000 acre-ft to 700,000 acre-ft;
- November 1 to February 15: 700,000 acre-ft;
- February 16 through March 31: linearly ramped from 700,000 acre-feet to 796,000 acre-feet;
- April 1 through April 30: linearly ramped from 796,000 acre-feet to 896,000 acre-feet;
- May 1 through May 31: linearly ramped from 896,000 acre-feet to 966,000 acre-feet; and
- June 1 through June 30: 966,000 acre-feet.
- July 1 to September 29: no fixed Baseline Storage Target amounts are provided for this period, because the maximum storage levels during this period at which Yuba would normally operate New Bullards Bar Reservoir under Baseline Conditions are governed by the runoff hydrology conditions of the Yuba River.

3. BASELINE FLOWS DETERMINATION

3.1. Baseline Flows will be determined as mean daily flows in cubic feet per second (cfs), with a separate determination for each day of the accounting period. Baseline operations will be

characterized by four categories of operation, each of which are governed by the overriding operational constraint for the applicable time period. The four categories of operation are: (1) Operation to Minimum Flows; (2) Operation to Baseline Storage Target release; (3) Transitional Operations; and (4) Flow Fluctuation Restricted Operations. The four categories and the calculation to determine the Baseline Flows under each category of operation as well as a general description of when each category will occur are described below. Once one of the four categories of operation has been determined to be in effect, the procedures of this section will be used to determine the resulting Baseline Flows that would have occurred at the Marysville Gage. Yuba will prepare a guideline description of baseline operations that can be used by the Parties and others to understand the operations of the Yuba Project that would occur under Baseline Conditions.

3.2. Due to the complex nature of the controlling operational criteria for the Yuba Project and the hydrology of the Yuba River watershed, there may be periods when conditions will not allow for use of the accounting procedures listed for any of these four categories of operations to determine the Baseline Flows. Technical representatives from each Party will work together to attempt to resolve the transfer accounting for such periods. If the Parties cannot agree upon the accounting for such periods, then the dispute resolution process of section 10.2 of this exhibit will be followed.

3.3. **Operation to Minimum Flows** is the controlling category of operation when releases under Baseline Conditions would have been made to maintain the minimum required flows at the Marysville Gage or at the Smartville Gage, whichever is the controlling location. The flow requirements listed in the table titled "Interim Instream Flow Requirements" on page 176 of Decision 1644 are the regulatory minimum required flows under Baseline Conditions and are the Baseline Flows that would occur when this category of operation is controlling.

3.3.1. **Determination of When Operation to Minimum Flows Would Occur -**

3.3.1.1. Beginning October 1, operations under Baseline Conditions will be considered to be at Minimum Flows unless or until there is a need to increase releases to manage storage levels at or below the Baseline Storage Targets. In the late winter and spring, forecasted runoff and resulting New Bullards Bar Reservoir storage govern when releases would exceed the minimum flows. For the winter and spring, if storage in New Bullards Bar Reservoir would have been at or above the Baseline Storage Targets with continued operations to minimum flows then a transition to releases above the minimum flow requirements would occur.

3.3.1.2. For the months of March through September, if, with releases from New Bullards Bar Reservoir to meet the Decision 1644 Interim Instream Flow Requirements and

Baseline Diversions, the end-of-September Baseline Storage Target in New Bullards Bar Reservoir would have been at or below 705,000 acre-feet, then the Baseline Flows for this period will be the Decision 1644 Interim Instream Flow Requirements.

3.3.2. **Calculation of Baseline Flow under Operations to Minimum Flows.** If operations to minimum flows has been determined to occur as described in Section 3.3 then Baseline Flows will be calculated as follows:

3.3.2.1. Calculate the River Balance – The River Balance includes intervening accretions or depletions of the Yuba River between the Smartville Gage and the Marysville Gage. The River Balance equals the measured flow at the Marysville Gage plus the measured Yuba diversions minus the measured flow at the Smartville Gage

3.3.2.2. Calculate the Baseline Flow – The Baseline Flows equal the greater of the required Decision 1644 Interim Instream Flow Requirement at the Smartville Gage minus the sum of the measured Yuba diversion plus the River Balance or the required Decision 1644 Interim Instream Flow Requirement at the Marysville Gage plus any adjustments for Total Uncontrolled Flows that would not have been offset by a reduction in releases from Englebright Reservoir. The adjustment of Total Uncontrolled Flows will include short-duration increases in releases from the Narrows II Powerhouse due to short-term increases in power demands, power outages resulting in loss of control of releases from Englebright Dam and short duration uncontrolled runoff downstream of Englebright Dam that occurs when there is no Decision 1644 Interim Instream Flow Requirement at the Smartville Gage.

3.4. Operations to Target Storage Release

3.4.1. For all times of the year, Operations to Target Storage Release is the controlling category of operation if operation to Minimum Flows would result in New Bullards Bar Reservoir storage above the Baseline Storage Target. If Operations to Target Storage Release would have occurred, then the Baseline Flow is the rate of release that would have been needed to meet the monthly Baseline Storage Target amount in New Bullards Bar Reservoir.

3.4.2. In the months of December through March, forecasts of future inflow and actual inflow are used to develop release decisions. During these months, operations are to

manage storage to meet the springtime Baseline Storage Target, while avoiding spills of water from New Bullards Bar Reservoir.

3.4.3. If the end-of-September storage in New Bullards Bar Reservoir under Baseline Conditions would have been above 705,000 acre-feet with releases from New Bullards Bar Reservoir minimized to meet the Decision 1644 Interim Instream Flow Requirements and diversions, then the Baseline Flows will be the flow rate schedule that would have been needed to release sufficient water from New Bullards Bar Reservoir to meet an end-of-September storage of 705,000 acre-feet.

3.4.4. The accounting in wetter years in the summer period is based on reaching storage in New Bullards Bar Reservoir on September 30 as described in and subject to the provisions above. The water storage volume in New Bullards Bar Reservoir is affected by natural inflow, and the scheduled release of water from New Bullards Bar Reservoir is predicated on an estimate of this inflow. Because the release of water to achieve the target storage is relatively fixed as of mid-summer, Yuba and the Projects may revise the target storage volume in New Bullards Bar Reservoir if mutual agreement is reached.

3.5. **Transition Operations** would have occurred when Baseline Releases would have previously been governed by either Operation to Minimum Flows or Operation to Target Storage Release and the operational constraint would have shifted to the other type of operation. Under this condition, a period of transition would have occurred and flows would have been based on the specific conditions at that time, including actual runoff, forecasts of runoff, and planned operations. Because each circumstance of Transition Operations would have been different, Yuba will prepare forecasted Baseline Flows for the transition time period and provide supporting data to show why the Baseline Flows would have been expected to have occurred. Maximum hourly and daily rates of flow change are prescribed in FERC License 2246 and the "November 22, 2005 FERC Order Modifying and Approving Amendment of License" for the Baseline Flows operations.

3.6. **Flow Fluctuation Operations** would have occurred when the FERC License 2246 restriction on flow reductions in the months of October to March, or the restriction on flow reductions in the November 22, 2005 FERC Order Modifying and Approving Amendment of License would have required flows to be maintained above the minimum flows. Flow Fluctuation Operations would have been managed the same as Operations for Minimum Flows except that the minimum instream flow requirement would be prescribed by the flow reduction restrictions in FERC License 2246 or the flow fluctuation restrictions in the November 22, 2005 FERC Order Modifying and Approving Amendment of License, rather

than the Decision 1644 Interim Instream Flow Requirements. As early as practical, Yuba will provide the minimum allowable flows for flow fluctuation operations as the Baseline Flows to DWR, along with an explanation of the determination of these Baseline Flows.

3.7. **Fishery Study Flows** - The Fishery Agreement calls for the development of fishery studies. Some of the studies to be conducted could involve fluctuation of flows during some periods. If a defined flow release schedule is planned as part of a fishery study administered by Yuba or the River Management Team (a group defined in the Fisheries Agreement) under the Fisheries Agreement, then these flows in this schedule will not be part of Baseline Flows and, if all other aspects of this exhibit are satisfied, then the amounts of these flows that exceed Baseline Flows will be accounted as Released Transfer Water. Any reduced releases as part of a fishery study will be accounted as a Negative Transfer Flow if the conditions of Section 4.4 of this exhibit Negative Transfer Flow are met. At a minimum of 14 days prior to the start of any such study, and as early as possible, Yuba will provide notice of any Fishery Study Flows to DWR.

3.8. **Baseline Storage** -Yuba will use the Baseline Flow amounts to determine the daily storage in New Bullards Bar Reservoir that would have occurred under Baseline Conditions. The calculation of Baseline Storage will use the actual inflows into New Bullards Bar Reservoir and Total Uncontrolled Flows into the lower Yuba River, along with a daily calculation of the releases from New Bullards Bar Reservoir that would have been made to meet the Baseline Flows, to determine the daily Baseline Storage amount. The Baseline Storage amount will be used to calculate the Base Transfer amount for Refill accounting in **Exhibit 2** of this Agreement.

4. TRANSFER WATER DELIVERY AND FLOW MEASUREMENT

4.1. **Point of Measurement and Delivery** - The point of delivery and the point of measurement of Released Transfer Water, and the point for determination of Baseline Flows, all will be at the Marysville Gage. The flows used for calculating Released Transfer Water and Baseline Flows will be mean-daily flows in cfs.

4.2. **Released Transfer Water** will be the amount of the actual mean-daily flow that has been measured at the Marysville Gage minus the mean daily Baseline Flows for the same day. The mean daily Baseline Flow will be determined according to the methods described in Section 3 of this exhibit.

4.3. **Stored Released Transfer Water** is water that has been accounted for as Released Transfer Water and that results in increased storage in an upstream Project reservoir (that is, water that is "backed into storage"). Released Transfer water will be deemed to have been stored

in an upstream Project reservoir when the Delta is in Balanced Conditions, there is no available pumping capacity at Project Delta pumping facilities, and releases from Project storage reservoirs would have been greater in the absence of Released Transfer Water. The incrementally greater Project release necessary under Baseline Conditions will be accounted for as Stored Released Transfer Water in Project storage. This accounting of Stored Released Transfer Water will be kept to determine whether Stored Released Transfer Water can subsequently be released from Project storage and exported by the Projects under Section 5.5 of this exhibit, and thus be accounted for as Delivered Transfer Water. Every effort will be made to account for Stored Released Transfer Water as backing into Oroville Reservoir as a first preference. This will necessitate an adjustment in the COA between the two Projects.

4.4. **Negative Transfer Flows** – During certain periods, the amount of the actual measured flow under Section 4.1 of this exhibit may be lower than the applicable Decision 1644 Interim Instream Flow Requirement. During these periods, the Baseline Flows will be the applicable Decision 1644 Interim Instream Flow Requirement. During these periods, the amount of the applicable Decision 1644 Interim Instream Flow Requirement minus the measured flow under Section 4.1 of this exhibit will be accounted for as a Negative Transfer Flow. If a Negative Transfer Flow occurs on a day when all or a portion of the Negative Transfer Flow amount could have been accounted for as Delivered Transfer Water as described in Section 5.5 of this exhibit, then this amount will be deducted from the total Delivered Transfer Water for the Water Accounting Year in which the Negative Transfer Flow occurred.

4.5. **Groundwater Substitution Component Flow** – Released Transfer Water may be fully or partially derived from Groundwater Substitution Component water. **Exhibit 3** of this Agreement describes the process that will be used to determine the planned amount of Groundwater Substitution Component water that will be provided each year and the monitoring and reporting that will be conducted by Yuba and participating Member Units for Groundwater Substitution Component operations.

4.5.1. Delivery and Measurement – Groundwater Substitution Component water will be delivered at the Marysville Gage, and measured as Released Transfer Water under Section 4.2 of this exhibit.

4.5.2. Water released as Groundwater Substitution Component water will not be included in the transfer amount for Refill accounting in **Exhibit 2** of this Agreement.

4.5.3. The total amount of Released Transfer Water that will be designated as Groundwater Substitution Component water will be limited to the amount of groundwater pumping that is measured by the procedures described in **Exhibit 3** of this Agreement.

5. DETERMINATION OF DELIVERED TRANSFER WATER

5.1. Delivered Transfer Water may only occur when the Delta is determined by DWR to be in Balanced Conditions.

5.2. For this Agreement, it is assumed that Released Transfer Water measured at the Marysville Gage will reach the Projects' Delta export pumps two days after the date of measurement at the Marysville Gage.

5.3. For this Agreement, Released Transfer Water used as Carriage Water or used as Delta outflow when the E/I ratio is controlling in the time period of July 1 to January 31 by the Projects will be accounted as Delivered Transfer Water as described in Section 5.11 of this exhibit. For this Agreement, Percent Inflow Diversion Loss will not be accounted as Delivered Transfer Water.

5.4. For this Agreement, it is assumed that there will be no conveyance losses between the Marysville Gage and the Projects' Delta pumping facilities.

5.5. For each day that Released Transfer Water is accounted for under Section 4.2 of this exhibit, Stored Released Transfer Water accounted for under Section 4.3 of this exhibit is released from Project storage, a determination will be made, utilizing information provided by DWR that is described in Section 5.11 of this exhibit, regarding whether or not there was capacity available at the Projects' Delta export facilities.

5.6. Stored Released Transfer Water will be released from Project storage only if capacity at the Projects' Delta pumping facilities is available unless the water "spills" from Project storage before such export capacity becomes available and therefore will not be accounted for as Delivered Transfer Water.

5.7. The lesser of the following two amounts will be accounted for as Delivered Transfer Water if DWR has determined that capacity is available at the Delta export facilities as described in Section 5.11.

5.7.1. The Released Transfer Water amount determined under Section 4.2 of this exhibit, or

5.7.2. The incremental increase in exports that occurs as a result of Released Transfer Water during a period when Percent Inflow Diversion Loss is occurring.

5.8. For each day that there are Negative Transfer Flows as accounted for under Section 4.4 of this exhibit, a determination will be made regarding the amount of reduced Delta exports or

increased Project releases that resulted from the Negative Transfer Flow. A Negative Transfer Flow will be accounted for as a debit to the total amount of Stored Released Transfer Water if the effect of the Negative Transfer Flow is that it causes an increase in Project releases or reduces Delta exports.

5.9. Some or all of the Stored Released Transfer Water will be deemed to have been spilled from Project reservoir storage and will be debited from the account described in Section 4.3 of this exhibit, if the Project reservoir in which the Stored Released Transfer Water is stored makes flood control releases. The debit amount will equal the actual amount of Stored Released Transfer Water spilled, or the total amount of Stored Released Transfer Water, whichever is less.

5.10. Along with the accounting of Delivered Transfer Water, Yuba will maintain an accounting of the Base Transfer amount for Refill accounting. The Base Transfer amount for refill accounting will be calculated as the difference in volume of actual New Bullards Bar Reservoir storage and the Baseline Storage that is directly attributable to the release of Delivered Transfer Water from New Bullards Bar Reservoir storage.

5.11. DWR will make every effort to export Released Transfer Water and Stored Yuba Water based on the available export capacity at the Projects' Delta pumping facilities, as determined by DWR, which includes a determination of capacity available after delivery of SWP water and water for regulatory, water right and contractual obligations.

6. PROCEDURES FOR ACCOUNTING OF BASELINE FLOWS AND TRANSFER AMOUNTS

6.1. The Water Accounting Year and provisions of this Agreement pertaining to notice and invoicing for Delivered Transfer Water will govern the timing of transfer accounting.

6.2. **Calculation of Forecasted Baseline Flows.** Yuba will calculate a preliminary forecast of Baseline Flows, as described in Section 3 of this exhibit on a monthly basis unless more frequent forecasted Baseline Flows are requested by DWR or provided by Yuba. The forecasted Baseline Flows along with forecasted flows will be used by DWR to plan Project operations to export Released Transfer Water. The preliminary forecast of the Baseline Flows will be made using forecasted hydrologic conditions for the month, based on Yuba River unimpaired flows forecasted in the most-recent DWR Bulletin 120 and any updates. Within 14 days after the end of the month, Yuba will provide DWR with its draft calculations of Baseline Flows.

6.2.1. Yuba will provide preliminary and draft final calculations of Baseline Flows to DWR for its review and concurrence. The calculation of preliminary Baseline Flows will be

used to predict the amount and timing of Released Transfer Water that will be generated for the upcoming period. During that period, Yuba may update the preliminary calculation of Baseline Flows as changes in hydrologic conditions affect the accuracy of the calculation. Yuba will provide to DWR all requested backup information and calculations, excluding any models that were the bases of the calculation of Baseline Flows, so that DWR may verify the calculation. If DWR concurs with the preliminary calculation of Baseline Flows, then such preliminary Baseline Flows will be used in coordinating operations and for any initial allocation of Released Transfer Water to Components 1, 2, 3 and 4 Water as described in Section 7 of this exhibit. Yuba will also provide a calculation of Baseline Storage for Refill accounting (**Exhibit 2**) and comparison with the Baseline Storage Target Line.

6.2.2. Due to the delayed release of final USGS reporting of flows at the Marysville Gage, Yuba's transfer accounting will use the mean-daily flows as reported by Yuba to the USGS. DWR will be given timely notice if this information subsequently changes due to re-rating or shifts in the Marysville Gage, as reported by Yuba to the USGS.

6.3. **Calculation of Final Baseline Flows and Delivered Transfer Water Amount.** At the time that Yuba develops a preliminary estimate of Baseline Flows and provides it to DWR, Yuba also will develop and provide to DWR a preliminary release schedule and forecast of daily Released Transfer Water. Yuba will update the release schedule and resulting forecast of daily Released Transfer Water no less than once per month, unless an alternative time period is agreed to by the Parties. Within fourteen days after the end of each month or within 14 days of an export period, Yuba will calculate a draft final Transfer Accounting under Section 6.3.5 of this exhibit. Section 11 of this exhibit describes the scheduling and coordination of sharing operational information.

6.3.1. Because of the variability of hydrologic conditions, and because of the uncertainty regarding whether or not DWR will call for option water in some periods, Yuba will prepare a matrix of one or more forecasted Baseline Flows, one or more release schedules and the resulting estimated quantities of Released Transfer Water. Yuba will provide indications of the relative probability of each Baseline Flows scenario that is provided in the matrix.

6.3.2. DWR will notify Yuba periodically, as information is available, when Project conditions are such that any of the forecasted Released Transfer Water may not be exported.

6.3.3. Calculation of the amount of Released Transfer Water will utilize the determination of export capacity and the Percent Inflow Diversion Loss provided to Yuba by DWR no

later than 14 days after the end of the assumed export period. An export period ends following a verifiable point in time at which Baseline Flows can be verified against the Baseline Storage Target Line as described in Section 3 of this exhibit.

6.3.4. If DWR concurs with Yuba's draft final calculation of Baseline Flows, then it will become the final Baseline Flows, and will be used for all final transfer accounting for the corresponding period.

6.3.5. Along with the calculation of the draft final Baseline Flows, Yuba will also calculate and submit to DWR a draft final accounting of the amounts of Components 1, 2, 3 and 4 Water that were Delivered Transfer Water during the accounting period. This draft final accounting will include entries for the following:

(a) Mean daily flow at the Marysville Gage, as measured according to Section 4 of this exhibit;

(b) Daily schedule of resulting Released Transfer Water according to Section 4.2 of this exhibit and accounting for Negative Transfer Flows under Section 4.4 of this exhibit;

(c) Calculation of Delivered Transfer Water under Section 5 of this exhibit, including any necessary reductions for Negative Transfer Flows and an accountings of Stored Released Transfer Water delivered and Stored Released Transfer Water remaining in storage, using the export capacities submitted DWR;

(d) Calculation of the amounts of Components 1, 2, 3 and 4 Water that were Delivered Transfer Water, as calculated under Section 7 of this exhibit; and

(e) A breakdown of the Storage Component and the Groundwater Substitution Component of the Delivered Transfer Water for the period.

(f) A calculation of the amount of reduced storage in New Bullards Bar Reservoir that resulted from releases of Storage Component Delivered Transfer Water. The resulting amount of reduced storage calculated at the start of the Refill Period will be the Base Transfer amount used for Refill accounting as described in **Exhibit 2.**

7. ACCOUNTING FOR COMPONENTS OF TRANSFER WATER

7.1. Water that has been determined to be Delivered Transfer Water will be credited towards one of four components of Water: Component 1, Component 2, Component 3, or Component 4.

7.2. Delivered Transfer Water will be credited to one of these four components of Water in the following priorities:

7.2.1. The first 60,000 acre-ft of Delivered Transfer Water that also is Storage Component water in each Water Accounting Year will be credited to Component 1 Water.

7.2.2. In Dry and Critical Water Years, the first 60,000 acre-ft of Storage Component water will be credited to Component 1 Water, and the next 15,000 acre-ft in Dry Water Years,[1] and 30,000 acre-ft in Critical Water Years, of Storage Component water will be credited to Component 2 Water. If the total amount of Delivered Transfer Water that also is Storage Component water in any Water Accounting Year is less than the total commitment for Component 1 Water (i.e., 60,000 acre-ft), Yuba will not be obligated to provide Groundwater Substitution Water to complete delivery of the 60,000 acre-feet. If the total amount of Delivered Transfer Water from the Storage Component water in a Water Accounting Year is less than the total commitment for Component 2 Water (i.e., 15,000 acre-ft in Dry Water Years and 30,000 acre-ft in Critical Water Years), then Yuba will provide Groundwater Substitution Component water, but subject to the provisions of **Exhibit 3** of this Agreement, to complete the balance of Yuba's commitment for Component 2 Water.

7.2.3. In years when Yuba has a commitment to provide 40,000 acre-ft of Component 3 Water, after Component 1 Water and Component 2 Water (if any is required) is fully accounted for, any remaining Storage Component water will be credited as Component 3 Water, and then any remaining unfulfilled commitment for Component 3 Water will be provided and accounted from Groundwater Substitution Component water, but subject to the provisions of **Exhibit 3** of this Agreement.

7.2.4. Any remaining balance of Storage Component water, and then Groundwater Substitution Component water, will be credited as Component 4 Water after all other commitments of Water have been credited from the total Delivered Transfer Water for the Water Accounting Year.

7.3. In years when there is no commitment for Component 2 or Component 3 Water, any Delivered Transfer Water that also is Storage Component water, and that exceeds the 60,000 acre-ft of the Component 1 Water obligation, will first be credited to repay any accrued deficit in Component 1 Water deliveries and then to repay any accrued deficit in Component 2 and Component 3 Water deliveries and finally accounted as Component 4 Water, subject to the provisions of Section 5A2 of this Agreement.

7.4. **Holding Account.** If Delivered Transfer Water Storage Component has been credited as Component 4 Water under Section 7.2.4 or Section 7.3 of this exhibit, and if DWR has not

[1] These water-year types are defined by the Sacramento Valley Index in SWRCB Decision 1641.

committed to pay for some or all of the credited Component 4 Water under the option provisions of this Agreement, then the uncommitted portion of Component 4 Water will be addressed in the following manner:

7.4.1. By September 30 of any year where there is Delivered Transfer Water that is uncommitted to one of the four Components of water, Yuba will notify DWR of the availability of the uncommitted Delivered Transfer Water for purchase as Component 3 or Component 4 water prior to accounting for the water in the Holding Account.

7.4.2. Water credited to the Holding Account will be available first as the following year's Component 3 or 4 Water and second as a credit to the following year's Component 1 Water, provided that the Holding Account water is not spilled from San Luis reservoir. The applicable purchase price for the water will be determined by the Water Year in which the water is accounted for as Delivered Transfer Water, even if the credit is applied in a subsequent year.

7.5. **Component 1 Water Accounting Deficit**. There are two conditions under which an account deficit of Component 1 Water can occur: (1) in very wet years, Yuba may release sufficient Released Transfer Water to provide the full required amount of Component 1 Water, but due to Delta conditions, some or all of this Released Transfer Water may not be able to be accounted for as Delivered Transfer Water under Section 5 of this exhibit. In such years, the amount of Delivered Transfer Water will be less than Yuba's obligation to provide Component 1 during that Water Accounting Year; and (2) in addition, under section 7.2.2 of this exhibit, there may be years in which there are less than 60,000 acre-feet of Storage Component Water available to meet Yuba's Component 1 obligation. In both of these cases, the amount of outstanding Component 1 Water will be noted as a Component 1 Water account deficit for that Water Accounting Year, and Yuba will be obligated to provide the remaining amount of Component 1 Water in a subsequent Water Accounting Year, subject to the provisions of Section 5A2 of this Agreement.

7.6 **Component 1 Water Makeup Provisions.** Yuba will apply Storage Component water in excess of the 60,000 acre-foot amount of Component 1 Water to be delivered during the current Water Accounting Year to any deficit in the Component 1 Water account from a previous year, as long as the current Water Year type is not a Dry or Critical Water Year. If the current Water Year type is a Dry or Critical Water Year, then Storage Component water may be applied to a deficit in the Component 1 Water account at Yuba's discretion, subject to the provisions of Section 5A2 of this Agreement.

7.7 **Components 2 and 3 Water Accounting Deficit and Makeup Provisions.** A deficit in providing Component 2 and/or Component 3 Water could occur if there is not enough Storage Component water accounted for as Delivered Transfer Water to meet the total obligations to provide Components 1, 2 and 3 Water, and due to the provisions of **Exhibit 3** for determining the amount of Groundwater Substitution Component water that may be provided, the amount of Groundwater Substitution Component water is not sufficient to make up the entire remainder of the commitment to provide Components 1, 2 and 3 Water. If there is a deficit in Component 2 or Component 3 Water the Parties will meet and confer under Section 22 ("Remedies and Dispute Resolution") of this Agreement to determine what actions should be taken.

8. CONFERENCE YEAR ACCOUNTING

8.1. No Negative Transfer Flows amounts will be accounted for in a Conference Year if there is no Delivered Transfer Water.

8.2. In a Conference Year, the obligation to provide Component 1 Water may be suspended by Yuba, and instead Yuba will incur a deficit in its obligation to provide Component 1 Water Delivered Transfer Water that must be repaid in a non-Conference Year as provided in this Agreement.

8.3. There will be no obligation to provide Component 2 or Component 3 Water in a Conference Year.

8.4. Makeup provisions and repayment of Refill provisions of the accounting will be suspended during a Conference Year. Any amounts of water in Holding Accounts or repayment amounts will be carried forward to the next year non-Conference Year following a Conference Year.

8.5. If Yuba and DWR agree to transfer some amount of Water in a Conference Year, then the Conference Year Baseline Conditions will be agreed to by Yuba and DWR.

8.6. Transfer of Component 4 Water may occur in a Conference Year only if Negative Transfer Flows and Refill impacts are accounted for and, in the case of Refill impacts, repaid first.

9. GROUNDWATER SUBSTITUTION COMPONENT WATER

9.1. Yuba, at Yuba's sole discretion, may decide to enter into agreements with participating Member Units under which the participating Member Units will arrange for their respective water users to reduce their use of surface water diversions by amounts to be determined by Yuba and the participating Member Units during the Water Accounting Year, and to pump equivalent amounts of groundwater from approved wells as replacement supplies for the

Groundwater Substitution Component of Released Transfer Water. Yuba will provide DWR with one or more lists of the locations of the wells that may be pumped for the Groundwater Substitution Component. In no case will groundwater pumping commence from a well for the Groundwater Substitution Component before approval of the well by DWR. Wells that are located within two miles of the Yuba River or the Feather River will be subject to review and approval by DWR. All other listed wells will be approved by DWR upon demonstration by Yuba that all required local permits for these wells have been obtained. DWR will review the list of wells, their locations and any other pertinent information provided by Yuba and the participating Member Units, and will notify Yuba and the participating Member Units within ten working days after the submittal of a list by Yuba of any well that DWR reasonably determines is not acceptable for pumping under this Agreement, and will inform Yuba and the Member Unit in which the well is located of the basis for the determination by DWR. Upon receipt of supplemental information from Yuba or the Member Unit in which the well is located, DWR may reconsider its refusal to allow the well to provide Groundwater Substitution Component water and reverse its determination. Groundwater pumped for the Groundwater Substitution Component must be put to reasonable use for irrigation on lands that otherwise would have been served with surface water within the participating Member Unit's service area between March 1 and December 31.

9.2. Yuba will comply with the Groundwater Monitoring, Reporting and Operations Program, which is **Exhibit 3** to this Agreement.

9.3. Yuba will ensure that flow-measuring devices are acquired, installed and maintained to measure the quantities of groundwater actually being pumped for the Groundwater Substitution Component from wells identified in Section 9.1 of this exhibit. Yuba and the participating Member Units will be responsible for the distribution of water pumped under this Agreement within each participating Member Unit's boundaries. The Projects will not be responsible for any costs of installing, operating or maintaining groundwater pumping facilities or flow-measuring devices, or for any costs of conveying groundwater pumped to places of use within the participating Member Units' service areas pursuant to this Agreement. By the fifteenth day of every other month, Yuba will provide a report to DWR of the quantities of groundwater pumped from each well for the Groundwater Substitution Component during the previous reporting period under this Agreement.

9.4. Yuba will make arrangements for DWR and its representatives to have access to facilities and records of Yuba and its participating Member Units to the extent reasonably necessary to verify that the groundwater pumping, the management of such pumping and the

implementation of the Groundwater Monitoring and Reporting Program for the Groundwater Substitution Component meet the requirements of Section 9 of this exhibit.

10. ACCOUNTING PREPARATION AND NOTIFICATIONS

10.1. **Accounting preparation for invoicing** - Yuba will prepare a draft accounting of the quantities of Released Transfer Water and the Delivered Transfer Water, utilizing information provided by DWR, as described in Section 6 of this exhibit, and Yuba will submit these calculations in a standard form to be developed by the Parties for review by the Technical Committee according to the schedules set forth in this Agreement. The Technical Committee will provide written notification to Yuba and DWR within 20 days of receipt of the Transfer Accounting from Yuba whether it agrees with the accounting. If the Technical Committee agrees with the accounting, or if there has been no written notification by the 20th day, then Yuba will submit invoices to DWR as provided in this Agreement.

10.2. **Disputes on accounting amounts** – If there is a dispute between the Parties regarding accounting, then the Technical Committee will first meet and attempt to resolve the dispute, and submit the disputed accounting for final resolution by the Management Committee. For accounting disputes only, if the dispute cannot be resolved by the Management Committee, then the Parties will resolve the accounting dispute as provided in Section 22 ("Remedies and Dispute Resolution") of this Agreement.

10.3. **Maintaining Records of Accounting and Accounts** – Yuba will maintain a set of records for all accountings, and all back-up materials used to prepare the accountings, at Yuba's offices, and Yuba will make these records available to DWR upon request during normal business hours. DWR will maintain records of DWR's determination of Delta conditions and Project export capacity as described in Section 6.3.2, and make these records available to Yuba upon request during normal business hours.

11. FORECASTING AND EXCHANGE OF INFORMATION FOR TRANSFER

11.1. Yuba and DWR will exchange operations forecasts and other data deemed useful for purposes of enhancing the usefulness of the water to be made available under this Agreement. The forecasts will identify and substantiate the quantities and timing of forecasted transfer flows over a range of possible hydrologic conditions, and identify forecasted periods of Balanced Conditions and water allocations for the CVP and SWP. Additionally, the operations forecasts to be provided will assist the CVP and SWP to

efficiently integrate the Yuba flows in their operations plans, and will assist EWA in planning asset acquisition and management.

11.2. Yuba will provide the following:

- Updated forecasts of operations, monthly from February through June.
- Updated forecasts as necessary, but not less than monthly, depending on changing conditions, from July through January.
- The operations forecast should extend through the end of the current Water Year classification through January 31.
- Initially, each Water Year, separate operations forecasts will be provided based on hydrologic probability of exceedence levels of 90%, 10%, and 50%. Some forecasts may be deleted as the Water Year progresses, depending on need. Likewise, other forecasts may be added, if needed.
- Each Yuba forecast will include:
    1. Forecasted flows at Marysville Gage (daily for the first 30 days of forecasted flows and then monthly, or for a partial month if the dates of flow change within month are known)
    2. Forecasted Baseline Flows (daily for the first 30 day of forecasted flows and then monthly, or for a partial month if the dates of flow change within month are known)
    3. Forecasted New Bullards Bar reservoir storage
    4. New Bullards Bar forecasted inflow, outflow, diversions, evaporation
    5. Yuba River Index and Water Year classification
    6. North Yuba Index and computation details, North Yuba Year classification
    7. Forecasted transfer water quantities (monthly)
    8. Identification of any "make-up" flows or other flows planned.
    9. Amounts and timing of groundwater pumping contributing to availability of transfer flows.

DWR will provide to Yuba before the 1st of each month from February through June, and from July through January if updated Yuba forecasts are needed, the following information:

- Details of CVP and SWP forecasted reservoir and export operations through the end of the current calendar year.

- Forecasted periods of balanced conditions though the end of the current calendar year.

12. TECHNICAL COMMITTEE AND MANAGEMENT COMMITTEE

12.1. Technical Committee

The Technical Committee will: (1) collect, review and analyze information relevant to accounting of water consistent with **Exhibits 1, 2 and 3** of this Agreement, and information related to advances, payments and cost adjustments; (2) identify and attempt to resolve technical implementation issues; (3) periodically report to the Management Committee on the information gathered and any technical implementation issues identified; and (4) make recommendations to the Management Committee for resolution of any policy issues that arise or for any required factual determinations. If the Technical Committee is unable to agree on a recommendation to the Management Committee, then the Technical Committee will cooperate to provide a balanced presentation of the facts, opinions and other information underlying the various positions on the issue to be determined.

12.2. Management Committee.

The Management Committee will: (1) provide policy guidance in implementing this Agreement; (2) make any factual determinations required to implement this Agreement; (3) consider information provided by the Technical Committee, if applicable, when making decisions; and (4) identify and resolve any policy-related implementation issues.

EXHIBIT 2

Reservoir Refill Accounting Provisions

SECTION 1: GENERAL PRINCIPLES

DWR must be assured that the refilling of New Bullards Bar Reservoir resulting from purchase of water from Yuba by DWR will not impact the Projects. Such impacts could occur (according to DWR) if storage vacated by the transfer is refilled during Balanced Conditions in the Delta. Yuba agrees that if there is an outstanding account of impacts after the Water Year reservoir refill period, then Yuba will release additional water during subsequent Balanced Conditions in excess of normal operating requirements to compensate for refill impacts. The following procedures for determining refill impacts and conditions for additional releases will be used in accounting for refill. DWR will work with Reclamation to allocate the impact account between the Projects. This exhibit includes the definitions set forth in **Exhibit 1** to this Agreement. In addition, when used in this exhibit, the following terms have the following definitions:

1. "Base Transfer" is the amount of Delivered Transfer Water released from New Bullards Bar Reservoir, as determined by the accounting rules in **Exhibit 1** to this Agreement, and which results in a storage amount in New Bullards Bar Reservoir that is lower than the storage that would have occurred under Baseline Conditions. Calculation of this amount is described in Section 5 of **Exhibit 1** to this Agreement.

2. "Impact Account" is the amount of water DWR would have obtained from the Yuba River in the absence of the transfer releases, but which DWR did not receive due to refilling of New Bullards Bar Reservoir. The amount of Impact Account water will be computed daily during the Refill Period based on Balanced Conditions.

3. "Refill Period" is from October 1 through September 30.

4. "Target Storage" is the maximum storage volume during the Refill Period at which Yuba would normally operate New Bullards Bar Reservoir without a water transfer. The Target Storage levels are as follows:

   (a) October 1 through October 31: linearly ramped from 705,000 acre-feet to 700,000 acre- feet
   (b) November 1 through February 15: 700,000 acre-feet.

   (c) February 16 through March 31: linearly ramped from 700,000 acre-feet to 796,000 acre-feet.

   (d) April 1 through April 30: linearly ramped from 796,000 acre-feet to 896,000 acre-feet.

(e) May 1 through May 31: linearly ramped from 896,000 acre-feet to 966,000 acre-feet.

(f) June 1 through June 30: 966,000 acre-feet. This Target storage amount of 966,000 acre-ft may be slightly reduced because this amount is the top of conservation storage in New Bullards Bar Reservoir and releases may be made to avoid exceeding this storage amount. The Target Storage reduction will be made when releases from New Bullards Bar Reservoir are increased as storage reaches 996,000 acre-ft which demonstrates filling of the Reservoir.

(g) During July 1 through September 29, Target Storage must be determined on a case by case basis as described in **Exhibit 1** to this Agreement.

5. "Actual Storage" is the amount of water physically in storage in New Bullards Bar Reservoir at any time.

6. "Theoretical Storage" is the sum of: (1) Actual Storage on the day specified; and (2) Transfer Account Amount.

7. When Actual Storage exceeds the Target Storage during the Refill Period, there will be no further refill impacts.

8. The accounting procedure in Section 2 of this exhibit will be used to calculate the Impact Account. The general principles in Section 2 of this exhibit will be applied in accounting for any unusual operational conditions not set forth in the application example described below.

9. If the Transfer Amount Account is not zero on September 30, then the remaining balance of the account will be carried forward to the subsequent water year and the impact accounting will continue until the outstanding balance is eliminated.

10. If there is an Impact Account balance on September 30, then Yuba will release water during Balanced Conditions on a schedule that is agreed to by the Parties at a time when such releases will not create or affect deficiencies in local deliveries or instream flows, and these releases will be coordinated with releases for other (if any) water transfers of Yuba. The water released to offset refill impacts will be delivered as Delivered Transfer Water by Yuba and the accounting provisions and refill conditions of this section will apply to those quantities.

11. By July 31 of each year, the Parties will complete an accounting of the Impact Account.

12. If Project operations effectively reduce or eliminate a refill impact, the Impact Account balance may be adjusted to reflect that reduction or elimination subject to approval by the Projects.

SECTION 2: ACCOUNTING PROCEDURES FOR DETERMINING NEW BULLARDS BAR REFILL IMPACTS ON THE PROJECTS

The following columnar description sets forth the format, criteria, and procedures to be used for the determination of combined impacts to the Projects due to changes in refilling New Bullards Bar Reservoir caused by the transfer to DWR. An example of the application is attached.

COLUMNAR DESCRIPTION

Column 1 - Date

Column 2 - New Bullards Bar Reservoir Actual Storage at 2400 hours.

Column 3 - Transfer Amount Account (Base Transfer for the year) lists transfer water for which impact accounting is yet to be made. It is the previous day's amount minus the previous day's impact volume. Column 3_i = Column 3_{i-1} - Column 6_{i-1} any transfer amount account remaining after September 30 will be the initial (October 1) amount used in the subsequent water year.

Column 4 - Theoretical Storage indicates the operation of storage as it might have occurred in the absence of the transfer. It is the actual storage plus the Transfer Amount Account. Column 4_i = Column 2_i + Column 3_i

Column 5 - Target Storage is a postulated level of storage, which New Bullards Bar Reservoir might not normally exceed. When Column 5 exceeds this level, it is postulated that the storage would be reduced to the Target Storage amount. The Target Storage is defined as follows: October 1 (705,000); October 2-October 31 (ramped linearly to 700,000) November 1-February 15 (700,000); February 16-March 31 (ramped linearly to 796,000); April 1-30 (ramped linearly to 896,000); May 1-31 (ramped linearly to 966,000); June 1-30 (966,000); July 1-September 29 – determined by hydrology.

Column 6 - Impact Volume indicates daily amounts of water that would be released to achieve the Column 5 Target Storage. Column 6_i = (Column 4_i - Column 5_i) but not less than zero, and not greater than Column 3i.

Column 7 - Delta Conditions are determined jointly by DWR and Reclamation in accordance with the COA. A "1" is listed if the Delta is declared to be in Balanced Conditions three days after the daily amounts are calculated, a zero or null "-"is listed when the Delta is declared to be in excess conditions three days after the daily amounts are calculated. The amount of Theoretical Storage above the Target Storage on December 31, if any (Column 4 - Column 5), is deducted from the Transfer Amount Account (Column 3) on January 1.

Column 8 - Net Daily Impact is the daily impact volumes when the Delta is in Balanced Conditions as indicated in Column 7. Column 8_i = Column 6_i x Column 7.

Column 9 - Impact Account is the accumulation of Net Daily Impacts.
Column 9_i = Column 9_{i-1} + Column 8_i

ACCOUNTING TO CONTINUE UNTIL SEPTEMBER 30 OR UNTIL REFILL IS NO LONGER POSSIBLE

EXHIBIT 3

GROUNDWATER MONITORING AND REPORTING PROGRAM

1. Groundwater Monitoring

In cooperation with DWR, Yuba has monitored Yuba County groundwater conditions for many years, and many aspects of the groundwater resources are well known. Yuba and DWR have worked cooperatively to develop a groundwater transfer monitoring and reporting program specific to Yuba County for past groundwater substitution water transfers. Yuba has also developed a Groundwater Management Plan ("GMP"), which was adopted on March 1, 2005 pursuant to Water Code Sections 10750 *et seq*. The GMP formalizes a monitoring program that includes measuring water levels in wells that are part of a dedicated monitoring well network, a plan to expand the network, annual reporting provisions and other groundwater monitoring activities. Since 2005, Yuba has constructed eight additional groundwater monitoring wells for this program. (See DWR, Memorandum Report, "Monitoring Well Construction Technical Assistance," April 2007.) Information gathered from the activities specified in the GMP, along with the activities described in this exhibit, will be used to assess effects of groundwater pumping on groundwater resources, and to provide reasonable assurances that any water pumped and accounted for as part of any groundwater substitution is in lieu of surface water delivered by Yuba to its Member Units. Yuba will continue to work with DWR and the Member Units to identify and resolve any new groundwater monitoring issues.

a. The water levels in selected production wells geographically dispersed throughout each Member Unit participating in the groundwater substitution program will be measured by the Member Unit prior to the initial pumping for each year during which a groundwater substitution transfer will take place. Selection of these wells will be by mutual agreement by DWR and Yuba, in consultation with the Member Unit. Upon termination of pumping for the year, the water levels will be measured by the Member Units, and such measurements will continue on a monthly basis until water levels have recovered to the pre-pumping levels, or have stabilized. In no case will water-level measurements be required following spring high water levels in the year following the year of the groundwater substitution pumping. The Member Units will provide the water-level readings to Yuba within 15 days of each reading.

b. To supplement the GMP-specified monitoring program, water levels in each monitoring well in the Yuba network will be measured at least every two months by Yuba in each year during which a groundwater substitution transfer is to take place, commencing no later than April. Upon termination of pumping, the monitoring well water levels will be measured, and such measurements will continue on a monthly basis until water levels have recovered to the pre-pumping levels, or have stabilized. In no case will water-level measurements be required following spring high water levels in the year following the year of the groundwater substitution pumping. DWR and Yuba will cooperate in obtaining these measurements.

c. Readings of flow meters on the discharges of the wells will be recorded every month during the pumping period by Member Units for each production well. In addition, electric meter readings and fuel consumption for diesel pumps will be recorded by the Member Units, and made available to Yuba upon request. The quantities of water pumped between successive readings will be calculated by Member Units and reported to Yuba.

d. Electrical Conductivity ("EC") will be measured for water pumped from selected production wells at the initiation of pumping (or as soon thereafter as practicable), two months after the initial EC measurements and at the termination of pumping.

e. For selected production wells (to be identified before the monitoring plan is finalized) near Yuba monitoring wells, drawdown analyses (of distance and time) will be completed, and comparisons made to monitoring well water levels.

All monitoring data will be reported on a semi-monthly basis, and in an annual final summary report prepared by Yuba that will evaluate the impacts of the groundwater substitution pumping transfer program for that year. The final report will include water-level contour maps for the groundwater basin showing initial water levels and final, recovered water levels.

2. Groundwater Pumping Operations Plan

This Agreement sets forth the procedures by which the total amount of water to be transferred will be determined. These amounts include Components 1, 2, 3 and 4 water. A portion of the Water will be from surface water and a portion may be provided through groundwater substitution pumping. Yuba will base the determination of the amount of water to be provided through groundwater substitution pumping (in consultation with the Member Units) by: (a) estimating the amount of surface water that will be transferred for the year by operation to the flow schedules in the Fisheries Agreement and the September 30 target New Bullards Bar Reservoir storage level; (b) determining the amount of water from groundwater substitution pumping that Member Units can make available through wells of farmers who are willing to participate in the program and whose farms are located within a participating Member Unit; and (c) determining the amount of water that can be pumped within the safe yield of the basin without contributing to long-term overdraft and without resulting in significant unmitigated impacts to other groundwater users in the basin.

This section sets forth the procedure that will be used to determine the amount of water that can be pumped within the safe yield of the basin without contributing to long-term overdraft, and without resulting in any significant unmitigated third-party ("Third Party" or "Third Parties") impacts to other groundwater users in the basin. Section 1 of this Exhibit describes the monitoring plan that will be used to obtain information from which the determination will be made of the condition of the groundwater basin in the spring of the year during which groundwater substitution pumping is planned. Based on this condition,

Yuba will determine the expected response of the basin to the proposed pumping for that year and the resulting condition of the basin at the conclusion of the pumping. Determination of the expected condition at the conclusion of the pumping will be made by examining the historic response of the basin during previous years when pumping occurred and by examining the recovery of the basin during pumping years and successive years, and by comparing these basin responses with the planned pumping. Analysis of the historical responses of the basin to pumping will be used to develop empirical relationships between pumping and basin drawdown and recovery. These empirically derived relationships will be the formulas that will be used to determine basin response to the proposed pumping.

The determination of basin response to the proposed pumping will result in an estimated basin condition at the end of pumping and an estimated condition for the spring of the next year. This estimated condition will be compared to historical groundwater levels in the basin. In 1991, Yuba and the Member Units completed a groundwater substitution transfer to provide water to other parts of California under the Governor's Emergency Drought Water Bank in response to a severe statewide drought. The groundwater levels that occurred in the fall of 1991 at the end of pumping did not result in any overdraft of the groundwater basin or any significant unmitigated Third-Party impacts. Groundwater levels had been lower than these levels during the 1980's, but the extent of effects of these lower levels on groundwater users in the basin is not well known. Therefore, the fall 1991 groundwater levels will be used for comparison with the estimated condition of the basin that will result from the proposed groundwater pumping under this Agreement and the Yuba River Accord.

If the estimated levels are above the fall 1991 levels, then significant unmitigated Third- Party impacts will not be expected. If the estimated levels are below the fall 1991 levels, then further examination of potential impacts and consultation with the Member Units and the GMP Water Advisory Group (discussed below) will be required. The GMP Water Advisory Group is a group that was formed under the GMP to provide input and guidance on groundwater issues. The GMP Water Advisory Group comprises representatives from local groundwater users, including municipal water purveyors, Member Units, reclamation districts and others. Groundwater substitution pumping that would result in levels near the fall 1991 levels will occur only if the Member Units agree to allow such pumping. Even if the determination is that estimated levels resulting from proposed pumping will be above the fall 1991 levels, the Member Units still will be consulted, and each Member Unit must individually approve the proposed pumping in its area or such pumping will not occur. If the amount of proposed pumping that will not cause fall groundwater levels to drop below 1991 levels cannot be confirmed using the procedures described above, then a lower amount of pumping that satisfies the conditions of this section will be determined using these procedures. The Yuba Board reserves the right to restrict the maximum amount of groundwater substitution pumping and the right to resolve any disputes in the Water Advisory Group regarding maximum amount of groundwater pumping.

If for any year the total amount of groundwater pumping that is determined to be acceptable under this section is less than the total amount of Components 1, 2 and 3 water

that is provided for in the Agreement, minus the amount of surface water to be transferred, then Yuba may either: (a) use additional surface water through supplemental surface water transfers to provide Components 1, 2 and 3 water; or (b) advise DWR that the total unmet amount of Components 1, 2 and 3 water will not be provided during the present year and instead will be owed to the Buyer and repaid in a manner detailed in **Exhibit 1** of this Agreement

3. Third-Party Impacts Action Plan

The purpose of this Third-Party impacts action plan is to describe actions that will be undertaken by Yuba and Member Units to respond to impacts to Third Parties that occur because of groundwater substitution pumping for transfers under this Agreement. Third Parties include local groundwater users that could be affected by fluctuations in groundwater levels because of the pumping of such groundwater substitution water. Yuba and the Member Units agree that prompt responses to and mitigation of potential impacts to Third Parties are an important requirement for Yuba's present and future groundwater substitution transfers.

This action plan includes a series of steps that will be taken to ensure that the groundwater substitution component of this Agreement and the Yuba River Accord does not cause significant, unmitigated impacts to Third Parties. Under this action plan, groundwater substitution pumping must not produce significant unmitigated impacts on Third Parties, impacts must be identified and mitigated as quickly as possible, and there must be ongoing, open communications with affected Third Parties. Because not all potential impacts can be known in advance, this plan provides a process for responding to concerns expressed by local groundwater users who believe that their water-production facilities are being or will be impacted by groundwater substitution pumping under this Agreement and the Yuba River Accord.

As a contractual condition of a Member Unit participating in the groundwater substitution component of this Agreement and the Yuba River Accord, the Member Unit will identify a contact person or persons who will be responsible for initially responding to a notification of a potential Third-Party impact, and take the other action specified in this section. The contact person for a Member Unit will be the person designated by the Member Unit. The responsibilities of Yuba under this action plan will be carried out by the General Manager, or by a person designated by the General Manager. The contact persons for the Member Units will also serve on a Yuba Groundwater Substitution Program Advisory Group ("Advisory Group") for either the area north of the Yuba River or the area south of the Yuba River.

Upon either Yuba or the Member Unit receiving notification of a potential Third-Party impact, Yuba or the Member Unit will immediately notify the other party of the nature of the potential impact. The Member Unit will promptly (within one day) contact the Third Party and obtain all available information regarding the nature and extent of the potential

impact, and provide that information to Yuba. The Member Unit also will regularly update Yuba on the status of the Member Unit's response.

If the Third Party is not within the boundaries of any Member Unit of Yuba, then Yuba will either: (a) determine if it is evident that the Third Party is in close proximity to the groundwater-production facilities within a Member Unit that are involved in the groundwater substitution program, and designate the Member Unit or Member Units responsible for responding to the potential impact; or (b) consult with the Advisory Group concerning which Member Unit or Member Units should be designated for responding to the potential impact.

After the Third Party has been contacted and the relevant information regarding the potential impact has been received, the Member Unit will develop an approach (subject to approval by Yuba) to: (a) determine whether the Third Party has actually been impacted by groundwater pumping by the Member Unit, and, if so; (b) mitigate for the impact. Yuba will be available to provide assistance to the Member Unit in developing the foregoing approach. Yuba and the Member Unit will consult with the applicable Advisory Group in developing the approach referred to in this section.

Yuba will resolve any dispute concerning implementation of this action plan, including which Member Unit will be responsible for mitigating a potential impact, whether it is reasonably likely that there was a Third-Party impact, and the measures to be taken by the Member Unit to mitigate the impact. If a Member Unit fails to carry out its responsibilities under this action plan, then Yuba will be authorized (but not required) to perform the responsibilities of the Member Unit and recover its reasonable costs in doing so from the Member Unit, including deducting these costs from payments due the Member Unit for the groundwater substitution transfer. Yuba will consult with the applicable Advisory Group in carrying out its responsibilities under this section.

It is the intention of this action plan that: (a) any Third-Party impact that is reasonably likely to have been caused by implementation of the groundwater substitution program will be promptly and substantially mitigated; (b) as to any Third-Party impact that is not reasonably likely to have been caused by implementation of the groundwater substitution program, the Third Party will be provided information to reasonably demonstrate the reasons that there were no impacts; and (c) Yuba, the Member Units and the Advisory Group will be involved in the implementation of this action plan. Actions that will be taken to mitigate an impact include, but are not limited to, deepening of the impacted Third Party's well or lowering of pump bowls, cessation of pumping in the area of the impacted well, and providing a temporary or permanent alternative water supply to the Third Party.

EXHIBIT 4

State of California – Department of Water Resources

Agreement for the Long-term Purchase of Water from Yuba County Water Agency by the Department of Water Resources

STANDARD CLAUSES

Worker's Compensation Clause. Contractor affirms that it is aware of the provisions of Section 3700 of the California Labor Code which require every employee to be insured against liability for worker's compensation or to undertake self-insurance in accordance with the provisions of that Code, and Contractor affirms that it will comply with such provisions before commencing the performance of work under this Agreement.

Nondiscrimination Clause. During the performance of this Agreement, Contractor and its subcontractors shall not unlawfully discriminate, harass, or allow harassment against any employee or applicant for employment because of sex, race, color, ancestry, religious creed, national origin, physical disability (including HIV and AIDS), mental disability, medical condition (cancer), age (over 40), marital status, and denial of family care leave. Contractor and subcontractors shall insure that the evaluation and treatment of their employees and applicants for employment are free from such discrimination and harassment. Contractor and subcontractors shall comply with the provisions of the Fair Employment and Housing Act (Gov. Code §12990 (a-f) et seq.) and the applicable regulations promulgated thereunder (California Code of Regulations, Title 2, Section 7285 et seq.). The applicable regulations of the Fair Employment and Housing Commission implementing Government Code Section 12990 (a-f), set forth in Chapter 5 of Division 4 of Title 2 of the California Code of Regulations, are incorporated into this Agreement by reference and made a part hereof as if set forth in full. Contractor and its subcontractors shall give written notice of their obligations under this clause to labor organizations with which they have a collective bargaining or other Agreement.

Contractor shall include the nondiscrimination and compliance provisions of this clause in all subcontracts to perform work under the Agreement.

Compliance with Laws, Regulations, Permit Requirements. Contractor shall at all times comply with, and require its contractors and subcontractors to comply with, all applicable federal and State laws, rules and regulations, permits and all applicable local ordinances, specifically including but not limited to environmental, procurement and safety laws, rules, regulations, permits and ordinances.

Availability of Funds. Work to be performed under this contract is subject to the availability of funds through the State's normal budget process.

Audit Clause. For contracts in excess of $10,000, the contracting parties shall be subject to the examination and audit of the State Auditor for a period of three years after the final payment under the contract (Government Code Section 8546.7).

Payment Retention Clause. Ten percent of any progress payments that may be provided under this contract shall be withheld per Public Contract Code Sections 10346 and 10379 pending satisfactory completion of all services under the contract.

Reimbursement Clause. If applicable, travel and per diem expenses to be reimbursed under this contract shall be at the same rates the State provides for unrepresented employees in accordance with the provisions of Title 2, Chapter 3, of the California Code of Regulations. Contractor's designated headquarters for the purpose of computing such expenses shall be: 1402 D Street, Marysville, California 95901-4226.

Drug-Free Workplace Certification. By signing this contract, the Contractor or grantee hereby certifies under penalty of perjury under the laws of the State of California that the Contractor or grantee will comply with the requirements of the Drug-Free Workplace Act of 1990 (Government Code Section 8350 et seq.) and will provide a drug-free workplace by taking the following actions:

1. Publish a statement notifying employees that unlawful manufacture, distribution, dispensation, possession, or use of a controlled substance is prohibited and specifying actions to be taken against employees for violations.

2. Establish a Drug-Free Awareness Program to inform employees about all of the following:

   (a) The dangers of drug abuse in the workplace,

   (b) The person's or organization's policy of maintaining a drug-free workplace,

   (c) Any available counseling, rehabilitation, and employee assistance programs; and

   (d) Penalties that may be imposed upon employees for drug abuse violations.

3. Every employee who works on the proposed contract or grant:

   (a) Will receive a copy of the company's drug-free policy statement, and

   (b) Will agree to abide by the terms of the company's statement as a condition of employment on the contract or grant.

This contract or grant may be subject to suspension of payments or termination, or both, and the contractor or grantee may be subject to debarment if the Department determines that: 1) the Contractor or grantee has made a false certification, or 2) the Contractor or grantee violates the certification by failing to carry out the requirements noted above.

Americans with Disabilities Act. By signing this contract, Contractor assures the State that it complies with the Americans With Disabilities Act (ADA) of 1990, 942 U.S.C.12101 et seq.), which prohibits discrimination on the basis of disability, as well as all applicable regulations and guidelines issued pursuant to the ADA.

Conflict of Interest. Current State Employees: a) No officer or employee shall engage in any employment activity or enterprise from which the officer or employee receives compensation or has a financial interest and which is sponsored or funded by any State agency, unless the employment, activity or enterprise is required as a condition of regular State employment. b) No State officer or employee shall contract on his or her own behalf as an independent contractor with any State agency to provide goods or services.

Former State Employees: a) For the two year period from the date he or she left State employment, no former State officer or employee may enter into a contract in which he or she engaged in any of the negotiations, transactions, planning, arrangements or any part of the decision-making process relevant to the contract while employed in any capacity by any State agency. b) For the twelve-month period from the date he or she left State employment, no former State officer or employee may enter into a contract with any State agency if he or she was employed by that State agency in a policy-making position in the same general subject area as the proposed contract within the twelve-month period prior to his or her leaving State service.

Child Support Compliance Act. For any agreement in excess of $100,000, the Contractor acknowledges in accordance herewith, that:

1. The Contractor recognizes the importance of child and family support obligations and shall full comply with all applicable State and federal laws relating to child and family support enforcement, including, but not limited to, disclosure of information and compliance with earning assignment orders, as provided in Chapter 8 (commencing with Section 5200) of Part 5 of Division 9 of the Family Code; and

2. The Contractor, to the best of its knowledge, is fully complying with the earnings assignment orders of all employees and is providing the names of all new employees to the New Hire Registry maintained by the Employment Development Department.

Air or Water Pollution Violation. Under the State laws, the Contractor shall not be: 1) in violation of any order or resolution not subject to review promulgated by the State Air Resources Board or an air pollution control district; 2) subject to cease and desist order not subject to review issued pursuant to Section 13301 of the Water Code for violation of waste

discharge requirements or discharge prohibitions; or 3) finally determined to be in violation of federal law relating to air or water pollution.

Union Organizing. For all contracts, except fixed price contracts of $50,000 or less, the Contractor acknowledges that: by signing this Agreement the Contractor hereby acknowledges the applicability of Government Code Section 16645 through Section 16649 to this Agreement and agrees to the following:

(a) Contractor will not assist, promote or deter union organizing by employees performing work on a State service contract, including a public works contract.

(b) No State funds received under this Agreement will be used to assist, promote or deter union organizing.

(c) Contractor will not, for any business conducted under this Agreement, use any State property to hold meetings with employees or supervisors, if the purpose of such meetings is to assist, promote or deter union organizing, unless the State property is equally available to the general public for holding meetings.

(d) If Contractor incurs costs or makes expenditures to assist, promote or deter union or organizing, Contractor will maintain records sufficient to show that no reimbursement from State funds has been sought for these costs, and that the Contractor shall provide those records to the Attorney General upon request.

Recycling Certification. Contractor shall certify in writing under penalty of perjury, the maximum, if not exact, percentage of recycled content, both post consumer water and secondary waste as defined in Public Contract Code, Section 12161 and 12200, in materials, goods, or supplies offered or products used in the performance of this Agreement, regardless of whether the product meets the required recycled product percentage as defined in Public Contract Code, Sections 12161 and 12200. Contractor may certify that the product contains zero content. (PCC 10233, 10308.5, 10354)

STATE OF CALIFORNIA
THE RESOURCES AGENCY
DEPARTMENT OF WATER RESOURCES
AND
YUBA COUNTY WATER AGENCY

AMENDMENT NO. 5 TO THE AGREEMENT FOR THE LONG-TERM PURCHASE OF WATER FROM YUBA COUNTY WATER AGENCY BY THE DEPARTMENT OF WATER RESOURCES SWPAO NO. 14-851

This Amendment No. 5 (Amendment) to the December 4, 2007 Agreement for the Long-Term Purchase of Water from Yuba County Water Agency by the Department of Water Resources, as amended from time to time (Agreement), is entered into as of _____, 2014, between the Department of Water Resources of the State of California (DWR), pursuant to the provisions of the California Water Resources Development Bond Act, the Central Valley Project Act, and other applicable laws of the State of California, and Yuba County Water Agency (Yuba), pursuant to the Yuba Act (California Statutes 1959, Chapter 788, as amended), and other applicable laws of the State of California. Except as provided for in this Amendment, defined terms in the Agreement will have the same meaning in this Amendment.

The Parties hereby amend the Agreement as follows:

1. **Recitals.** The Recitals Section of the Agreement is amended by adding the following new recitals:

"**N**. The Parties amended the Agreement in 2009 (Amendment No. 1 and Amendment No. 2), 2010 (Amendment No. 3) and 2012 (Amendment No. 4).

O. Under Section 15 of the Agreement, the pricing provisions for Water that is made available after September 30, 2015 will be subject to a new pricing agreement among the Parties. Amendment 5 memorializes the agreement of the Parties under Section 15 of the Agreement, as well as amending other provisions of the Agreement.

P. On June 9, 2014, the State Board approved Yuba's petition to change water right permit 15026 to add a point of rediversion at the point of diversion for the Freeport Regional Water Project. The State Board's order determined that the ordering conditions satisfied the State Board's public trust responsibility, relying on the Yuba Accord Environmental Impact Report and an addendum to the Yuba Accord Environmental Impact Report that was prepared by Yuba."

2. **Definitions.** Section 1 of the Agreement is amended by inserting in proper alphabetical order, the following new defined terms:

A. "Accrued Groundwater Substitution Component" water means the amount of surface water in New Bullards Bar Reservoir that results from Yuba's groundwater substitution pumping program established by Yuba and its Member Units under their Conjunctive Use Agreements for making available Groundwater Substitution Component water."

B. "Freeport POD" means the point of diversion for the Freeport Regional Water Project, as described in the June 9, 2014 order of the State Board that approved the Freeport POD as an authorized point of rediversion for Yuba transfer water."

C. "Participating Contractors" means all SWP contractors and CVP contractors who have executed an agreement with DWR to be entitled to receive water supplies under the Agreement."

D. "State Board Order" means State Board Corrected Order WR 2008-0014, which amended Yuba's Water Right Permits 15026, 15027 and 15030 to include, with some modifications, the streamflow requirements in the Fisheries Agreement and by adding, through December 31, 2025, the SWP and CVP Delta diversion facilities as points of rediversion, and the SWP and CVP service areas to the place of use, under Permit 15026."

3. Section 5.A.2. Section 5.A.2. of the Agreement is amended to read as follows:

"2. In certain years, and pursuant to the accounting principles set forth in Exhibit 1 to the Agreement, operational limitations of the Yuba Project, the CVP, and/or the SWP may cause the quantity of Component 1 Water that Yuba can deliver to the Buyer to be reduced below 60,000 acre-feet during a Water Accounting Year. Under those circumstances, unless the Parties agree otherwise, Yuba will deliver the undelivered Component 1 Water from the 2011 Water Accounting Year and the quantity (if any) of undelivered Component 1 Water from the 2015 Water Accounting Year during subsequent years under the following conditions: (a) during the next Water Accounting Year that is not a Dry or Critical Water Year; (b) when such make-up water can be

delivered from Yuba's available surface-water supply; (c) notwithstanding any other provision of the Agreement, as the first Delivered Transfer Water provided in the first Water Accounting Year after 2015 that has a Final Classification either as Wet, Above Normal, or Below Normal at the rate of 60,000 acre-feet per year until fully repaid; and (d) on a schedule that is acceptable to the Buyer and Yuba. Yuba will not be required to provide a makeup supply for an account deficit of Component 1 Water that was incurred on or after January 1, 2016. In any year starting in the 2016 Water Accounting Year that Yuba provides a makeup supply of Component 1 Water, Yuba will not be obligated to also provide the quantity of Component 1 Water that is provided for in section 25.C.1 of the Agreement."

4. **Section 5.A.4.** Section 5.A.4. of the Agreement (Component 1 Water Quantity during the term of an FERC Annual License) is deleted as of October 1, 2015.

5. **Section 5.C.** Section 5.C. of the Agreement is amended to read as follows:

"**C. Invoicing**. Yuba will invoice DWR for Component 1 Water made available starting January 1, 2016 in the same manner that Yuba invoices DWR for Component 2 Water and Component 3 Water except that, in those years when Yuba is delivering the remaining undelivered quantity of the 480,000 acre-feet of Component 1 Water, Yuba will reduce its invoice for current year Component 1 deliveries by the amount of water being delivered to repay the remaining undelivered quantity of the 480,000 acre-feet of Component 1 Water."

6. **Section 6.A.** Section 6.A. of the Agreement is amended by adding at the end the following new paragraph:

> **"5.** Yuba will not be required to provide a makeup supply for an account deficit of Component 2 Water that existed before or after the effective date of Amendment 5 to the Agreement."

7. **Section 6.C.1** Section 6.C.1. of the Agreement is amended by changing the date of June 1 to the date of May 22.

8. **Section 7.A.** Section 7.A. of the Agreement is deleted.

9. **Section 7.B.1.** Section 7.B.1. of the Agreement is amended by deleting subpart f.

10. **Section 7.C.1.** Section 7.C.1. of the Agreement is amended by changing the date of June 1 to the date of May 22.

11. **Section 7.C.** Section 7.C. of the Agreement is amended by adding at the end the following new paragraph:

> "3. Yuba will not be required to provide a makeup supply for an account deficit of Component 3 Water that existed before or after the effective date of Amendment 5 to the Agreement."

12. **Section 8.B.** Section 8.B. of the Agreement is amended to read as follows:

"**B.** Provisions Applicable to Groundwater Substitution Component Water as of the Effective Date of Amendment 5 to the Agreement. Notwithstanding any other provision of the Agreement (including Amendment 4 to the Agreement), the following provisions will apply to Groundwater Substitution Component Water that is made available by Yuba after January 1, 2016:

1. Yuba is not required to provide Groundwater Substitution Component water for any purpose under the Agreement except upon pricing and other terms that are agreed to by Yuba and the Member Units, which are also agreed to by DWR and the Participating Contractors.

2. Yuba is not required to provide Groundwater Substitution Component water for delivery of Component 1 Water, Component 2 Water or Component 3 Water. Sections 7.2.2, 7.2.3 and 7.2.4 of Exhibit 1 of the Agreement are inapplicable to Groundwater Substitution Component water.

3. Groundwater Substitution Component water will be the only water that comprises Component 4.

4. Yuba will notify DWR by April 1 of each year during the term of this Agreement of the amount of Accrued Groundwater Substitution Component water that Yuba will make available during the Water Accounting Year. By April 15, DWR will notify Yuba of the amount of Accrued Groundwater Substitution Component water it commits to purchase based on requests by Participating

Contractors. DWR may adjust this amount, up or down, on or before May 15, and on May 15 DWR will commit to the final quantity of Accrued Groundwater Substitution Component water to be purchased during the Water Accounting Year, but such amount will not be less than the actual amount of Accrued Groundwater Substitution Component water made available between April 1 and May 15 for Groundwater Substitution Component water in accordance with the accounting provisions for Groundwater Substitution Component water set forth in Exhibit 1 of the Agreement. The dates herein may be adjusted if approved in writing by Yuba and DWR to allow the Member Units to maximize the quantities of groundwater substitution pumping program water that could be made available during each year.

5. In every year that DWR desires to purchase Accrued Groundwater Substitution Component water, representatives of DWR, Yuba, the Member Units and the Participating Contractors will convene by February 15 and conclude by March 31 as the Management Committee to negotiate the price per acre-foot of Accrued Groundwater Substitution Component water, any provisions for the Delta export priority for such water and any other terms applicable to the Accrued Groundwater Substitution Component water. The 30,000 acre-feet of Groundwater Substitution Component water that Yuba is required to provide in a Schedule 6 Year under term 1a of the State Board Order will be Accrued Groundwater Substitution Component water for all purposes under the Agreement, except that, the Member Units will not be involved in the negotiation of the price for this water supply.

6. In every Water Accounting Year when: (1) one or more Participating Contractor(s) desire to purchase Accrued

Groundwater Substitution Component water; (2) the annual negotiations referenced in Paragraph 5 above have reached a successful conclusion calling for the purchase of such water in that year; (3) the Management Committee representatives for Yuba, the Authority, and the State Water Contractors have agreed as to the terms of, and each of these representatives has recommended in writing said terms and the approval of, a letter agreement between Yuba and DWR establishing the price per acre-foot and any other modified terms that will be applicable to the Accrued Groundwater Substitution Component water for that Water Accounting Year; and (4) DWR and Yuba have executed said letter agreement, DWR will offer in writing to Participating Contractors the opportunity to purchase Accrued Groundwater Substitution Component water at the price and terms as provided in the letter agreement between DWR and Yuba.

7. Yuba will confirm on a monthly basis the quantities of the Accrued Groundwater Substitution Component water and the quantities of Groundwater Substitution Component water released as Released Transfer Water, in accordance with the accounting provisions for Groundwater Substitution Component water set forth in Exhibit 1 of the Agreement.

8. DWR will provide Yuba not less than 72 hours' notification for suspension or termination of groundwater pumping due to limitations on the ability of DWR to divert and use the Groundwater Substitution Component water. In the event of such a suspension or termination of Groundwater Substitution Component water, DWR will pay for the quantity of Accrued Groundwater Substitution Component water up to and including through the 72-hour notification of suspension or termination (i.e., DWR will pay

for the quantity of Accrued Groundwater Substitution Component water through the notice period irrespective of whether DWR was able to divert and use the Accrued Groundwater Substitution Component water).

9. Pursuant to the negotiations described in Paragraph 5 above, if the Management Committee so determines, DWR will require any Participating Contractor requesting Groundwater Substitution Component water to schedule this water with the Delta conveyance priority in relation to any other transfer water that DWR conveys at the Harvey O. Banks Pumping Plant for these same Participating Contractors that has been agreed to by the Management Committee, provided that the Groundwater Substitution Component water will not have a higher priority than Storage Component water provided under the Agreement.

10. Pursuant to the negotiations described in Paragraph 5 above, if the Management Committee so determines, DWR will require that the Authority schedule Groundwater Substitution Component water with the Delta conveyance priority in relation to any other transfer water that the Authority schedules for conveyance at the Harvey O. Banks Pumping Plant or at the C.W. Jones pumping plant for the members of the Authority that will receive water pursuant to this Amendment that has been agreed to by the Management Committee, provided that the Groundwater Substitution Component water will not have a higher priority than Storage Component water provided under the Agreement.

11. Except as otherwise provided herein, Groundwater Substitution Component water and Accrued Groundwater

Substitution Component water will be accounted for in accordance with the provisions of the Agreement.

12. Consistent with the water accounting principles set forth in Exhibit 1 to the Agreement, Yuba agrees that making the Groundwater Substitution Component water available in any Water Accounting Year will not affect the quantity of Storage Component water that Yuba makes available in that year or thereafter."

13. Section 8.C. Section 8.C. of the Agreement is amended to read as follows:

"C. Groundwater Substitution Payment Provisions

1. DWR will pay Yuba the per acre foot price for the amount of Accrued Groundwater Substitution Component that DWR has committed to purchase in the letter agreement described in this Section, unless this amount is reduced as provided for under Section 8.B.8 or is reduced because the Yuba Member Units do not pump the requested quantity of groundwater substitution pumping program water for the Groundwater Substitution Component water.

2. The Parties acknowledge that Section 5.1.8 of the Yuba Accord Fisheries Agreement allows the River Management Team to schedule the release of a portion of Groundwater Substitution Component water at a time when it might not be transferable. DWR will not be required to pay for the portion (if any) of Groundwater Substitution Component water that is scheduled for release in accordance with the provisions of Section 5.1.8 of the Yuba Accord Fisheries Agreement to the extent that this quantity of Groundwater Substitution Component water is not transferable

under the accounting provisions set forth in Exhibit 1 of the Agreement."

14. Section 8. Section 8 of the Agreement is amended by adding at the end the following new subparagraph:

"D. Groundwater Substitution Water Invoicing

1. On or about May 22 in each year that DWR has agreed to purchase Accrued Groundwater Substitution Component water, Yuba will submit an invoice to DWR for 50 percent of the amount of Accrued Groundwater Substitution Component water that DWR has committed to purchase in the letter agreement described in this section during the current Water Accounting Year.

2. On or about August 30 in each year that DWR has agreed to purchase Accrued Groundwater Substitution Component water, Yuba will submit an invoice to DWR for 100 percent of the amount of Accrued Groundwater Substitution Component water DWR has committed to purchase in the letter agreement described in this section or that is otherwise payable under Section 8 during the current Water Accounting Year, less the amount of prior invoices for such Accrued Groundwater Substitution Component water during the current Water Accounting Year.

3. Within 60 days of the date that DWR receives an invoice from Yuba, DWR will submit payment to Yuba. DWR's payment will be reduced by 10 percent to allow accounting adjustments (if necessary) in the final payment to Yuba for the Accrued Groundwater Substitution Component water.

4. Approximately 30 days after the end of the release of groundwater substitution transfer water from New Bullards Bar Reservoir, after confirmation of the amount of groundwater substitution transfer water has been completed, and after Yuba and DWR have reached agreement on the final accounting, Yuba will provide to DWR in a final invoice that is undisputed and as required under the Agreement, an amount for final payment for Accrued Groundwater Substitution Component water provided under Section 8. The final payment for Accrued Groundwater Substitution Component water will reflect any adjustments necessary to account for the total quantity of Accrued Groundwater Substitution Component water payable under Section 8 and any adjustments provided for under Section 8.B.8.

5. If payments from any contractors to DWR for Accrued Groundwater Substitution Component water are delinquent, DWR will make partial payments to Yuba by the invoice due dates by remitting the amounts received pursuant to the invoice as of the due date. DWR will pay any delinquent portion to Yuba as soon as DWR receives the delinquent payments.

6. The agreements between DWR and the Participating Contractors provide for a Participating Contractor to pay interest on delinquent payments at the rate of 1 percent per month from the due date until paid in full. DWR will assess and use reasonable efforts to collect such interest from Participating Contractors who are delinquent in making payments to DWR for invoices under the Agreement, and DWR will pay such interest collected along with the payments on invoices to Yuba."

15. Section 11.F. Section 11.F. of the Agreement is amended to read as follows:

"F. Reservation of the Right of Yuba to Transfer Certain Quantities of Water to a Third Party.

1. As provided in Section 25.B. of the Agreement, DWR will purchase all Storage Component water that is accounted for as Delivered Transfer Water. The Parties will estimate as expeditiously as possible during each year whether Storage Component water is likely to be accounted for as Delivered Transfer Water in that Water Accounting Year. Yuba may transfer any quantity of Released Transfer Water that DWR determines will not be accounted for as Delivered Transfer Water to a "Third Party." A Third Party as defined in this Section 11 includes an agency, entity or individual that is other than: (a) DWR; (b) a Participating Contractor; or (c) a member unit, customer, landowner or any other entity within the boundaries of a Participating Contractor. This type of water transfer is referred to as the "First Type of Third-Party Transfer." Yuba may transfer the First Type of Third-Party Transfer water for diversion at any diversion facility that is a current or future authorized point of rediversion for Yuba transfer water, except that, the First Type of Third-Party Transfer can be diverted at diversion facilities for Contra Costa Water District, if authorized, and if the diversion does not adversely affect the operation of the Projects during Balanced Conditions or at any other time that such diversion would directly or indirectly require the Projects to release water from storage or to reduce their diversion or rediversion of water from the Delta to provide or assure flow in the Delta required to meet any applicable provision of state or federal law. In order to implement the First Type of Third-Party Transfer, Yuba reserves the right to notify DWR on or before September 1 to not back a specified quantity of Released Transfer Water into Project storage

after September 30 of a Water Accounting Year. DWR reserves the right on or before September 15 to notify Yuba that DWR will purchase the specified quantity of water at current year pricing.

2. Notwithstanding Paragraph 1, beginning in the 2016 Water Accounting Year, Yuba may transfer up to 10,000 acre-feet per year of Released Transfer Water to a Third Party that would otherwise have been made available to DWR and the Participating Contractors as Component 2 Water or Component 3 Water under the Agreement (referred to as the "Second Type of Third-Party Transfer"), subject to the following: (a) The Second Type of Third-Party Transfer can be diverted: (i) at the Freeport POD; (ii) at a point of diversion North of the Freeport POD, if authorized; (iii) at diversion facilities for Contra Costa Water District, if authorized, and if the diversion does not adversely affect the operation of the Projects during Balanced Conditions or at any other time that such diversion would directly or indirectly require the Projects to release water from storage or to reduce their diversion or rediversion of water from the Delta to provide or assure flow in the Delta required to meet any applicable provision of state or federal law; (b) Yuba will use reasonable efforts to transfer the Second Type of Third-Party Transfer during times when Yuba Storage Component water could not otherwise be accounted for as Delivered Transfer Water, as a way of minimizing to the extent feasible reductions in the quantities of Component 2 Water and Component 3 Water that Yuba makes available to DWR and the Participating Contractors; and (c) To the extent needed to preserve the benefit of the 80% payment for Component 2 Water (as provided in Section 26) that DWR and the Participating Contractors would have received that year but for a Second Type of Third-Party Transfer, Yuba will adjust the invoice for payments for Component 1 water at 80% for the

quantity of the Second Type of Third-Party Transfer. The following hypothetical example illustrates this provision (c) to preserve benefits of Component 2 pricing: if in a Critical Year, there would have been 90,000 acre-feet of Delivered Transfer Water (which would have been allocated 60,000 acre-feet for Component 1 and 30,000 acre-feet for Component 2), and Yuba carries out a Second Type of Third-Party Transfer in the amount of 10,000 acre-feet that was transferred during times when Yuba Storage Component water would have been accounted for as Delivered Transfer Water, then the payment for 50,000 acre-feet of Component 1 Water would be at $300 per acre foot, the payment for 10,000 acre-feet of Component 1 Water would be at $240 per acre foot (reflecting the 80% Component 2 Water) and the payment for 20,000 acre-feet of Component 2 Water would be at $240 per acre foot.

3. So long as a First Type of Third-Party Transfer or a Second Type of Third-Party Transfer is carried out consistent with the transfer water accounting provisions of Exhibit 1 for Released Transfer Water during Balanced Conditions, DWR and the Participating Contractors will not object based on the use of the transfer water accounting provisions of Exhibit 1 to such a transfer as not protective of DWR and the Participating Contractors as legal users of water. Except as provided in Section 11.F.2 above, Yuba may conduct Third-Party transfers provided that such transfers will not impair Yuba's ability to meet its obligations under this Agreement. Any agreement between DWR and a Participating Contractor to implement Amendment 5 will contain provisions that are consistent with this subsection. Yuba will provide DWR with ten days' advance notice of a Yuba water transfer to a Third Party. Yuba may transfer Storage Component water to a Third Party only in accordance with this Section 11.F.

4. So long as a transfer of Accrued Groundwater Storage Component water is carried out consistent with the transfer water accounting provisions of Exhibit 1 for Released Transfer Water during Balanced Conditions, Yuba may sell to a Third-Party any quantity of Accrued Groundwater Substitution Component water for which there is no agreement for DWR and the Participating Contractors to purchase pursuant to the negotiations described in Paragraphs 5 and 6 of Section 8.B. and DWR and the Participating Contractors will not object based on the use of the transfer water accounting provisions of Exhibit 1 to such a transfer as not protective of DWR and the Participating Contractors as legal users of water. Any agreement between DWR and the Participating Contractors to implement Amendment 5 will contain provisions that are consistent with this subsection. Yuba will provide DWR with ten days' advance notice of a Yuba water transfer to a Third-Party. Yuba may transfer Accrued Groundwater Component water to a Third Party only in accordance with this Section 11.F."

16. Section 11. Section 11 of the Agreement is further amended by adding at the end the following new subparagraphs:

"H. The Water Scheduling and Accounting Principles (Exhibit 1) of the Agreement: (a) are intended to provide long-term protection of legal users of water (including without limitation, DWR, Participating Contractors, the SWP and the CVP) from injury from Yuba water transfers; (b) apply throughout the term of the Agreement to Yuba water transfers made available under the Agreement; and (c) are not subject to adjustment due to any regulatory actions (including actions regarding instream flows) that

concern Yuba's water rights permits or licenses, a FERC Annual License, the FERC Long-Term License or a Water Quality Certification issued by the State Board in relation thereto. If there is a regulatory action that requires a change in the operation of the Yuba Project, then Yuba will promptly notify DWR and discuss with DWR and the Participating Contractors the extent to which such action would affect the ability of Yuba to deliver Storage Component or Groundwater Substitution Component water under this Agreement.

I. Yuba has no obligation to make available Storage Component or Groundwater Substitution Component water after September 30, 2020, and DWR and the Participating Contractors have no obligation to pay for such water, unless and until the Parties have entered into an amendment to the Agreement for that purpose."

17. Section 12. Section 12 of the Agreement is amended by deleting Subparagraph B. (Payments for Fixed Annual Costs and for Environmental Compliance) and Subparagraph C. (Payments for Adjustments in Groundwater O&M Costs).

18. New Sections 25 and 26. The Agreement is amended by adding at the end the following new sections:

"**25. Storage Component Water.** Notwithstanding any other provision of the Agreement, the following provisions will apply to Storage Component water that is made available by Yuba:

A. Following the effective date of Amendment 5 to the Agreement, Yuba will provide an invoice for payment by DWR to Yuba of $20,000,000 (Prepayment) by wire transfer instructions provided by Yuba. Payment of this invoice will be due no later than December 31, 2014. Yuba understands that DWR will make arrangements for Participating Contractors to provide the funding for this purpose to DWR. After DWR has obtained contractual commitments from Participating Contractors to fund the Prepayment, then DWR will process one or more wire transfers to Yuba of partial funding of the Prepayment as funds are received by DWR from the Participating Contractors until the full amount of the Prepayment has been made. The Prepayment will be credited by Yuba toward payments due on invoices for Storage Component water that has been accounted for as Delivered Transfer Water that is made available starting October 1, 2015. In the event that there are Prepayment funds that have not been fully credited for Storage Component water that has been accounted for as Delivered Transfer Water that is made available through September 30, 2020, then these remaining funds will be: (1) applied to future payments due by DWR to Yuba for Storage Component Delivered Transfer Water delivered on or after October 1, 2020 under a subsequent amendment between the Parties at the prices provided in Section

26 of the Agreement, (as added by Amendment 5); or (2) if there is no such amendment, refunded by Yuba to DWR.

B. DWR will purchase under the terms set forth in Amendment 5 to the Agreement, all Storage Component water that Yuba makes available from October 1, 2015 through September 30, 2020 that is accounted for as Delivered Transfer Water under the accounting rules set forth in Exhibit 1 to the Agreement, except that DWR is not required to pay for Storage Component water that Yuba transfers to a Third-Party as provided in Section 11.F. of the Agreement, as amended. The Parties expect that DWR will enter into agreements with the Participating Contractors to provide funding for such payments.

C. Subject to the provisions of Section 11 of the Agreement, as amended, Yuba will make the following quantities of Storage Component water available in each Water Accounting Year from January 1, 2016 through December 31, 2020.

1. Component 1. 60,000 acre-feet per year of Component 1 Water.

2. Component 2. 15,000 acre-feet in a Final Classification Dry Year and 30,000 acre-feet in a Final Classification Critical Year of Component 2 Water.

3. Component 3. Any quantity of Storage Component water in excess of the amount of Component 1 and Component 2 Water will be considered Component 3 Water. Yuba will optimize to the extent feasible the operation of the

Yuba Project to make Component 1, 2 and 3 Water available.

26. Payments. In accordance with Section 15 of the Agreement, the Parties have met, conferred and agreed upon the following pricing for Storage Component Water made available from October 1, 2015 through September 30, 2020. DWR will make the following payments to Yuba for Storage Component water made available during this time period, except that, the payment for Component 2 Water will be 80% of these amounts:

A. Wet Year. $50 per acre foot in a Final Classification Wet Water Year.

B. Above-Normal Year. $100 per acre foot in a Final Classification Above-Normal Water Year.

C. Below-Normal Year. $150 per acre foot in a Final Classification Below-Normal Water Year.

D. Dry-Year. $200 per acre foot in a Final Classification Dry Water Year (except as provided in subsection 6, below).

E. Critical Year. $300 per acre foot in a Final Classification Critical Water Year (except as provided in subsection 6, below).

F. Consecutive Dry or Critical Years. $350 per acre foot in two or more consecutive Final Classification Dry Water Years (or a Dry Year following a Critical Year) or in two or more consecutive Final Classification Critical Water Years."

19. **DWR Agreements with Participating Contractors.** Nothing in the terms of an agreement between DWR and the Participating Contractors that implements this Amendment will be inconsistent with DWR's or Yuba's obligations under this Amendment.

20. **Effective Date of this Amendment.** Section 25.A. of the Agreement (Prepayment) will become effective upon execution by the Parties of this Amendment. Section 26 of the Agreement (Payments) will become effective October 1, 2015. The remaining terms of the Amendment will become effective January 1, 2015.

21. **Effect of this Amendment.** All of the remaining provisions of the Agreement that are not changed by this Amendment will remain in full force and effect. Nothing in this Amendment affects the current term of the Agreement, which is through December 31, 2025.

22. **Environmental Compliance.** On October 23, 2007, Yuba's Board of Directors adopted Resolution No. 2007-23 and, as the lead agency under CEQA, certified the Final Environmental Impact Report/Environmental Impact Statement for the Proposed Lower Yuba River Accord (State Clearinghouse #2005062111) (Final EIR). DWR approved the Final EIR as a responsible agency under CEQA. Yuba will be responsible for complying with CEQA to the extent required for Yuba to transfer water to a Third Party under this Agreement.

The foregoing is hereby agreed to by the Parties.

Defendants.

I. INTRODUCTION

1. Pleadings, Parties and Jurisdiction

The complaint herein was filed on February 20, 2003, seeking an adjudication of water rights, injunctive relief and the imposition of a physical solution. The defaults of certain defendants have been entered, and certain other defendants dismissed. Other than defendants who have been dismissed or whose defaults have been entered, all defendants have appeared herein. This Court has jurisdiction of the subject matter of this action and of the parties herein.

2. Stipulation for Judgment

Stipulation for Entry of Judgment has been filed by and on behalf of all defendants who have appeared herein.

3. Definitions

As used in this Judgment, these terms shall have the following meanings:

A. Appropriator or Appropriator Parties: the pumpers identified in Exhibit "C" attached hereto.

B. Appropriator's Production Right: consists of an Appropriator's share of Operating Yield, plus (1) any water acquired by an Appropriator from an Overlying Producer or other Appropriator pursuant to this Judgment, (2) any water

LAW OFFICES
AKLUFI & WYSOCKI

RIVERSIDE, CALIFORNIA 92501
(909) 682-5480

withdrawn from the Appropriator's storage account, (3) and New Yield created by the Appropriator.

C. Appropriative Water: the amount of Safe Yield remaining after satisfaction of Overlying Water Rights.

D. Appropriative Water Right: each Appropriator's share of Appropriative Water, such share expressed as a percentage as shown on Exhibit "C".

E. Beaumont Basin or Beaumont Storage Unit: the area situated within the boundaries shown on Exhibit "A" attached hereto.

F. Conjunctive Use: the storage of water in a Groundwater Basin for use at a later time.

G. Groundwater: water beneath the surface of the ground within the zone below the water table in which soil is saturated with water.

H. Groundwater Basin: an area underlain by one or more permeable formations capable of furnishing a substantial water supply.

I. Groundwater Storage Agreement: a standard form of written agreement between the Watermaster and any Person requesting the storage of Supplemental Water.

J. Groundwater Storage Capacity: the space available in a Groundwater Basin that is not utilized for storage or regulation of Safe Yield and is reasonably available for Stored Water and Conjunctive Use.

K. Minimal Producer: any Producer who pumps 10 or fewer acre feet of Groundwater from the Beaumont Basin per year.

LAW OFFICES
AKLUFI & WYSOCKI
3403 TENTH ST, SUITE 610
RIVERSIDE, CALIFORNIA 92501
(909) 682-5480

L. New Yield: increases in yield in quantities greater than historical amounts from sources of supply including, but not limited to, capture of available storm flow, by means of projects constructed after February 20, 2003, as determined by the Watermaster.

M. Operating Yield: the maximum quantity of water which can be produced annually by the Appropriators from the Beaumont Basin, which quantity consists of Appropriative Water plus Temporary Surplus.

N. Overdraft: a condition wherein the total annual production from a Groundwater Basin exceeds the Safe Yield thereof.

O. Overlying Parties: the Persons listed on Exhibit "B", who are owners of land which overlies the Beaumont Basin and have exercised Overlying Water Rights to pump therefrom. Overlying Parties include successors in interest and assignees.

P. Overlying Water Rights: the quantities decreed to Overlying Parties in Column 4 of Exhibit "B" to this Judgment.

Q. Overproduction: by an Appropriator, measured by an amount equal to the Appropriator's actual annual production minus the Appropriator's Production Right. By a new overlying producer, an amount equal to what the overlying producer pumped during the year.

R. Party (Parties): any Person(s) named in this action, or who has intervened, or has become subject to this Judgment either through stipulation, trial or otherwise

LAW OFFICES
AKLUFI & WYSOCKI
3403 TENTH ST, SUITE 610
RIVERSIDE, CALIFORNIA 92501
(909) 682-5480

S. Person: any individual, partnership, association, corporation, governmental entity or agency, or other organization.

T. Physical Solution: the physical solution set forth in Part V of this Judgment.

U. Produce, Producing, Production, Pump or Pumping: the extraction of groundwater.

V. Producer or Pumper: any Person who extracts groundwater.

W. Recycled Water: has the meaning provided in Water Code Section 13050(n) and includes other nonpotable water for purposes of this Judgment.

X. Safe Yield: the maximum quantity of water which can be produced annually from a Groundwater Basin under a given set of conditions without causing a gradual lowering of the groundwater level leading eventually to depletion of the supply in storage. The Safe Yield of the Beaumont Basin is 8650 acre feet per year in each of the ten (10) years following entry of this Judgment.

Y. San Timoteo Watershed Management Authority: a joint powers public agency whose members are the Beaumont-Cherry Valley Water District, the City of Beaumont, the South Mesa Mutual Water Company and the Yucaipa Valley Water District.

Z. Stored Water: Supplemental Water stored in the Beaumont Basin pursuant to a Groundwater Storage Agreement with the Watermaster.

AA. Supplemental Water: water imported into the

LAW OFFICES
AKLUFI / WYSOCKI
3403 TENTH ST., SUITE 610
RIVERSIDE, CALIFORNIA 92501
(909) 682-5480

Beaumont Basin from outside the Beaumont Basin including, without limitation, water diverted from creeks upstream and tributary to Beaumont Basin and water which is recycled and useable within the Beaumont Basin.

BB. Temporary Surplus: the amount of groundwater that can be pumped annually in excess of Safe Yield from a Groundwater Basin necessary to create enough additional storage capacity to prevent the waste of water.

CC. Watermaster: the Person appointed by the Court to administer and enforce the Physical Solution.

4. List of Exhibits

The following exhibits are attached to this Judgment and made a part hereof:

Exhibit "A" -- "Location Map of Beaumont Basin"
Exhibit "B" -- "Overlying Owners and Their Water Rights"
Exhibit "C" -- "Appropriators and Their Water Rights"
Exhibit "D" -- "Legal Description of Lands of the Overlying Parties"
Exhibit "E" -- "Location of Overlying Producer Parcels and Boundary of the Beaumont Basin"

II. INJUNCTIONS

1. Injunction Against Unauthorized Production of Beaumont Basin Water

Each party herein is enjoined, as follows:

A. Overlying Parties: Each defendant who is an Overlying Party, and its officers, agents, employees, successors and assigns, is hereby enjoined and restrained from producing groundwater from the Beaumont Basin in any five-year period hereafter in excess of five times the share of the Safe Yield assigned to the Overlying Parties as set

LAW OFFICES
AKLUFI & WYSOCKI
3403 TENTH ST., SUITE 610
RIVERSIDE, CALIFORNIA 92501
(909) 682-5480

forth in Column 4 of Exhibit "B", as more fully described in the Physical Solution.

B. Appropriator Parties: Each defendant who is an Appropriator Party, and its officers, agents, employees, successors and assigns, is hereby enjoined and restrained from producing groundwater from the Beaumont Basin in any year hereafter in excess of such party's Appropriator's Production Right, except as additional annual Production may be authorized by the provisions of the Physical Solution.

2. Injunction Against Unauthorized Storage or Withdrawal of Stored Water

Each and every Party, and its officers, agents, employees, successors and assigns, is hereby enjoined and restrained from storing Supplemental Water in the Beaumont Basin for withdrawal, or causing withdrawal of water stored by that Party, except pursuant to the terms of a written Groundwater Storage Agreement with the Watermaster and in accordance with Watermaster Rules and Regulations. Any Supplemental Water stored in the Beaumont Basin, except pursuant to a Groundwater Storage Agreement, shall be deemed abandoned and not classified as Stored Water.

III. DECLARATION AND ADJUSTMENT OF RIGHTS

1. Overlying Rights

The Overlying Parties are currently exercising Overlying Water Rights in the Beaumont Basin. As shown on Exhibit "B", the aggregate Projected Maximum Production of water from the Beaumont Basin pursuant to Overlying Water Rights is 8650 acre feet and the Overlying Water Rights are individually decreed, in Column 4 of Exhibit "B", for each Overlying Party. The Overlying Parties

LAW OFFICES
AKLUFI & WYSOCKI
3403 TENTH ST, SUITE 610
RIVERSIDE, CALIFORNIA 92501
(909) 682-5480

shall continue to have the right to exercise their respective Overlying Water Right as set forth in Column 4 of Exhibit "B" except to the extent their respective properties receive water service from an Appropriator Party, as contemplated by Paragraph III.3 of this Judgment.

2. Appropriator's Share of Operating Yield

Each Appropriator Party's share of Operating Yield is shown on Exhibit "C". Notwithstanding any other provision of this Judgment, each Appropriator Party may use its Appropriator's Production Right anywhere within its service area.

3. Adjustment of Rights

A. The Overlying Parties shall have the right to exercise their respective Overlying Water Rights except as provided in this Paragraph 3.

B. To the extent any Overlying Party requests, and uses its Exhibit "B", Column 4 water to obtain water service from an Appropriator Party, an equivalent volume of potable groundwater shall be earmarked by the Appropriator Party which will serve the Overlying Party, up to the volume of the Overlying Water Right as reflected in Column 4 of Exhibit "B" attached hereto, for the purpose of serving the Overlying Party. The intent of this provision is to ensure that the Overlying Party is given credit towards satisfying the water availability assessment provisions of Government Code, Section 66473.7 et seq. and Water Code, Section 10910 et seq. or other similar provisions of law, equal to the amount of groundwater earmarked hereunder.

C. When an Overlying Party receives water service as

LAW OFFICES
AKLUFI & WYSOCKI
3403 TENTH STREET, SUITE 610
RIVERSIDE, CALIFORNIA 92501
(909) 682-5480

provided for in subparagraph III.3.B the Overlying Party shall forebear the use of that volume of the Overlying Water Right earmarked by the Appropriator Party. The Appropriator Party providing such service shall have the right to produce the volume of water foregone by the Overlying Party, in addition to other rights otherwise allocated to the Appropriator Party.

D. Should the volume of the Overlying Water Right equal or exceed the volume of potable groundwater earmarked as provided in subparagraph 3.B, the Appropriator Party which will serve the Overlying Party shall (i) impose potable water charges and assessments upon the Overlying Party and its successors in interest at the rates charged to the then-existing regular customers of the Appropriator Party, and (ii) not collect from such Overlying Party any development charge that may be related to the importation of water into the Beaumont Basin. The Appropriator Party which will serve the Overlying Party pursuant to Subparagraph III.3.B shall also consider, and negotiate in good faith regarding, the provision of a meaningful credit for any pipelines, pump stations, wells or other facilities that may exist on the property to be served.

E. In the event an Overlying Party receives Recycled Water from an Appropriator Party to serve an overlying use served with groundwater, the Overlying Water Right of the Overlying Party shall not be diminished by the receipt and use of such Recycled Water. Recycled Water provided by an Appropriator Party to an Overlying Party shall satisfy the

AKLUFI & WYSOCKI
3403 TENTH ST, SUITE 610
RIVERSIDE, CALIFORNIA 92501
(909) 682-5480

criteria set forth in the California Water Code including, without limitation, the criteria set forth in Water Code Sections 13550 and 13551. The Appropriator Party which will serve the Recycled Water shall have the right to use that portion of the Overlying Water Right of the Overlying Party offset by the provision of Recycled Water service pursuant to the terms of this subparagraph; provided, however, that such right of use by the Appropriator Party shall no longer be valid if the Recycled Water, provided by the Appropriator Party to the Overlying Party, does not satisfy the requirements of Sections 13550 and 13551 and the Overlying Party ceases taking delivery of such Recycled Water.

F. Nothing in this Judgment is intended to impair or adversely affect the ability of an Overlying Party to enter into annexation or development agreements with any Appropriator Party.

G. Oak Valley Partners LP ("Oak Valley") is developing its property pursuant to Specific Plans 216 and 216A adopted by the County of Riverside ("County") in May 1990, and Specific Plan 318 adopted by the County in August, 2001, (Specific Plans 216, 216A and 318 are collectively referred to as the "Specific Plans"). The future water supply needs at build-out of the Specific Plans will greatly exceed Oak Valley's Projected Maximum Production, as reflected in Exhibit "B" to the Judgment, and may be as much as 12,811 acre feet per year. Oak Valley has annexed the portion of its property now within the City of Beaumont into the Beaumont-Cherry Valley Water District ("BCVWD"), and is in

LAW OFFICES
AKLUFI & WYSOCKI
3403 TENTH ST, SUITE 610
RIVERSIDE, CALIFORNIA 92501
(909) 682-5480

the process of annexing the remainder portion of its property into the Yucaipa Valley Water District ("YVWD"), in order to obtain retail water service for the development of the Oak Valley property pursuant to the Specific Plans (for purposes of this subparagraph BCVWD and YVWD are collectively referred to as the "Water Districts", and individually as a "Water District"). YVWD covenants to use its best efforts to finalize the annexation of the Oak Valley property within the Calimesa City limits. Oak Valley, for itself and its successors and assigns, hereby agrees, by this stipulation and upon final annexation of its property by YVWD, to forbear from claiming any future, unexercised, overlying rights in excess of the Projected Maximum Production of Exhibit "B" of 1806 acre feet per year. As consideration for the forbearance, the Water Districts agree to amend their respective Urban Water Management Plans ("UWMP") in 2005 as follows: BCVWD agrees that 2,400 acre feet per year of projected water demand shall be included for the portion of Oak Valley to be served by BCVWD in its UWMP, and YVWD agrees to include 8,000 acre feet per year of projected water demand as a projected demand for the portion of Oak Valley to be served by YVWD in its UWMP by 2025. The Water Districts agree to use their best judgment to accurately revise this estimate to reflect the projected water demands for the UWMP prepared in 2010. Furthermore, the Water Districts further agree that, in providing water availability assessments prior to 2010, as required by Water Code §10910 and water supply verifications as required by Government Code §§66455.3 and

LAW OFFICES
AKLUFI & WYSOCKI
3403 TENTH ST, SUITE 610
RIVERSIDE, CALIFORNIA 92501
(909) 682-5480

66473.7, or any similar statute, and in maintaining their respective UWMP, each shall consider the foregoing respective projected water demand figures for Oak Valley as proposed water demands. The intent of the foregoing requirements is to ensure that Oak Valley is credited for the forbearance of its overlying water rights and is fully accounted for in each Water District's UWMP and overall water planning. The Water Districts' actions in performance of the foregoing planning obligations shall not create any right or entitlement to, or priority or allocation in, any particular water supply source, capacity or facility, or any right to receive water service other than by satisfying the applicable Water District's reasonable requirements relating to application for service. Nothing in this subparagraph G is intended to affect or impair the provision of earmarked water to Overlying Parties who request and obtain water service from Appropriator Parties, as set forth in subparagraph III.3.B, above.

H. Persons who would otherwise qualify as Overlying Producers based on an interest in land lying within the City of Banning's service area shall not have the rights described in this Paragraph III.3.

4. Exemption for Minimal Producers

Unless otherwise ordered by the Court, Minimal Producers are exempt from the provisions of this Judgment.

IV. CONTINUING JURISDICTION

Full jurisdiction, power and authority is retained and reserved to the Court for purposes of enabling the Court, upon

LAW OFFICES
AKLUFI AND WYSOCKI
3403 TENTH ST, SUITE 610
RIVERSIDE, CALIFORNIA 92501
(909) 682-5480

application of any Party, by a motion noticed for at least a 30-day period (or consistent with the review procedures of Paragraph VII.6 herein, if applicable), to make such further or supplemental order or directions as may be necessary or appropriate for interim operation of the Beaumont Basin before the Physical Solution is fully operative, or for interpretation, or enforcement or carrying out of this Judgment, and to modify, amend or amplify any of the provisions of this Judgment or to add to the provisions hereof consistent with the rights herein decreed; except that the Court's jurisdiction does not extend to the redetermination of (a) Safe Yield during the first ten years of operation of the Physical Solution, and (b) the fraction of the share of Appropriative Water of each Appropriator.

V. THE PHYSICAL SOLUTION

1. Purpose and Objective

In accordance with the mandate of Section 2 of Article X of the California Constitution, the Court hereby adopts, and orders the parties to comply with, a Physical Solution. The purpose of the Physical Solution is to establish a legal and practical means for making the maximum reasonable beneficial use of the waters of Beaumont Basin, to facilitate conjunctive utilization of surface, ground and Supplemental Waters, and to satisfy the requirements of water users having rights in, or who are dependent upon, the Beaumont Basin. Such Physical Solution requires the definition of the individual rights of all Parties within the Beaumont Basin in a manner which will fairly allocate the native water supplies and which will provide for equitable sharing of costs of Supplemental Water.

AKLUFI AND WYSOCKI
3403 TENTH STREET, SUITE 610
RIVERSIDE, CALIFORNIA 92501
(909) 682-5480

2. Need for Flexibility

The Physical Solution must provide maximum flexibility and adaptability in order that the Watermaster and the Court may be free to use existing and future technological, social, institutional and economic options. To that end, the Court's retained jurisdiction shall be utilized, where appropriate, to supplement the discretion granted herein to the Watermaster.

3. Production and Storage in Accordance With Judgment

This Judgment, and the Physical Solution decreed herein, address all Production and Storage within the Beaumont Basin. Because the Beaumont Basin is at or near a condition of Overdraft, any Production outside the framework of this Judgment and Physical Solution will potentially damage the Beaumont Basin, injure the rights of all Parties, result in the waste of water and interfere with the Physical Solution. The Watermaster shall bring an action or a motion to enjoin any Production that is not in accordance with the terms of this Judgment.

4. General Pattern of Operation

One fundamental premise of the adjudication is that all Producers shall be allowed to pump sufficient water from the Beaumont Basin to meet their respective requirements. Another fundamental premise of the adjudication is that Overlying Parties who pump no more than the amount of their Overlying Water Right as shown on Column 4 of Exhibit "B" hereto, shall not be charged for the replenishment of the Beaumont Basin. To the extent that pumping exceeds five (5) times the share of the Safe Yield assigned to an Overlying Party (Column 4 of Exhibit "B") in any five (5) consecutive years, or the share of Operating Yield

AKLUFI & WYSOCKI
3403 TENTH STREET, SUITE 610
RIVERSIDE, CALIFORNIA 92501
(909) 682-5480

Right of each Appropriator Party, each such Party shall provide funds to enable the Watermaster to replace such Overproduction.

5. Use of Available Groundwater Storage Capacity

A. There exists in the Beaumont Basin a substantial amount of available Groundwater Storage Capacity. Such Capacity can be reasonably used for Stored Water and Conjunctive Use and may be used subject to Watermaster regulation to prevent injury to existing Overlying and Appropriative water rights, to prevent the waste of water, and to protect the right to the use of Supplemental Water in storage and Safe Yield of the Beaumont Basin.

B. There shall be reserved for Conjunctive Use a minimum of 200,000 acre feet of Groundwater Storage Capacity in the Beaumont Basin provided that such amount may be reduced as necessary to prevent injury to existing water rights or existing uses of water within the Basin, and to prevent the waste of water. Any Person may make reasonable beneficial use of the Groundwater Storage Capacity for storage of Supplemental Water; provided, however, that no such use shall be made except pursuant to a written Groundwater Storage Agreement with the Watermaster. The allocation and use of Groundwater Storage Capacity shall have priority and preference for Producers within the Beaumont Basin over storage for export. The Watermaster may, from time-to-time, redetermine the available Groundwater Storage Capacity.

///

///

AKLUFI & WYSOCKI
3403 TENTH STREET, SUITE 610
RIVERSIDE, CALIFORNIA 92501
(909) 682-5480

VI. ADMINISTRATION

1. Administration and Enforcement by Watermaster

The Watermaster shall administer and enforce the provisions of this Judgment and any subsequent order or instructions of the Court.

2. Watermaster Control

The Watermaster is hereby granted discretionary powers to develop and implement a groundwater management plan and program for the Beaumont Basin, which plan shall be filed with and shall be subject to review and approval by, the Court, and which may include water quantity and quality considerations and shall reflect the provisions of this Judgment. Except for the exercise by Overlying Parties of their respective Rights described in Column 4 of Exhibit "B" hereto in accordance with the provisions of the Physical Solution, groundwater extractions and the replenishment thereof, and the storage of Supplemental Water, shall be subject to procedures established and administered by the Watermaster. Such procedures shall be subject to review by the Court upon motion by any Party.

3. Watermaster Standard of Performance

The Watermaster shall, in carrying out its duties and responsibilities herein, act in an impartial manner without favor or prejudice to any Party or purpose of use.

4. Watermaster Appointment

The Watermaster shall consist of a committee composed of persons nominated by the City of Banning, the City of Beaumont, the Beaumont-Cherry Valley Water District, the South Mesa Mutual Water Company and the Yucaipa Valley Water District, each of

AKLUFI AND WYSOCKI
3403 TENTH ST, SUITE 610
RIVERSIDE, CALIFORNIA 92501
(909) 682-5480

which shall have the right to nominate one representative to the Watermaster committee who shall be an employee of or consultant to the nominating agency. Each such nomination shall be made in writing, served upon the other parties to this Judgment and filed with the Court, which shall approve or reject such nomination. Each Watermaster representative shall serve until a replacement nominee is approved by the Court. The nominating agency shall have the right to nominate that representative's successor.

5. Powers and Duties of the Watermaster

Subject to the continuing supervision and control of the Court, the Watermaster shall have and may exercise the following express powers, and shall perform the following duties, together with any specific powers, authority, and duties granted or imposed elsewhere in this Judgment or hereafter ordered or authorized by the Court in the exercise of its continuing jurisdiction:

A. Rules and Regulations: The adoption of appropriate rules and regulations for the conduct of Watermaster affairs, copies of which shall be provided to all interested parties.

B. Wellhead Protection and Recharge: The identification and management of wellhead protection areas and recharge areas.

C. Well Abandonment: The administration of a well abandonment and well destruction program.

D. Well Construction: The development of minimum well construction specifications and the permitting of new wells.

AKLUFI AND WYSOCKI
3403 TENTH ST, SUITE 610
RIVERSIDE, CALIFORNIA 92501
(909) 682-5480

E. Mitigation of Overdraft: The mitigation of conditions of uncontrolled overdraft.

F. Replenishment: The acquisition and recharge of Supplemental Water.

G. Monitoring: The monitoring of groundwater levels, ground levels, storage, and water quality.

H. Conjunctive Use: The development and management of conjunctive-use programs.

I. Local Projects: The coordination of construction and operation, by local agencies, of recharge, storage, conservation, water recycling, extraction projects and any water resource management activity within or impacting the Beaumont Basin.

J. Land Use Plans: The review of land use plans and coordination with land use planning agencies to mitigate or eliminate activities that create a reasonable risk of groundwater contamination.

K. Acquisition of Facilities: The purchase, lease and acquisition of all necessary real and personal property, including facilities and equipment.

L. Employment of Experts and Agents: The employment or retention of such technical, clerical, administrative, engineering, accounting, legal or other specialized personnel and consultants as may be deemed appropriate. The Watermaster shall maintain records allocating the cost of such services as well as all other expenses of Watermaster administration.

M. Measuring Devices: Except as otherwise provided

LAW OFFICES
AKLUFI A[illegible] VYSOCKI
3403 TENTH [illegible]T, SUITE 610
RIVERSIDE, CALIFORNIA 92501
(909) 682-5480

by agreement the Watermaster shall install and maintain in good operating condition, at the cost of the Watermaster, such necessary measuring devices or meters as Watermaster may deem appropriate. Such devices shall be inspected and tested as deemed necessary by the Watermaster and the cost thereof borne by the Watermaster. Meter repair and retesting will be a Producer expense.

N. Assessments: The Watermaster is empowered to levy and collect the following assessments:

(1) Annual Replenishment Assessments

The Watermaster shall levy and collect assessments in each year, in amounts sufficient to purchase replenishment water to replace Overproduction by any Party.

(2) Annual Administrative Assessments

a. Watermaster Expenses: The expenses of administration of the Physical Solution shall be categorized as either "General Watermaster Administration Expenses", or "Special Project Expenses".

i. General Watermaster Administration Expenses: shall include office rent, labor, supplies, office equipment, incidental expenses and general overhead. General Watermaster Administration Expenses shall be assessed by the Watermaster equally against the Appropriators who have appointed representatives to the Watermaster.

LAW OFFICES
AKLUFI AND WYSOCKI
3403 TENTH ST, SUITE 610
RIVERSIDE, CALIFORNIA 92501
(909) 682-5480

ii. Special Project Expenses: shall include special engineering, economic or other studies, litigation expenses, meter testing or other major operating expenses. Each such project shall be assigned a task order number and shall be separately budgeted and accounted for. Special Project Expenses shall be allocated to the Appropriators, or portion thereof, on the basis of benefit.

O. Investment of Funds; Borrowing: The Watermaster may hold and invest Watermaster funds as authorized by law, and may borrow, from time-to-time, amounts not exceeding annual receipts.

P. Contracts: The Watermaster may enter into contracts for the performance of any of its powers.

Q. Cooperation With Other Agencies: The Watermaster may act jointly or cooperate with other local, state and federal agencies.

R. Studies: The Watermaster may undertake relevant studies of hydrologic conditions and operating aspects of the management program for the Beaumont Basin.

S. Groundwater Storage Agreements: The Watermaster shall adopt uniform rules and a standard form of agreement for the storage of Supplemental Water, provided that the activities undertaken pursuant to such agreements do not injure any Party.

T. Administration of Groundwater Storage Capacity: Except for the exercise by the Overlying Parties of their

LAW OFFICES
AKLUFI AND WYSOCKI
3403 TENTH ST, SUITE 610
RIVERSIDE, CALIFORNIA 92501
(909) 682-5480

respective Overlying Water Rights described in Part III, above, in accordance with the provisions of the Physical Solution, all Groundwater Storage Capacity in the Beaumont Basin shall be subject to the Watermaster's rules and regulations, which regulations shall ensure that sufficient storage capacity shall be reserved for local projects. Any Person or entity may apply to the Watermaster to store water in the Beaumont Basin.

U. Accounting for Stored Water: The Watermaster shall calculate additions, extractions and losses and maintain an annual account of all stored water in the Beaumont Basin, and any losses of water supplies or Safe Yield resulting from such stored water.

V. Accounting for New Yield: Recharge of the Beaumont Basin with New Yield water shall be credited to the Party that creates the New Yield. The Watermaster shall make an independent scientific assessment of the estimated New Yield created by each proposed project. New Yield will be allocated on an annual basis, based upon monitoring data and review by the Watermaster.

W. Accounting for Acquisitions of Water Rights: The Watermaster shall maintain an accounting of acquisitions by Appropriators of water otherwise subject to Overlying Water Rights as the result of the provision of water service thereto by an Appropriator.

X. Annual Administrative Budget: The Watermaster shall prepare an annual administrative budget for public review, and shall hold a public hearing on each such budget

LAW OFFICES
AKLUFI AND WYSOCKI
3403 TENTH STREET, SUITE 610
RIVERSIDE, CALIFORNIA 92501
(909) 682-5480

prior to adoption. The budget shall be prepared in sufficient detail so as to make a proper allocation of the expenses and receipts. Expenditures within budgeted items may thereafter be made by the Watermaster as a matter of course.

Y. Redetermining the Safe Yield: The Safe Yield of the Beaumont Basin shall be redetermined at least every 10 years beginning 10 years after the date of entry of this Judgment.

6. Reports and Accounting

(a) Production Reports: Each Pumper shall periodically file, pursuant to Watermaster rules and regulations, a report showing the total production of such Pumper from each well during the preceding report period, and such additional information as the Watermaster may reasonably require.

(b) Watermaster Report and Accounting: The Watermaster shall prepare an annual report of the preceding year's operations, which shall include an audit of all assessments and Watermaster expenditures.

7. Replenishment

Supplemental Water may be obtained by the Watermaster from any source. The Watermaster shall seek the best available quality of Supplemental Water at the most reasonable cost for recharge in the Basin. Sources may include, but are not limited to:

(a) Recycled Water;

(b) State Water Project Water;

LAW OFFICES
AKLUFI A[illegible]WYSOCKI
3403 TENTH [illegible]T, SUITE 610
RIVERSIDE, CALIFORNIA 92501
(909) 682-5480

(c) Other imported water.

Replenishment may be accomplished by any reasonable method including:

(a) Spreading and percolation, or injection of water in existing or new facilities; and/or

(b) In-lieu deliveries for direct surface use, in lieu of groundwater extraction.

VII. MISCELLANEOUS PROVISIONS

1. Designation of Address for Notice and Service

Each Party shall designate, in writing to the plaintiff, the name and address to be used for purposes of all subsequent notices and service herein, such designation to be delivered to the plaintiff within 30 days after the Judgment has been entered. The plaintiff shall, within 45 days after judgment has been entered, file the list of designees with the Court and serve the same on the Watermaster and all Parties. Such designation may be changed from time-to-time by filing a written notice of such change with the Watermaster. Any Party desiring to be relieved of receiving notices of Watermaster activity may file a waiver of notice on a form to be provided by the Watermaster. The Watermaster shall maintain, at all times, a current list of Parties to whom notices are to be sent and their addresses for purposes of service. The Watermaster shall also maintain a full current list of names and addresses of all Parties or their successors, as filed herein. Copies of such lists shall be available to any Person. If no designation is made, a Party's designee shall be deemed to be, in order of priority: (i) the Party's attorney of record; or (ii) if the Party does not have an

LAW OFFICES
AKLUFI A[illegible] WYSOCKI
3403 TENTH [illegible], SUITE 610
RIVERSIDE, C[illegible]FORNIA 92501
(909) 682-5480

attorney of record, the Party itself at the address on the Watermaster list.

2. Intervention After Judgment

Any Person who is neither a Party to this Judgment nor a successor or assignee of a Party to this Judgment may seek to become a party to this Judgment by filing a petition in intervention.

3. Interference with Pumping

Nothing in this judgment shall be deemed to prevent any party from seeking judicial relief against any other party whose pumping activities constitute an unreasonable interference with the complaining party's ability to extract groundwater.

4. Successors and Assigns

This Judgment and all provisions herein shall be binding on and shall inure to the benefit of the heirs, executors, administrators, successors and assigns of the parties hereto.

5. Severability

The provisions of this Judgment are severable. If any provision of this Judgment is held by the Court to be illegal, invalid or unenforceable, that provision shall be excised from the Judgment. The remainder of the terms of the Judgment shall remain in full force and effect and shall in no way be affected, impaired or invalidated by such excision. This Judgment shall be reformed to add, in lieu of the excised provision, a provision as similar in terms to the excised provision as may be possible and be legal, valid and enforceable.

6. Review Procedures

Any action, decision, rule or procedure of the Watermaster

LAW OFFICES
AKLUFI AND WYSOCKI
3403 TENTH ST., SUITE 610
RIVERSIDE, CALIFORNIA 92501
(909) 682-5480

pursuant to this Judgment shall be subject to review by the Court on its own motion or on timely motion by any Party, as follows:

A. Effective Date of Watermaster Action: Any order, decision or action of the Watermaster pursuant to this Judgment on noticed specific agenda items shall be deemed to have occurred on the date of the order, decision or action.

B. Notice of Motion: Any Party may, by a regularly-noticed motion, petition the Court for review of the Watermaster's action or decision pursuant to this Judgment. The motion shall be deemed to be filed when a copy, conformed as filed with the Court, has been delivered to the Watermaster, together with the service fee established by the Watermaster sufficient to cover the cost to photocopy and mail the motion to each Party. The Watermaster shall prepare copies and mail a copy of the motion to each Party or its designee according to the official service list which shall be maintained by the Watermaster according to Part VII, paragraph 1, above. A Party's obligation to serve the notice of a motion upon the Parties is deemed to be satisfied by filing the motion as provided herein. Unless ordered by the Court, any petition shall not operate to stay the effect of any Watermaster action or decision which is challenged.

C. Time for Motion: A motion to review any Watermaster action or decision shall be filed within 90 days after such Watermaster action or decision, except that motions to review Watermaster assessments hereunder shall be filed within 30 days of mailing of notice of the assessment.

AKLUFI & WYSOCKI

RIVERSIDE, CALIFORNIA 92501
(909) 682-5480

D. De Novo Nature of Proceeding: Upon filing of a petition to review a Watermaster action, the Watermaster shall notify the Parties of a date when the Court will take evidence and hear argument. The Court's review shall be de novo and the Watermaster decision or action shall have no evidentiary weight in such proceeding.

E. Decision: The decision of the Court in such proceedings shall be an appealable Supplemental Order in this case. When the same is final, it shall be binding upon the Watermaster and the Parties.

Dated: FEB - 4 2004

As requested, Watermaster designated a portion of these aggregated rights to Hector Gutierrez, Luis Gutierrez and Sebastian Monroy on June 13, 2006.

Note 8 -- Parcels owned by Sunny-Cal Egg & Poultry Company include the overlying water rights of Manheim, Manheim and Berman (MMB) and is aggregated as shown in Column 4 of Exhibit B as attributable to Sunny-Cal Egg & Poultry Company. As requested, Watermaster designated a portion of these aggregated rights to Boris and Miriam Durmont on June 13, 2006.

Appendix H: Water Shortage Contingency Plan Ordinance

SAN GORGONIO PASS WATER AGENCY

ORDINANCE NO. XX

ORDINANCE ADOPTING A WHOLESALE WATER SHORTAGE CONTINGENCY PLAN FOR PURPOSES OF THE URBAN WATER MANAGEMENT PLANNING ACT

WHEREAS, the San Gorgonio Pass Water Agency ("Agency") is a public water agency organized and operating pursuant to the San Gorgonio Pass Water Agency Law, California Water Code Appendix 101-1 et seq., and is authorized to, among other things, supply water on a wholesale basis to retail water suppliers and other entities within the San Gorgonio Pass area; and

WHEREAS, the Agency is an urban wholesale water supplier for purposes of the Urban Water Management Planning Act (Water Code section 10610 et seq.) and the Water Conservation Act of 2009 (Water Code Section 10608 et seq.), commonly referred to as SBX7-7, and as such the Agency is required to provide a water shortage contingency analysis as part of its Urban Water Management Plan, which must include, among other things, a final or draft water shortage contingency resolution or ordinance that includes stages of action to be undertaken by the Agency in response to water supply shortages, including up to a 50 percent reduction in water supply; and

WHEREAS, the Agency is a State Water Project ("SWP") Contractor and has rights and access to multiple sources of water that it may supply on a wholesale basis to retail water agencies and other entities in the San Gorgonio Pass area, which sources of water include, but are not limited to, annual contractual supplies from the SWP, and surplus water from the Yuba County Water Agency; and

WHEREAS, the State of California recently experienced record multiple dry-year conditions and many portions of the state continue to face ongoing drought conditions, wherein such conditions have affected the availability and reliability of the Agency's wholesale water supplies and water supplies throughout the San Gorgonio Pass area, and wherein future drought conditions will continue to affect the availability and reliability of water supplies available to the Agency; and

WHEREAS, in addition to being subject to drought conditions, water supplies available to the Agency are subject to environmental, regulatory, legal, and other constraints, and are further subject to shortages and reductions caused by catastrophic conditions such as regional power outages, earthquakes, or other disasters; and

WHEREAS, in response to California's recurring drought conditions, Governor Jerry Brown and the prior Governor have issued various emergency drought declarations requiring

DRAFT

immediate actions by state agencies and calling upon local agencies and all Californians to take aggressive and immediate actions to reduce water consumption statewide, regionally, and locally, and to prevent the waste of water; and

WHEREAS, the Agency is authorized by law, including but not limited to, Water Code section 350 et seq., Water Code section 375 et seq., and the San Gorgonio Pass Water Agency Law, to take various actions in response to reductions in water supply, including but not limited to: declaring a water shortage emergency; adopting regulations and restrictions regarding the delivery, distribution and allocation of water; and adopting, implementing, and enforcing a wholesale water conservation program; and

WHEREAS, on July 21, 2014, the Agency adopted Ordinance No. 10 which established a Water Shortage Plan which sets forth a policy regarding how the Agency will allocate wholesale water supplies available for purchase by the Agency during a Water Shortage Year(s); and

WHEREAS, in accordance with the requirements of the Urban Water Management Planning Act, the Agency desires to enact this Water Shortage Contingency Ordinance for purposes of its 2015 Urban Water Management Plan to include stages of action to be undertaken by the Agency in response to shortages in wholesale water supplies available for purchase by the Agency, including up to a 50 percent reduction in those supplies, and to provide an outline of the specific water supply conditions that are applicable to each stage of action by reference to the allocation scenarios established in Agency Ordinance No. 10.

NOW, THEREFORE, BE IT ORDAINED by the Board of Directors of the San Gorgonio Pass Water Agency as follows:

1. Incorporation of Recitals. The Recitals set forth above are incorporated herein and made an operative part of this Resolution.

2. Purpose and Scope. This Water Shortage Contingency Ordinance is adopted pursuant to the authorities of the Agency under the San Gorgonio Pass Water Agency Law and in accordance with the Urban Water Management Planning Act to include stages of action to be undertaken by the Agency in response to shortages in wholesale water supplies available for purchase by the Agency, including up to a 50 percent reduction in those supplies, and to provide an outline of the specific water supply conditions that are applicable to each stage of action by reference to the allocation scenarios established in Agency Ordinance No. 10. As such, implementation of this Ordinance shall be carried out in conjunction with Ordinance No. 10.

3. Notice and Public Hearing. The Agency's Board of Directors has conducted a noticed public hearing on _____ to allow public agencies, members of the public, and other interested stakeholders to review, submit comments, and have an opportunity to be heard on or protest this Ordinance prior to it being adopted by the Board of Directors. Notice of the

DRAFT

public hearing was published on _____ in the _____, a newspaper of general circulation within the Agency.

4. Water Shortage Contingency Principles. In addition to the scope and purpose of this Water Shortage Contingency Ordinance as described in Section 2, above, a guiding principle of this Ordinance is to assist in managing the Agency's water resources and water supply planning efforts to minimize the effects of water shortages or water supply reductions. Additional supporting principles include:

- Encourage and promote efficient water use throughout the San Gorgonio Pass area;
- Coordinate the Agency's water supply planning efforts and water supply operations with retail water supply agencies and other entities in the San Gorgonio Pass area to the greatest extent practicable;
- Pursue innovative programs to secure additional imported water supplies for use in dry years and during water shortage conditions;
- Prepare for potential catastrophic interruption of water supplies, including, but not limited to, a regional power outage, earthquake, or other disaster scenario; and
- Increase public awareness about water supply issues.

5. Implementation. On an ongoing basis, the Agency evaluates its water supply conditions to determine the appropriate stage of action under this Ordinance. Each stage is associated with specific water resource management considerations designed to: (1) avoid shortages to the maximum extent practicable; and (2) coordinate with retail agencies and others to minimize the effects of reductions in water supply or water shortage conditions.

6. Stage 0 Water Supply Condition.

a. A Stage 0 Water Supply Condition may be declared in the Agency's sole discretion in any calendar year or portion thereof when the Agency determines that (1) at least 62 percent of its contractual SWP Table A imported water supplies ("Average SWP Supplies") are available for purchase by the Agency, and (2) that amount exceeds the total amount of imported water needed to satisfy all First, Second, Third, and Fourth Priority Water Deliveries as set forth by Agency Ordinance No. 10. When the Agency determines in its sole discretion that the foregoing conditions exist, the Agency is considered to be in a Stage 0 Water Supply Condition, and extraordinary water supply management actions are not required. Notwithstanding a Stage 0 Water Supply Condition, the following actions may continue to be undertaken by the Agency:

DRAFT

i. Coordination. Meet and coordinate with retail water agencies and other entities in the San Gorgonio Pass area regarding current and projected water supplies and demands.
ii. Public Messaging. Encourage the public to avoid water waste and increase water use efficiency.
iii. Manage Water Supplies in Excess of Demands. Pursue programs and projects to manage water supplies in excess of demands, including, but not limited to, placing such water in storage or water banking or exchange programs.

7. Stage 1 Water Supply Condition

a. A Stage 1 Water Supply Condition may be declared in the Agency's sole discretion in any calendar year or portion thereof when the Agency determines that due to drought, regulatory, legal, catastrophic, or other conditions, the amount of the Agency's Average SWP Supplies will be reduced by up to 25 percent. The Agency's declaration of a Stage 1 Water Supply Condition will trigger the following water management actions by the Agency:
i. Water Shortage Plan. The Agency will determine whether a Water Shortage Year exists in accordance with Ordinance 10 and the extent to which imported water supplies available for purchase by the Agency will need to be allocated in accordance with Ordinance No. 10.
ii. Coordination. Meet and coordinate with retail water agencies and other entities in the San Gorgonio Pass area regarding current and projected water supplies and demands, and the extent to which other agencies may implement the appropriate stages and actions under their respective water shortage contingency plans.
iii. Continue to undertake other applicable actions identified above under a Stage 0 Water Supply Condition.

8. Stage 2 Water Supply Condition

a. A Stage 2 Water Supply Condition may be declared in the Agency's sole discretion in any calendar year or portion thereof when the Agency determines that due to drought, regulatory, legal, catastrophic, or other conditions, the amount of the Agency's Average SWP Supplies will be reduced by between 26 and 45 percent. The Agency's declaration of a Stage 2 Water Supply Condition will trigger the following water management actions by the Agency:
i. Water Shortage Plan. The Agency will determine whether a Water Shortage Year exists in accordance with Ordinance 10 and the extent

DRAFT

to which imported water supplies available for purchase by the Agency will need to be allocated in accordance with Ordinance No. 10.

ii. Shift and Increase in Public Messaging. The Agency will utilize its own website and other local media and communication efforts to educate the public on the shortage and to encourage greater conservation on the part of individuals, businesses, and institutions.

iii. Dry Year Supplies. Determine from its customers if they desire additional dry-year supplies at an additional cost and, if so, to make reasonable and practicable attempts to obtain and deliver such supplies to customers who request and ensure payment for them.

iv. Continue to undertake other applicable actions identified above under Stage 0 and Stage 1 Water Supply Conditions.

9. Stage 3 Water Supply Condition

a. A Stage 3 Water Supply Condition may be declared in the Agency's sole discretion in any calendar year or portion thereof when the Agency determines that due to drought, regulatory, legal, catastrophic, or other conditions, the amount of the Agency's Average SWP Supplies will be reduced by more than 45 percent. The Agency's declaration of a Stage 3 Water Supply Condition will trigger the following water management actions by the Agency:

i. Water Shortage Plan. The Agency will determine whether a Water Shortage Year exists in accordance with Ordinance 10 and the extent to which imported water supplies available for purchase by the Agency will need to be allocated in accordance with Ordinance No. 10.

ii. Shift and Increase in Public Messaging. The Agency will utilize its own website and other local media and communication efforts to educate the public on the shortage and to encourage greater conservation on the part of individuals, businesses, and institutions.

iii. Dry-Year Supplies. Determine from its customers if they desire additional dry-year supplies at an additional cost and, if so, to make reasonable and practicable attempts to obtain and deliver such supplies to customers who request and ensure payment for them.

iv. Transfers. Evaluate and solicit input from its customers whether the Agency should pursue any transfers to augment supplies during the Stage 3 Condition, including related considerations of potential impacts to future water supplies.

v. Continue to undertake other applicable actions identified above under Stage 0, Stage 1, and Stage 2 Water Supply Conditions.

10. Exemption from the California Environmental Quality Act (CEQA). The Board of Directors determines that the adoption of this Ordinance, for the purposes of addressing

DRAFT

potential reductions in water supply or water supply shortages, is exempt from the requirements for the California Environmental Quality Act in accordance with applicable law, including, but not limited to, Sections 15378(b)(2) and (b)(5) of the State CEQA Guidelines, and Section 10652 of the Urban Water Management Planning Act.

11. Effective Date. This Ordinance shall be effective immediately upon adoption and shall be presumed to continue in effect unless or until a contrary finding is made by applicable action by the Board of Directors. Within ten (10) days after adoption of this Ordinance No. __, a copy of this Ordinance shall be published one time in a newspaper of general circulation with the names of the Directors voting for and against this Ordinance.

12. Severability. If any section, subsection, clause or phrase in this Ordinance No. __ is for any reason held invalid, the validity of the remainder of this Ordinance shall not be affected thereby.

ADOPTED AND APPROVED this ____th day of _____, [Year].

Defendants.

I. STIPULATING PARTIES IDENTIFIED

The following parties, and each of them, agree to the terms of this Stipulation:

Plaintiff:

SAN TIMOTEO WATERSHED MANAGEMENT AUTHORITY

Overlying Defendants:

1. SHARONDALE MESA OWNERS ASSOCIATION, an unincorporated association
2. CALIFORNIA OAK VALLEY GOLF AND RESORT LLC, a California limited liability company
3. OAK VALLEY PARTNERS LP, a Texas limited partnership
4. SOUTHERN CALIFORNIA SECTION OF THE PROFESSIONAL GOLFERS ASSOCIATION OF AMERICA, a California corporation
5. SUNNY-CAL EGG AND POULTRY COMPANY, a California corporation
6. MANHEIM, MANHEIM & BERMAN, a California general partnership
7. WALTER M. BECKMAN, individually, and as Trustee of the BECKMAN FAMILY TRUST dated December 11, 1990
8. THE ROMAN CATHOLIC BISHOP of San Bernardino, a California corporation
9. MERLIN PROPERTIES, LLC
10. LEONARD M. STEARNS and DOROTHY D. STEARNS, individually and as Trustees of the LEONARD M. STEARNS FAMILY TRUST OF 1991
11. PLANTATION ON THE LAKE LLC, a California limited liability company

Appropriating Defendants:

1. CITY OF BANNING, a municipal corporation
2. BEAUMONT-CHERRY VALLEY WATER DISTRICT, an irrigation district
3. SOUTH MESA MUTUAL WATER COMPANY, a mutual water company
4. YUCAIPA VALLEY WATER DISTRICT, a county water district

II. RECITALS

WHEREAS, plaintiff is a joint powers public agency, formed in 2001 for the purpose, among others, of preparing and implementing a Water Resources Management Plan for the San Timoteo Watershed and the waters tributary thereto, including the Beaumont Basin, in order to conserve local water supplies, improve surface and subsurface water quality and quantity, and to protect and enhance groundwater storage, for the benefit of the public;

WHEREAS, the Beaumont Basin, also known as the Beaumont Storage Unit, is the common source of water supply for appropriative water uses within the communities of Banning, Beaumont, Cherry Valley and Calimesa, and for various overlying uses including, but not limited to, golf courses and related facilities and agricultural production, including egg production and related agricultural irrigation uses;

WHEREAS, the maximum quantity of water which can be produced from the Beaumont Basin, at safe yield, is currently estimated to be 8650 acre feet per year, and the total groundwater production from the Beaumont Basin has exceeded and continues to exceed its safe yield;

WHEREAS, much of the land area within and adjacent to the Beaumont Basin is proposed to be intensively developed with residential, commercial and industrial uses, which will place additional demands on local water resources;

WHEREAS, it is estimated that the Beaumont Basin has the capability of storing more than 200,000 acre feet of water for overlying and appropriative use by water users within and

RIVERSIDE, C. ORNIA 92501
(909) 682-5480

adjacent to the Beaumont Basin;

WHEREAS, the plaintiff proposes to invest substantial public funds to construct facilities that will enable the storage of water within the Beaumont Basin, in addition to the storage that occurs naturally;

WHEREAS, the Overlying and Appropriating Defendants wish to secure the provision and availability of a reliable, affordable, long-term water supply for the area within plaintiff's jurisdiction, making reasonable and beneficial use of the native groundwater in the Beaumont Basin, and other local water resources, promoting the importation of water into the area, and storage of such water, and local surface waters, in the Beaumont Basin;

WHEREAS, the Overlying Defendants believe that it is in their best interest to enter into this Stipulation and be subject to the attached Judgment, rather than continue to litigate the safe yield of the Beaumont Basin, the quantity of their overlying rights, both historical and unexercised, the rights they may have to use the storage volume existing beneath their respective lands, and other issues;

WHEREAS, in order to protect existing overlying and appropriative uses and to justify and protect the public investment necessary to utilize the available groundwater storage capacity in the Beaumont Basin, it is necessary to adjudicate the Beaumont Basin and to define the respective water rights of the overlying and appropriative producers of groundwater.

NOW, THEREFORE, the undersigned parties, and each of them, hereby agree to the following Stipulated Terms.

AKLUFI & WYSOCKI
3403 TENTH ST, SUITE 610
RIVERSIDE, CALIFORNIA 92501
(909) 682-5480

III. STIPULATED TERMS

1. Form of Judgment: Judgment may be filed and entered in the form attached hereto as Exhibit "1" and made a part hereof.

2. Fees and Costs: Each party shall bear its own costs, attorneys fees and litigation expenses arising out of this adjudication.

3. Waiver: Notice of entry of judgment, the right to trial, stay of execution and appeal, is hereby waived, except as expressly set forth in the Judgment.

4. Binding Effect: This Stipulation and all obligations herein, shall be binding on and shall inure to the benefit of the heirs, executors, administrators, successors and assigns of the parties hereto.

5. Construction and Interpretation: No adverse construction or interpretation of this Stipulation shall be made under the Civil Code simply because the parties drafted or participated in the drafting of this Stipulation. The terms of the Judgment shall be interpreted to further the purposes of this Stipulation.

6. Jurisdiction and Venue: The Superior Court of California in and for the County of Riverside shall have jurisdiction of this matter. In the event of any litigation arising out of this Stipulation, venue shall conclusively be deemed to lie in the County of Riverside.

7. Advice of Counsel: The undersigned each have had the opportunity to consult with or have consulted with their own legal counsel regarding this Stipulation and all matters set forth herein, or have knowingly waived the right to do so.

I. INTRODUCTION

1. Pleadings, Parties and Jurisdiction

The complaint herein was filed on February 20, 2003, seeking an adjudication of water rights, injunctive relief and the imposition of a physical solution. The defaults of certain defendants have been entered, and certain other defendants dismissed. Other than defendants who have been dismissed or whose defaults have been entered, all defendants have appeared herein. This Court has jurisdiction of the subject matter of this action and of the parties herein.

2. Stipulation for Judgment

Stipulation for Entry of Judgment has been filed by and on behalf of all defendants who have appeared herein.

3. Definitions

As used in this Judgment, these terms shall have the following meanings:

A. Appropriator or Appropriator Parties: the pumpers identified in Exhibit "C" attached hereto.

B. Appropriator's Production Right: consists of an Appropriator's share of Operating Yield, plus (1) any water acquired by an Appropriator from an Overlying Producer or other Appropriator pursuant to this Judgment, (2) any water

3403 TENTH ST, SUITE 610
RIVERSIDE, CALIFORNIA 92501
(909) 682-5480

withdrawn from the Appropriator's storage account, (3) and New Yield created by the Appropriator.

C. Appropriative Water: the amount of Safe Yield remaining after satisfaction of Overlying Water Rights.

D. Appropriative Water Right: each Appropriator's share of Appropriative Water, such share expressed as a percentage as shown on Exhibit "C".

E. Beaumont Basin or Beaumont Storage Unit: the area situated within the boundaries shown on Exhibit "A" attached hereto.

F. Conjunctive Use: the storage of water in a Groundwater Basin for use at a later time.

G. Groundwater: water beneath the surface of the ground within the zone below the water table in which soil is saturated with water.

H. Groundwater Basin: an area underlain by one or more permeable formations capable of furnishing a substantial water supply.

I. Groundwater Storage Agreement: a standard form of written agreement between the Watermaster and any Person requesting the storage of Supplemental Water.

J. Groundwater Storage Capacity: the space available in a Groundwater Basin that is not utilized for storage or regulation of Safe Yield and is reasonably available for Stored Water and Conjunctive Use.

K. Minimal Producer: any Producer who pumps 10 or fewer acre feet of Groundwater from the Beaumont Basin per year.

AKLUFI & WYSOCKI
3403 TENTH ST, SUITE 610
RIVERSIDE, CALIFORNIA 92501
(909) 682-5480

L. New Yield: increases in yield in quantities greater than historical amounts from sources of supply including, but not limited to, capture of available storm flow, by means of projects constructed after February 20, 2003, as determined by the Watermaster.

M. Operating Yield: the maximum quantity of water which can be produced annually by the Appropriators from the Beaumont Basin, which quantity consists of Appropriative Water plus Temporary Surplus.

N. Overdraft: a condition wherein the total annual production from a Groundwater Basin exceeds the Safe Yield thereof.

O. Overlying Parties: the Persons listed on Exhibit "B", who are owners of land which overlies the Beaumont Basin and have exercised Overlying Water Rights to pump therefrom. Overlying Parties include successors in interest and assignees.

P. Overlying Water Rights: the quantities decreed to Overlying Parties in Column 4 of Exhibit "B" to this Judgment.

Q. Overproduction: by an Appropriator, measured by an amount equal to the Appropriator's actual annual production minus the Appropriator's Production Right. By a new overlying producer, an amount equal to what the overlying producer pumped during the year.

R. Party (Parties): any Person(s) named in this action, or who has intervened, or has become subject to this Judgment either through stipulation, trial or otherwise

LAW OFFICES
3403 TENTH ST, SUITE 610
RIVERSIDE, CALIFORNIA 92501
(909) 682-5480

S. Person: any individual, partnership, association, corporation, governmental entity or agency, or other organization.

T. Physical Solution: the physical solution set forth in Part V of this Judgment.

U. Produce, Producing, Production, Pump or Pumping: the extraction of groundwater.

V. Producer or Pumper: any Person who extracts groundwater.

W. Recycled Water: has the meaning provided in Water Code Section 13050(n) and includes other nonpotable water for purposes of this Judgment.

X. Safe Yield: the maximum quantity of water which can be produced annually from a Groundwater Basin under a given set of conditions without causing a gradual lowering of the groundwater level leading eventually to depletion of the supply in storage. The Safe Yield of the Beaumont Basin is 8650 acre feet per year in each of the ten (10) years following entry of this Judgment.

Y. San Timoteo Watershed Management Authority: a joint powers public agency whose members are the Beaumont-Cherry Valley Water District, the City of Beaumont, the South Mesa Mutual Water Company and the Yucaipa Valley Water District.

Z. Stored Water: Supplemental Water stored in the Beaumont Basin pursuant to a Groundwater Storage Agreement with the Watermaster.

AA. Supplemental Water: water imported into the

AKLUFI & WYSOCKI
3403 TENTH ST, SUITE 610
RIVERSIDE, CALIFORNIA 92501
(909) 682-5480

Beaumont Basin from outside the Beaumont Basin including, without limitation, water diverted from creeks upstream and tributary to Beaumont Basin and water which is recycled and useable within the Beaumont Basin.

BB. Temporary Surplus: the amount of groundwater that can be pumped annually in excess of Safe Yield from a Groundwater Basin necessary to create enough additional storage capacity to prevent the waste of water.

CC. Watermaster: the Person appointed by the Court to administer and enforce the Physical Solution.

4. List of Exhibits

The following exhibits are attached to this Judgment and made a part hereof:

Exhibit "A" -- "Location Map of Beaumont Basin"
Exhibit "B" -- "Overlying Owners and Their Water Rights"
Exhibit "C" -- "Appropriators and Their Water Rights"
Exhibit "D" -- "Legal Description of Lands of the Overlying Parties"
Exhibit "E" -- "Location of Overlying Producer Parcels and Boundary of the Beaumont Basin"

II. INJUNCTIONS

1. Injunction Against Unauthorized Production of Beaumont Basin Water

Each party herein is enjoined, as follows:

A. Overlying Parties: Each defendant who is an Overlying Party, and its officers, agents, employees, successors and assigns, is hereby enjoined and restrained from producing groundwater from the Beaumont Basin in any five-year period hereafter in excess of five times the share of the Safe Yield assigned to the Overlying Parties as set

3403 TENTH ST, SUITE 610
RIVERSIDE, CALIFORNIA 92501
(909) 682-5480

forth in Column 4 of Exhibit "B", as more fully described in the Physical Solution.

B. Appropriator Parties: Each defendant who is an Appropriator Party, and its officers, agents, employees, successors and assigns, is hereby enjoined and restrained from producing groundwater from the Beaumont Basin in any year hereafter in excess of such party's Appropriator's Production Right, except as additional annual Production may be authorized by the provisions of the Physical Solution.

2. Injunction Against Unauthorized Storage or Withdrawal of Stored Water

Each and every Party, and its officers, agents, employees, successors and assigns, is hereby enjoined and restrained from storing Supplemental Water in the Beaumont Basin for withdrawal, or causing withdrawal of water stored by that Party, except pursuant to the terms of a written Groundwater Storage Agreement with the Watermaster and in accordance with Watermaster Rules and Regulations. Any Supplemental Water stored in the Beaumont Basin, except pursuant to a Groundwater Storage Agreement, shall be deemed abandoned and not classified as Stored Water.

III. DECLARATION AND ADJUSTMENT OF RIGHTS

1. Overlying Rights

The Overlying Parties are currently exercising Overlying Water Rights in the Beaumont Basin. As shown on Exhibit "B", the aggregate Projected Maximum Production of water from the Beaumont Basin pursuant to Overlying Water Rights is 8610 acre feet and the Overlying Water Rights are individually decreed, in Column 4 of Exhibit "B", for each Overlying Party. The Overlying Parties

8650

AKLUFI & WYSOCKI
3403 TENTH ST, SUITE 610
RIVERSIDE, CALIFORNIA 92501
(909) 682-5480

shall continue to have the right to exercise their respective Overlying Water Right as set forth in Column 4 of Exhibit "B" except to the extent their respective properties receive water service from an Appropriator Party, as contemplated by Paragraph III.3 of this Judgment.

2. Appropriator's Share of Operating Yield

Each Appropriator Party's share of Operating Yield is shown on Exhibit "C". Notwithstanding any other provision of this Judgment, each Appropriator Party may use its Appropriator's Production Right anywhere within its service area.

3. Adjustment of Rights

A. The Overlying Parties shall have the right to exercise their respective Overlying Water Rights except as provided in this Paragraph 3.

B. To the extent any Overlying Party requests, and uses its Exhibit "B", Column 4 water to obtain water service from an Appropriator Party, an equivalent volume of potable groundwater shall be earmarked by the Appropriator Party which will serve the Overlying Party, up to the volume of the Overlying Water Right as reflected in Column 4 of Exhibit "B" attached hereto, for the purpose of serving the Overlying Party. The intent of this provision is to ensure that the Overlying Party is given credit towards satisfying the water availability assessment provisions of Government Code, Section 66473.7 et seq. and Water Code, Section 10910 et seq. or other similar provisions of law, equal to the amount of groundwater earmarked hereunder.

C. When an Overlying Party receives water service as

K I F N O C I
...03 ...ENT, ...ET, SUITE 610
RIVERSIDE, CALIFORNIA 92501
(909) 682-5480

provided for in subparagraph III.3.B the Overlying Party shall forebear the use of that volume of the Overlying Water Right earmarked by the Appropriator Party. The Appropriator Party providing such service shall have the right to produce the volume of water foregone by the Overlying Party, in addition to other rights otherwise allocated to the Appropriator Party.

D. Should the volume of the Overlying Water Right equal or exceed the volume of potable groundwater earmarked as provided in subparagraph 3.B, the Appropriator Party which will serve the Overlying Party shall (i) impose potable water charges and assessments upon the Overlying Party and its successors in interest at the rates charged to the then-existing regular customers of the Appropriator Party, and (ii) not collect from such Overlying Party any development charge that may be related to the importation of water into the Beaumont Basin. The Appropriator Party which will serve the Overlying Party pursuant to Subparagraph III.3.B shall also consider, and negotiate in good faith regarding, the provision of a meaningful credit for any pipelines, pump stations, wells or other facilities that may exist on the property to be served.

E. In the event an Overlying Party receives Recycled Water from an Appropriator Party to serve an overlying use served with groundwater, the Overlying Water Right of the Overlying Party shall not be diminished by the receipt and use of such Recycled Water. Recycled Water provided by an Appropriator Party to an Overlying Party shall satisfy the

AKLUFI & WYSOCKI
3403 TENTH ST, SUITE 610
RIVERSIDE, CALIFORNIA 92501
(909) 682-5480

criteria set forth in the California Water Code including, without limitation, the criteria set forth in Water Code Sections 13550 and 13551. The Appropriator Party which will serve the Recycled Water shall have the right to use that portion of the Overlying Water Right of the Overlying Party offset by the provision of Recycled Water service pursuant to the terms of this subparagraph; provided, however, that such right of use by the Appropriator Party shall no longer be valid if the Recycled Water, provided by the Appropriator Party to the Overlying Party, does not satisfy the requirements of Sections 13550 and 13551 and the Overlying Party ceases taking delivery of such Recycled Water.

F. Nothing in this Judgment is intended to impair or adversely affect the ability of an Overlying Party to enter into annexation or development agreements with any Appropriator Party.

G. Oak Valley Partners LP ("Oak Valley") is developing its property pursuant to Specific Plans 216 and 216A adopted by the County of Riverside ("County") in May 1990, and Specific Plan 318 adopted by the County in August, 2001, (Specific Plans 216, 216A and 318 are collectively referred to as the "Specific Plans"). The future water supply needs at build-out of the Specific Plans will greatly exceed Oak Valley's Projected Maximum Production, as reflected in Exhibit "B" to the Judgment, and may be as much as 12,811 acre feet per year. Oak Valley has annexed the portion of its property now within the City of Beaumont into the Beaumont-Cherry Valley Water District ("BCVWD"), and is in

RIVERSIDE, CALIFORNIA 92501
(909) 682-5480

the process of annexing the remainder portion of its property into the Yucaipa Valley Water District ("YVWD"), in order to obtain retail water service for the development of the Oak Valley property pursuant to the Specific Plans (for purposes of this subparagraph BCVWD and YVWD are collectively referred to as the "Water Districts", and individually as a "Water District"). YVWD covenants to use its best efforts to finalize the annexation of the Oak Valley property within the Calimesa City limits. Oak Valley, for itself and its successors and assigns, hereby agrees, by this stipulation and upon final annexation of its property by YVWD, to forbear from claiming any future, unexercised, overlying rights in excess of the Projected Maximum Production of Exhibit "B" of 1806 acre feet per year. As consideration for the forbearance, the Water Districts agree to amend their respective Urban Water Management Plans ("UWMP") in 2005 as follows: BCVWD agrees that 2,400 acre feet per year of projected water demand shall be included for the portion of Oak Valley to be served by BCVWD in its UWMP, and YVWD agrees to include 8,000 acre feet per year of projected water demand as a projected demand for the portion of Oak Valley to be served by YVWD in its UWMP by 2025. The Water Districts agree to use their best judgment to accurately revise this estimate to reflect the projected water demands for the UWMP prepared in 2010. Furthermore, the Water Districts further agree that, in providing water availability assessments prior to 2010, as required by Water Code §10910 and water supply verifications as required by Government Code §§66455.3 and

AKLUFI & WYSOCKI
3403 TENTH ST, SUITE 610
RIVERSIDE, CALIFORNIA 92501
(909) 682-5480

66473.7, or any similar statute, and in maintaining their respective UWMP, each shall consider the foregoing respective projected water demand figures for Oak Valley as proposed water demands. The intent of the foregoing requirements is to ensure that Oak Valley is credited for the forbearance of its overlying water rights and is fully accounted for in each Water District's UWMP and overall water planning. The Water Districts' actions in performance of the foregoing planning obligations shall not create any right or entitlement to, or priority or allocation in, any particular water supply source, capacity or facility, or any right to receive water service other than by satisfying the applicable Water District's reasonable requirements relating to application for service. Nothing in this subparagraph G is intended to affect or impair the provision of earmarked water to Overlying Parties who request and obtain water service from Appropriator Parties, as set forth in subparagraph III.3.B, above.

H. Persons who would otherwise qualify as Overlying Producers based on an interest in land lying within the City of Banning's service area shall not have the rights described in this Paragraph III.3.

4. Exemption for Minimal Producers

Unless otherwise ordered by the Court, Minimal Producers are exempt from the provisions of this Judgment.

IV. CONTINUING JURISDICTION

Full jurisdiction, power and authority is retained and reserved to the Court for purposes of enabling the Court, upon

RIVERSIDE, CALIFORNIA 92501
(909) 682-5480

application of any Party, by a motion noticed for at least a 30-day period (or consistent with the review procedures of Paragraph VII.6 herein, if applicable), to make such further or supplemental order or directions as may be necessary or appropriate for interim operation of the Beaumont Basin before the Physical Solution is fully operative, or for interpretation, or enforcement or carrying out of this Judgment, and to modify, amend or amplify any of the provisions of this Judgment or to add to the provisions hereof consistent with the rights herein decreed; except that the Court's jurisdiction does not extend to the redetermination of (a) Safe Yield during the first ten years of operation of the Physical Solution, and (b) the fraction of the share of Appropriative Water of each Appropriator.

V. THE PHYSICAL SOLUTION

1. Purpose and Objective

In accordance with the mandate of Section 2 of Article X of the California Constitution, the Court hereby adopts, and orders the parties to comply with, a Physical Solution. The purpose of the Physical Solution is to establish a legal and practical means for making the maximum reasonable beneficial use of the waters of Beaumont Basin, to facilitate conjunctive utilization of surface, ground and Supplemental Waters, and to satisfy the requirements of water users having rights in, or who are dependent upon, the Beaumont Basin. Such Physical Solution requires the definition of the individual rights of all Parties within the Beaumont Basin in a manner which will fairly allocate the native water supplies and which will provide for equitable sharing of costs of Supplemental Water.

ARLOFT AND WYSOCKI
3403 TENTH ET, SUITE 610
RIVERSIDE, C FORNIA 92501
(909) 682-5480

2. Need for Flexibility

The Physical Solution must provide maximum flexibility and adaptability in order that the Watermaster and the Court may be free to use existing and future technological, social, institutional and economic options. To that end, the Court's retained jurisdiction shall be utilized, where appropriate, to supplement the discretion granted herein to the Watermaster.

3. Production and Storage in Accordance With Judgment

This Judgment, and the Physical Solution decreed herein, address all Production and Storage within the Beaumont Basin. Because the Beaumont Basin is at or near a condition of Overdraft, any Production outside the framework of this Judgment and Physical Solution will potentially damage the Beaumont Basin, injure the rights of all Parties, result in the waste of water and interfere with the Physical Solution. The Watermaster shall bring an action or a motion to enjoin any Production that is not in accordance with the terms of this Judgment.

4. General Pattern of Operation

One fundamental premise of the adjudication is that all Producers shall be allowed to pump sufficient water from the Beaumont Basin to meet their respective requirements. Another fundamental premise of the adjudication is that Overlying Parties who pump no more than the amount of their Overlying Water Right as shown on Column 4 of Exhibit "B" hereto, shall not be charged for the replenishment of the Beaumont Basin. To the extent that pumping exceeds five (5) times the share of the Safe Yield assigned to an Overlying Party (Column 4 of Exhibit "B") in any five (5) consecutive years, or the share of Operating Yield

RIVERSIDE, CALIFORNIA 92501
(909) 682-5480

Right of each Appropriator Party, each such Party shall provide funds to enable the Watermaster to replace such Overproduction.

5. Use of Available Groundwater Storage Capacity

A. There exists in the Beaumont Basin a substantial amount of available Groundwater Storage Capacity. Such Capacity can be reasonably used for Stored Water and Conjunctive Use and may be used subject to Watermaster regulation to prevent injury to existing Overlying and Appropriative water rights, to prevent the waste of water, and to protect the right to the use of Supplemental Water in storage and Safe Yield of the Beaumont Basin.

B. There shall be reserved for Conjunctive Use a minimum of 200,000 acre feet of Groundwater Storage Capacity in the Beaumont Basin provided that such amount may be reduced as necessary to prevent injury to existing water rights or existing uses of water within the Basin, and to prevent the waste of water. Any Person may make reasonable beneficial use of the Groundwater Storage Capacity for storage of Supplemental Water; provided, however, that no such use shall be made except pursuant to a written Groundwater Storage Agreement with the Watermaster. The allocation and use of Groundwater Storage Capacity shall have priority and preference for Producers within the Beaumont Basin over storage for export. The Watermaster may, from time-to-time, redetermine the available Groundwater Storage Capacity.

3403 TENTH STREET, SUITE 610
RIVERSIDE, CALIFORNIA 92501
(909) 682-5480

VI. ADMINISTRATION

1. Administration and Enforcement by Watermaster

The Watermaster shall administer and enforce the provisions of this Judgment and any subsequent order or instructions of the Court.

2. Watermaster Control

The Watermaster is hereby granted discretionary powers to develop and implement a groundwater management plan and program for the Beaumont Basin, which plan shall be filed with and shall be subject to review and approval by, the Court, and which may include water quantity and quality considerations and shall reflect the provisions of this Judgment. Except for the exercise by Overlying Parties of their respective Rights described in Column 4 of Exhibit "B" hereto in accordance with the provisions of the Physical Solution, groundwater extractions and the replenishment thereof, and the storage of Supplemental Water, shall be subject to procedures established and administered by the Watermaster. Such procedures shall be subject to review by the Court upon motion by any Party.

3. Watermaster Standard of Performance

The Watermaster shall, in carrying out its duties and responsibilities herein, act in an impartial manner without favor or prejudice to any Party or purpose of use.

4. Watermaster Appointment

The Watermaster shall consist of a committee composed of persons nominated by the City of Banning, the City of Beaumont, the Beaumont-Cherry Valley Water District, the South Mesa Mutual Water Company and the Yucaipa Valley Water District, each of

RIVERSIDE, CA... ORNIA 92501
(909) 682-5480

which shall have the right to nominate one representative to the Watermaster committee who shall be an employee of or consultant to the nominating agency. Each such nomination shall be made in writing, served upon the other parties to this Judgment and filed with the Court, which shall approve or reject such nomination. Each Watermaster representative shall serve until a replacement nominee is approved by the Court. The nominating agency shall have the right to nominate that representative's successor.

5. Powers and Duties of the Watermaster

Subject to the continuing supervision and control of the Court, the Watermaster shall have and may exercise the following express powers, and shall perform the following duties, together with any specific powers, authority, and duties granted or imposed elsewhere in this Judgment or hereafter ordered or authorized by the Court in the exercise of its continuing jurisdiction:

A. Rules and Regulations: The adoption of appropriate rules and regulations for the conduct of Watermaster affairs, copies of which shall be provided to all interested parties.

B. Wellhead Protection and Recharge: The identification and management of wellhead protection areas and recharge areas.

C. Well Abandonment: The administration of a well abandonment and well destruction program.

D. Well Construction: The development of minimum well construction specifications and the permitting of new wells.

AKLUFI AND WYSOCKI
3403 TENTH ST, SUITE 610
RIVERSIDE, CALIFORNIA 92501
(909) 682-5480

E. Mitigation of Overdraft: The mitigation of conditions of uncontrolled overdraft.

F. Replenishment: The acquisition and recharge of Supplemental Water.

G. Monitoring: The monitoring of groundwater levels, ground levels, storage, and water quality.

H. Conjunctive Use: The development and management of conjunctive-use programs.

I. Local Projects: The coordination of construction and operation, by local agencies, of recharge, storage, conservation, water recycling, extraction projects and any water resource management activity within or impacting the Beaumont Basin.

J. Land Use Plans: The review of land use plans and coordination with land use planning agencies to mitigate or eliminate activities that create a reasonable risk of groundwater contamination.

K. Acquisition of Facilities: The purchase, lease and acquisition of all necessary real and personal property, including facilities and equipment.

L. Employment of Experts and Agents: The employment or retention of such technical, clerical, administrative, engineering, accounting, legal or other specialized personnel and consultants as may be deemed appropriate. The Watermaster shall maintain records allocating the cost of such services as well as all other expenses of Watermaster administration.

M. Measuring Devices: Except as otherwise provided

3403 TENTH ST, SUITE 610
RIVERSIDE, CALIFORNIA 92501
(909) 682-3480

by agreement the Watermaster shall install and maintain in good operating condition, at the cost of the Watermaster, such necessary measuring devices or meters as Watermaster may deem appropriate. Such devices shall be inspected and tested as deemed necessary by the Watermaster and the cost thereof borne by the Watermaster. Meter repair and retesting will be a Producer expense.

N. Assessments: The Watermaster is empowered to levy and collect the following assessments:

(1) Annual Replenishment Assessments

The Watermaster shall levy and collect assessments in each year, in amounts sufficient to purchase replenishment water to replace Overproduction by any Party.

(2) Annual Administrative Assessments

a. Watermaster Expenses: The expenses of administration of the Physical Solution shall be categorized as either "General Watermaster Administration Expenses", or "Special Project Expenses".

i. General Watermaster Administration Expenses: shall include office rent, labor, supplies, office equipment, incidental expenses and general overhead. General Watermaster Administration Expenses shall be assessed by the Watermaster equally against the Appropriators who have appointed representatives to the Watermaster.

AKLUFI AND VYSOCKI
3403 TENTH ST, SUITE 610
RIVERSIDE, CALIFORNIA 92501
(909) 682-5480

ii. Special Project Expenses: shall include special engineering, economic or other studies, litigation expenses, meter testing or other major operating expenses. Each such project shall be assigned a task order number and shall be separately budgeted and accounted for. Special Project Expenses shall be allocated to the Appropriators, or portion thereof, on the basis of benefit.

O. Investment of Funds; Borrowing: The Watermaster may hold and invest Watermaster funds as authorized by law, and may borrow, from time-to-time, amounts not exceeding annual receipts.

P. Contracts: The Watermaster may enter into contracts for the performance of any of its powers.

Q. Cooperation With Other Agencies: The Watermaster may act jointly or cooperate with other local, state and federal agencies.

R. Studies: The Watermaster may undertake relevant studies of hydrologic conditions and operating aspects of the management program for the Beaumont Basin.

S. Groundwater Storage Agreements: The Watermaster shall adopt uniform rules and a standard form of agreement for the storage of Supplemental Water, provided that the activities undertaken pursuant to such agreements do not injure any Party.

T. Administration of Groundwater Storage Capacity: Except for the exercise by the Overlying Parties of their

RIVERSIDE, CALIFORNIA 92501
(909) 682-5480

respective Overlying Water Rights described in Part III, above, in accordance with the provisions of the Physical Solution, all Groundwater Storage Capacity in the Beaumont Basin shall be subject to the Watermaster's rules and regulations, which regulations shall ensure that sufficient storage capacity shall be reserved for local projects. Any Person or entity may apply to the Watermaster to store water in the Beaumont Basin.

U. Accounting for Stored Water: The Watermaster shall calculate additions, extractions and losses and maintain an annual account of all stored water in the Beaumont Basin, and any losses of water supplies or Safe Yield resulting from such stored water.

V. Accounting for New Yield: Recharge of the Beaumont Basin with New Yield water shall be credited to the Party that creates the New Yield. The Watermaster shall make an independent scientific assessment of the estimated New Yield created by each proposed project. New Yield will be allocated on an annual basis, based upon monitoring data and review by the Watermaster.

W. Accounting for Acquisitions of Water Rights: The Watermaster shall maintain an accounting of acquisitions by Appropriators of water otherwise subject to Overlying Water Rights as the result of the provision of water service thereto by an Appropriator.

X. Annual Administrative Budget: The Watermaster shall prepare an annual administrative budget for public review, and shall hold a public hearing on each such budget

AKLUFI & WYSOCKI
3403 TENTH ST, SUITE 610
RIVERSIDE, CALIFORNIA 92501
(909) 682-5480

prior to adoption. The budget shall be prepared in sufficient detail so as to make a proper allocation of the expenses and receipts. Expenditures within budgeted items may thereafter be made by the Watermaster as a matter of course.

Y. Redetermining the Safe Yield: The Safe Yield of the Beaumont Basin shall be redetermined at least every 10 years beginning 10 years after the date of entry of this Judgment.

6. Reports and Accounting

(a) Production Reports: Each Pumper shall periodically file, pursuant to Watermaster rules and regulations, a report showing the total production of such Pumper from each well during the preceding report period, and such additional information as the Watermaster may reasonably require.

(b) Watermaster Report and Accounting: The Watermaster shall prepare an annual report of the preceding year's operations, which shall include an audit of all assessments and Watermaster expenditures.

7. Replenishment

Supplemental Water may be obtained by the Watermaster from any source. The Watermaster shall seek the best available quality of Supplemental Water at the most reasonable cost for recharge in the Basin. Sources may include, but are not limited to:

(a) Recycled Water;

(b) State Water Project Water;

3403 TENTH ST, SUITE 610
RIVERSIDE, CALIFORNIA 92501
(909) 682-5480

(c) Other imported water.

Replenishment may be accomplished by any reasonable method including:

(a) Spreading and percolation, or injection of water in existing or new facilities; and/or

(b) In-lieu deliveries for direct surface use, in lieu of groundwater extraction.

VII. MISCELLANEOUS PROVISIONS

1. Designation of Address for Notice and Service

Each Party shall designate, in writing to the plaintiff, the name and address to be used for purposes of all subsequent notices and service herein, such designation to be delivered to the plaintiff within 30 days after the Judgment has been entered. The plaintiff shall, within 45 days after judgment has been entered, file the list of designees with the Court and serve the same on the Watermaster and all Parties. Such designation may be changed from time-to-time by filing a written notice of such change with the Watermaster. Any Party desiring to be relieved of receiving notices of Watermaster activity may file a waiver of notice on a form to be provided by the Watermaster. The Watermaster shall maintain, at all times, a current list of Parties to whom notices are to be sent and their addresses for purposes of service. The Watermaster shall also maintain a full current list of names and addresses of all Parties or their successors, as filed herein. Copies of such lists shall be available to any Person. If no designation is made, a Party's designee shall be deemed to be, in order of priority: (i) the Party's attorney of record; or (ii) if the Party does not have an

AKLUFI & WYSOCKI
3403 TENTH ST, SUITE 610
RIVERSIDE, CALIFORNIA 92501
(909) 682-5480

attorney of record, the Party itself at the address on the Watermaster list.

2. Intervention After Judgment

Any Person who is neither a Party to this Judgment nor a successor or assignee of a Party to this Judgment may seek to become a party to this Judgment by filing a petition in intervention.

3. Interference with Pumping

Nothing in this judgment shall be deemed to prevent any party from seeking judicial relief against any other party whose pumping activities constitute an unreasonable interference with the complaining party's ability to extract groundwater.

4. Successors and Assigns

This Judgment and all provisions herein shall be binding on and shall inure to the benefit of the heirs, executors, administrators, successors and assigns of the parties hereto.

5. Severability

The provisions of this Judgment are severable. If any provision of this Judgment is held by the Court to be illegal, invalid or unenforceable, that provision shall be excised from the Judgment. The remainder of the terms of the Judgment shall remain in full force and effect and shall in no way be affected, impaired or invalidated by such excision. This Judgment shall be reformed to add, in lieu of the excised provision, a provision as similar in terms to the excised provision as may be possible and be legal, valid and enforceable.

6. Review Procedures

Any action, decision, rule or procedure of the Watermaster

RIVERSIDE, CALIFORNIA 92501
(909) 682-5480

pursuant to this Judgment shall be subject to review by the Court on its own motion or on timely motion by any Party, as follows:

A. Effective Date of Watermaster Action: Any order, decision or action of the Watermaster pursuant to this Judgment on noticed specific agenda items shall be deemed to have occurred on the date of the order, decision or action.

B. Notice of Motion: Any Party may, by a regularly-noticed motion, petition the Court for review of the Watermaster's action or decision pursuant to this Judgment. The motion shall be deemed to be filed when a copy, conformed as filed with the Court, has been delivered to the Watermaster, together with the service fee established by the Watermaster sufficient to cover the cost to photocopy and mail the motion to each Party. The Watermaster shall prepare copies and mail a copy of the motion to each Party or its designee according to the official service list which shall be maintained by the Watermaster according to Part VII, paragraph 1, above. A Party's obligation to serve the notice of a motion upon the Parties is deemed to be satisfied by filing the motion as provided herein. Unless ordered by the Court, any petition shall not operate to stay the effect of any Watermaster action or decision which is challenged.

C. Time for Motion: A motion to review any Watermaster action or decision shall be filed within 90 days after such Watermaster action or decision, except that motions to review Watermaster assessments hereunder shall be filed within 30 days of mailing of notice of the assessment.

AKLUFI & WYSOCKI
3403 TENTH STREET, SUITE 610
RIVERSIDE, CALIFORNIA 92501
(909) 682-5480

D. De Novo Nature of Proceeding: Upon filing of a petition to review a Watermaster action, the Watermaster shall notify the Parties of a date when the Court will take evidence and hear argument. The Court's review shall be de novo and the Watermaster decision or action shall have no evidentiary weight in such proceeding.

E. Decision: The decision of the Court in such proceedings shall be an appealable Supplemental Order in this case. When the same is final, it shall be binding upon the Watermaster and the Parties.

Dated: FEB - 4 2004

WHITEWATER RIVER ADJUDICATION PROCEEDINGS

ORDER DETERMINING AND ESTABLISHING THE SEVERAL RIGHTS BY APPROPRIATION TO THE USE OF THE WATERS OF THE

WHITEWATER RIVER STREAM SYSTEM

SAN BERNARDINO AND RIVERSIDE COUNTIES, CALIFORNIA

Order entered April 23, 1928, in Book 1 of Orders of Determination, page 426

58985

BEFORE THE DIVISION OF WATER RIGHTS

Department of Public Works

STATE OF CALIFORNIA

IN THE MATTER OF THE DETERMINATION OF THE RELATIVE RIGHTS, BASED UPON PRIOR APPROPRIATION, OF THE VARIOUS CLAIMANTS TO THE WATERS OF WHITEWATER RIVER AND ITS TRIBUTARIES, IN SAN BERNARDINO AND RIVERSIDE COUNTIES, CALIFORNIA.

ORDER DETERMINING AND ESTABLISHING THE SEVERAL RIGHTS BY APPROPRIATION IN AND TO THE USE OF THE WATERS OF SAID STREAM SYSTEM.

This matter coming before the Division of Water Rights of the Department of Public Works of the State of California pursuant to the petition of the Coachella Valley County Water District, filed herein on June 29, 1922, all notices having been given and all proceedings having been taken as provided by law, and the said Division of Water Rights being fully advised in the premises,

It is hereby ordered, that the several rights by appropriation in and to the use of the waters of Whitewater River and its tributaries, in San Bernardino and Riverside counties, California, as of October 31, 1924, the date on which the extended period for filing proofs of appropriation in the above entitled matter expired, be and hereby are determined and established as hereinafter set forth:

GENERAL PROVISIONS AND DEFINITIONS

1. All allotments of water hereinafter provided for direct application to beneficial use are expressed in terms of continuous flow, but it is recognized that irrigation does not, in general, require a continuous use of water upon a specific parcel of land, and nothing herein contained shall be construed as limiting or restricting the rights of any parties to rotate in the use of water, or the right of any party to divert for limited periods of time convenient "irrigation heads" and thus apply water to his lands at a greater rate than indicated by his continuous flow allowance; *provided*, that such practice of rotation or such use of "irrigation heads" shall not result in the use by any party of a total quantity of water during any thirty-day period in excess of the equivalent of his continuous flow allotment for thirty days; *and provided, further*, that such practice of rotation or such use of "irrigation heads" shall not impair or infringe any other vested water rights.

2. The points of measurement of all allotments of water hereinafter provided shall be at the respective points of diversion from the stream system.

3. The term "directly apply to beneficial use" as herein used shall be construed to designate the direct conveyance and application of water diverted to beneficial use, without intermediate storage, except such regulatory storage as may be practiced for the purpose of equalizing the flow of water diverted to a convenient "irrigation head."

4. The term "natural flow" as herein used shall be construed to designate such surface and subsurface flow as will naturally occur at any given point in a stream from the run-off of the watershed which it drains, from springs which naturally contribute to the stream, from seepage, and from waste and return flow from dams, conduits and irrigated lands; as distinguished from released stored water and from "foreign water" directly conveyed to the stream from another watershed.

5. The "Division of Water Rights Map" herein referred to is the map prepared by the Division of Water Rights of the Department of Public Works of the State of California from its 1923 survey, which map is entitled "Map of Whitewater River Watershed Showing Diversion Systems and Irrigated Areas, San Bernardino and Riverside Counties, California," and is dated 1923.

DEFINITION OF VARIOUS WATER RIGHTS

Subject to the foregoing general provisions and definitions, the several owners of rights in and to the use of the waters of said stream system are entitled to divert and use such water as follows:

6. Stuart D. Allen

is entitled to divert from the natural flow of Blaisdell Creek, through the Allen Blaisdell Pipe Line,

0.025 cubic foot per second—priority July 2, 1924,

or as much thereof as he directly applies to beneficial use for the purpose hereinafter set forth, throughout the entire year; said water to be diverted from said Blaisdell Creek at a point situated approximately 2000 feet south from the northwest corner of Sec. 36, T. 3 S., R. 3 E., S. B. B. and M., being within the SW¼ NW¼ of said Sec. 36, and said water to be used for domestic purposes within the

SW¼ NW¼, Sec. 30, T. 3 S., R. 4 E., S. B. B. and M.

7. Stuart D. Allen

will be entitled to divert from the natural flow of Whitewater River, through the Allen Whitewater Conduit,

0.50 cubic foot per second—priority June 19, 1922,

or as much thereof as he directly applies to beneficial use for the purpose hereinafter set forth, throughout the entire year; said water to be diverted from said Whitewater River at a point situated approximately 4000 feet north of the southeast corner of Sec. 24, T. 3 S., R. 3 E., S. B. B. and M., being within the SE¼ NE¼ of said Sec. 24, and said water to be used for the irrigation of the following described lands:

25.0 acres in NE¼ NW¼, Sec. 30, T. 3 S., R. 4 E., S. B. B. and M.
15.0 acres in SE¼ NW¼, Sec. 30, T. 3 S., R. 4 E., S. B. B. and M.

40.0 acres—Total.

provided, that prior to December 1, 1929, said Stuart D. Allen shall have completed the above appropriation and applied said water to beneficial use in accordance with the terms of Division of Water Rights Permit 1723, and shall have submitted evidence of such completed appropriation and use to the Division of Water Rights of the Department of Public Works of the State of California. Upon receipt of such evidence of such completed appropriation and use, the said Division of Water Rights will act thereupon as provided in section 36*f* of the Water Commission Act, and in accordance with said evidence will enter findings supplemental hereto, determining and establishing the above described right by appropriation in so far as the same shall have been completed.

8. R. E. Bailiff

will be entitled to divert from the natural flow of the stream flowing in Water Canyon, through the Bailiff Water Canyon Pipe Line,

(a) during the period between March first and November first of each year,

0.37 cubic foot per second—priority March 12, 1924,

or as much thereof as he directly applies to beneficial use for domestic and stock watering purposes and for the irrigation of his lands hereinafter described;

(b) during the period between November first of each year and March first of the succeeding year,

45 acre-feet per season—priority March 12, 1924,

or as much thereof as he impounds in the proposed Bailiff Storage Reservoir to be constructed in the SW¼ SW¼ of Sec. 18, T. 3 S., R. 2 E., S. B. B. and M., and thereafter withdraws from said reservoir and applies to beneficial use for domestic and stock watering purposes and for the irrigation of his lands hereinafter described;

all of said water to be diverted from said stream at a point which bears approximately N. 77° 00′ W., approximately 310 feet distant from the southwest corner of Sec. 18, T. 3 S., R. 2 E., S. B. B. and M., being within the SE¼ SE¼ of Sec. 13,

T. 3 S., R. 1 E., S. B. B and M., and all of said water to be used upon the following described lands:

25.0 acres in NW¼ SE¼, Sec. 18, T. 3 S., R. 2 E., S. B. B. and M.
5.0 acres in NE¼ SW¼, Sec. 18, T. 3 S., R. 2 E., S. B. B. and M.

30.0 acres—Total.

provided, that prior to December 1, 1929, said R. E. Bailiff shall have completed the above appropriation and applied said water to beneficial use in accordance with the terms of Division of Water Rights Permit 1855, and shall have submitted evidence of such completed appropriation and use to the Division of Water Rights of the Department of Public Works of the State of California. Upon receipt of such evidence of such completed appropriation and use the said Division of Water Rights will act thereupon as provided in section 36*f* of the Water Commission Act, and in accordance with said evidence will enter findings supplemental hereto, determining and establishing the above described right by appropriation in so far as the same shall have been completed.

9. R. E. Bailiff

will be entitled to divert from the natural or developed flow of two unnamed springs; the upper (Spring No. 1) being situated approximately S. 13° 30′ W., approximately 3960 feet distant from the northeast corner of Sec. 23, T. 3 S., R. 1 E., S. B. B. and M., being within the NE¼ SE¼ of said Sec. 23; and the lower (Spring No. 2) being situated approximately S. 77° 00′ W., approximately 310 feet distant from the southwest corner of Sec. 18, T. 3 S., R. 2 E., S. B. B. and M., being within the SE¼ SE¼ of Sec. 13, T. 3 S., R. 1 E., S. B. B. and M.; through the Bailiff West Spring Pipe Line,

(a) during the period between March first and November first of each year,

0.11 cubic foot per second—priority March 14, 1924,

from Spring No. 1, and

0.02 cubic foot per second—priority March 14, 1924,

from Spring No. 2,
or as much of said amounts as he directly applies to beneficial use for domestic and stock watering purposes and for the irrigation of his lands hereinafter described;

(b) during the period between November first of each year and March first of the succeeding year, a total of

0.025 cubic foot per second—priority March 14, 1924,

from either, or in part from each of said springs, or as much thereof as he directly applies to beneficial use for domestic and stock watering purposes;

(c) during the period between November first of each year and March first of the succeeding year, a total of

6 acre-feet per season—priority March 14, 1924,

from either, or in part from each of said springs, or as much thereof as he impounds in the proposed Bailiff Storage Reservoir to be constructed in the SW¼ SW¼ of Sec. 18, T. 3 S., R. 2 E., S. B. B. and M., and thereafter withdraws from said reservoir and applies to beneficial use for domestic and stock watering purposes and for the irrigation of his lands hereinafter described:

all of said water to be diverted at the above described springs and used upon the following described lands:

8.0 acres in NE¼ SW¼, Sec. 18, T. 3 S., R. 2 E., S. B. B. and M.
2.0 acres in SW¼ SW¼, Sec. 18, T. 3 S., R. 2 E., S. B. B. and M.

10.0 acres—Total.

provided, that prior to December 1, 1929, said R. E. Bailiff shall have completed the above appropriation and applied said water to beneficial use in accordance with the

terms of Division of Water Rights Permit 1856, and shall have submitted evidence of such completed appropriation and use to the Division of Water Rights of the Department of Public Works of the State of California. Upon receipt of such evidence of such completed appropriation and use, the said Division of Water Rights will act thereupon as provided in section 36*f* of the Water Commission Act, and in accordance with said evidence will enter findings supplemental hereto, determining and establishing the above described right by appropriation in so far as the same shall have been completed.

10. R. E. Bailiff

is entitled to divert from the natural or developed flow of an unnamed spring situated approximately N. 70° 00′ W., approximately 2330 feet distant from the southeast corner of Sec. 19, T. 3 S., R. 2 E., S. B. B. and M., being within the NE¼ SE¼ of said Sec. 19, through the Bailiff East Spring Pipe Line,

(a) during the period between March first and November first of each year,

0.05 cubic foot per second—priority April 24, 1924,

or as much thereof as he directly applies to beneficial use for domestic and stock watering purposes and for the irrigation of his lands hereinafter described;

(b) during the period between November first of each year and March first of the succeeding year,

0.025 cubic foot per second—priority April 24, 1924,

or as much thereof as he directly applies to beneficial use for domestic and stock watering purposes:

all of said water to be diverted at said spring and to be used upon the following described land:

7.0 acres in NE¼ NE¼, Sec. 19, T. 3 S., R. 2 E., S. B. B. and M.

11. The Banning Heights Mutual Water Company, the Banning Water Company and the San Gorgonio Power Company,

jointly, are entitled to divert from the natural flow of the South Fork of Whitewater River, through the Consolidated Reservoir and Power Company Canal, a total of

13.26 cubic feet per second—priority October 31, 1906,

or as much thereof as they apply to beneficial use for the purposes hereinafter set forth, throughout the entire year; said total quantity of water to be diverted from said South Fork of Whitewater River, all or in part, at any of the following described points:

(1) At a point on the East Branch of said South Fork of Whitewater River (designated on Division of Water Rights Map as Diversion 1) which bears approximately N. 26° 45′ E., approximately 11,709 feet distant from the northeast corner of Sec. 1, T. 2 S., R. 1 E., S. B. B. and M., being within the SE¼ SE¼ of Sec. 19, T. 1 S., R. 2 E., S. B. B. and M.

(2) At a point on the West Branch of said South Fork of Whitewater River (designated on Division of Water Rights Map as Diversion 2) which bears approximately N. 11° 48′ E., approximately 10,351 feet distant from the northeast corner of Sec. 1, T. 2 S., R. 1 E., S. B. B. and M., being within the NE¼ NW¼ of Sec. 30, T. 1 S., R. 2 E., S. B. B. and M.

(3) At a point on the Blackwheel Canyon Branch of the West Branch of said South Fork of Whitewater River (designated on Division of Water Rights Map as Diversion 3) which bears N. 12° 19½′ E., approximately 9882 feet distant from the northeast corner of Sec. 1, T. 2 S., R. 1 E., S. B. B. and M., being within the NE¼ NW¼ of Sec. 30, T. 1 S., R. 2 E., S. B. B. and M.:

and said water to be used first by said San Gorgonio Power Company for the purpose of generating electric energy at two power plants, the upper of said plants being situated in the SW¼ NW¼ of Sec. 2, T. 2 S., R. 1 E., S. B. B. and M., and the lower of said plants being situated in the NE¼ NE¼ of Sec. 8, T. 2 S., R. 1 E.,

S. B. B. and M.: and said water to be used thereafter by said Banning Heights Mutual Water Company and by said Banning Water Company for the purpose of supplying water for domestic, stock watering and irrigation uses within the respective territories served by said companies as hereinafter described. During the winter months, at times when the entire quantity of water available under this right may not be required for direct application to use for domestic, stock watering and irrigation purposes as hereinabove provided for, the Banning Water Company is entitled to spread and store underground in San Gorgonio Canyon, above the mouth of said canyon in the SE¼ SE¼ of Sec. 33, T. 2 S., R. 1 E., S. B. B. and M., all surplus water available over and above the quantity required for direct application to use for domestic, stock watering and irrigation purposes:

provided, that all water so spread and stored is subsequently withdrawn from said underground storage and applied to beneficial use by said Banning Water Company as hereinafter provided in paragraph 13. The joint diversion and use of water under this right by said Banning Heights Mutual Water Company, said Banning Water Company, and said San Gorgonio Power Company, is subject to the provisions of the following agreements and deeds:

(a) Agreement dated January 10, 1913, between the Consolidated Reservoir and Power Company and the Banning Water Company, recorded October 14, 1913, in Book No. 380 of Deeds, page 337 *et seq.*, records of Riverside County, California.

(b) Instrument dated December 30, 1913, between the Consolidated Reservoir and Power Company and the Banning Heights Mutual Water Company, recorded December 14, 1922, in Book No. 561 of Deeds, page 543 *et seq.*, records of Riverside County, California.

(c) Deed dated August 7, 1922, between the Consolidated Reservoir and Power Company and the San Gorgonio Power Company, recorded February 1, 1923, in Book No. 564 of Deeds, page 383 *et seq.*, records of Riverside County, California.

The territory served by said Banning Heights Mutual Water Company includes approximately 1500 acres of land, situated within the following described parcels:

All of lots 1, 2, 3, 4, 5, 6, 7, 7A, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 22, 23, 24, 25, 26, 27, 28, 29, 30, 31, 32, 33, 34, 35, 36, 37, 38, 39, 40, 41, 42, 43, 44, 45, 46, 47, 48, 49, 50, 51, 52, 53, 54, 55, 55A, 55B, 56, 57, 57A, 58, 58A, 59, 60, 61, 62, 63, 64, 65, 66, 67, 68, 69, 70, 71, 72, 73, 74, 75, 76, 77, 78, 79, 80, 81, 82, 83, 84, 85, 86, 87, 88, 89 and 90 of the Banning Heights Subdivision, situate in Riverside County, California, as said lots are delineated on the "Map of Banning Heights" recorded in the office of the county recorder of Riverside County, California, in Book 9 of Maps, at pages 37 to 51 thereof.

60.0 acres in block 1 of the Ginzell-Montgomery Tract, situate in Riverside County, California, as said block is delineated on the map of said Ginzell-Montgomery Tract recorded in the office of the county recorder of Riverside County, California, in Book 8 of Maps, at page 64 thereof.

48.0 acres in S½ S½, Sec. 5, T. 3 S., R. 1 E., S. B. B. and M.
10.0 acres in S½ NW¼, Sec. 5, T. 3 S., R. 1 E., S. B. B. and M.
65.0 acres in S½ S½, Sec. 6, T. 3 S., R. 1 E., S. B. B. and M.

The territory served by said Banning Water Company includes approximately 3745 acres of land, situated within the following described parcels:

All of blocks 1, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 22, 23, 24, 25, 25½, 27, 35, 36, 37, 38, 39, 40, 41, 42, 43, 44, 57, 58, 59, 60, 61, 62, 63, 64, 65, 66, 67, 68, 69, 70, 71, 72, 73, 74, 75, 76, 77, 78, 79, 80, 81, 82, 83, 84, 85, 86, 87, 88, 125, 129, 130, 131, 132, 133, 134, 135, 136, 137, 138, 139, 140, 141, 142, 143, 144, 145, 146, 147, 148, 149, 150, 151, 152, 153, 154, 155, 156, 157, 158, 159, 160, 161, 162, 163, 164, 165, 166, 167, 168, 169, 170, 171, 172, 173, 174, 175, 176, 177, 178, 179, 180, 181, 182, 183, 184; 2.1 acres in block 2; 0.7 acre in block 26½; 0.8 acre in block 28½; 0.7 acre in block 31½; 2.0 acres in block 32; 1.0 acre in block 32½; 3.3 acres in block 90; 8.0 acres in block 91; 6.5 acres in block 92; 7.1 acres in block 93; 8.7 acres in block 94; 8.5 acres in block 95; 8.4 acres in block 96; 4.8 acres in block 101; 4.3 acres in block 102; 3.0 acres in block 103; 2.9 acres in block 104; E½ of block 124; and W½ of block 126; all within the Banning Colony Subdivision, situate in Riverside County, California, as said blocks are delineated on the map entitled

"Map of Part of Banning Colony Lands" recorded in the office of the county recorder of Riverside County, California, in Book 5 of Maps, at page 186 thereof.

All of blocks 1 to 20, both inclusive, of the San Jose Tract, situate in Riverside County, California, as said blocks are delineated on the map of said San Jose Tract recorded in the office of the county recorder of San Diego County, California, in Book 1 of Maps, at page 55 thereof.

All of blocks 1, 2, 3, 4, 5, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18 and 19; and 4.6 acres in block 6; all within the Waverly Tract, situate in Riverside County, California, as said blocks are delineated on the map of said Waverly Tract recorded in the office of the county recorder of Riverside County, California, in Book 8 of Maps, at page 44 thereof.

All of blocks A, B, C, D, E, F, G, H, I, J, K, L; 6.0 acres in block M; and 5.1 acres in block N; all within the North Side Tract, situate in Riverside County, California, as said blocks are delineated on the map of said North Side Tract recorded in the office of the county recorder of Riverside County, California, in Book 1 of Maps, at page 28 thereof.

All of blocks 202, 214, 226, 242, 243, 245, 248, 249, 252, 254, 255, 256, 261, 262, 263, 265, 266, 267, 268, 269, 270, 271, 272, 273, 274, 275, 276, 277, 278, 279, 280, 281, 282, 283, 284 and 285; 1.7 acres in block 207; 6.4 acres in block 208; 1.0 acre in block 209; 2.6 acres in block 225; 0.9 acre in block 227; W½ of block 236; N½ of block 238; W½ of block 240; W½ of block 241; 4.0 acres in block 260; and 5.15 acres in block 264; all within the town of Banning, Riverside County, California, as said blocks are delineated on the "Amended Map of Banning Land Company" recorded in the office of the county recorder of San Bernardino County, California, in Book 9 of Maps, at page 44 thereof.

All of blocks 286, 287, 288, 289, 290, 291, 292, 293, 294, 295, 296, 297, 298, 299, 300, 301, 302, 303, 304, 305, 306, 307, 308, 309, 311, 312, 313, 314, 317 and 318; 5.0 acres in block 310; 6.6 acres in block 315; and 7.1 acres in block 316; all within the "Subdivision of Lands Adjoining Banning on the Southwest," situate in Riverside County, California, as said blocks are delineated on the map of said subdivision recorded in the office of the county recorder of San Diego County, California, in Book 14 of Maps, at page 662 thereof.

All of blocks 1 to 10, both inclusive, of "C. O. Barker's Subdivision of a Portion of Section 8." situate in Riverside County, California, as said blocks are delineated on the map of said subdivision recorded in the office of the county recorder of Riverside County, California, in Book 6 of Maps, at page 14 thereof.

All of blocks 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 31, 32, 35 and 36 of "C. O. Barker's Subdivision of a Portion of Sections 8 and 17," situate in Riverside County, California, as said blocks are delineated on the map of said subdivision recorded in the office of the county recorder of Riverside County, California, in Book 7 of Maps, at page 21 thereof.

All of blocks 50 to 71, both inclusive, of the Almcot Tract, situate in Riverside County, California, as said blocks are delineated on the map of said Almcot Tract recorded in the office of the county recorder of Riverside County, California, in Book 4 of Record of Surveys, at page 15 thereof.

All of blocks 5, 6, 7, 8, 9, 11, 12, 13, 14, 15 and 16; 18.0 acres in block 3; 1.2 acres in block 4; and 1.0 acre in block 17; all within the Ginzell-Montgomery Tract, situate in Riverside County, California, as said blocks are delineated on the map of said Ginzell-Montgomery Tract recorded in the office of the county recorder of Riverside County, California, in Book 8 of Maps, at page 64 thereof.

All of blocks 1 to 5, both inclusive, of the Beverly Tract, situate in Riverside County, California, as said blocks are delineated on the map of said Beverly Tract recorded in the office of the county recorder of Riverside County, California, in Book 9 of Maps, at page 55 thereof.

50.0 acres in Sec. 29, T. 2 S., R. 1 E., S. B. B. and M.
60.0 acres in Sec. 33, T. 2 S., R. 1 E., S. B. B. and M.
18.5 acres in E½ NE¼, Sec. 4, T. 3 S., R. 1 E., S. B. B. and M.
72.6 acres in S½ SW¼, Sec. 4, T. 3 S., R. 1 E., S. B. B. and M.
233.3 acres in N½ Sec. 8, T. 3 S., R. 1 E., S. B. B. and M.
3.8 acres in NE¼ SW¼, Sec. 8, T. 3 S., R. 1 E., S. B. B. and M.
40.0 acres in SW¼ SW¼, Sec. 11, T. 3 S., R. 1 E., S. B. B. and M.

258.0 acres in	$W\frac{1}{2}$	Sec. 16, T. 3 S., R. 1 E., S. B. B. and M.
89.4 acres in	$NE\frac{1}{4}$	Sec. 16, T. 3 S., R. 1 E., S. B. B. and M.
25.5 acres in	$NE\frac{1}{4}$ $SE\frac{1}{4}$,	Sec. 16, T. 3 S., R. 1 E., S. B. B. and M.
10.5 acres in	$NE\frac{1}{4}$ $NE\frac{1}{4}$,	Sec. 18, T. 3 S., R. 1 E., S. B. B. and M.

12. The Banning Water Company

is entitled to divert from the natural flow of San Gorgonio River and its tributaries, through its system of spreading ditches shown as diversion ditches numbered 1 to 7, both inclusive, on the "Map Showing System of the Banning Water Company in San Gorgonia Canyon," prepared by J. F. Davidson, Civil Engineer, and dated January, 1923.

20,000 acre-feet per annum—priority January 1, 1887,

or as much thereof as it spreads and stores underground in San Gorgonio Canyon; said quantity of water to be so diverted, spread and stored during the period from January first to December thirty-first of each year, both dates inclusive:

provided, that said water is subsequently withdrawn from said underground storage and applied to beneficial use by said Banning Water Company as hereinafter provided in paragraph 13.

13. The Banning Water Company

is entitled to divert from the natural flow of San Gorgonio River, or from its underground storage in San Gorgonia Canyon as hereinabove provided for in paragraphs 11 and 12, or in part from both of said sources, through the Main Stone Lined Conduit of said Banning Water Company's System, and through the various ditches and pipe lines leading thereto hereinafter mentioned, a total of

14,000 acre-feet per annum—priority March 17, 1875,

or as much thereof as it directly applies to beneficial use for the purpose of supplying water for domestic, stock watering and irrigation uses within the territory served by said company as hereinabove described in paragraph 11, for the purpose of supplying water for domestic and municipal uses within the city of Banning, Riverside County, California, and for the purpose of driving water wheels connected with pumps at three pumping plants operated by said company, located as follows:

(1) In the $NE\frac{1}{4}$ $SW\frac{1}{4}$ of Sec. 17, T. 2 S., R. 1 E., S. B. B. and M.,
(2) In the $SE\frac{1}{4}$ $NE\frac{1}{4}$ of Sec. 29, T. 2 S., R. 1 E., S. B. B. and M.,
(3) In the $NE\frac{1}{4}$ $SE\frac{1}{4}$ of Sec. 33, T. 2 S., R. 1 E., S. B. B. and M.;

said total quantity of water to be diverted from said sources, all or in part, at any of the following described points:

(a) At the upper intake of said Stone Lined Conduit situated at a point which bears approximately N. 35° 10′ E., approximately 720 feet distant from the southwest corner of Sec. 4, T. 2 S., R. 1 E., S. B. B. and M., being within the $SW\frac{1}{4}$ $SW\frac{1}{4}$ of said Sec. 4,

(b) At the intake of a ditch leading to said Stone Lined Conduit and known as Diversion Ditch No. 11, situated at a point which bears approximately N. 51° 24′ E., approximately 1424 feet distant from the southwest corner of Sec. 17, T. 2 S., R. 1 E., S. B. B. and M., being within the $SW\frac{1}{4}$ $SW\frac{1}{4}$ of said Sec. 17,

(c) At the lower intake of said Stone Lined Conduit situated at a point which bears approximately S. 86° 03′ E., approximately 1232 feet distant from the northwest corner of Sec. 20, T. 2 S., R. 1 E., S. B. B. and M., being within the $NW\frac{1}{4}$ $NW\frac{1}{4}$ of said Sec. 20,

(d) At the intake of a twenty-inch pipe line leading to said Stone Lined Conduit, situated at a point which bears approximately N. 15° 34′ W., approximately 3200 feet distant from the southeast corner of Sec. 29, T. 2 S., R. 1 E., S. B. B. and M., being within the $SE\frac{1}{4}$ $NE\frac{1}{4}$ of said Sec. 29,

(e) At the intake of a twelve-inch pipe line leading to said twenty-inch pipe line, situated at a point which bears approximately N. 11° 30′ W., approximately 3188 feet distant from the southeast corner of Sec. 29, T. 2 S., R. 1 E., S. B. B. and M., being within the $SE\frac{1}{4}$ $NE\frac{1}{4}$ of said Sec. 29,

(f) At the intake of a ten-inch pipe line leading to said Stone Lined Conduit, situated at a point which bears approximately N. 45° 45′ W.,

approximately 2538 feet distant from the southeast corner of Sec. 33, T. 2 S., R. 1 E., S. B. B. and M., being within the NW¼ SE¼ of said Sec. 33,

(g) At the intake of an iron flume leading to said Stone Lined Conduit, situated at a point which bears approximately N. 8° 05′ W., approximately 1165 feet distant from the southeast corner of Sec. 33, T. 2 S., R. 1 E., S. B. B. and M., being within the SE¼ SE¼ of said Sec. 33,

(h) At the intake of a short stone lined ditch leading to said iron flume, situated at a point which bears approximately N. 15° 49′ W., approximately 1659 feet distant from the southeast corner of Sec. 33, T. 2 S., R. 1 E., S. B. B. and M., being within the NE¼ SE¼ of said Sec. 33;

and said total quantity of water to be diverted at such times and at such rates throughout the year as may be necessary in order that said Banning Water Company may adequately supply the requirements of water for domestic, stock watering and irrigation purposes within the territory which it serves as hereinabove described in paragraph 11, and the requirements of water for domestic and municipal purposes within the city of Banning.

14. Donald M. Bedwell

will be entitled to divert from the natural or developed flow of Thousand Palms Canyon Creek, through the Bedwell and Richey Ditch and Pipe Line,

1.00 cubic foot per second—priority January 31, 1913,

or as much thereof as he directly applies to beneficial use for the purposes hereinafter set forth, throughout the entire year; said water to be diverted from said Thousand Palms Canyon Creek at a point (designated on Division of Water Rights Map as Diversion 63) which bears approximately S. 77° 11′ E., approximately 2345 feet distant from the west quarter corner of Sec. 12, T. 4 S., R. 6 E., S. B. B. and M., being within the NE¼ SW¼ of said Sec. 12, and said water to be used for domestic and stock watering purposes and for the irrigation of at least 80 acres of land in the N½ of Sec. 22, T. 4 S., R. 6 E., S. B. B. and M.;

provided, that prior to December 1, 1929, said Donald M. Bedwell shall have completed the above appropriation and applied said water to the beneficial use above specified, and shall have submitted evidence of such completed appropriation and use to the Division of Water Rights of the Department of Public Works of the State of California. Upon receipt of such evidence of such completed appropriation and use, the said Division of Water Rights will act thereupon as provided in section 36*f* of the Water Commission Act, and in accordance with said evidence will enter findings supplemental hereto, determining and establishing the above described right by appropriation in so far as the same shall have been completed.

15. The Cabazon Water Company

is entitled to divert from the natural flow of Millard Creek, through the Cabazon Water Company Conduit,

4.67 cubic feet per second—priority January 1, 1885,
2.50 cubic feet per second—priority July 22, 1915,

7.17 cubic feet per second—Total,

or as much thereof as said company directly applies to beneficial use for the purposes hereinafter set forth, throughout the entire year; said water to be diverted from said Millard Creek at a point (designated on Division of Water Rights Map as Diversion 27) situated approximately 272 feet southwesterly from a point which bears approximately S. 0° 13′ W., approximately 510.5 feet distant from the east quarter corner of Sec. 20, T. 2 S., R. 2 E., S. B. B. and M., being within the NE¼ SE¼ of said Sec. 20; and said water to be used by said Cabazon Water Company for the purpose of supplying water for domestic, stock watering and irrigation purposes within the territory served by said company, which territory includes approximately 2560 acres of land, situated within the following described parcels:

NW¼ of Sec. 5, T. 3 S., R. 2 E., S. B. B. and M.
S½ of Sec. 5, T. 3 S., R. 2 E., S. B. B. and M.
W½ NE¼ of Sec. 5, T. 3 S., R. 2 E., S. B. B. and M.
All of Sec. 15, T. 3 S., R. 2 E., S. B. B. and M.

All of Sec. 16, T. 3 S., R. 2 E., S. B. B. and M., except that portion of said section occupied by the right of way of the Southern Pacific Railroad Company.

All of Sec. 17, T. 3 S., R. 2 E., S. B. B. and M., except that portion of said section occupied by the right of way of the Southern Pacific Railroad Company.

N½ NW¼ of Sec. 21, T. 3 S., R. 2 E., S. B. B. and M.

16. The Coachella Valley County Water District

will be entitled to divert from the natural flow of Whitewater River by means of its spreading dams, ditches and other spreading works, all situated along the channel of said Whitewater River east of the west line of Secs. 20 and 29, T. 3 S., R. 4 E., S. B. B. and M., and west of the west line of Secs. 30 and 31, T. 3 S., R. 5 E.,

80,000 acre-feet per annum—priority October 25, 1918,

or as much thereof as it spreads and stores underground in the basin underlying Coachella Valley, situate in Riverside County, California: said quantity of water to be so diverted, spread and stored during the period between January first and December thirty-first of each year, both dates inclusive:

provided, that said water is subsequently withdrawn from said underground storage by the inhabitants of said Coachella Valley and applied by said inhabitants to beneficial use for domestic, stock watering, municipal and industrial purposes and for the irrigation of 25,000 acres of land lying within the 195,000-acre area included within the confines of the yellow border line on Coachella Valley County Water District Map No. 2, dated September, 1918, and filed by said Coachella Valley Water District with the State Water Commission with its Application 1122, and which map is now on file and of record in the office of the Division of Water Rights of the Department of Public Works of the State of California: and

provided, further, that prior to July 1, 1932, said Coachella Valley County Water District shall have completed the above appropriation and applied said water to beneficial use in accordance with the terms of Division of Water Rights Permit 536, and shall have submitted evidence of such completed appropriation and use to said Division of Water Rights. Upon receipt of such evidence of such completed appropriation and use, the said Division of Water Rights will act thereupon as provided in section 36*f* of the Water Commission Act, and in accordance with said evidence will enter findings supplemental hereto, determining and establishing the above described right by appropriation in so far as the same shall have been completed.

17. The Coachella Valley County Water District

will be entitled to divert from the natural flows of Whitewater River, Snow Creek, Falls Creek, Tahquitz Creek, Andreas Creek, Murray Creek, and Palm Canyon Creek, by means of spreading dams, ditches and other spreading works,

20,000 acre-feet per annum from Whitewater River,
8,000 acre-feet per annum from Snow Creek,
2,000 acre-feet per annum from Falls Creek,
5,000 acre-feet per annum from Tahquitz Creek,
1,000 acre-feet per annum from Andreas Creek,
1,000 acre-feet per annum from Murray Creek,
2,000 acre-feet per annum from Palm Canyon Creek,

39,000 acre-feet per annum—Total—priority July 8, 1922,

or as much of said quantities of water as it spreads and stores underground in the basin underlying Coachella Valley, situate in Riverside County, California; said quantities of water to be diverted from said streams at the respective points described as follows:

(1) From Whitewater River at a point situated approximately 3450 feet south and approximately 1750 feet east from the south quarter corner of Sec. 2, T. 3 S., R. 3 E., S. B. B. and M., being within the NE¼ SE¼ of Sec. 11, T. 3 S., R. 3 E., S. B. B. and M.:

(2) From Snow Creek at a point situated approximately 3645 feet north and approximately 2115 feet east from the section corner common to Secs. 20,

21, 28 and 29, T. 3 S., R. 3 E., S. B. B. and M., being within the SE¼ NW¼ of Sec. 21, T. 3 S., R. 3 E., S. B. B. and M.;

(3) From Falls Creek at a point situated approximately 1280 feet south and approximately 1110 feet east from the south quarter corner of Sec. 28, T. 3 S., R. 3 E., S. B. B. and M., being within the NW¼ NE¼ of Sec. 33, T. 3 S., R. 3 E., S. B. B. and M.;

(4) From Tahquitz Creek at a point situated approximately 2130 feet south and approximately 2950 feet west from the section corner common to Secs. 14, 15, 22 and 23, T. 4 S., R. 4 E., S. B. B. and M., being within the SE¼ NW¼ of Sec. 22, T. 4 S., R. 4 E., S. B. B. and M.;

(5) From Andreas Creek at a point situated approximately 3440 feet north and approximately 255 feet east from the west quarter corner of Sec. 11, T. 5 S., R. 4 E., S. B. B. and M., being within the SW¼ SW¼ of Sec. 2, T. 5 S., R. 4 E., S. B. B. and M.;

(6) From Murray Creek at a point situated approximately 690 feet north and approximately 75 feet east from the west quarter corner of Sec. 11, T. 5 S., R. 4 E., S. B. B. and M., being within the SW¼ NW¼ of said Sec. 11;

(7) From Palm Canyon Creek at a point situated approximately 1330 feet south and approximately 3400 feet east from the west quarter corner of Sec. 11, T. 5 S., R. 4 E., S. B. B. and M., being within the SW¼ SE¼ of said Sec. 11;

said quantities of water to be so diverted, spread and stored during the period between January first and December thirty-first of each year, both dates inclusive; *provided*, that said water is subsequently withdrawn from said underground storage by the inhabitants of said Coachella Valley and applied by said inhabitants to beneficial use for domestic, stock watering, municipal and industrial purposes and for the irrigation of 25,000 acres of land lying within the 195,000-acre area included within the confines of the yellow border line on Coachella Valley County Water District Map No. 2, dated September, 1918, and filed by said Coachella Valley County Water District with the State Water Commission with its Application 1122, and which map is now on file and of record in the office of the Division of Water Rights of the Department of Public Works of the State of California; and

provided, further, that prior to July 1, 1932, said Coachella Valley County Water District shall have completed the above appropriation and applied said water to beneficial use in accordance with the terms of Division of Water Rights Permit 3011, and shall have submitted evidence of such completed appropriation and use to said Division of Water Rights. Upon receipt of such evidence of such completed appropriation and use, the said Division of Water Rights will act thereupon as provided in section 36*f* of the Water Commission Act, and in accordance with said evidence will enter findings supplemental hereto, determining and establishing the above described right by appropriation in so far as the same shall have been completed.

18. Nellie N. Coffman, Cornelia B. White, Florilla M. White, Lavina F. Crocker, Helen Coffman, Pearl McCallum McManus, Isabel White Chase, George Wellwood Murray, Ruth J. Orr, T. L. Douglas, C. A. Abbott, and Charles Powers,

jointly, are entitled to divert from the natural flow of Tahquitz Creek, through the Agua Caliente Ditch,

1.36 cubic feet per second—priority April 26, 1884,

or as much thereof as they directly apply to beneficial use for the purpose hereinafter set forth, throughout the entire year; said water to be diverted from said Tahquitz Creek at a point (designated on Division of Water Rights Map as Diversion 61) which bears approximately S. 49° 30′ W., approximately 5400 feet distant from the northeast corner of Sec. 22, T. 4 S., R. 4 E., S. B. B. and M., being within the NW¼ SW¼ of said Sec. 22, and said water to be used for the irrigation of the respective lands of said parties as follows:

Nellie N. Coffman:

2.6 acres in a parcel bounded as follows: Beginning at the northwesterly corner of Spring Street and Main Avenue in the town of Palm Springs, Riverside County, California; thence west along the northerly line of Spring Street 290.4 feet; thence at right angles northerly 355.0 feet; thence at right angles

easterly 290.4 feet to westerly boundary line of Main Avenue; thence southerly along said westerly boundary of Main Avenue 355.0 feet to point of beginning.

0.6 acre in lots 22, 23 and 24 of block 8 of said town of Palm Springs.

6.9 acres in blocks 1, 6 and 8 of said town of Palm Springs bounded as follows: Beginning at a point in block 8 where the westerly side of the Whitewater or Palm Valley Water Company's Ditch intersects a line 150.0 feet north of and parallel with the north line of Park Street; thence N. 30° 58′ W., 327.0 feet; thence N. 0° 23′ W., 174.0 feet; thence west 40.0 feet; thence N. 0° 08′ W., 103.0 feet; thence S. 79° 10′ W., 335.7 feet; thence S. 84° 08′ W., 217.0 feet; thence S. 3° 40′ E., 264.25 feet; thence N. 89° 50′ E., 60.0 feet; thence S. 0° 08′ E., 210.0 feet; thence N. 89° 50′ E., 678.3 feet to point of beginning.

1.2 acres in lots 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 32 and 33, all in Block 20 of said town of Palm Springs.

0.4 acre in block 27 of said town of Palm Springs bounded as follows: Beginning at the southwest corner of said block; thence northerly on the easterly line of Main Avenue 100.0 feet; thence at right angles easterly and parallel with Park Street 145.0 feet; thence at right angles southerly 100.0 feet to northerly line of Park Street; thence westerly 145.0 feet to point of beginning.

11.7 acres—Total.

Cornelia B. White:

4.0 acres constituting all of block 27 of said town of Palm Springs, except the parcel last above described under Nellie N. Coffman, and except a parcel 80.0 feet square situate in the northwest corner of said block.

4.0 acres—Total.

Cornelia B. White and Florilla M. White:

4.1 acres constituting all of block 26 of said town of Palm Springs, except lots 1, 2, 3 and 4 thereof, and except a rectangular parcel having a frontage of 50.0 feet on Main Avenue, a depth of 100.0 feet, and situate south and contiguous to lot 4 of said block.

4.1 acres—Total.

Lavina F. Crocker:

1.6 acres in a parcel bounded as follows: Beginning at a point on the northerly line of Spring Street in said town of Palm Springs, 290.4 feet westerly from the northwest corner of Spring Street and Main Avenue; thence westerly along the said line of Spring Street 323.5 feet; thence N. 0° 08′ W., 204.0 feet; thence N. 89° 50′ E., 323.5 feet; thence S. 0° 08′ E., 204.0 feet to point of beginning; said description containing within its boundaries lots 9 to 20, both inclusive, of block 14 of said town of Palm Springs.

1.6 acres—Total.

Helen Coffman:

0.3 acre in lots 1, 2 and 3 of block 8 of said town of Palm Springs.

0.3 acre—Total.

Pearl McCallum McManus:

3.7 acres in lots 1, 2, 3 and 4 of block 1,
10.4 acres in lots 1, 2, 3 and 4 of block 2,
0.6 acre in lots 22, 23 and 24 of block 7,
2.2 acres in lots 4 to 9, both inclusive, and lots 14 to 21, both inclusive, of block 8,
2.6 acres in lots 1 to 16, both inclusive, and lots 26 to 28, both inclusive, of block 15,

0.3 acre in lots 11 and 12 of block 16.
0.6 acre in lots 9 to 12, both inclusive, of block 19,
1.5 acres in lots 1 to 12, both inclusive, of block 20,
all in said town of Palm Springs.

21.9 acres—Total.

Isabel White Chase:

1.1 acres constituting the west 250 feet of lot 4 of block 1 of said town of Palm Springs.

1.1 acres —Total.

George Wellwood Murray:

0.2 acre constituting a parcel of land 80.0 feet square situate in the northwest corner of block 27 of said town of Palm Springs.

0.2 acre—Total.

Ruth J. Orr:

0.5 acre in lots 34, 35 and 36 of block 20 of said town of Palm Springs.

0.5 acre—Total.

T. L. Douglas:

0.6 acre constituting the east 150 feet of lot 1 of block 2 of said town of Palm Springs.

0.6 acre——Total.

C. A. Abbott:

1.9 acres constituting the east 250 feet of lots 3 and 4 of block 2 of said town of Palm Springs.

1.9 acres—Total.

Charles Powers:

1.0 acre in lots 1, 2, 3, 4 and 5 of block 5 of said town of Palm Springs.

1.0 acre—Total.

The joint diversion and use of water under this right by the parties hereinabove enumerated is subject to the provisions of that certain agreement dated February 10, 1911, between the United States of America (Indian Service) and George Wellwood Murray et al., recorded March 11, 1911, in Book No. 325 of Deeds, page 260 *et seq.*, records of Riverside County, California.

19. Nellie N. Coffman, Prescott T. Stevens, Zaddie R. Bunker, T. A. Gray, Pearl McCallum McManus, Lavina F. Crocker, Ruth J. Orr, Helen Coffman, George Wellwood Murray, Trustees of Palm Springs Presbyterian Church, Cornelia B. White, Florilla M. White, Owen Earl Coffman and George B. Robertson,

jointly, are entitled to divert from the natural flow of Whitewater River, through the Palm Valley Water Company System (now generally known as the "Stevens Pipe Line"),

1.60 cubic feet per second—priority November 11, 1884,

or as much thereof as they directly apply to beneficial use for the purpose hereinafter set forth, throughout the entire year; said water to be diverted from said Whitewater River, all or in part, through any of the following described works:

(1) Through the main intake ditch leading to the "Stevens Pipe Line," the head of which ditch is situated at a point which bears approximately S. 84° 30′ E., approximately 440 feet distant from the northwest corner of lot 2 of Sec. 2, T. 3 S., R. 3 E., S. B. B. and M., being within said lot 2,

(2) Through Infiltration Pipe Line "A" as shown on the map prepared by Davidson and Fulmor, Engineers, dated April, 1927, and entitled "Map Showing the Prescott T. Stevens Intake and Infiltration Pipe Lines from Whitewater River, Riverside County, Cal.," the head of which pipe line is situated approximately 727 feet due east of the northwest corner of lot 2 of Sec. 2, T. 3 S., R. 3 E., S. B. B. and M., and approximately on the north line of said Sec. 2,

(3) Through Infiltration Pipe Line "B" as shown on said map prepared by Davidson and Fulmor, the head of which pipe line is situated approximately 122 feet due east of the northwest corner of lot 2 of Sec. 2, T. 3 S., R. 3 E., S. B. B. and M., and approximately on the north line of said Sec. 2,

(4) Through Infiltration Pipe Line "C" as shown on said map prepared by Davidson and Fulmor, the head of which pipe line is situated at a point which bears approximately S. 62° 15′ W., approximately 278 feet distant from the northeast corner of lot 3 of Sec. 2, T. 3 S., R. 3 E., S. B. B. and M., being within said lot 3;

and said water to be used for the irrigation of the respective lands of said parties as follows:

Nellie N. Coffman:

13.2 acres in a parcel bounded as follows: Beginning at the intersection of the center lines of Main Avenue and Spring Street in the town of Palm Springs, Riverside County, California; thence northerly along the center line of Main Avenue 453.0 feet; thence westerly at right angles to said center line 330.4 feet; thence at right angles northerly 146.0 feet; thence easterly at right angles 330.4 feet to center line of said Main Avenue; thence northerly along said center line 38.0 feet; thence at right angles westerly 618.88 feet; thence at right angles northerly 200.0 feet; thence at right angles westerly 491.12 feet to Palm Valley Water Company Ditch; thence southerly along line of said ditch 600 feet more or less to a point on said ditch 237.0 feet northerly of the center line of said Spring Street; thence easterly and parallel with the center line of Spring Street 669.6 feet more or less to a point 330.4 feet westerly from the center line of Main Avenue; thence at right angles southerly 237.0 feet to center line of said Spring Street; thence easterly along said center line of Spring Street 330.4 feet to point of beginning.

0.4 acre in block 27 of said town of Palm Springs bounded as follows: Beginning at the southwest corner of said block; thence northerly on the easterly line of Main Avenue 100.0 feet; thence at right angles easterly and parallel with Park Street 145.0 feet; thence at right angles southerly 100.0 feet to northerly line of Park Street; thence westerly 145.0 feet to point of beginning.

1.2 acres in lots 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 32 and 33, all in block 20 of said town of Palm Springs.

0.6 acre in lots 22, 23 and 24 of block 8 of said town of Palm Springs.

6.9 acres in blocks 1, 6 and 8 of said town of Palm Springs bounded as follows: Beginning at a point in block 8 where the westerly side of the Whitewater or Palm Valley Water Company's Ditch intersects a line 150.0 feet north of and parallel with the north line of Park Street; thence N. 30° 58′ W., 327.0 feet; thence N. 0° 23′ W., 174.0 feet; thence west 40.0 feet; thence N. 0° 08′ W., 103.0 feet; thence S. 79° 10′ W., 335.7 feet; thence S. 84° 08′ W. 217.0 feet; thence S. 3° 40′ E., 264.25 feet; thence N. 89° 50′ E., 60.0 feet; thence S. 0° 08′ E., 210.0 feet; thence N. 89° 50′ E., 678.3 feet to point of beginning.

22.3 acres—Total.

Prescott T. Stevens:

7.0 acres in SW¼ NE¼ NE¼ of Sec. 15, T. 4 S., R. 4 E., S. B. B. and M.

7.0 acres—Total.

Zaddie R. Bunker:

1.0 acre in SE¼ NE¼ of Sec. 15, T. 4 S., R. 4 E., S. B. B. and M.

1.0 acre—Total.

T. A. Gray:

1.3 acres in SE¼ NE¼ of Sec. 15, T. 4 S., R. 4 E., S. B. B. and M.

1.3 acres—Total.

Pearl McCallum McManus:

16.2 acres in E½ SE¼ of Sec. 15, T. 4 S., R. 4 E., S. B. B. and M.

16.2 acres—Total.

Lavina F. Crocker:

1.6 acres in a parcel bounded as follows: Beginning at a point on the northerly line of Spring street in said town of Palm Springs, 290.4 feet westerly from the northwest corner of Spring Street and Main Avenue; thence westerly along the said line of Spring Street 323.5 feet; thence N. 0° 08′ W., 204.0 feet; thence N. 89° 50′ E., 323.5 feet; thence S. 0° 08′ E., 204.0 feet to point of beginning; said description containing within its boundaries lots 9 to 20, both inclusive, of block 14 of said town of Palm Springs.

1.6 acres—Total.

Ruth J. Orr:

0.5 acre in lots 34, 35 and 36 of block 20 of said town of Palm Springs.

0.5 acre—Total.

Helen Coffman:

0.3 acre in lots 1, 2 and 3 of block 8 of said town of Palm Springs.

0.3 acre—Total.

George Wellwood Murray:

0.2 acre constituting a parcel of land 80.0 feet square situate in the northwest corner of block 27 of said town of Palm Springs.

0.2 acre—Total.

Trustees of Palm Springs Presbyterian Church:

0.4 acre constituting a rectangular parcel of land in the northwest corner of block 26 of said town of Palm Springs.

0.4 acre—Total.

Cornelia B. White:

4.0 acres in block 27 of said town of Palm Springs.

4.0 acres—Total.

Cornelia B. White and Florilla M. White:

4.1 acres in block 26 of said town of Palm Springs.

4.1 acres—Total.

Owen Earl Coffman:

0.5 acre in a parcel bounded as follows: Beginning at a point 470.0 feet westerly from the westerly line of Main Avenue in said town of Palm Springs and 604.0 feet northerly from the northerly property line of Spring Street; thence N. 0° 08′ W., 200.0 feet; thence westerly at right angles 108.88 feet; thence at right angles southerly 200.0 feet; thence easterly at right angles 108.88 feet to point of beginning.

0.5 acre—Total.

George B. Robertson:

0.4 acre in a parcel bounded as follows: Beginning at a point on the westerly property line of Main Avenue 566.0 feet northerly of the northerly property line of Spring Street in said town of Palm Springs; thence at right angles westerly to said line of Main Avenue 290.4 feet; thence at right angles southerly 61.0 feet; thence at right angles easterly 290.4 feet to the westerly property line of Main Avenue; thence northerly 61.0 feet to point of beginning.

0.4 acre—Total.

provided, however, that the lands described in this paragraph to which the water right hereinabove provided from Tahquitz Creek, by paragraph 18, is also appurtenant, shall only be entitled to water from Whitewater River under this right at such times and to such extent as the water supply available from Tahquitz Creek under the right provided in paragraph 18 may be inadequate for the irrigation of said lands. The joint diversion and use of water under this right by the parties hereinabove enumerated is subject to the provisions of that certain stipulation dated March 17, 1926, between the Banning Water Company, Banning Heights Mutual Water Company and San Gorgonio Power Company on the one part, and Nellie N. Coffman et al., on the other part, which stipulation is on file and of record in these proceedings, and by the terms of which stipulation said Nellie N. Coffman et al., recognize that said Banning Water Company, Banning Heights Mutual Water Company and San Gorgonio Power Company are the owners of the paramount right to divert water from the South Fork of Whitewater River through the Consolidated Reservoir and Power Company Canal as hereinbefore set forth in paragraph 11, regardless of the fact that the priority of said right set forth in said paragraph 11 is subsequent to the priority of the right of said Nellie N. Coffman et al., as set forth in this paragraph.

20. W. V. Covington

is entitled to divert from the natural flow of Lower Big Morongo Creek through the Covington West Ditch,

0.14 cubic foot per second—priority January 1, 1873,

or as much thereof as he directly applies to beneficial use for the purposes hereinafter set forth, throughout the entire year; said water to be diverted from said Lower Big Morongo Creek at a point (designated on Division of Water Rights Map as Diversion 55) which bears approximately N. 56° 30′ W, approximately 2410 feet distant from the southeast corner of Sec. 28, T. 1 S., R. 4 E., S. B. B. and M., being within the NW¼ SE¼ of said Sec. 28, and said water to be used for domestic and stock watering purposes and for the irrigation of the following described land:

3.5 acres in SW¼ SE¼, Sec. 28, T. 1 S., R. 4 E., S. B. B. and M.

21. W. V. Covington

is entitled to divert from the natural flow of an unnamed stream rising in a meadow in Lower Big Morongo Wash, through the Covington East Ditch,

0.50 cubic foot per second—priority January 1, 1873,

or as much thereof as he directly applies to beneficial use for the purposes hereinafter set forth, throughout the entire year; said water to be diverted from said

unnamed stream at a point (designated on Division of Water Rights Map as Diversion 56) which bears approximately N. 38° 00′ W., approximately 2030 feet distant from the southeast corner of Sec. 28, T. 1 S., R. 4 E., S. B. B. and M., being within the NE¼ SE¼ of said Sec. 28, and said water to be used for domestic and stock watering purposes and for the irrigation of the following described land:

13.7 acres in SW¼ SE¼, Sec. 28, T. 1 S., R. 4 E., S. B. B. and M.

22. W. V. Covington

is entitled to divert from the natural flow of an unnamed stream rising in a meadow in Lower Big Morongo Wash, by means of a series of dykes and short spreading ditches,

0.74 cubic foot per second—priority January 1, 1873,

or as much thereof as he directly applies to beneficial use for the purposes hereinafter set forth, throughout the entire year; said water to be diverted from said unnamed stream between the head of the Covington East Ditch, as hereinabove described in the preceding paragraph, and the point where said unnamed stream crosses the south boundary line of the NE¼ of Sec. 33, T. 1 S., R. 4 E., S. B. B. and M., and said water to be used for stock watering purposes and for the irrigation of the following described lands:

35.0 acres in SE¼, Sec. 28, T. 1 S., R. 4 E., S. B. B. and M.
30.0 acres in E½ NE¼, Sec. 33, T. 1 S., R. 4 E., S. B. B. and M.

65.0 acres—Total.

23. Annie B. Fick

is entitled to divert from the natural or developed flow of an unnamed spring (designated on Division of Water Rights Map as Diversion 5) situated approximately N. 35° 00′ W., approximately 1000 feet distant from the east quarter corner of Sec. 5, T. 2 S., R. 1 E., S. B. B. and M., being within the SE¼ NE¼ of said Sec. 5, through the Fick East Pipe Line,

(a) during the period between March first and November first of each year,

0.07 cubic foot per second—priority July 31, 1913,

or as much thereof as she directly applies to beneficial use for domestic and stock watering purposes and for the irrigation of her lands hereinafter described;

(b) during the period between November first of each year and March first of the succeeding year,

0.025 cubic foot per second—priority July 31, 1913,

or as much thereof as she directly applies to beneficial use for domestic and stock watering purposes;

all of said water to be diverted at said spring, and to be used upon the following described lands:

3.3 acres in SW¼ NW¼, Sec. 4, T. 2 S., R. 1 E., S. B. B. and M.
2.2 acres in NW¼ SW¼, Sec. 4, T. 2 S., R. 1 E., S. B. B. and M.

5.5 acres—Total.

24. Annie B. Fick

is entitled to divert from the natural or developed flow of two unnamed springs (designated on Division of Water Rights Map as Diversion 6) situated approximately S. 70° 00′ W., approximately 1600 feet distant from the east quarter corner of Sec. 32, T. 1 S., R. 1 E., S. B. B. and M., being within the NW¼ SE¼ of said Sec. 32, through the Fick West Pipe Line,

(a) during the period between March first and November first of each year,

0.033 cubic foot per second—priority October 23, 1916,

or as much thereof as she directly applies to beneficial use for domestic and stock watering purposes and for the irrigation of her lands hereinafter described;

(b) during the period between November first of each year and March first of the succeeding year,

0.025 cubic foot per second—priority October 23, 1916,

or as much thereof as she directly applies to beneficial use for domestic and stock watering purposes;

all of said water to be diverted at said springs and to be used upon the following described land:

4.3 acres in NW¼ SE¼, Sec. 5, T. 2 S., R. 1 E., S. B. B. and M.

25. The Gilman Home Company

is entitled to divert from the natural flow of the stream flowing in Gilman Canyon No. 1, through an unnamed flume,

(a) during the period between March first and November first of each year,

0.10 cubic foot per second—priority March 1, 1869,
0.09 cubic foot per second—priority March 1, 1882,
0.06 cubic foot per second—priority March 1, 1892,

0.25 cubic foot per second—Total,

or as much thereof as said company directly applies to beneficial use for domestic and stock watering purposes and for the irrigation of its lands hereinafter described,

(b) during the period between November first of each year and March first of the succeeding year,

0.025 cubic foot per second—priority March 1, 1869,

or as much thereof as said company directly applies to beneficial use for domestic and stock watering purposes;

all of said water to be diverted at a point (designated on Division of Water Rights Map as Diversion 11) which bears approximately S. 76° 30′ W, approximately 1860 feet distant from the east quarter corner of Sec. 5, T. 3 S., R. 1 E., S. B. B. and M., being within the NW¼ SE¼ of said Sec. 5, and all of said water to be used upon the following described lands:

24.0 acres in SE¼ SE¼, Sec. 5, T. 3 S., R. 1 E., S. B. B. and M.

26. The Gilman Home Company

is entitled to divert from the natural flow of the stream flowing in Gilman Canyon No. 2, through an unnamed pipe line,

0.125 cubic foot per second—priority March 1, 1892,

or as much thereof as said company directly applies to beneficial use for the purpose hereinafter set forth during the period between March first and November first of each year; said water to be diverted at a point (designated on Division of Water Rights Map as Diversion 12) which bears approximately N. 85° 00′ W., approximately 1420 feet distant from the east quarter corner of Sec. 5, T. 3 S., R. 1 E., S. B. B. and M., being within the SW¼ NE¼ of said Sec. 5 and said water to be used for the irrigation of the following described lands:

2.0 acres in NE¼ SE¼, Sec. 5, T. 3 S., R. 1 E., S. B. B. and M.
10.0 acres in SW¼ SE¼, Sec. 5, T. 3 S., R. 1 E., S. B. B. and M.

12.0 acres—Total.

27. The Gilman Home Company

is entitled to divert from the natural flow of the stream flowing in Gilman Canyon No. 3, through an unnamed pipe line,

0.25 cubic foot per second—priority March 1, 1891,

or as much thereof as said company directly applies to beneficial use for the purpose hereinafter set forth, during the period between March first and November first of each year; said water to be diverted at a point (designated on Division of Water Rights Map as Diversion 13) which bears approximately N. 52° 30′ W., approximately 970 feet distant from the east quarter corner of Sec. 5, T. 3 S., R. 1 E., S. B. B. and M., being within the SE¼ NE¼ of said Sec. 5, and said water to be used for the irrigation of the following described land:

24.0 acres in NW¼ NE¼, Sec. 8, T. 3 S., R. 1 E., S. B. B. and M.

28. George R. Hicks

will be entitled to divert from the natural flow of Upper Little Morongo Creek, through the Hicks Pipe Line and Ditch,

(a) during the period between March first and November first of each year,

2.50 cubic feet per second—priority April 24, 1917,

or as much thereof as he directly applies to beneficial use for domestic and stock watering purposes and for the irrigation of the lands hereinafter described in this paragraph;

(b) during the period between November first of each year and March first of the succeeding year,

0.50 cubic foot per second—priority April 24, 1917,

or as much thereof as he directly applies to beneficial use for domestic and stock watering purposes;

all of said water to be diverted at a point (designated on Division of Water Rights Map as Diversion 57) which bears approximately N. 30° 00′ E., approximately 3600 feet distant from the southwest corner of Sec. 2, T. 1 S., R. 4 E., S. B. B. and M., being within the SE¼ NW¼ of said Sec. 2, and all of said water to be used upon the following described lands:

80.0 acres in N½ SE¼, Sec. 12, T. 1 S., R. 4 E., S. B. B. and M.
80.0 acres in S½ NE¼, Sec. 14, T. 1 S., R. 4 E., S. B. B. and M.
80.0 acres in N½ SE¼, Sec. 14, T. 1 S., R. 4 E., S. B. B. and M.

240.0 acres—Total.

provided, that prior to December 1, 1929, said George R. Hicks shall have completed the above appropriation and applied said water to beneficial use in accordance with the terms of Division of Water Rights Permit 768, and shall have submitted evidence of such completed appropriation and use to the Division of Water Rights of the Department of Public Works of the State of California. Upon receipt of such evidence of such completed appropriation and use, the said Division of Water Rights will act thereupon as provided in section 36*f* of the Water Commission Act, and in accordance with said evidence will enter findings supplemental hereto, determining and establishing the above described right by appropriation in so far as the same shall have been completed.

29. Marshall G. Jost

is entitled to divert from the natural or developed flow of an unnamed spring situated in Dunlap Canyon at a point which bears approximately N. 14° 30′ E., approximately 125 feet distant from the west quarter corner of Sec. 32, T. 2 S., R. 1 E., S. B. B. and M., being within the SW¼ NW¼ of said Sec. 32, through the Marshall Jost Pipe Line,

0.04 cubic foot per second—priority July 31, 1900,

or as much thereof as he directly applies to beneficial use for the purpose hereinafter set forth, throughout the entire year; said water to be diverted at said spring, and to be used for stock watering purposes in the

NE¼ SE¼, Sec. 31, T. 2 S., R. 1 E., S. B. B. and M.

30. Charles C. Leary

is entitled to divert from the natural or developed flow of an unnamed spring situated at a point (designated on Division of Water Rights Map as Diversion 33) which bears approximately S. 7° 30′ E., approximately 1780 feet distant from the west quarter corner of Sec. 20, T. 3 S., R. 2 E., S. B. B. and M., being within the SW¼ SW¼ of said Sec. 20, through the Leary Pipe Line,

0.025 cubic foot per second—priority October 18, 1913,

or as much thereof as he directly applies to beneficial use for the purpose hereinafter set forth, during the period between March first and November first of each year; said water to be diverted at said spring, and to be used for the irrigation of the following described land:

7.0 acres in Lot 4 of NW¼ of Sec. 20, T. 3 S., R. 2 E., S. B. B. and M.

31. Charles C. Leary

is entitled to divert from the natural or developed flow of an unnamed spring situated at a point (designated on Division of Water Rights Map as Diversion 32) which bears approximately S. 14° 00′ E., approximately 1420 feet distant from the west quarter corner of Sec. 20, T. 3 S., R. 2 E., S. B. B. and M., being within the SW¼ SW¼ of said Sec. 20, through the Leary Pipe Line.

(a) during the period between March first and November first of each year,

0.05 cubic foot per second—priority October 18, 1913,

or as much thereof as he directly applies to beneficial use for domestic and stock watering purposes and for the irrigation of his lands hereinafter described;

(b) during the period between November first of each year and March first of the succeeding year,

0.025 cubic foot per second—priority October 18, 1913,

or as much thereof as he directly applies to beneficial use for domestic and stock watering purposes;

all of said water to be diverted at said spring, and to be used upon the following described land:

14.0 acres in Lot 4 of NW¼ of Sec. 20, T. 3 S., R. 2 E., S. B. B. and M.

32. Herman Luhrman (successor in interest to C. F. Jost)

is entitled to divert from the natural flow of the West Fork of Stubby Creek, through the Jost West Ditch and Pipe Line,

0.10 cubic foot per second—priority April 23, 1886,

or as much thereof as he directly applies to beneficial use for the purposes hereinafter set forth, throughout the entire year; said water to be diverted from said West Fork of Stubby Creek at a point (designated on Division of Water Rights Map as Diversion 36) which bears approximately S. 69° 00′ W., approximately 1950 feet distant from the northeast corner of Sec. 36, T. 2 S., R. 2 E., S. B. B. and M., being within the NW¼ NE¼ of said Sec. 36, and said water to be used for domestic, stock watering, irrigation and bee culture purposes within the

S½ NE¼, Sec. 36, T. 2 S., R. 2 E., S. B. B. and M.

33. Herman Luhrman (successor in interest to C. F. Jost)

is entitled to divert from the natural flow of the East Fork of Stubby Creek, through the Jost East Ditch.

0.10 cubic foot per second—priority April 23, 1886,

or as much thereof as he directly applies to beneficial use for the purposes hereinafter set forth, throughout the entire year; said water to be diverted from said East Fork of Stubby Creek at a point (designated on Division of Water Rights Map as Diversion 37) which bears approximately S. 82° 30′ W., approximately 1050 feet

distant from the northeast corner of Sec. 36, T. 2 S., R. 2 E., S. B. B. and M., being within the NE¼ NE¼ of said Sec. 36, and said water to be used for domestic, stock watering, irrigation and bee culture purposes within the

NE¼ NE¼, Sec. 36, T. 2 S., R. 2 E., S. B. B. and M.

34. Mayme V. Matthay (successor in interest to H. F. Nelles)

will be entitled to divert from the natural flow of Cottonwood Creek, through the Matthay Pipe Line,

0.25 cubic foot per second—priority February 6, 1923,

or as much thereof as she directly applies to beneficial use for the purposes hereinafter set forth, throughout the entire year; said water to be diverted from said Cottonwood Creek at a point situated approximately 6319 feet upstream from a point approximately 2600 feet westerly of the east quarter corner of Sec. 32, T. 2 S., R. 3 E., S. B. B. and M.; said point of diversion being within the NE¼ SE¼ of Sec. 30, T. 2 S., R. 3 E., S. B. B. and M.; and said water to be used for domestic and stock watering purposes and for the irrigation of the following described land:

320 acres in S½, Sec. 9, T. 3 S., R. 3 E., S. B. B. and M. (or as much of said tract as it is possible to irrigate with said quantity of water);

provided, that prior to December 1, 1928, said Mayme V. Matthay shall have completed the above appropriation and applied said water to beneficial use in accordance with the terms of Division of Water Rights Permit 1858, and shall have submitted evidence of such completed appropriation and use to the Division of Water Rights of the Department of Public Works of the State of California. Upon receipt of such evidence of such completed appropriation and use, the said Division of Water Rights will act thereupon as provided in section 36*f* of the Water Commission Act, and in accordance with said evidence will enter findings supplemental hereto, determining and establishing the above described right by appropriation in so far as the same shall have been completed.

35. The Morongo Valley Mutual Water Company

is entitled to divert from the natural flow of Big Morongo Creek, through the Morongo Valley Mutual Water Company Pipe Line,

0.14 cubic foot per second—priority June 14, 1915,

or as much thereof as said company directly applies to beneficial use for the purposes hereinafter set forth, throughout the entire year; said water to be diverted from said Big Morongo Creek at a point (designated on Division of Water Rights Map as Diversion 54) which bears approximately N. 30° 20′ W., approximately 1575 feet distant from the southeast corner of Sec. 18, T. 1 S., R. 4 E., S. B. B. and M., being within the NE¼ SE¼ of said Sec. 18, and said water to be used for domestic and stock watering purposes and for the irrigation of the following described lands:

160.0	acres in	NW¼,	Sec. 28, T. 1 S., R. 4 E., S. B. B. and M.
80.0	acres in	W½ SW¼,	Sec. 28, T. 1 S., R. 4 E., S. B. B. and M.
40.0	acres in	NE¼ SW¼,	Sec. 28, T. 1 S., R. 4 E., S. B. B. and M.
80.0	acres in	E½ SE¼,	Sec. 29, T. 1 S., R. 4 E., S. B. B. and M.
40.0	acres in	SW¼ SE¼,	Sec. 29, T. 1 S., R. 4 E., S. B. B. and M.
80.0	acres in	N½ NE¼,	Sec. 32, T. 1 S., R. 4 E., S. B. B. and M.
40.0	acres in	NW¼ NW¼,	Sec. 33, T. 1 S., R. 4 E., S. B. B. and M.
520.0	acres—Total.		

36. The Palm Valley Water Company

is entitled to divert from the natural flow of Chino Creek, through the Chino Creek Pipe Line,

2.00 cubic feet per second—priority October 2, 1897,

or as much thereof as said company applies to beneficial use for the purpose hereinafter set forth, throughout the entire year; said water to be diverted from said

Chino Creek at a point (designated on Division of Water Rights Map as Diversion 59) which bears approximately S. 60° 30′ W., approximately 725 feet distant from the northeast corner of Sec. 7, T. 4 S., R. 4 E., S. B. B. and M., being within the NE¼ NE¼ of said Sec. 7, and said water to be used by said company for the purpose of supplying water for domestic and municipal uses in the territory within and adjacent to the town of Palm Springs, Riverside County, California.

37. George W. Parker and F. E. Matthews,

jointly, are entitled to divert from the natural flow of the stream flowing in Water Canyon, through the Parker and Matthews Water Canyon Pipe Line,

0.04 cubic foot per second—priority January 1, 1909,

or as much thereof as they directly apply to beneficial use for the purpose hereinafter set forth, throughout the entire year: said water to be diverted from said stream at a point which bears approximately S. 78° 30′ W., approximately 2080 feet distant from the northeast corner of Sec. 24, T. 3 S., R. 1 E., S. B. B. and M., being within the NW¼ NE¼ of said Sec. 24, and said water to be used for the irrigation of the following described land:

8.2 acres in NW¼ NE¼, Sec. 13, T. 3 S., R. 1 E., S. B. B. and M.

38. George W. Parker and F. E. Matthews,

jointly, are entitled to divert from the natural or developed flow of Tunnel No. 1 Spring, through the Tunnel No. 1 Pipe Line,

0.04 cubic foot per second—priorty October 20, 1894,

or as much thereof as they directly apply to beneficial use for the purpose hereinafter set forth, throughout the entire year; said water to be diverted from said spring at a point (designated on Division of Water Rights Map as Diversion 24) which bears approximately N. 87° 00′ W., approximately 1280 feet distant from the southeast corner of Sec. 13, T. 3 S., R. 1 E., S. B. B. and M., being within the SE¼ SE¼ of said Sec. 13, and said water to be used for the irrigation of the following described lands:

2.2 acres in SE¼ NE¼, Sec. 13, T. 3 S., R. 1 E., S. B. B. and M.
4.3 acres in NE¼ SE¼, Sec. 13, T. 3 S., R. 1 E., S. B. B. and M.

6.5 acres—Total.

39. George W. Parker and F. E. Matthews,

jointly, are entitled to divert from the natural or developed flow of Newland Spring, through the Newland Spring Pipe Line,

0.08 cubc foot per second—priority January 3, 1898,

or as much thereof as they directly apply to beneficial use for the purposes hereinafter set forth, throughout the entire year; said water to be diverted from said spring at a point (designated on Division of Water Rights Map as Diversion 23) which bears approximately N. 71° 00′ W., approximately 2450 feet distant from the southeast corner of Sec. 13, T. 3 S., R. 1 E., S. B. B. and M., being within the SW¼ SE¼ of said Sec. 13, and said water to be used for domestic and stock watering purposes and for the irrigation of the following described lands:

2.6 acres in SW¼ NE¼, Sec. 13, T. 3 S., R. 1 E., S. B. B. and M.
1.0 acre in SE¼ NE¼, Sec. 13, T. 3 S., R. 1 E., S. B. B. and M.
7.0 acres in NE¼ SE¼, Sec. 13, T. 3 S., R. 1 E., S. B. B. and M.

10.6 acres—Total.

40. George W. Parker and F. E. Matthews,

jointly, are entitled to divert from the natural or developed flow of South Spring, through the South Spring Pipe Line,

0.06 cubic foot per second—priority January 3, 1898,

or as much thereof as they directly apply to beneficial use for the purpose hereinafter set forth, throughout the entire year; said water to be diverted from said

spring at a point (designated on Division of Water Rights Map as Diversion 26) which bears approximately S. 2° 30′ W., approximately 1340 feet distant from the northeast corner of Sec. 24, T. 3 S., R. 1 E., S. B. B. and M., being within the SE¼ NE¼ of said Sec. 24, and said water to be used for the irrigation of the following described lands:

1.2 acres in NW¼ NE¼, Sec. 13, T. 3 S., R. 1 E., S. B. B. and M.
9.4 acres in SE¼ NE¼, Sec. 13, T. 3 S., R. 1 E., S. B. B. and M.

10.6 acres—Total.

41. George W. Parker and F. E. Matthews,

jointly, are entitled to divert from the natural or developed flow of Head Spring, through the Head Spring Pipe Line,

0.02 cubic foot per second—priority June 20, 1894,

or as much thereof as they directly apply to beneficial use for the purpose hereinafter set forth, throughout the entire year; said water to be diverted from said spring at a point (designated on Division of Water Rights Map as Diversion 25) which bears approximately S. 67° 00′ W., approximately 3050 feet distant from the northeast corner of Sec. 24, T. 3 S., R. 1 E., S. B. B. and M., being within the NE¼ NW¼ of said Sec. 24, and said water to be used for the irrigation of the following described lands:

1.2 acres in SE¼ NE¼, Sec. 13, T. 3 S., R. 1 E., S. B. B. and M.
2.2 acres in NE¼ SE¼, Sec. 13, T. 3 S., R. 1 E., S. B. B. and M.

3.4 acres—Total.

42. H. C. Ratcliff (successor in interest to H. P. Jensen and H. C. Ratcliff)

is entitled to divert from the natural or developed flow of Jensen's Spring, through the Jensen West Pipe Line,

0.06 cubic foot per second—priority June 17, 1911,

or as much thereof as he directly applies to beneficial use for the purposes hereinafter set forth, throughout the entire year; said water to be diverted from said spring at a point (designated on Division of Water Rights Map as Diversion 34) which bears approximately S. 29° 30′ W., approximately 2930 feet distant from the southeast corner of the NE¼ of Sec. 22, T. 3 S., R. 2 E., S. B. B. and M., being within Lot 11 of said Sec. 22, and said water to be used for domestic and stock watering purposes and for the irrigation of the following described land:

5.0 acres in SW¼ NE¼, Sec. 22, T. 3 S., R. 2 E., S. B. B. and M.

To Walter O. Edwards Dec 23, 1932

43. H. C. Ratcliff (successor in interest to H. P. Jensen and H. C. Ratcliff)

will be entitled to divert from the natural or developed flow of Jensen's Creek, through the Jensen East Pipe Line,

0.60 cubic foot per second—priority October 23, 1913,

or as much thereof as he directly applies to beneficial use for the purposes hereinafter set forth throughout the entire year: said water to be diverted from said Jensen's Creek at a point (designated on Division of Water Rights Map as Diversion 35) which bears approximately S. 28° 30′ E., approximately 3100 feet distant from the southwest corner of the NW¼ of Sec. 23, T. 3 S., R. 2 E., S. B. B. and M., being within Lot 11 of said Sec. 23, and said water to be used for domestic and stock watering purposes and for the irrigation of at least 50 acres of land within the following described tracts:

S½ NE¼, Sec. 22, T. 3 S., R. 2 E., S. B. B. and M.
Lot 8 of Sec. 22, T. 3 S., R. 2 E., S. B. B. and M.
Lot 8 of Sec. 23, T. 3 S., R. 2 E., S. B. B. and M.

provided, that prior to December 1, 1929, said H. C. Ratcliff shall have completed the above appropriation and applied said water to the beneficial use above specified, and shall have submitted evidence of such completed appropriation and use to the

Division of Water Rights of the Department of Public Works of the State of California. Upon receipt of such evidence of such completed appropriation and use, the Division of Water Rights will act thereupon as provided in section 36*f* of the Water Commission Act, and in accordance with said evidence will enter findings supplemental hereto, determining and establishing the above described right by appropriation in so far as the same shall have been completed.

44. George D. Richey

will be entitled to divert from the natural or developed flow of Thousand Palms Canyon Creek, through the Bedwell and Richey Ditch and Pipe Line,

1.00 cubic foot per second—priority January 31, 1913,

or as much thereof as he directly applies to beneficial use for the purposes hereinafter set forth, throughout the entire year; said water to be diverted from said Thousand Palms Canyon Creek at a point (designated on Division of Water Rights Map as Diversion 63) which bears approximately S. 77° 11′ E., approximately 2345 feet distant from the west quarter corner of Sec. 12, T. 4 S., R. 6 E., S. B. B. and M., being within the NE¼ SW¼ of said Sec. 12, and said water to be used for domestic and stock watering purposes and for the irrigation of at least 80 acres of land in the S½ of Sec. 22, T. 4 S., R. 6 E., S. B. B. and M.;

provided, that prior to December 1, 1929, said George D. Richey shall have completed the above appropriation and applied said water to the beneficial use above specified, and shall have submitted evidence of such completed appropriation and use to the Division of Water Rights of the Department of Public Works of the State of California. Upon receipt of such evidence of such completed appropriation and use, the Division of Water Rights will act thereupon as provided in section 36*f* of the Water Commission Act, and in accordance with said evidence will enter findings supplemental hereto, determining and establishing the above described right by appropriation in so far as the same shall have been completed.

45. The Southern Pacific Company and the Southern Pacific Railroad Company,

jointly, are entitled to divert from the natural flow of Snow Creek, through the Southern Pacific Snow Creek Ditch and Pipe Line,

2.00 cubic feet per second—priority October 24, 1899,

or as much thereof as they apply to beneficial use for the purposes hereinafter set forth, throughout the entire year; said water to be diverted from said Snow Creek at a point (designated on Division of Water Rights Map as Diversion 39) which bears approximately S. 54° 52′ E., approximately 1300 feet distant from the northwest corner of Sec. 33, T. 3 S., R. 3 E., S. B. B. and M., being within the NW¼ NW¼ of said Sec. 33, and said water to be used for railroad and domestic purposes at and adjacent to Whitewater and Garnet stations on the Southern Pacific Railroad, in Riverside County, California, and for domestic, stock watering and irrigation purposes upon the following described lands:

7.8 acres in	SE¼ SE¼, Sec. 20, T. 3 S., R. 3 E., S. B. B. and M.
7.0 acres in	NE¼ SE¼, Sec. 20, T. 3 S., R. 3 E., S. B. B. and M.
4.3 acres in	SW¼ SW¼, Sec. 21, T. 3 S., R. 3 E., S. B. B. and M.
20.9 acres in	NW¼ SW¼, Sec. 21, T. 3 S., R. 3 E., S. B. B. and M.
40.0 acres—Total.	

46. The Southern Pacific Company and the Southern Pacific Railroad Company,

jointly, are entitled to divert from the natural or developed flow of springs rising in Millard Canyon near the center of Sec. 32, T. 2 S., R. 2 E., S. B. B. and M., through the Southern Pacific Millard Canyon Conduit,

0.23 cubic foot per second—priority January 1, 1877,
0.27 cubic foot per second—priority January 3, 1917,

0.50 cubic foot per second—Total.

or as much thereof as they apply to beneficial use for the purposes hereinafter set forth, throughout the entire year; said water to be diverted from said springs at a point (designated on Division of Water Rights Map as Diversion 28) which bears approximately N. 39° 53′ E., approximately 3350 feet distant from the southwest corner of Sec. 32, T. 2 S., R. 2 E., S. B. B. and M., being within the NE¼ SW¼ of said Sec. 32, and said water to be used for railroad and domestic purposes at and adjacent to Cabazon Station on the Southern Pacific Railroad, in Riverside County, California.

47. The Southern Pacific Land Company

is entitled to divert from the natural or developed flow of springs rising in Millard Canyon near the center of Sec. 32, T. 2 S., R. 2 E., S. B. B. and M., through the Southern Pacific Millard Canyon Conduit,

0.12 cubic foot per second—priority January 1, 1877,
0.16 cubic foot per second—priority January 3, 1917,

0.28 cubic foot per second—Total.

or as much thereof as said company applies to beneficial use for the purposes hereinafter set forth, throughout the entire year; said water to be diverted from said springs at a point (designated on Division of Water Rights Map as Diversion 28) which bears approximately N. 39° 53′ E., approximately 3350 feet distant from the southwest corner of Sec. 32, T. 2 S., R. 2 E., S. B. B. and M., being within the NE¼ SW¼ of said Sec. 32, and said water to be used for domestic, stock watering and irrigation purposes upon the following described lands:

18.7 acres in NE¼ SW¼, Sec. 32, T. 2 S., R. 2 E., S. B. B. and M.
13.0 acres in SE¼ SW¼, Sec. 32, T. 2 S., R. 2 E., S. B. B. and M.
0.8 acre in SW¼ SW¼, Sec. 32, T. 2 S., R. 2 E., S. B. B. and M.

32.5 acres—Total.

48. The Southern Sierras Power Company

will be entitled to divert from the natural flows of Falls Creek, the East Fork of Snow Creek, and Snow Creek, through the Snow Creek Power Plant No. 1 Pipe Line,

10.00 cubic feet per second from Falls Creek,
10.00 cubic feet per second from East Fork of Snow Creek,
40.00 cubic feet per second from Snow Creek,

60.00 cubic feet per second—Total—priority November 9, 1920,

or as much of said quantities of water as said company applies to beneficial use for the purpose hereinafter set forth, throughout the entire year; said quantities of water to be diverted from said streams at the respective points of diversion described as follows:

(1) From Falls Creek either at a point which bears approximately S. 38° 09′ E., approximately 8665 feet distant from the west quarter corner of Sec. 33, T. 3 S., R. 3 E., S. B. B. and M., being within the SW¼ SW¼ of Sec. 3, T. 4 S., R. 3 E., S. B. B. and M., or at a point which bears approximately S. 37° 14′ E., approximately 8185 feet distant from said west quarter corner of Sec. 33, being within the NE¼ SE¼ of Sec. 4, T. 4 S., R. 3 E., S. B. B. and M., or in part at each of said points;

(2) From the East Fork of Snow Creek at a point which bears approximately S. 28° 46′ E., approximately 8123 feet distant from the west quarter corner of Sec. 33, T. 3 S., R. 3 E., S. B. B. and M., being within the SW¼ SE¼ of Sec. 4, T. 4 S., R. 3 E., S. B. B. and M.;

(3) From Snow Creek at a point which bears approximately S. 30° 34′ W., approximately 8045 feet distant from the west quarter corner of Sec. 33, T. 3 S., R. 3 E., S. B. B. and M., being within the SW¼ SW¼ of Sec. 5, T. 4 S., R. 3 E., S. B. B. and M.;

and said quantities of water to be used for the purpose of generating electric energy at a power plant situated in the SW¼ NW¼ of Sec. 33, T. 3 S., R. 3 E., S. B. B. and M.;

provided, that all water diverted under this right, with the exception of such quantity as may be necessarily lost in transportation, shall be returned to the natural channel of Snow Creek at a point within the SW¼ NW¼ of Sec. 33, T. 3 S., R. 3 E., S. B. B. and M.; and

provided, further, that prior to December 1, 1929, said Southern Sierras Power Company shall have completed the above appropriation and applied said water to beneficial use in accordance with the terms of Division of Water Rights Permit 1008, and shall have submitted evidence of such completed appropriation and use to the Division of Water Rights of the Department of Public Works of the State of California. Upon receipt of such evidence of such completed appropriation and use, the said Division of Water Rights will act thereupon as provided in section 36*f* of the Water Commission Act, and in accordance with said evidence will enter findings supplemental hereto, determining and establishing the above described right by appropriation in so far as the same shall have been completed.

49. The Southern Sierras Power Company

will be entitled to divert from the natural flows of Snow Creek and the East Fork thereof, through the Snow Creek Power Plant No. 2 Pipe Line,

40.00 cubic feet per second from Snow Creek,
20.00 cubic feet per second from East Fork of Snow Creek,

60.00 cubic feet per second—Total—priority November 20, 1920,

or as much of said quantities of water as said company applies to beneficial use for the purpose hereinafter set forth, throughout the entire year; said quantities of water to be diverted from said streams at the respective points of diversion described as follows:

(1) From Snow Creek at a point which bears approximately N. 50° 47′ E., approximately 365 feet distant from the west quarter corner of Sec. 33, T. 3 S., R. 3 E., S. B. B. and M., being within the SW¼ NW¼ of said Sec. 33;

(2) From the East Fork of Snow Creek at a point which bears approximately N. 72° 52′ E., approximately 1136 feet distant from the west quarter corner of Sec. 33, T. 3 S., R. 3 E., S. B. B. and M., being within the SW¼ NW¼ of said Sec. 33;

and said quantities of water to be used for the purpose of generating electric energy at a power plant situated in the SE¼ SE¼ of Sec. 20, T. 3 S., R. 3 E., S. B. B. and M.;

provided, that all water diverted under this right, with the exception of such quantity as may be necessarily lost in transportation, shall be returned either to the natural channel of Snow Creek or to the existing Southern Pacific Company Ditch leading from Snow Creek, at respective points immediately below said power plant; and

provided, further, that prior to December 1, 1929, said Southern Sierras Power Company shall have completed the above appropriation and applied said water to beneficial use in accordance with the terms of Division of Water Rights Permit 1009, and shall have submitted evidence of such completed appropriation and use to the Division of Water Rights of the Department of Public Works of the State of California. Upon receipt of such evidence of such completed appropriation and use, the said Division of Water Rights will act thereupon as provided in section 36*f* of the Water Commission Act, and in accordance with said evidence will enter findings supplemental hereto, determining and establishing the above described right by appropriation in so far as the same shall have been completed.

50. Prescott T. Stevens

will be entitled to divert from the natural flow of Whitewater River, through the Palm Valley Water Company System (now generally known as the "Stevens Pipe Line"),

10.00 cubic feet per second—priority September 19, 1913,

1.60 from No 19

or as much thereof as he directly applies to beneficial use for the purpose hereinafter set forth, throughout the entire year; said water to be diverted from said Whitewater River, all or in part, through any of the following described works:

(1) Through the main intake ditch leading to the "Stevens Pipe Line", the head of which ditch is situated at a point which bears approximately S. 84° 30′ E., approximately 440 feet distant from the northwest corner of Lot 2 of Sec. 2, T. 3 S., R. 3 E., S. B. B. and M., being within said Lot 2,

(2) Through Infiltration Pipe Line "A" as shown on the map prepared by Davidson & Fulmor, Engineers, dated April, 1927, and entitled "Map Showing the Prescott T. Stevens Intake and Infiltration Pipe Lines from Whitewater River, Riverside County, Cal.," the head of which pipe line is situated approximately 727 feet due east of the northwest corner of Lot 2 of Sec. 2, T. 3 S., R. 3 E., S. B. B. and M., and approximately on the north line of said Sec. 2,

(3) Through Infiltration Pipe Line "B" as shown on said map prepared by Davidson and Fulmor, the head of which pipe line is situated approximately 122 feet due east of the northwest corner of Lot 2 of Sec. 2, T. 3 S., R. 3 E., S. B. B. and M., and approximately on the north line of said Sec. 2,

(4) Through Infiltration Pipe Line "C" as shown on said map prepared by Davidson and Fulmor, the head of which pipe line is situated at a point which bears approximately S. 62° 15′ W., approximately 278 feet distant from the northeast corner of Lot 3 of Sec. 2, T. 3 S., R. 3 E., S. B. B. and M., being within said Lot 3;

and said water to be used for the irrigation of approximately 725 acres of land within the following described tracts:

SE¼ NE¼,	Sec. 3,	T. 4 S.,	R. 4 E.,	S. B. B. and M.	160
E½,	Sec. 10,	T. 4 S.,	R. 4 E.,	S. B. B. and M.	320
N½,	Sec. 11,	T. 4 S.,	R. 4 E.,	S. B. B. and M.	320
SW¼,	Sec. 11,	T. 4 S.,	R. 4 E.,	S. B. B. and M.	160
NE¼,	Sec. 15,	T. 4 S.,	R. 4 E.,	S. B. B. and M.	160

provided, that prior to January 1, 1930, said Prescott T. Stevens shall have completed the above appropriation and applied said water to the beneficial use above specified, and shall have submitted evidence of such completed appropriation and use to the Division of Water Rights of the Department of Public Works of the State of California. Upon receipt of such evidence of such completed appropriation and use, the Division of Water Rights will act thereupon as provided in section 36*f* of the Water Commission Act, and in accordance with said evidence will enter findings supplemental hereto, determining and establishing the above described right by appropriation in so far as the same shall have been completed.

NOTE.—The findings as to the claim of Prescott T. Stevens hereinabove set forth in this paragraph are based upon the *prima facie* case established by the "proof of appropriation" filed by the claimant and the field investigations of the Division of Water Rights, such findings being authorized by that certain stipulation dated February 13, 1928, and signed by W. G. Irving, attorney for the claimant and H. L. Carnahan, attorney for contestant Coachella Valley County Water District. In making said findings the Division of Water Rights has in no way considered or passed upon the objection raised by contestant Coachella Valley County Water District against the change in point of diversion made by the claimant, and said findings are made with the express intention that nothing therein contained shall be deemed prejudicial to either claimant or contestant in the event that either or both parties decide to file a notice of exception to this order of determination in the matter of said claim, and in the event of a hearing in the superior court upon the subject matter of said "proof of appropriation" and the "notice of contest" against the same filed herein by contestant Coachella Valley County Water District.

✓51. **Frank W. Talmadge, John W. Talmadge and William S. Talmadge** (hereinafter referred to as Talmadge Brothers),

jointly, are entitled to divert from the natural flow of Whitewater River, through the Whitewater Ranch Ditch,

3.75 cubic feet per second—priority January 1, 1850,

or as much thereof as they directly apply to beneficial use for the purposes hereinafter set forth, throughout the entire year; said water to be diverted from said

Whitewater River at a point (designated on Division of Water Rights Map as diversion 44) which bears approximately S. 87° 30′ W., approximately 1950 feet distant from the northeast corner of Sec. 11, T. 3 S., R. 3 E., S. B. B. and M., being within the NW¼ NE¼ of said Sec. 11, and said water to be used for domestic and stock watering purposes and for the irrigation of 100 acres of land within the following described tracts:

SW¼, Sec. 10, T. 3 S., R. 3 E., S. B. B. and M.
NW¼ NW¼, Sec. 15, T. 3 S., R. 3 E., S. B. B. and M.

The diversion and use of water under this right is subject to the provisions of that certain stipulation dated March 17, 1926, between the Banning Water Company, the Banning Heights Mutual Water Company and the San Gorgonio Power Company on the one part, and Julia B. Berry, Talmadge Brothers, and Andrew J. Warner and Clara J. Warner on the other part, which stipulation is on file and of record in these proceedings, and by the terms of which stipulation said Julia B. Berry, Talmadge Brothers, and Andrew J. Warner and Clara J. Warner recognize that said Banning Water Company, Banning Heights Mutual Water Company and San Gorgonio Power Company are the owners of the paramount right to divert water from the South Fork of Whitewater River through the Consolidated Reservoir and Power Company Canal as hereinbefore set forth in paragraph 11, regardless of the fact that the priority of said right set forth in said paragraph 11 is subsequent to the priority of the right of said Talmadge Brothers as set forth in this paragraph.

2. The United States of America

is entitled to divert from the natural flow of Hathaway Creek, through the Hathaway Canyon Pipe Line,

2.00 cubic feet per second—priority January 1, 1890,

so much thereof as it applies to beneficial use for the purposes hereinafter set forth, throughout the entire year; said water to be diverted from said Hathaway Creek at a point within the NW¼ NE¼ of Sec. 34, T. 2 S., R. 1 E., S. B. B. and M., and said water to be used for domestic, stock watering, power development and irrigation purposes within the Morongo Indian Reservation, comprising some 30,600 acres of land described as follows:

All of Secs. 10, 12, 13, 14, 15, 22, 23, 25, 26, 27, 34, 35 and 36, T. 2 S., R. 1 E., S. B. B. and M.
All of Secs. 8, 9, 17, 18, 25, 26, 27, 28 30, 31, 33, 34 and 35, T. 2 S., R. 2 E., S. B. B. and M.

53. The United States of America

is entitled to divert from the natural flow of Potrero Creek, through the Potrero Creek Ditch,

7.00 cubic feet per second—priority January 1, 1894,

or as much thereof as it applies to beneficial use for the purposes hereinafter set forth, throughout the entire year; said water to be diverted from said Potrero Creek, all or in part, at any of the following described points:

(1) At the rock dam across Woods Canyon (Potrero Creek headwaters) in the SW¼, Sec. 7, T. 2 S., R. 2 E., S. B. B. and M.

(2) At the intake from Potrero Creek in the SE¼ SE¼, Sec. 14, T. 2 S., R. 1 E., S. B. B. and M. (below Cienega).

(3) At the intake from Potrero Creek in the NW¼ NW¼, Sec. 25, T. 2 S., R. 1 E., S. B. B. and M. (below spring).

(4) At the Infiltration Gallery from Potrero Creek in the NE¼ NW¼, Sec. 25, T. 2 S., R. 1 E., S. B. B. and M.

(5) At the earth dam across Potrero Creek in the SE¼ SE¼, Sec. 25, T. 2 S., R. 1 E., S. B. B. and M.,

and said water to be used for domestic, stock watering, power development and irrigation purposes within the Morongo Indian Reservation, comprising some 30,600 acres of land as hereinabove described in the preceding paragraph. During the winter months, at times when the entire quantity of water available under this right may not be required for direct application to the uses hereinabove specified, the said United States of America is entitled to spread and store underground in Potrero Canyon, above the lowest point of diversion hereinabove described, all surplus water over and above the quantity required for direct application to use; *provided*, that all water so spread and stored is subsequently withdrawn from said underground storage and applied to beneficial use for the purposes hereinabove specified.

54. The United States of America

is entitled to divert from the natural flow of Mission Creek, through the Mission Creek Pipe Line,

3.00 cubic feet per second—priority January 1, 1902,

or as much thereof as it applies to beneficial use for the purposes hereinafter set forth, throughout the entire year: said water to be diverted from said Mission Creek at a point (designated on Division of Water Rights Map as Diversion 49) which bears approximately S. 56° 30′ W., approximately 2200 feet distant from the northeast corner of Sec. 2, T. 2 S., R. 3 E., S. B. B. and M., being within the NW¼ NE¼ of said Sec. 2, and said water to be used for domestic, stock watering, power development and irrigation purposes within the Mission Creek Indian Reservation, comprising some 2560 acres of land described as follows:

All of Secs. 12, 13 and 14, T. 2 S., R. 3 E., S. B. B. and M.
S½ Sec. 1, T. 2 S., R. 3 E., S. B. B. and M.
E½ Sec. 2, T. 2 S., R. 3 E., S. B. B. and M.

55. The United States of America

is entitled to divert from the natural flow of Andreas Creek, through the Andreas Creek Pipe Line,

6.00 cubic feet per second—priority January 1, 1893,

or as much thereof as it applies to beneficial use for the purposes hereinafter set forth, throughout the entire year; said water to be diverted from said Andreas Creek at a point (designated on Division of Water Rights Map as Diversion 62) which bears approximately S. 31° 00′ W., approximately 1900 feet distant from the east quarter corner of Sec. 3, T. 5 S., R. 4 E., S. B. B. and M., being within the SE¼ SE¼ of said Sec. 3, and said water to be used for domestic, stock watering, power development and irrigation purposes within the Agua Caliente Indian Reservation, comprising some 30,240 acres of land described as follows:

All of Secs. 2, 4, 6, 8, 12, 14, 18, 20, 22, 24, 26, 28, 30, 32, 34 and 35, T. 4 S., R. 4 E., S. B. B. and M.
W½ Sec. 10, T. 4 S., R. 4 E., S. B. B. and M.
All of Secs. 2, 4, 6, 8, 10, 12, 14, 18, 20, 22, 24, 28, 30, 32 and 34, T. 4 S., R. 5 E., S. B. B. and M.
All of Secs. 2, 4, 6, 8, 10, 12, 14, 18, 20, 22, 24, 26, 28, 30, 32 and 34, T. 5 S., R. 4 E., S. B. B. and M.
SE¼ Sec. 3, T. 5 S., R. 4 E., S. B. B. and M.
N½ Sec. 11, T. 5 S., R. 4 E., S. B. B. and M.

56. The United States of America

is entitled to divert from the natural flow of Tahquitz Creek, through the Agua Caliente Ditch,

4.80 cubic feet per second—priority April 26, 1884,

or as much thereof as it applies to beneficial use for the purposes hereinafter set forth, throughout the entire year; said water to be diverted from said Tahquitz Creek at a point (designated on Division of Water Rights Map as Diversion 61) which bears approximately S. 49° 30′ W., approximately 5400 feet distant from the northeast corner of Sec. 22, T. 4 S., R. 4 E., S. B. B. and M., being within the NW¼ SW¼ of said Sec. 22, and said water to be used for domestic, stock watering, power development and irrigation purposes within the Agua Caliente Indian Reservation, comprising some 30,240 acres of land as hereinabove described in the preceding paragraph. The use of water under this right by said United States of America is subject to the provisions of that certain agreement dated February 10, 1911, between the United States of America (Indian Service) and George Wellwood Murray et al.—recorded March 11, 1911, in Book No. 325 of Deeds, page 260 *et seq.*, records of Riverside County, California.

57. Andrew J. Warner and Clara J. Warner

jointly, are entitled to divert from the natural flow of Whitewater River, through the Warner Ranch Ditch,

1.62 cubic feet per second—priority September 18, 1907,

or as much thereof as they directly apply to beneficial use for the purposes hereinafter set forth, throughout the entire year; said water to be diverted from said Whitewater River at a point (designated on Division of Water Rights Map as Diversion 45) which bears approximately S. 45° 00′ W., approximately 1580 feet distant from the northeast corner of Sec. 11, T. 3 S., R. 3 E., S. B. B. and M., being within the NE¼ NE¼ of said Sec. 11, and said water to be used for domestic and stock watering purposes and for the irrigation of the following described land:

50.0 acres in S½ SE¼, Sec. 10, T. 3 S., R. 3 E., S. B. B. and M.

See stipulation Trans. p 231

Dated at Sacramento, California, this twenty-third day of April, 1928.

HAROLD CONKLING,
Chief of Division of Water Rights,
Department of Public Works, State of California.

[SEAL]

Entered in Book 1 of Orders of Determination, at page 426, April 23, 1928.

CERTIFICATE No. 1110

I, KATHERINE A. FEENY, Chief Clerk of the Division of Water Rights, Department of Public Works of the State of California, do hereby certify the foregoing to be a full, true, and correct copy of the original Order of Determination in the above entitled matter signed and filed in the office of said Division of Water Rights, April 23, 1928, as the same remains on file in said office.

In witness whereof, I hereunto set my hand and affix the seal of the Department of Public Works of the State of California, this twenty-third day of April, 1928.

KATHERINE A. FEENY,
Chief Clerk, Division of Water Rights,
Department of Public Works, State of California.

APPENDIX

CHRONOLOGICALLY ARRANGED SUMMARY

of

RIGHTS BY APPROPRIATION TO USE OF THE WATERS OF WHITEWATER RIVER STREAM SYSTEM

EXPLANATORY

For the purpose of showing the relationships of the several rights by appropriation to the use of the waters of the Whitewater River Stream System established by the foregoing Order of Determination, the following chronologically arranged summary of the various rights is submitted.

In the first column of the tabulation the relative positions of the various rights are designated by numerals. The second, third, fourth and fifth columns are self-explanatory. In the sixth and seventh columns the maximum amounts of water to which the respective rights are entitled are given, either in cubic feet per second or in acre-feet per season. In the last column the numbers of the paragraphs of the Order of Determination in which the respective rights are defined, are given.

CHRONOLOGICALLY ARRANGED SUMMARY OF RIGHTS BY APPROPRIATION TO USE OF WATERS OF WHITEWATER RIVER STREAM SYSTEM

Order	Priority	Owner	Source	Conduit	Amount		Paragraph of order
					Cubic feet per second	Acre-feet per season	
1	Jan. 1, 1850	Talmadge Brothers	Whitewater River	Whitewater Ranch Ditch	[a]3.75		51
2	Mar. 1, 1869	Gilman Home Company	Stream in Gilman Canyon No. 1	Unnamed Flume	0.10		25
3	Jan. 1, 1873	W. V. Covington	Lower Big Morongo Creek	Covington West Ditch	0.14		20
3	Jan. 1, 1873	W. V. Covington	Stream in Lower Big Morongo Wash	Covington East Ditch	0.50		21
3	Jan. 1, 1873	W. V. Covington	Stream in Lower Big Morongo Wash	Dykes and Spreading Ditches	0.74		22
4	Mar. 17, 1875	Banning Water Company	San Gorgonio River (including foreign water and underground storage)	Banning Water Company Conduit		14,000	13
5	Jan. 1, 1877	Southern Pacific Co., et al	Springs in Millard Canyon	S. P. Millard Canyon Conduit	0.23		46
5	Jan. 1, 1877	Southern Pacific Land Company	Springs in Millard Canyon	S. P. Millard Canyon Conduit	0.12		47
6	Mar. 1, 1882	Gilman Home Company	Stream in Gilman Canyon No. 1	Unnamed Flume	0.09		25
7	April 26, 1884	United States of America (Indian Service)	Tahquitz Creek	Agua Caliente Ditch	4.80		56
7	April 26, 1884	Nellie N. Coffman, et al	Tahquitz Creek	Agua Caliente Ditch	1.36		18
8	Nov. 11, 1884	Nellie N. Coffman, et al	Whitewater River	Stevens Pipe Line	[a]1.60		19
9	Jan. 1, 1885	Cabazon Water Company	Millard Creek	Cabazon Water Company Conduit	4.67		15
10	April 23, 1886	Herman Luhrman	West Fork Stubby Creek	Jost West Conduit	0.10		32
10	April 23, 1886	Herman Luhrman	East Fork Stubby Creek	Jost East Conduit	0.10		33
11	Jan. 1, 1887	Banning Water Company	San Gorgonio River	Series of Spreading Ditches		[b]20,000	12
12	Jan. 1, 1890	United States of America (Indian Service)	Hathaway Creek	Hathaway Canyon Pipe Line	2.00		52
13	Mar. 1, 1891	Gilman Home Company	Stream in Gilman Canyon No. 3	Unnamed Pipe Line	0.25		27
14	Mar. 1, 1892	Gilman Home Company	Stream in Gilman Canyon No. 1	Unnamed Flume	0.08		25
14	Mar. 1, 1892	Gilman Home Company	Stream in Gilman Canyon No. 2	Unnamed Pipe Line	0.125		26
15	Jan. 1, 1893	United States of America (Indian Service)	Andreas Creek	Andreas Creek Pipe Line	6.00		55
16	Jan. 1, 1894	United States of America (Indian Service)	Potrero Creek	Potrero Creek Ditch	7.00		53
17	June 20, 1894	George W. Parker and F. E. Matthews	Head Spring	Head Spring Pipe Line	0.02		41
18	Oct. 20, 1894	George W. Parker and F. E. Matthews	Tunnel No. 1 Spring	Tunnel No. 1 Pipe Line	0.04		38
19	Oct. 2, 1897	Palm Valley Water Company	Chino Creek	Chino Creek Pipe Line	2.00		36
20	Jan. 3, 1898	George W. Parker and F. E. Matthews	Newland Spring	Newland Spring Pipe Line	0.08		39
20	Jan. 3, 1898	George W. Parker and F. E. Matthews	South Spring	South Spring Pipe Line	0.08		40
21	Oct. 24, 1899	Southern Pacific Co., et al	Snow Creek	S. P. Snow Creek Conduit	2.00		45
22	July 31, 1900	Marshall G. Jost	Unnamed Spring in Dunlap Canyon	Marshall Jost Pipe Line	0.04		29
23	Jan. 1, 1902	United States of America (Indian Service)	Mission Creek	Mission Creek Pipe Line	3.00		54

[a]Subject to right of Banning Heights Mutual Water Company, Banning Water Company and San Gorgonio Power Company to divert from South Fork of Whitewater River as set forth under priority Order 24.

[b]Right covers only spreading in San Gorgonio Canyon for purpose of equalizing the flow of San Gorgonio River to produce 14,000 acre-feet per annum as required o supply the right set forth under Priority Order 4.

*Right contingent upon completion of appropriation prior to December 1, 1929.

**Right contingent upon completion of appropriation prior to January 1, 1930.

***Right contingent upon completion of appropriation prior to July 1, 1932.

****Right contingent upon completion of appropriation prior to December 1, 1928.

pWater to be used for power purposes only, with subsequent return to stream system.

CHRONOLOGICALLY ARRANGED SUMMARY OF RIGHTS BY APPROPRIATION TO USE OF WATERS OF WHITEWATER RIVER STREAM SYSTEM—Continued

Order	Priority	Owner	Source	Conduit	Amount		Paragraph of order
					Cubic feet per second	Acre-feet per season	
44	Mar. 12, 1924	R. E. Bailiff	Stream in Water Canyon	Bailiff Water Canyon Pipe Line	*0.37	*45	8
45	Mar. 14, 1924	R. E. Bailiff	Unnamed Spring in NE¼, SE¼, Sec. 23, T. 3S., R. 1E., S.B.B. & M.	Bailiff West Spring Pipe Line	*0.11	*6	9
45	Mar. 14, 1924	R. E. Bailiff	Unnamed Spring in SE¼, SE¼, Sec. 13, T. 3S., R. 1E., S.B.B. & M.	Bailiff West Spring Pipe Line	*0.02		
46	April 24, 1924	R. E. Bailiff	Unnamed Spring in NE¼, SE¼, Sec. 19, T. 3S., R. 2E., S.B.B. & M.	Bailiff East Spring Pipe Line	0.05	.....	10
47	July 2, 1924	Stuart D. Allen	Blaisdell Creek	Allen Blaisdell Pipe Line	0.025	.....	6
				Total	a195.628	b153,051	

*Right contingent upon completion of appropriation prior to December 1, 1929.
aTotal includes 120.00 cubic feet per second for power use, all which is to be returned to the stream system,
bTotal includes 20,000 acre-feet per season for spreading by Banning Water Company for purpose of equalizing the flow available from San Gorgonio River, only.

DECEMBER 9, 1938

IN THE SUPERIOR COURT OF THE STATE OF CALIFORNIA

IN AND FOR THE COUNTY OF RIVERSIDE

--oOo--

IN THE MATTER OF THE DETERMINATION OF THE RELATIVE RIGHTS, BASED UPON PRIOR APPROPRIATION, OF THE VARIOUS CLAIMANTS TO THE WATERS OF WHITEWATER RIVER AND ITS TRIBUTARIES, IN SAN BERNARDINO AND RIVERSIDE COUNTIES, CALIFORNIA.	No. 18035

--oOo--

The above entitled proceeding came on regularly for hearing, trial and determination before the court sitting without jury, a trial by jury having been duly waived, on the 27th day of November, 1928, and was duly and regularly continued for further hearing, trial and determination to April 5, 1938;

Howard Surr, Surr & Hellyer, and Frank L. Miller appearing as counsel for Banning Water Company, a corporation, the San Gorgonia Power Company, a corporation, Banning Heights Mutual Water Company, a corporation, and Cabazon Water Company, a corporation; Frank L. Miller appearing as counsel for Morongo Valley Mutual Water Company, a corporation; C.L. McFarland appearing as counsel for George R. Hicks, Palm Valley Water Company, a corporation, Palm Springs Water Company, a corporation, and W. V. Covington; Arvin B. Shaw, Jr., and Stewart, Shaw & Murphey appearing as counsel for the Coachella Valley County Water District, having been duly and regularly substituted as such counsel for and in stead of H.L. Carnahan and Thos.C. Yeger; A. Heber Winder appearing as counsel for Pearl McCallum McManus and J.A. Gray; W. G. Irving appearing as counsel for the Whitewater Mutual Water Company, a corporation, successor in interest to Prescott T. Stevens; W.G.Irving and H.L.Thompson and Sarau&Thompson appearing as counsel for Nellie N.Coffman,Cornelia B.White,Florilla M.White,Lavina F.Crocker, Helen Coffman, Pearl McCallum McManus,Isabel White Chase, George Wellwood

Murray, Ruth J. Orr, T. L. Douglas, C. A. Abbott, Charles Powers, Zaddie R. Bunker, J. A. Gray, Owen Earl Coffman, George B. Roberson , and Trustees for Palm Springs Presbyterian Church, said H. L. Thompson and Sarau & Thompson having been duly and regularly associated as such counsel with said W. G. Irving; H. L. Thompson and Sarau & Thompson appearing as counsel for Walter O. Edwards, successor in interest to H. C. Ratcliff; Ralph E. Swing and Swing & Wilson, and Swing & Swing appearing as counsel for Frank L. Talmadge, John W. Talmadge and William S. Talmadge; Paul V. DeFord appearing as counsel for Southern Pacific Land Company, a corporation, Southern Pacific Railroad Company, a corporation, and Southern Pacific Company, a corporation, having been duly and regularly substituted as such counsel for and instead of Frank Thuneh; Robert F. Shippee appearing as counsel for Gertrude G. Hittson as successor in interest to George D. Richey; Carl W. Minton, and Minton & Minton appearing as counsel for Andrew J. Warner and Clara J. Warner; William O. Mackey appearing as counsel for R. E. Bailiff; Wing & Wing appearing as counsel for Stuart D. Allen and Stuart D. Allen as successor in interest to Julia B. Berry; Robert W. Daniels appearing specially as counsel for the United States of America; and Spencer Burroughs appearing as counsel for the Division of Water Resources, Department of Public Works, State of California; evidence both oral and documentary having been introduced, the evidence having been closed, the matter having been fully argued and submitted to the court for consideration and decision, the court having fully considered the facts and the law and being fully advised, and findings of fact and conclusions of law being duly waived, the court makes this its judgment and decree and it is therefore

ORDERED, ADJUDGED AND DECREED as follows:

I.

The Whitewater River rises on the south and east slopes of San Gorgonio Mountain, in the southwestern part of San Bernardino County at an altitude of about 11,000 feet, flows in a general southerly

direction for a distance of about sixty-five miles, traversing the central part of Riverside County, and empties into Salton Sea, the elevation of which is about 250 feet below sea level. Except in times of extreme flood, the entire flow of said river sinks into the desert between Whitewater Station and Palm Springs Station, on the Southern Pacific Railroad.

II

The principal tributaries rising in the San Bernardino Mountains are San Gorgonio River, Hathaway Creek, Potrero Creek, Millard Creek, Stubby Creek, Cottonwood Creek, Mission Creek, Dry Morongo Creek, Big Morongo Creek and Little Morongo Creek. Of these tributaries, the San Gorgonio River is by far the most important and drains San Gorgonio Canyon, situated north of Banning, and also San Gorgonio Pass from Banning east to Whitewater Station. Mission Creek and the Morongo Creeks, although having large watersheds, drain areas of comparatively low precipitation and consequently contribute but little water except in times of flood.

III

The principal tributaries rising in the San Jacinto Mountains are Cabazon Creek, Snow Creek, Falls Creek, Chino Creek, Tahquitz Creek, Andreas Creek, Murray Creek, and Palm Canyon Creek. Of these, Snow Creek, which drains the north slope of San Jacinto Peak, is the most important, and Tahquitz Creek, which drains the east slope of San Jacinto Peak, is next in importance. Both Snow Creek and Tahquitz Creek are extremely precipitous, falling from near the summit of San Jacinto Peak to the floor of the desert at rates in excess of 1,000 feet per mile. Palm Canyon Creek is about twenty miles long and drains the largest area, but its watershed is relatively low and consequently produces less water than the streams to the north.

IV

The only important tributaries entering from the Santa Rosa Mountains are Deep Canyon Creek and Martinez Canyon Creek. The Cottonwood

Mountains, forming the eastern boundary of Coachella Valley, produce no living streams with the exception of that in Thousand Palms Canyon, opposite Edom.

V

The various tributaries of the Whitewater River have built up debris cones where they debouch from their respective canyons, and, except in times of flood, their entire flows sink in these cones, travelling through underground channels to the lower part of Coachella Valley. The total area drained by the Whitewater River stream system is about 1200 square miles.

VI

On account of the extremes in altitude, there is a wide variation in climate in the different parts of the watershed. The climate of the high mountain region is characterized by a wet season extending from the first part of November to the latter part of April, followed by a long period during which there is practically no precipitation. In this region, the winters are severe and the summers are mild. Above the 7,000 foot level, a considerable portion of the precipitation falls as snow, which remains on the ground until early summer.

VII

The climate also varies widely over the valley floor. In the vicinity of Banning, the winters are mild, and while the summer days are often hot the nights are usually cool. The rainfall in this region is ample to permit the growing of grain crops without irrigation. Proceeding from Banning eastward through San Gorgonio Pass, the transition in climate is very rapid until, at Whitewater Station, a distinctly desert climate is reached. The climate of Coachella Desert and Coachella Valley is characterized by short mild winters followed by long hot seasons during which the heat is extreme. Temperatures of 125 degrees Fahrenheit are not uncommon in July and August. The precipitation in this region is low and erratic. During the late winter and early spring, very high winds are frequent,

originating in San Gorgonio Pass and sweeping southeastward across the desert.

VIII

In the San Gorgonio Pass area, deciduous fruits are the principal crop, although in the vicinity of Whitewater Station some alfalfa is grown. There is a small cultivated area in the vicinity of Palm Springs, in which the principal crops raised are alfalfa and citrus fruits. In the Coachella Valley a variety of crops are raised, the principal ones being cotton, grapes, dates, onions, alfalfa and citrus fruits. There are comparatively small areas in corn, vegetables and grain.

IX

The successful production of crops on all cultivated lands in the Whitewater River watershed is dependent upon irrigation and since the water supply of the stream system is inadequate for all agricultural needs throughout each irrigation season, it is essential that the rights in and to said water supply be determined in order that there may be an orderly distribution of the same to the rightful owners.

X

The term "act" when used herein means the "water commission act", being Chapter 586, Statutes of 1913 of the State of California, as amended; the term "stream system" when used herein means the Whitewater River and its various tributaries; the term "commission" when used herein means the commission created by said act, and its successors in power and jurisdiction under the laws of the State of California; the term "claimant" when used herein means parties claiming rights based on prior appropriation in and to the Whitewater River or any of its tributaries; and the term "order of determination" when used herein means the order duly given and made by said commission on April 23, 1928, and filed in this Court under and pursuant to sections 25 to 36g, inclusive, of said act.

XI

The above entitled proceeding was initiated by Coachella Valley

County Water District, a public district organized and existing under and by virtue of the County Water District Act, being an act approved June 10, 1913, Stats. 1913, P. 1049, as amended, and the Coachella District Merger Act, being an act approved June 21, 1937, Stats. 1937, P. 1410, which said district on June 29, 1922, duly filed a petition with the Division of Water Rights of the Department of Public Works, successor to the said commission, and predecessor of the Division of Water Resources of the Department of Public Works of the State of California, herein referred to as "commission", for determination in accordence with the provisions of said water commission act, of the relative rights by prior appropriation of the various claimants in and to the waters of the Whitewater River Stream system.

XII

On December 9, 1922, by order duly given and made, said commission granted said petition, and thereafter duly gave notice by publication as provided by law, setting forth the entry of the aforesaid order and of the pendency of said proceedings;the date upon which said commission would begin its examination of said stream system, to-wit, March 1, 1923; and prescribing and requiring all claimants to rights by appropriation of the waters of said stream system to make proof of their claims in the manner provided by law.

XIII

At the time set in said notice said commission began its investigation of the flow of the stream system and of the conduits diverting water, and of the lands irrigated or irrigable therefrom, and proceeded to gather all other data and information essential to the proper determination of the water rights by appropriation from said stream system; and thereafter said commission reduced its observations, data, information and measurements to writing and executed surveys and prepared maps from the observations of such surveys in accordance with uniform rules and regulations duly and regularly adopted by said commission, and upon said maps and surveys showed with substantial accuracy the course of the streams in said stream system; the location of each conduit diverting water there-

from; land irrigated and capable of being irrigated by each conduit; and the kind of culture upon said irrigated lands. Said maps and surveys were prepared by said commission as the surveys and observations progressed, and when completed were duly and regularly filed and made of record in the office of said commission.

XIV

Upon the completion of the aforesaid measurements and maps and after the filing of said observations, data, information and measurements, as aforesaid, said commission, by order duly given and made, gave notice by publication thereof as provided by law, setting forth the date prior to which proofs to be furnished by claimants in and to the waters of said stream system were required to be filed with said commission, and said commission gave like notice and enclosed therewith forms of proofs as required by said act, by registered mail, with postage fully prepaid thereon, to each claimant to rights by appropriation of the waters of said stream system, insofar as such claimant could be reasonably ascertained, at his last known place of address. Thereafter the time allowed within which proofs of appropriation might be filed was extended by orders duly given and made by said commission, to and including October 31, 1924, and within said period claimants herein duly filed with said commission proofs of appropriation of their respective rights to the waters of said stream system.

XV

After the filing of proofs of appropriation by claimants as aforesaid, and after the expiration of the time fixed by said commission for the filing of said proofs, said commission duly assembled all proofs, which had been filed and prepared, and duly certified an abstract of all said proofs, and duly caused the same to be printed in accordance with the provisions of said act, and thereafter by order duly given and made, prepared a notice fixing and setting a time and place convenient to the claimants when and where evidence taken by or filed with the commission

would be open to inspection for a period of not less than ten days; and a copy of said notice together with a printed copy of said abstract of proofs, was thereafter, and more than fifteen days prior to the first day prescribed in said order as the commencement of the period of such inspection, duly mailed by registered mail, with the postage fully prepaid thereon, to each claimant who had appeared and filed proofs of appropriation as required by said act; and thereafter and in accordance with said notice and with said act, all of the evidence taken by or filed with said commission was open for inspection at the times and in the places and for the period designated in said notice, and any and all persons during said period were permitted to inspect such evidence and proofs in conformity with the provisions of said act, and during all of said period of inspection, a representative of said commission was present.

XVI

In conformity with the provisions of section 34 of said act, contests were filed by certain of said claimants, with said commission, and thereafter by orders duly given and made, and within ten days after receipt by said commission of each contest of claimants, said commission duly notified by registered mail, with postage prepaid thereon, such contestant and claimant, respectively, whose rights were contested, to appear before said commission at the time and place specified in said notice, which said time in each instance was not less than fifteen days nor more than sixty days from the date of mailing of said notice by said commission; and thereafter and in conformity therewith, said commission held hearings on all contests filed by claimants, and upon the conclusion of said hearings closed the same and ordered the proceedings submitted for decision by said commission.

XVII

Thereafter and on April 23, 1928, said commission duly made and entered its order, finding, determining and establishing the several rights by appropriation to the use of the waters of said Whitewater River and its

tributaries which said order was entered of record in the office of said commission in Book No. 1, Orders of Determination, at page 426, which said order was duly certified by said commission. Thereafter said commission caused said order of determination so certified to be printed in the State Printing Office and a copy thereof to be sent by registered mail, with the postage fully prepaid, to each person who had filed proof of claim, and to each person who had become interested through intervention in said proceeding under the provisions of said act, in all respects as provided by said act and in conformity therewith.

XVIII

At the time of submission of said proofs of appropriation said commission collected the fees due thereon, as prescribed in section 32 of said act, and at the time of mailing its order of determination, as aforesaid, computed the entire cost incurred in performing the duties prescribed in sections 26 to 36 of said act, and duly apportioned the amount by which said entire cost exceeded the total amount received on account of fees paid at the time of filing said proofs of appropriation among all claimants according to the method of apportionment provided in section 32 of said act, and in all respects in conformity therewith, and duly mailed notice of the assessment of said additional charges by registered mail to each claimant, said notice including a statement of the total sum assessed and of the sum assessed to each claimant addressed, all of which said additional charges have been paid.

XIX

After the entry of said order of determination as aforesaid, and on April 30, 1928, a certified copy thereof, together with the original evidence and transcript of testimony filed with or taken before said commission, all duly certified by said commission, was filed with the clerk of the Superior Court of the State of California, in and for the County of Riverside. Upon the filing of said certified copy of said order, evidence and transcript with the clerk of said Court, and on April 30, 1928, said

commission procured an order from said Court setting November 27, 1928, at 2:00 o'clock in the afternoon of said day, in the courtroom of said Court in the City of Riverside, County of Riverside, State of California, as the time and place for hearing on said order of determination, and requiring and prescribing that on or before ten days prior thereto all parties in interest aggrieved or dissatisfied with said order of determination, should file with the clerk of said court notice of exceptions to said order of determination. Said commission thereupon procured from the clerk of said court a certified copy of said order of said court setting said time and place for hearing as aforesaid, and forthwith said commission mailed a copy of such certified copy of said order of said Court by registered mail, with postage fully prepaid thereon, addressed to each known party in interest at his last known place of residence, in all respects as required by said act, and duly caused said certified copy of said order to be published as required by said act, and duly filed with the clerk of said Court proof of such service by registered mail and publication.

XX

Prior to the effective date of said water commission act, certain of said claimants had made and maintained according to law certain appropriations from said stream system which, at and upon said effective date of said act were incomplete in that at said date said claimants or their predecessors or successors in interest, had not applied the full amount of water so appropriated to a useful or beneficial purpose; that upon the initiation of this proceeding before said commission, pursuant to sections 12 and 36f of said act then in effect, jurisdiction over said incomplete rights was vested in said commission as provided by said sections of said act; that said commission duly included in said order of determination said rights by appropriation which were incomplete as aforesaid, and duly fixed and prescribed therein for each of such rights the time within which said full amount of water so appropriated should be applied to such useful or beneficial purpose; and with respect to certain thereof, for good cause

shown, from time to time, upon due application therefor, duly extended said time, and duly made and entered supplemental findings in accordance with proof offered and presented to said commission, of completion of certain of said incomplete rights, and duly made other findings and orders with respect thereto, and filed with this court certified copies thereof.

XXI

On the 14th day of August, 1931, jurisdiction of said commission as aforesaid over said incomplete rights ceased and terminated, except as provided by said section 12 of said act, and in and by Chapter 1136 of the Statutes of 1931, amending said section 36f of said act, and upon said 14th day of August, 1931, jurisdiction over said incomplete rights vested in this Court as provided in and by said section 36f of said act as amended by said Chapter 1136 of the Statutes of 1931; that thereafter this court, for good cause shown, and upon motion therefor by certain of said claimants, from time to time, duly extended said time for completion of said incomplete rights as aforesaid, and, upon notice thereof and motion therefor, with respect to certain of said incomplete rights, received proof of completion thereof and duly entered findings (designated "Supplemental Decree") establishing said rights to appropriate the waters of said stream system.

XXII

This court hereby ratifies, approves and confirms each, every and all of said acts, orders and findings of said commission and of this Court with respect to said incompleted rights and herein enters judgment pursuant thereto, and in accordance therewith; said rights, incomplete as aforesaid, as contained in said order of determination filed as aforesaid with this court on said 30th day of April, 1928, together with each and every of said acts, orders and findings of said commission and of this Court appertaining thereto are as follows:

1. In and by paragraph 7 of said order of determination, said commission found that Stuart D. Allen would be entitled to divert, as therein

provided, the waters of Whitewater River, provided said appropriation thereof should be completed and said water applied to beneficial use prior to December 1, 1929, in accordance with the terms of Division of Water Rights Permit 1723 (Application 2888); on January 9, 1930, said commission entered an order extending said time for completion and application to beneficial use to December 1, 1931; on May 10, 1932, at the request of said claimant, said commission entered an order revoking said Permit 1723, and prepared and duly certified a copy of said order, and on June 2, 1932, duly forwarded the same by mail to the clerk of this court, which said certified copy was duly received by said clerk and filed in the above entitled proceeding; and pursuant to said last mentioned order of said commission, said incomplete right so found as aforesaid in paragraph 7 of said order of determination is hereby ordered, adjudged and decreed to have been abandoned and revoked, and is cancelled and held for naught.

2. In and by paragraph 8 of said order of determination, said commission found that R. E. Bailiff would be entitled to divert, as therein provided, certain of the waters of Water Canyon, provided that said appropriation should be completed and said water applied to beneficial use prior to December 1, 1929 in accordance with the terms of the Division of Water Rights Permit 1855 (Application 3902); on December 2, 1929, said commission entered an order extending said time for completion and application to beneficial use to December 1, 1930; on November 28, 1930, said commission entered an order further extending said time for completion and application to beneficial use to December 1, 1933; and on November 20, 1933, this court duly entered its findings (designated "Supplemental Decree") establishing said right of said claimant to appropriate the waters of said Water Canyon, and judgment and decree is entered herein pursuant thereto and in accordance therewith.

3. In and by paragraph 9 of said order of determination said commission found that R. E. Bailiff would be entitled to divert, as therein provided, certain of the waters of two unnamed springs, provided that said

appropriation should be completed and said water applied to beneficial use prior to December 1, 1929 in accordance with the terms of Division of Water Rights Permit 1856 (Application 3904); on May 11, 1931, said commission duly entered and made supplemental findings in accordance with proof of completion of said incomplete right by appropriation as presented to and found by it, a certified copy of which findings was on May 11, 1931, forwarded by mail to the clerk of this court and was received by said clerk and duly filed in this proceeding, and judgment and decree is entered herein pursuant thereto and in accordance therewith.

4. In and by paragraph 14 of said order of determination said commission found that Donald M. Bedwell would be entitled to a right to divert, as therein provided, certain of the waters of Thousand Palms Canyon Creek, provided the said appropriation should be completed and said water applied to beneficial use prior to December 1, 1929; on February 26, 1930, said commission entered an order extending said time for completion and application to beneficial use to December 1, 1930; and on May 11, 1931, said commission entered and made supplemental findings in accordance with proof of completion of said incomplete right as presented to and found by it, a certified copy of which findings was on May 11, 1931, forwarded by mail to the clerk of this court, and was received by said clerk and duly filed in the above entitled proceeding, and judgment and decree is entered herein pursuant thereto and in accordance therewith.

5. In and by paragraph 16 of said order of determination said commission found that the Coachella Valley County Water District would be entitled, as therein provided, to spread and store underground certain of the waters of the Whitewater River, provided that said appropriation should be completed and said water applied to beneficial use prior to July 1, 1932, in accordance with the terms of Division of Water Rights Permit 536 (Application 1122); on June 28, 1932, this court duly entered an order extending said time for completion and application to beneficial use to June 30, 1935; on July 18, 1935 this court duly entered an order

further extending said time for completion and application to beneficial use to June 30, 1938; and on April 28, 1938 this court duly entered an order further extending said time for completion and application to beneficial use to July 1, 1943.

6. In and by paragraph 17 of said order of determination said commission found that Coachella Valley County Water District would be entitled, as therein provided, to spread and store underground certain of the waters of Whitewater River, Snow Creek, Falls Creek, Tahquitz Creek, Andreas Creek, Murray Creek and Palm Canyon Creek, provided that said appropriation should be completed and said water applied to beneficial use prior to July 1, 1932 in accordance with the terms of Division of Water Rights Permit 3011 (Application 2922); on June 28, 1932 this court duly entered an order extending said time for completion and application to beneficial use to June 30, 1935; and on July 18, 1935 this court duly entered an order further extending said time for completion and application to beneficial use to June 30, 1938; and on April 28, 1938 this court duly entered an order further extending said time for completion and application to beneficial use to July 1, 1943.

7. In and by paragraph 28 of said order of determination said commission found that George R. Hicks would be entitled to divert as therein provided the waters of Upper Little Morongo Creek, provided said appropriation should be completed and said water applied to beneficial use prior to December 1, 1929 in accordance with the terms of Division of Water Rights Permit 768 (Application 650); on December 20, 1929, said commission entered an order extending said time for completion and application to beneficial use to December 1, 1931; on December 9, 1931 this court duly entered an order further extending said time for completion and application to beneficial use to December 1, 1932; and on December 21, 1932 this court duly entered an order further extending said time for completion and application to beneficial use to December 1, 1933; on December 1, 1933 this court duly entered an order further extending said

time for completion and application to beneficial use to December 1, 1934; on May 17, 1935 this court duly entered an order further extending said time for completion and application to beneficial use to December 1, 1935; on November 27, 1935 this court duly entered an order further extending said time for completion and application to beneficial use to December 1, 1936; on January 18, 1937 this court duly entered an order further extending said time for completion and application to beneficial use to June 1, 1937; and on July 12, 1937 this court entered its findings (designated "Supplemental Decree") establishing the right of said claimant to appropriate said waters; and judgment and decree is entered herein pursuant thereto and in accordance therewith.

8. In and by paragraph 34 of said order of determination said commission found that Mayme V. Matthey would be entitled to divert certain of the waters of Cottonwood Creek, provided that said appropriation should be completed and said water applied to beneficial use prior to December 1, 1928 in accordance with the terms of Permit 1858 (Application 3253); on November 30, 1928 said commission entered an order extending said time for completion and application to beneficial use to December 1, 1930; on November 12, 1930 at the request of said claimant, said commission entered an order revoking said Permit 1858, and prepared and duly certified a copy of said order, and on May 11, 1931, duly forwarded the same by mail to the clerk of this court, which said certified copy was received by said clerk and duly filed in the above entitled proceeding; and pursuant to said last mentioned order of said commission said incomplete right so found as aforesaid in said paragraph 34 of said order of determination is hereby ordered, adjudged and decreed to have been abandoned and revoked, and is cancelled and held for naught.

the Division of Water Rights

9. In and by paragraph 43 of said order of determination said commission found that H. C. Ratcliff would be entitled to divert certain of the waters of Jensen's Creek provided said appropriation was completed and said water applied to beneficial use prior to December 1, 1929; on December

herein in lieu, place and stead of the said Ruth J. Orr, it was so ordered by the court; and

5. It appearing to the court that Walter O. Edwards has succeeded to all right, title and interest of H. C. Retcliff as found in paragraphs 42 and 43 of said order of determination, and that said Walter O. Edwards should be substituted herein in lieu, place and stead of the said H. C. Retcliff, it was so ordered by the court; and

6. It appearing to the court that there was doubt concerning the accuracy of description of certain properties found as in the ownership of Pearl McCallum McManus in and by paragraph 18 of said order of determination, and particularly with respect to the description of said properties contained in the first items thereof whether such description should refer to lots 1, 2, 3 and 4, as stated in said paragraph of said order of determination, or whether such description, in lieu thereof, should refer to lots 5, 6, 7 and 8, it was duly and regularly stipulated and agreed orally in open court at the hearing herein held on April 5, 1938, by and among all parties in interest appearing at said hearing, including said Pearl McCallum McManus, which said stipulation was duly entered in the minutes of the court, that the said commission should make due examination with respect to such description, and if it found said description to be inaccurate, it should report the matter to this court and said paragraph 18 should be reformed accordingly, and it was so ordered by the court, and said commission having made such examination, and having found that said description as stated in said order of determination is accurately set forth therein, said finding is approved by the court and ordered in effect.

XXV

Subject to the hereinafter mentioned definitions, limitations and provisions the relative rights based upon prior appropriation of the various claimants to the waters of the Whitewater River and its tributaries in San Bernardino and Riverside counties, California, are

established, determined, adjudged and decreed as hereinafter in this judgment and decree set forth, said definitions, limitations and provisions being as follows, to-wit:

1. Although all quantities of water hereinafter adjudged and decreed to the several claimants for direct application to beneficial use are severally expressed in terms of continuous flow, nevertheless, nothing herein contained shall be construed as limiting or restricting the rights of any such claimants to rotate in the use of water, or the right of any such claimant to divert for limited periods of time convenient irrigation heads, and thereby apply water to his lands at a greater rate than indicated by the quantity of continuous flow so adjudged and decreed; provided, however, that such practice of rotation or use of irrigation heads shall not result in the use by any such claiment of a total quantity of water during any thirty-day period in excess of the equivalent of such claimant's continuous flow allowance for thirty days; and provided, further, that such practice of rotation or such use of irrigation heads shall not impair or infringe the right of any other such claimant.

2. The respective points of measurement of the quantities of water established, determined, adjudged and decreed to the several claiments hereinafter mentioned, are at the respective points of diversion from said stream system, as hereinafter set forth.

3. The term "directly apply to beneficial use" means the direct conveyance and application of water diverted to beneficial use without intermediate storage, except such regulatory storage as may be practiced for the purpose of equalizing the flow of water diverted to a convenient irrigation head.

4. The term "natural flow" means such flow as will naturally occur at any given point in a stream from the run-off of the watershed which it drains, from springs which naturally contribute to the stream, from seepage, and from waste and return flow from dems, conduits, and irrigated lands; as distinguished from released stored water, and from foreign water

directly conveyed to the stream from another watershed.

5. The "Division of Water Rights Map" hereinafter referred to is the map prepared by the Division of Water Rights of the Department of Public Works of the State of California, from its surveys made in 1922 and 1923, which map is entitled "Map of Whitewater River Watershed showing Diversion Systems and Irrigated Areas, San Bernardino and Riverside Counties, California", is dated 1923, and is on file in this proceeding.

XXVI

Said relative rights based upon prior appropriation of the various claimants to the waters of the Whitewater River and its Tributaries, in San Bernardino and Riverside Counties, California, are, subject to the aforesaid definitions, limitations and provisions, hereby established, determined, adjudged and decreed as follows, to-wit:

1. STUART D. ALLEN

is entitled to divert from the natural flow of Blaisdell Creek through the Allen Blaisdell Pipe Line,

0.025 cubic foot per second--priority July 2, 1924,

or as much thereof as he directly applies to beneficial use for the purpose hereinafter set forth, throughout the entire year; said water to be diverted from said Blaisdell Creek at a point situated approximately 2000 feet south from the northwest corner of Sec. 36, T. 3 S., R. 3 E., S.B.B. and M., being within the $SW\frac{1}{4}$ $NW\frac{1}{4}$ of said Sec. 36, and said water to be used for domestic purposes within the

$S\frac{1}{2}$ $NW\frac{1}{4}$, Sec. 30, T. 3 S., R. 4 E., S.B.B. and M.

2. R. E. BAILIFF

is entitled to divert from the natural flow of the stream flowing in Water Canyon, through the Bailiff Water Canyon Pipe Line,

(a) during the period between March first and November first of each year,

0.37 cubic foot per second--priority March 12, 1924,

or as much thereof as he directly applies to beneficial use for

domestic and stock watering purposes and for the irrigation of his lands hereinafter described;

(b) during the period between November first of each year and March first of the succeeding year,

45 acre-feet per season--priority March 12, 1924,

or as much thereof as he impounds in the Bailiff Storage Reservoir constructed in the SW¼ SW¼ of Section 18, T. 3 S., R. 2 E., S.B.B. and M., and thereafter withdrawsfrom said reservoir and applies to beneficial use for domestic and stock watering purposes and for the irrigation of his lands hereinafter described;

all of said water to be diverted from said stream at a point which bears approximately N. 77° 00' W., approximately 310 feet distant from the southwest corner of Section 18, T. 3 S., R. 2 E., S.B.B. and M., being within the SE¼ SE¼ of Section 13, T. 3 S., R. 1 E., S.B.B. and M., and all of said water to be used upon the following described lands:

25.0 acres in NW¼ SE¼, Sec. 18, T. 3 S., R. 2 E., S.B.B. and M.
5.0 acres in NE¼ SW¼, Sec. 18, T. 3 S., R. 2 E., S.B.B. and M.

3. R. E. BAILIFF

is entitled to divert from the natural or developed flow of two unnamed springs; the upper (Spring No. 1) being situated South 3805 feet and West 935 feet from the northeast corner of Section 23, T. 3 S., R. 1 E., S.B.B. and M., being within the NE¼ SE¼ of said Section 23, and the lower (Spring No. 2) being situated South 70 feet and West 300 feet from the southwest corner of Section 18, T. 3 S., R. 2 E., S.B.B. and M., being within the SE¼ SE¼ of Section 13, T. 3 S., R. 1 E., S.B.B. and M.; through the Bailiff West Spring Pipe Line,

(a) during the period between March first and November first of each year,

0.11 cubic foot per second--priority March 14, 1924,

from Spring No. 1, and

0.02 cubic foot per second--priority March 14, 1924,

from Spring No. 2,

or as much of said amounts as he directly applies to beneficial use for domestic and stock watering purposes and for the irrigation of his lands hereinafter described;

(b) during the period between November first of each year and March first of the succeeding year, a total of

0.025 cubic foot per second--priority March 14, 1924,

from either, or in part from each of said springs, or as much thereof as he directly applies to beneficial use for domestic and stock watering purposes;

(c) during the period between November first of each year and March first of the succeeding year, a total of

1.5 acre-feet per season--priority March 14, 1924,

from either, or in part from each of said springs, or as much thereof as he impounds in the Bailiff Reservoir located in the NE¼ SW¼ of Section 18, T. 3 S., R. 2 E., S.B.B. and M., and thereafter withdraws from said reservoir and applies to beneficial use for domestic and stock watering purposes and for the irrigation of his lands hereinafter described;

all of said water to be diverted at the above described springs, and used for domestic and stock watering purposes and for the irrigation of

10.0 acres of land in the NE¼ SW¼, Section 18, T. 3 S., R. 2 E., S.B.B. and M.

4. R. E. BAILIFF

is entitled to divert from the natural or developed flow of an unnamed spring situated approximately N. 70° 00' W., approximately 2330 feet distant from the southeast corner of Sec. 19, T. 3 S., R. 2 E., S.B.B. and M., being within the NE¼ SE¼ of said Sec. 19, through the Bailiff East Spring Pipe Line,

(a) during the period between March first and November first of each year,

0.05 cubic foot per second--priority April 24, 1924,

or as much thereof as he directly applies to beneficial use for domestic and stock watering purposes and for the irrigation of his lands hereinafter described;

(b) during the period between November first of each year and March first of the succeeding year,

0.025 cubic foot per second--priority April 24, 1924,

or as much thereof as he directly applies to beneficial use for domestic and stock watering purposes;

all of said water to be diverted at said spring and to be used upon the following described land:

7.0 acres in NW¼ NE¼, Sec. 19, T. 3 S., R. 2 E., S.B.B. and M.

5. THE BANNING HEIGHTS MUTUAL WATER COMPANY, THE BANNING WATER COMPANY AND THE SAN GORGONIO POWER COMPANY,

Calif. Electric Power Company, ~~et al~~ Fed. Power Com. Docket No. IT-6171

jointly, are entitled to divert from the natural flow of the South Fork of Whitewater River, through the Consolidated Reservoir and Power Company Canal, a total of

13.26 cubic feet per second--priority October 31, 1906,

or as much thereof as they apply to beneficial use for the purposes hereinafter set forth, throughout the entire year; said total quantity of water to be diverted from said South Fork of Whitewater River, all or in part, at any of the following described points.

(1) At a point on the East Branch of said South Fork of Whitewater River (designated on Division of Water Rights Map as Diversion 1) which bears approximately N. 26° 45' E., approximately 11,709 feet distant from the northeast corner of Sec. 1, T. 2 S., R. 1 E., S.B.B. and M., being within the SW¼ SE¼ of Sec. 19, T. 1 S., R. 2 E., S.B.B. and M.

(2) At a point on the West Branch of said South Fork of Whitewater River (designated on Division of Water Rights Map as Diversion 2) which bears approximately N. 11° 48' E., approximately

10,351 feet distant from the northeast corner of Sec. 1, T. 2 S., R. 1 E., S.B.B. and M., being within the NE¼ NW¼ of Sec. 30, T. 1 S., R. 2 E., S.B.B. and M.

(3) At a point on the Blackwheel Canyon Branch of the West Branch of said South Fork of Whitewater River (designated on Division of Water Rights Map as Diversion 3) which bears N. 12° 19½' E., approximately 9882 feet distant from the northeast corner of Sec. 1, T. 2 S., R. 1 E., S.B.B. and M., being within the NE¼ NW¼ of Sec. 30, T. 1 S., R. 2 E., S.B.B. and M.;

and said water to be used first by said San Gorgonio Power Company for the purpose of generating electric energy at two power plants, the upper of said plants being situated in the SW¼ NW¼ of Sec. 2, T. 2 S., R. 1 E., S.B.B. and M., and the lower of said plants being situated in the NE¼ NE¼ of Sec. 8, T. 2 S., R. 1 E., S.B.B. and M.; and said water to be used thereafter by said Banning Heights Mutual Water Company and by said Banning Water Company for the purpose of supplying water for domestic, stock watering and irrigation uses within the respective territories served by said companies as hereinafter described. During the winter months, at times when the entire quantity of water available under this right may not be required for direct application to use for domestic, stock watering and irrigation purposes as hereinabove provided for, the Banning Water Company is entitled to spread and store underground in San Gorgonio Canyon, above the mouth of said canyon in the SE¼ SE¼ of Sec. 33, T. 2 S., R. 1 E., S.B.B. and M., all surplus water available over and above the quantity required for direct application to use for domestic, stock watering and irrigation purposes;

provided, that all water so spread and stored is subsequently withdrawn from said underground storage and applied to beneficial use by said Banning Water Company as hereinafter provided in paragraph 7. The joint diversion and use of water under this right by said Banning Heights Mutual Water Company, said Banning Water Company, and said San Gorgonio

Power Company, is subject to the provisions of the following agreements and deeds:

(a) Agreement dated January 10, 1913, between the Consolidated Reservoir and Power Company and the Banning Water Company, recorded October 14, 1913, in Book No. 380 of Deeds, page 337 et seq., records of Riverside County, California.

(b) Instrument dated December 30, 1913, between the Consolidated Reservoir and Power Company and the Banning Heights Mutual Water Company, recorded December 14, 1922, in Book No. 561 of Deeds, page 543 et seq., records of Riverside County, California.

(c) Deed dated August 7, 1922, between the Consolidated Reservoir and Power Company and the San Gorgonio Power Company, recorded February 1, 1923, in Book No. 564 of Deeds, page 383 et seq., records of Riverside County, California.

The territory served by said Banning Heights Mutual Water Company includes approximately 1500 acres of land, situated within the following described parcels:

All of lots 1, 2, 3, 4, 5, 6, 7, 7A, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 22, 23, 24, 25, 26, 27, 28, 29, 30, 31, 32, 33, 34, 35, 36, 37, 38, 39, 40, 41, 42, 43, 44, 45, 46, 47, 48, 49, 50, 51, 52, 53, 54, 55, 55A, 55B, 56, 57, 57A, 58, 58A, 59, 60, 61, 62, 63, 64, 65, 66, 67, 68, 69, 70, 71, 72, 73, 74, 75, 76, 77, 78, 79, 80, 81, 82, 83, 84, 85, 86, 87, 88, 89 and 90 of the Banning Heights Subdivision, situate in Riverside County, California, as said lots are delineated on the "Map of Banning Heights" recorded in the office of the county recorder of Riverside County, California, in Book 9 of Maps, at pages 37 to 51 thereof.

60.0 acres in block 1 of the Ginzell-Montgomery Tract, situate in Riverside County, California, as said block is delineated on the map of said Ginzell-Montgomery Tract recorded in the office of the county recorder of Riverside County, California, in Book 8 of Maps,

at page 64 thereof.

48.0 acres in $S\frac{1}{2}$ $S\frac{1}{2}$, Sec. 5, T. 3 S., R. 1 E., S.B.B. and M.
10.0 acres in $S\frac{1}{2}$ $NW\frac{1}{4}$, Sec. 5, T. 3 S., R. 1 E., S.B.B. and M.
65.0 acres in $S\frac{1}{2}$ $S\frac{1}{2}$, Sec. 6, T. 3 S., R. 1 E., S.B.B. and M.

The territory served by said Banning Water Company includes approximately 3745 acres of land, situated within the following described parcels:

All of blocks 1, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 22, 23, 24, 25, $25\frac{1}{2}$, 27, 35, 36, 37, 38, 39, 40, 41, 42, 43, 44, 57, 58, 59, 60, 61, 62, 63, 64, 65, 66, 67, 68, 69, 70, 71, 72, 73, 74, 75, 76, 77, 78, 79, 80, 81, 82, 83, 84, 85, 86, 87, 88, 125, 129, 130, 131, 132, 133, 134, 135, 136, 137, 138, 139, 140, 141, 142, 143, 144, 145, 146, 147, 148, 149, 150, 151, 152, 153, 154, 155, 156, 157, 158, 159, 160, 161, 162, 163, 164, 165, 166, 167, 168, 169, 170, 171, 172, 173, 174, 175, 176, 177, 178, 179, 180, 181, 182, 183, 184; 2.1 acres in block 2; 0.7 acre in block $26\frac{1}{2}$; 0.8 acre in block $28\frac{1}{2}$; 0.7 acre in block $31\frac{1}{2}$; 2.0 acres in block 32; 1.0 acre in block $32\frac{1}{2}$; 3.3 acres in block 90; 8.0 acres in block 91; 6.5 acres in block 92; 7.1 acres in block 93; 8.7 acres in block 94; 8.5 acres in block 95; 8.4 acres in block 96; 4.8 acres in block 101; 4.3 acres in block 102; 3.0 acres in block 103; 2.9 acres in block 104; $E\frac{1}{2}$ of block 124; and $W\frac{1}{2}$ of block 126; all within the Banning Colony Subdivision, situate in Riverside County, California, as said blocks are delineated on the map entitled "Map of Part of Banning Colony Lands" recorded in the office of the county recorder of Riverside County, California, in Book 5 of Maps, at page 186 thereof.

All of blocks 1 to 20, both inclusive, of the San Jose Tract, situate in Riverside County, California, as said blocks are delineated on the map of said San Jose Tract recorded in the office of the county recorder of San Diego County, California, in Book 1 of Maps, at page 55 thereof.

recorder of San Diego County, California, in Book 14 of Maps, at

60.0 acres in Sec. 33, T. 2 S., R. 1 E., S.B.B. and M.
18.5 acres in E½ NE¼, Sec. 4, T. 3 S., R. 1 E., S.B.B. and M.
72.6 acres in S½ SW¼, Sec. 4, T. 3 S., R. 1 E., S.B.B. and M.
235.3 acres in N½, Sec. 8, T. 3 S., R. 1 E., S.B.B. and M.
3.8 acres in NE¼ SW¼, Sec. 8, T. 3 S., R. 1 E., S.B.B. and M.
40.0 acres in SW¼ SW¼, Sec.11, T. 3 S., R. 1 E., S.B.B. and M.
258.0 acres in W½, Sec.16, T. 3 S., R. 1 E., S.B.B. and M.
89.4 acres in NE¼, Sec.16, T. 3 S., R. 1 E., S.B.B. and M.
25.5 acres in NE¼ SE¼, Sec.16, T. 3 S., R. 1 E., S.B.B. and M.
10.5 acres in NE¼ NE¼, Sec.18, T. 3 S., R. 1 E., S.B.B. and M.

6. THE BANNING WATER COMPANY

is entitled to divert from the natural flow of San Gorgonio River and its tributaries, through its system of spreading ditches shown as diversion ditches numbered 1 to 7, both inclusive, on the "Map Showing System of the Banning Water Company in San Gorgonio Canyon," prepared by J. F. Davidson, Civil Engineer, and dated January, 1923.

20,000 acre-feet per annum--priority January 1, 1887,

or as much thereof as it spreads and stores underground in San Gorgonio Canyon; said quantity of water to be so diverted, spread and stored during the period from January first to December thirty-first of each year, both dates inclusive; provided, that said water is subsequently withdrawn from said underground storage and applied to beneficial use by said Banning Water Company as hereinafter provided in paragraph 7.

7. THE BANNING WATER COMPANY

is entitled to divert from the natural flow of San Gorgonio River, or from its underground storage in San Gorgonio Canyon as hereinabove provided for in paragraphs 5 and 6, or in part from both of said sources, through the Main Stone Lined Conduit of said Banning Water Company's System, and through the various ditches and pipe lines leading thereto hereinafter mentioned, a total of

14,000 acre-feet per annum--priority March 17, 1925,

or as much thereof as it directly applies to beneficial use for the purpose of supplying water for domestic, stock watering and irrigation uses within the territory served by said company as hereinabove described in paragraph 5, for the purpose of supplying water for domestic and

municipal uses within the city of Banning, Riverside County, California, and for the purpose of driving water wheels connected with pumps at pumping plants of said company located in said San Gorgonio Canyon between the west line of Section 3, T. 2 S., R. 1 E., S.B.B. and M. and the east line of Section 33, T. 2 S., R. 1 E., S.B.B. and M.; said total quantity of water to be diverted from said sources, all or in part, at any of the following described points:

(a) At the upper intake of said Stone Lined Conduit situated at a point which bears approximately N. 35° 10' E., approximately 720 feet distant from the southwest corner of Sec. 4, T. 2 S., R. 1 E., S.B.B. and M., being within the SW¼ SW¼ of said Sec. 4,

(b) At the intake of a ditch leading to said Stone Lined Conduit and known as Diversion Ditch No. 11, situated at a point which bears approximately N. 51° 24' E., approximately 1424 feet distant from the southwest corner of Sec. 17, T. 2 S., R. 1 E., S.B.B. and M., being within the SW¼ SW¼ of said Sec. 17,

(c) At the lower intake of said Stone Lined Conduit situated at a point which bears approximately S. 86° 03' E., approximately 1232 feet distant from the northwest corner of Sec. 20, T. 2 S., R. 1 E., S.B.B. and M., being within the NW¼ NW¼ of said Sec. 20,

(d) At the intake of a twenty-inch pipe line leading to said Stone Lined Conduit, situated at a point which bears approximately N. 15° 34' W., approximately 3200 feet distant from the southeast corner of Sec. 29, T. 2 S., R. 1 E., S.B.B. and M., being within the SE¼ NE¼ of said Sec. 29,

(e) At the intake of a twelve-inch pipe line leading to said twenty-inch pipe line, situated at a point which bears approximately N. 11° 30' W., approximately 3188 feet distant from the southeast corner of Sec. 29, T. 2 S., R. 1 E., S.B.B. and M., being within the SE¼ NE¼ of said Sec. 29,

(f) At the intake of a ten-inch pipe line leading to said

Stone Lined Conduit, situated at a point which bears approximately N. 45° 45' W., approximately 2538 feet distant from the southeast corner of Sec. 33, T. 2 S., R. 1 E., S.B.B. and M., being within the NW¼ SE¼ of said Sec. 33,

(g) At the intake of an iron flume leading to said Stone Lined Conduit, situated at a point which bears approximately N. 8° 05' W., approximately 1165 feet distant from the southeast corner of Sec. 33, T. 2 S., R. 1 E., S.B.B. and M., being within the SE¼ SE¼ of said Sec. 33,

(h) At the intake of a short stone lined ditch leading to said iron flume, situated at a point which bears approximately N. 15° 49' W., approximately 1659 feet distant from the southeast corner of Sec. 33, T. 2 S., R. 1 E., S.B.B. and M., being within the NE¼ SE¼ of said Sec. 33;

and said total quantity of water to be diverted at such times and at such rates throughout the year as may be necessary in order that said Banning Water Company may adequately supply the requirements of water for domestic, stock watering and irrigation purposes within the territory which it serves as hereinabove described in paragraph 5, and the requirements of water for domestic and municipal purposes within the city of Banning.

8. DONALD M. BEDWELL

is entitled to divert from the natural or developed flow of Thousand Palms Canyon Creek through the Bedwell and Richey Ditch and pipe line,

0.35 cubic foot per second--priority January 31, 1913,

or as much thereof as he directly applies to beneficial use for the purposes hereinafter set forth, throughout the entire year; said water to be diverted from said Thousand Palms Canyon Creek at a point (designated on Division of Water Rights Map as Diversion 63) which bears approximately S. 77° 11' E., approximately 2345 feet distant from the west quarter corner of Sec. 12, T. 4 S., R. 6 E., S.B.B. and M., being within

the NE¼ SW¼ of said Sec. 12, and said water to be used for domestic and stock watering purposes and for the irrigation of

40.0 acres of land in the N½ Sec. 22, T. 4 S., R. 6 E., S.B.B. and M.

9. THE CABAZON WATER COMPANY

is entitled to divert from the natural flow of Millard Creek, through the Cabazon Water Company Conduit,

4.67 cubic feet per second--priority January 1, 1835,
2.50 cubic feet per second--priority July 22, 1915,
7.17 cubic feet per second--Total,

or as much thereof as said company directly applies to beneficial use for the purposes hereinafter set forth, throughout the entire year; said water to be diverted from said Millard Creek at a point (designated on Division of Water Rights Map as Diversion 27) situated approximately 272 feet southwesterly from a point which bears approximately S. 0° 15' W., approximately 510.5 feet distant from the east quarter corner of Sec. 20, T. 2 S., R. 2 E., S.B.B. and M., being within the NE¼ SE¼ of said Sec. 20; and said water to be used by said Cabazon Water Company for the purpose of supplying water for domestic, stock watering and irrigation purposes within the territory served by said company, which territory includes approximately 2560 acres of land, situated within the following described parcels:

NW¼ of Sec. 5, T. 3 S., R. 2 E., S.B.B. and M.
S½ of Sec. 5, T. 3 S., R. 2 E., S.B.B. and M.
W½ NE¼ of Sec. 5, T. 3 S., R. 2 E., S.B.B. and M.
All of Sec.15, T. 3 S., R. 2 E., S.B.B. and M.
All of Sec.16, T. 3 S., R. 2 E., S.B.B. and M., except that portion of said section occupied by the right of way of the Southern Pacific Railroad Company.
All of Sec.17, T. 3 S., R. 2 E., S.B.B. and M., except that portion of said section occupied by the right of way of theSouthern Pacific Railroad Company.
N½ NW¼ of Sec. 21, T. 3 S., R. 2 E., S.B.B. and M.

10. THE COACHELLA VALLEY COUNTY WATER DISTRICT

will be entitled to divert from the natural flow of Whitewater River by means of its spreading dams, ditches and other spreading works, all situated along the channel of said Whitewater River east of the west

line of Secs. 20 and 29, T. 3 S., R. 4 E., S.B.B. and M., and west of the west line of Secs. 30 and 31, T. 3 S., R. 5 E.,

80,000 acre-feet per annum--priority October 25, 1918,

or as much thereof as it spreads and stores underground in the basin underlying Coachella Valley, situate in Riverside County, California; said quantity of water to be so diverted, spread and stored during the period between January first and December thirty-first of each year, both dates inclusive; provided, that said water is subsequently withdrawn from said underground storage by the inhabitants of said Coachella Valley and applied by said inhabitants to beneficial use for domestic, stock watering, municipal and industrial purposes and for the irrigation of 25,000 acres of land lying within the 195,000-acre area included within the confines of the yellow border line on Coachella Valley County Water District Map No. 2 dated September, 1918, and filed by said Coachella Valley County Water District with the state water commission with its Application 1122, and which map is now on file and of record in the office of the Division of Water Resources of the Department of Public Works of the State of California; and provided, further, that prior to July 1, 1943, said Coachella Valley County Water District shall have completed the above appropriation and applied said water to beneficial use in accordance with the terms of the Division of Water Rights Permit 536, and shall have submitted evidence of such completed appropriation and use to this court. Upon receipt of such evidence of such completed appropriation and use, this court will act thereupon as provided in section 36f of the Water Commission Act, and in accordance with said evidence will enter a supplemental decree determining and establishing the right by appropriation specified in this paragraph, insofar as the same shall have been completed.

11. THE COACHELLA VALLEY COUNTY WATER DISTRICT

will be entitled to divert from the natural flows of Whitewater River, Snow Creek, Falls Creek, Tahquitz Creek, Andreas Creek, Murray Creek, and Palm Canyon Creek, by means of spreading dams, ditches

and other spreading works,

20,000 acre-feet per annum from Whitewater River,
8,000 acre-feet per annum from Snow Creek,
2,000 acre-feet per annum from Falls Creek,
5,000 acre-feet per annum from Tahquitz Creek,
1,000 acre-feet per annum from Andreas Creek,
1,000 acre-feet per annum from Murray Creek,
2,000 acre-feet per annum from Palm Canyon Creek,

39,000 acre-feet per annum--Total--priority July 8, 1922,

or as much of said quantities of water as it spreads and stores underground in the basin underlying Coachella Valley, situate in Riverside County, California; said quantities of water to be diverted from said streams at the respective points described as follows:

(1) From Whitewater River at a point situated approximately 3450 feet south and approximately 1750 feet east from the south quarter corner of Sec. 2, T. 3 S., R. 3 E., S.B.B. and M.; being within the NE¼ SE¼ of Sec. 11, T. 3 S., R. 3 E., S.B.B. and M.;

(2) From Snow Creek at a point situated approximately 3645 feet north and approximately 2115 feet east from the section corner common to Secs. 20, 21, 28 and 29, T. 3 S., R. 3 E., S.B.B. and M., being within the SE¼ NW¼ of Sec. 21, T. 3 S., R. 3 E., S.B.B. and M.;

(3) From Falls Creek at a point situated approximately 1280 feet south and approximately 1110 feet east from the south quarter corner of Sec. 28, T. 3 S., R. 3 E., S.B.B. and M., being within the NW¼ NE¼ of Sec. 33, T. 3 S., R. 3 E., S.B.B. and M.;

(4) From Tahquitz Creek at a point situated approximately 2130 feet south and approximately 2950 feet west from the section corner common to Secs. 14, 15, 22 and 23, T. 4 S., R. 4 E., S.B.B. and M., being within the SE¼ NW¼ of Sec. 22, T. 4 S., R. 4 E., S.B.B. and M.;

(5) From Andreas Creek at a point situated approximately 3440 feet north and approximately 255 feet east from the west quarter corner of Sec. 11, T. 5 S., R. 4 E., S.B.B. and M., being within the SW¼ SW¼ of Sec. 2, T. 5 S., R. 4 E., S.B.B. and M.;

(6) From Murray Creek at a point situated approximately 690 feet north and approximately 75 feet east from the west quarter corner of Sec. 11, T. 5 S., R. 4 E., S.B.B. and M., being within the SW¼ NW¼ of said Sec. 11;

(7) From Palm Canyon Creek at a point situated approximately 1330 feet south and approximately 3400 feet east from the west quarter corner of Sec. 11, T. 5 S., R. 4 E., S.B.B. and M., being within the SW¼ SE¼ of said Sec. 11;

said quantities of water to be so diverted, spread and stored during the period between January first and December thirty-first of each year, both dates inclusive; provided, that said water is subsequently withdrawn from said underground storage by the inhabitants of said Coachella Valley and applied by said inhabitants to beneficial use for domestic, stockwatering, municipal and industrial purposes and for the irrigation of 25,000 acres of land lying within the 195,000-acre area included within the confines of the yellow border line on Coachella Valley County Water District Map No. 2, dated September, 1918, and filed by said Coachella Valley County Water District with the State Water Commission with its Application 1122, and which map is now on file and of record in the office of the Division of Water Resources of the Department of Public Works of the State of California; and provided, further, that prior to July 1, 1943, said Coachella Valley County Water District shall have completed the above appropriation and applied said water to beneficial use in accordance with the terms of Division of Water Rights Permit 3011, and shall have submitted evidence of such completed appropriation and use to this court. Upon receipt of such evidence of such completed appropriation and use, this court will act thereupon as provided in section 36f of the Water Commission Act, and in accordance with said evidence will enter a supplemental decree determining and establishing the right by appropriation specified in this paragraph, insofar as the same shall have been completed; and provided, finally, that the rights of the Coachella Valley County Water

District as set forth in this paragraph are subsequent in right to the water rights of the Palm Valley Water Company under Division of Water Resources Permit 3503 issued on Application 4752, to the extent of one and one-half (1.50) cubic feet per second, all as stipulated and agreed to in that certain stipulation and agreement between the Coachella Valley County Water District and Palm Valley Water Company dated February 21, 1929, and on file and of record in these proceedings.

12. NELLIE N. COFFMAN, CORNELIA B. WHITE, FLORILLA M. WHITE, LAVINA F. CROCKER, HELEN COFFMAN, PEARL McCALLUM McMANUS, ISABEL WHITE CHASE, GEORGE WELLWOOD MURRAY, T. L. DOUGLAS, C. A. ABBOTT, AND CHARLES POWERS,

jointly, are entitled to divert from the natural flow of Tahquitz Creek, through the Agua Caliente Ditch,

1.36 cubic feet per second--priority April 26, 1884,

or as much thereof as they directly apply to beneficial use for the purpose hereinafter set forth, throughout the entire year; said water to be diverted from said Tahquitz Creek at a point (designated on Division of Water Rights Map as Diversion 61) which bears approximately S. 49° 30' W., approximately 5400 feet distant from the northeast corner of Sec. 22, T. 4 S., R. 4 E., S.B.B. and M., being within the NW¼ SW¼ of said Sec. 22, and said water to be used for the irrigation of the respective lands of said parties as follows:

Nellie N. Coffman:

2.6 acres in a parcel bounded as follows: Beginning at the northwesterly corner of Spring Street and Main Avenue in the town of Palm Springs, Riverside County, California; thence west along the northerly line of Spring Street 290.4 feet; thence at right angles northerly 355.0 feet; thence at right angles easterly 290.4 feet to westerly boundary line of Main Avenue; thence southerly along said westerly boundary of Main Avenue 355.0 feet to point of beginning.

0.6 acre in lots 22, 23 and 24 of block 8 of said town of Palm Springs.

6.9 acres in blocks 1, 6 and 8 of said town of Palm Springs bounded as follows: Beginning at a point in block 8 where the westerly side of the Whitewater or Palm Valley Water Company's Ditch intersects a line 150.0 feet north of and parallel with the north line of Park Street; thence N. 30° 58' W., 327.0 feet; thence N. 0° 23' W., 174.0 feet;

thence west 40.0 feet; thence N. 0° 08' W., 103.0 feet; thence S. 79° 10' W., 335.7 feet; thence S. 84° 08' W., 217.0 feet; thence S. 3° 40' E., 264.25 feet; thence N. 89° 50' E., 60.0 feet; thence S. 0° 08' E., 210.0 feet; thence N. 89° 50' E., 678.3 feet to point of beginning.

1.7 acres in lots 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 32, 33, 34, 35 and 36, all in Block 20 of said town of Palm Springs.

0.4 acre in block 27 of said town of Palm Springs bounded as follows: Beginning at the southwest corner of said block; thence northerly on the easterly line of Main Avenue 100.0 feet; thence at right angles easterly and parallel with Park Street 145.0 feet; thence at right angles southerly 100.0 feet to northerly line of Park Street; thence westerly 145.0 feet to point of beginning.

12.2 acres--Total.

Cornelia B. White:

4.0 acres constituting all of block 27 of said town of Palm Springs, except the parcel last above described under Nellie N. Coffmen, and except a parcel 80.0 feet square situate in the northwest corner of said block.

4.0 acres--Total.

Cornelia B. White and Florilla M. White:

4.1 acres constituting all of block 26 of said town of Palm Springs, except lots 1, 2, 3 and 4 thereof, and except a rectangular parcel having a frontage of 50.0 feet on Main Avenue, a depth of 100.0 feet, and situate south and contiguous to lot 4 of said block.

4.1 acres--Total.

Lavina F. Crocker:

1.6 acres in a parcel bounded as follows: Beginning at a point on the northerly line of Spring Street in said town of Palm Springs, 290.4 feet westerly from the northwest corner of Spring Street and Main Avenue; thence westerly along the said line of Spring Street 323.5 feet; thence N. 0° 08' W., 204.0 feet; thence N. 89° 50' E., 323.5 feet; thence S. 0° 08' E., 204.0 feet to point of beginning; said description containing within its boundaries lots 9 to 20, both inclusive, of block 14 of said town of Palm Springs.

1.6 acres--Total.

Helen Coffman:

0.3 acre in lots 1, 2 and 3 of block 8 of said town of Palm Springs.

0.3 acre--Total.

Pearl McCallum McManus:

3.7 acres in lots 1, 2, 3 and 4 of block 1;
10.4 acres in lots 1, 2, 3 and 4 of block 2,
0.6 acre in lots 22, 23 and 24 of block 7,
2.2 acres in lots 4 to 9, both inclusive, and lots 14 to 21, both inclusive, of block 8,
2.6 acres in lots 1 to 16, both inclusive and lots 26 to 28, both inclusive, of block 15,
0.3 acre in lots 11 and 12 of block 16,
0.6 acre in lots 9 to 12, both inclusive, of block 19,
1.5 acres in lots 1 to 12, both inclusive, of block 20, all in said town of Palm Springs.

21.9 acres--Total.

Isabel White Chase:

1.1 acres constituting the west 250 feet of lot 4 of block 1 of said town of Palm Springs.

1.1 acres--Total.

George Wellwood Murray:

0.2 acre constituting a parcel of land 30.0 feet square situate in the northwest corner of block 27 of said town of Palm Springs.

0.2 acre--Total.

T. L. Douglas:

0.6 acre constituting the east 150 feet of lot 1 of block 2 of said town of Palm Springs.

0.6 acre--Total.

C. A. Abbott:

1.9 acres constituting the east 250 feet of lots 3 and 4 of block 2 of said town of Palm Springs.

1.9 acres--Total.

Charles Powers:

1.0 acre in lots 1, 2, 3, 4 and 5 of block 5 of said town of Palm Springs.

1.0 acre--Total.

The joint diversion and use of water under this right by the parties hereinabove enumerated is subject to the provisions of that certain agreement dated February 10, 1911, between the United States of America (Indian Service) and George Wellwood Murray, et al., recorded March 11, 1911, in Book No. 325 of Deeds, page 260 et seq., records of Riverside County, California.

13. NELLIE N. COFFMAN, PRESCOTT T. STEVENS, ZADDIE R. BUNKER, J. A. GRAY, PEARL McCALLUM McMANUS, LAVINA F. CROCKER, HELEN COFFMAN, GEORGE WELLWOOD MURRAY, TRUSTEES OF PALM SPRINGS PRESBYTERIAN CHURCH,

CORNELIA B. WHITE, FLORILLA M. WHITE, OWEN EARL COFFMAN AND GEORGE B. ROBERSON,

jointly, are entitled to divert from the natural flow of Whitewater River, through the Palm Valley Water Company System (later known as the "Stevens Pipe Line"),

1.60 cubic feet per second--priority November 11, 1884,

or as much thereof as they directly apply to beneficial use for the purpose hereinafter set forth, throughout the entire year; said water to be diverted from said Whitewater River, all or in part, through any of the following described works:

(1) Through the main intake ditch leading to the "Stevens Pipe Line," the head of which ditch is situated at a point which bears approximately S. 84° 30' E., approximately 440 feet distent from the northwest corner of lot 2 of Sec. 2, T. 3 S., R. 3 E., S.B.B. and M., being within said lot 2,

(2) Through Infiltration Pipe Line "A" as shown on the map prepared by Davidson and Fulmor, Engineers, dated April, 1927, and entitled "Map Showing the Prescott T. Stevens Intake and Infiltration Pipe Lines from Whitewater River, Riverside County, Cal.," the head of which pipe line is situated approximately 727 feet due east of the northwest corner of lot 2 of Sec. 2, T. 3 S., R. 3 E., S.B.B. and M., and approximately on the north line of said Sec. 2,

(3) Through Infiltration Pipe Line "B" as shown on said map prepared by Davidson and Fulmor, the head of which pipe line is situated approximately 122 feet due east of the northwest corner of lot 2 of Sec. 2, T. 3 S., R. 3 E., S.B.B. and M., and approximately on the north line of said Sec. 2,

(4) Through Infiltration Pipe Line "C" as shown on said map prepared by Davidson and Fulmor, the head of which pipe line is situated at a point which bears approximately S. 62° 15' W.,

approximately 278 feet distant from the northeast corner of lot 3 of Sec. 2, T. 3 S., R. 3 E., S.B.B. and M., being within said lot 3; and said water to be used for the irrigation of the respective lands of said parties as follows:

Nellie N. Coffman

13.2 acres in a parcel bounded as follows: Beginning at the intersection of the center line of Main Avenue and Spring Street in the town of Palm Springs, Riverside County, California; thence northerly along the center line of Main Avenue 453.0 feet; thence westerly at right angles to said center line 330.4 feet; thence at right angles northerly 146.0 feet; thence easterly at right angles 330.4 feet to center line of said Main Avenue; thence northerly along said center line 38.0 feet; thence at right angles westerly 618.88 feet; thence at right angles northerly 200.0 feet; thence at right angles westerly 491.12 feet to Palm Valley Water Company Ditch; thence southerly along line of said ditch 600 feet more or less to a point on said ditch 237.0 feet northerly of the center line of said Spring Street; thence easterly and parallel with the center line of Spring Street 669.6 feet, more or less, to a point 330.4 feet westerly from the center line of Main Avenue; thence at right angles southerly 237.0 feet to center line of said Spring Street; thence easterly along said center line of Spring Street 330.4 feet to point of beginning.

0.4 acre in block 27 of said town of Palm Springs bounded as follows: Beginning at the southwest corner of said block; thence northerly on the easterly line of Main Avenue 100.0 feet; thence at right angles easterly and parallel with Park Street 145.0 feet; thence at right angles southerly 100.0 feet to northerly line of Park Street; thence westerly 145.0 feet to point of beginning.

1.7 acres in lots 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 32, 33, 34, 35 and 36, all in block 20 of said town of Palm Springs.

0.6 acre in lots 22, 23 and 24 of block 8 of said town of Palm Springs.

6.9 acres in blocks 1, 6 and 8 of said town of Palm Springs bounded as follows: Beginning at a point in block 8 where the westerly side of the Whitewater or Palm Valley Water Company's Ditch intersects a line 150.0 feet north of and parallel with the north line of Park Street; thence N. 30° 58' W., 327.0 feet; thence N. 0° 23' W., 174.0 feet; thence west 40.0 feet; thence N. 0° 08' W., 103.0 feet; thence S. 79° 10' W., 335.7 feet; thence S. 84° 08' W., 217.0 feet; thence S. 3° 40' E., 264.25 feet; thence N. 89° 50' E., 60.0 feet; thence S. 0° 08' E., 210.0 feet; thence N. 89° 50' E., 678.3 feet, to point of beginning.

22.8--Total.

Prescott T. Stevens:

7.0 acres in SW¼ NE¼ NE¼ of Sec. 15, T. 4 S., R. 4 E., S.B.B.and M.

7.0 acres--Total.

Zeddie R. Bunker:

1.0 acre in $SE\frac{1}{4}$ $NE\frac{1}{4}$ of Sec. 15, T. 4 S., R. 4 E., S.B.B. and M.

1.0 acre--Total.

J. A. Gray:

1.3 acres in $SE\frac{1}{4}$ $NE\frac{1}{4}$ of Sec. 15, T. 4 S., R. 4 E., S.B.B. and M.

1.3 acres--Total.

Pearl McCallum McManus:

16.2 acres in $E\frac{1}{2}$ $SE\frac{1}{4}$ of Sec. 15, T. 4 S., R. 4 E., S.B.B. and M.

16.2 acres--Total.

Lavina F. Crocker

1.6 acres in a parcel bounded as follows: Beginning at a point on the northerly line of Spring Street in said town of Palm Springs, 290.4 feet westerly from the northwest corner of Spring Street and Main Avenue; thence westerly along the said line of Spring Street 323.5 feet; thence N. 0° 08' W., 204.0 feet; thence N. 89° 50' E., 323.5 feet; thence S. 0° 08' E., 204.0 feet to point of beginning; said description containing within its boundaries lots 9 to 20, both inclusive, of block 14 of said town of Palm Springs.

1.6 acres--Total.

Helen Coffmen:

0.3 acre in lots 1, 2 and 3 of block 8 of said town of Palm Springs.

0.3 acre--Total.

George Wellwood Murray:

0.2 acre constituting a parcel of land 80.0 feet square situate in the northwest corner of block 27 of said town of Palm Springs.

0.2 acre--Total.

Trustees of Palm Springs Presbyterian Church:

0.4 acre constituting a rectangular parcel of land in the northwest corner of block 26 of said town of Palm Springs.

0.4 acre--Total.

Cornelia B. White:

4.0 acres in block 27 of said town of Palm Springs.

4.0 acres--Total.

Cornelia B. White and Florilla M. White:

4.1 acres in block 26 of said town of Palm Springs.

4.1 acres--Total.

Owen Earl Coffman:

0.5 acre in a parcel bounded as follows: Beginning at a point 470.0 feet westerly from the westerly line of Main Avenue in said town of Palm Springs and 604.0 feet northerly from the northerly property line of Spring Street; thence N. 0° 08' W., 200.0 feet; thence westerly at right angles 108.88 feet; thence at right angles southerly 200.0 feet; thence easterly at right angles 108.88 feet to point of beginning.

0.5 acre--Total.

George B. Roberson:

0.4 acre in a parcel bounded as follows: Beginning at a point on the westerly property line of Main Avenue 566.0 feet northerly of the northerly property line of Spring Street in said town of Palm Springs; thence at right angles westerly to said line of Main Avenue 290.4 feet; thence at right angles southerly 61.0 feet; thence at right angles easterly 290.4 feet to the westerly property line of Main Avenue; thence northerly 61.0 feet to point of beginning.

0.4 acre--Total

provided, however, that the lands described in this paragraph to which the water right hereinabove provided from Tahquitz Creek, by paragraph 12, is also appurtenant, shall only be entitled to water from Whitewater River under this right at such times and to such extent as the water supply available from Tahquitz Creek under the right provided in paragraph 12 may be inadequate for the irrigation of said lands. The joint diversion and use of water under this right by the parties hereinabove enumerated is subject to the provisions of that certain stipulation dated March 17, 1926, between said parties in this paragraph hereinabove enumerated, on the one part, and the Banning Water Company, Banning Heights Mutual Water Company and San Gorgonio Power Company on the other part, which stipulation is on file and of record in these proceedings, and by the terms of which stipulation said parties in this paragraph hereinabove enumerated recognize that said Banning Water Company, Banning Heights Mutual Water Company and San Gorgonio Power Company are the owners of the

paramount right to divert water from the South Fork of Whitewater River through the Consolidated Reservoir and Power Company Canal as hereinbefore set forth in paragraph 5, regardless of the fact that the priority of said right set forth in said paragreph 5 is subsequent to the priority of the right of said parties in this paragraph hereinabove enumerated, as set forth in this paragraph.

14. W. V. COVINGTON

is entitled to divert from the natural flow of Lower Big Morongo Creek, through the Covington West Ditch,

0.14 cubic foot per second--priority January 1, 1873,

or as much thereof as he directly applies to beneficial use for the purposes hereinafter set forth, throughout the entire year; said water to be diverted from said Lower Big Morongo Creek at a point (designated on Division of Water Rights Map as Diversion 55) which bears approximately N. 56° 30' W., approximately 2410 feet distant from the southeast corner of Sec. 28, T. 1 S., R. 4 E., S.B.B. and M., being within the NW¼ SE¼ of said Sec. 28, and said water to be used for domestic and stock watering purposes and for the irrigation of the following described land:

3.5 acres in SW¼ SE¼, Sec. 28, T. 1 S., R. 4 E., S.B.B. and M.

15. W. V. COVINGTON

is entitled to divert from the natural flow of an unnamed stream rising in a meadow in Lower Big Morongo Wash, through the Covington East Ditch,

0.50 cubic foot per second--priority January 1, 1873,

or as much thereof as he directly applies to beneficial use for the purposes hereinafter set forth, throughout the entire year; said water to be diverted from said unnamed stream at a point (designated on Division of Water Rights Map as Diversion 56) which bears approximately N. 38° 00' W., approximately 2030 feet distant from the southeast corner of Sec. 28, T. 1 S., R. 4 E., S.B.B. and M., being within the NE¼ SE¼ of said Sec. 28, and said water to be used for domestic and stock watering purposes and

for the irrigation of the following described land:

13.7 acres in SW¼ SE¼, Sec. 28, T. 1 S., R. 4 E., S.B.B. and M.

16. W. V. COVINGTON

is entitled to divert from the natural flow of an unnamed stream rising in a meadow in Lower Big Morongo Wash, by means of a series of dykes and short spreading ditches,

0.74 cubic foot per second--priority January 1, 1973,

or as much thereof as he directly applies to beneficial use for the purposes hereinafter set forth, throughout the entire year; said water to be diverted from said unnamed stream between the head of the Covington East Ditch, as hereinabove described in the preceding paragraph, and the point where said unnamed stream crosses the south boundary line of the NE¼ of Sec. 33, T. 1 S., R. 4 E., S.B.B. and M., and said water to be used for stock watering purposes and for the irrigation of the following described lands:

35.0 acres in SE¼, Sec. 28, T. 1 S., R. 4 E., S.B.B. and M.
30.0 acres in E½ NE¼, Sec. 33, T. 1 S., R. 4 E., S.B.B. and M.

65.0 acres--Total.

17. WALTER O. EDWARDS

is entitled to divert from the natural or developed flow of Jensen's Spring, through the Jensen West Pipe Line,

0.06 cubic foot per second--priority June 17, 1911,

or as much thereof as he directly applies to beneficial use for the purposes hereinafter set forth, throughout the entire year; said water to be diverted from said spring at a point (designated on Division of Water Rights Map as Diversion 34) which bears approximately S. 29° 30' W., approximately 2930 feet distant from the southeast corner of the NE¼ of Sec. 22, T. 3 S., R. 2 E., S.B.B. and M., being within Lot 11 of said Sec. 22, and said water to be used for domestic and stock watering purposes and for the irrigation of the following described land:

5.0 acres in SW¼ NE¼, Sec. 22, T. 3 S., R. 2 E., S.B.B. and M.

18. WALTER O. EDWARDS

is entitled to divert from the natural or developed flow of Jensen's Creek, through the Jenson East Pipe Line,

0.60 cubic foot per second--priority October 23, 1913,

or as much thereof as he directly applies to beneficial use for the purposes hereinafter set forth throughout the entire year; said water to be diverted from said Jensen's Creek at a point (designated on Division of Water Rights Map as Diversion 35) which bears approximately S. 28° 30' E., approximately 3100 feet distant from the southwest corner of the NW¼ of Sec. 23, T. 3 S., R. 2 E., S.B.B. and M., being within Lot 11 of said Sec. 23, and said water to be used for domestic and stock watering purposes and for the irrigation of approximately 50 acres of land within the following described tracts:

S½ NE¼, Sec. 22, T. 3 S., R. 2 E., S.B.B. and M.
Lot 8 of Sec. 22, T. 3 S., R. 2 E., S.B.B. and M.
Lot 8 of Sec. 23, T. 3 S., R. 2 E., S.B.B. and M.

19. ANNIE B. FICK

is entitled to divert from the natural or developed flow of an unnamed spring (designated on Division of Water Rights Map as Diversion 5) situated approximately N. 35° 00' W., approximately 1000 feet distant from the east quarter corner of Sec. 5, T. 2 S., R. 1 E., S.B.B. and M., being within the SE¼ NE¼ of said Sec. 5, through the Fick East Pipe Line,

(a) during the period between March first and November first of each year,

0.07 cubic foot per second--priority July 31, 1913,

or as much thereof as she directly applies to beneficial use for domestic and stock watering purposes and for the irrigation of her lands hereinafter described;

(b) during the period between November first of each year and March first of the succeeding year,

0.025 cubic foot per second--priority July 31, 1913,

or as much thereof as she directly applies to beneficial use for

0.10 cubic foot per second--priority March 1, 1869,
0.09 cubic foot per second--priority March 1, 1882,
0.06 cubic foot per second--priority March 1, 1892,

0.25 cubic foot per second--Total,

or as much thereof as said company directly applies to beneficial use for domestic and stock watering purposes and for the irrigation of its lands hereinafter described,

(b) during the period between November first of each year and March first of the succeeding year,

0.025 cubic foot per second--priority March 1, 1869,

or as much thereof as said company directly applies to beneficial use for domestic and stock watering purposes;

all of said water to be diverted at a point (designated on Division of Water Rights Map as Diversion 11) which bears approximately S. 76° 30' W., approximately 1860 feet distant from the east quarter corner of Sec. 5, T. 3 S., R. 1 E., S.B.B. and M., being within the NW¼ SE¼ of said Sec. 5, and all of said water to be used upon the following described land:

24.0 acres in SE¼ SE¼, Sec. 5, T. 3 S., R. 1 E., S.B.B. and M.

22. THE GILMAN HOME COMPANY

is entitled to divert from the natural flow of the stream flowing in Gilman Canyon No. 2, through an unnamed pipe line,

0.125 cubic foot per second--priority March 1, 1892,

or as much thereof as said company directly applies to beneficial use for the purpose hereinafter set forth during the period between March first and November first of each year; said water to be diverted at a point (designated on Division of Water Rights Map as Diversion 12) which bears approximately N. 85° 00' W., approximately 1420 feet distant from the east quarter corner of Sec. 5, T. 3 S., R. 1 E., S.B.B. and M., being within the SW¼ NE¼ of said Sec. 5 and said water to be used for the irrigation of the following described lands:

2.0 acres in NE¼ SE¼, Sec. 5, T. 3 S., R. 1 E., S.B.B. and M.
10.0 acres in SW¼ SE¼, Sec. 5, T. 3 S., R. 1 E., S.B.B. and M.

12.0 acres--Total.

23. THE GILMAN HOME COMPANY

is entitled to divert from the natural flow of the stream flowing in Gilman Canyon No. 3, through an unnamed pipe line,

0.25 cubic foot per second--priority March 1, 1891,

or as much thereof as said company directly applies to beneficial use for the purpose hereinafter set forth, during the period between March first and November first of each year; said water to be diverted to a point (designated on Division of Water Rights Map as Diversion 13) which bears approximately N. 52° 30' W., approximately 970 feet distant from the east quarter corner of Sec. 5, T. 3 S., R. 1 E., S.B.B. and M., being within the SE¼ NE¼ of said Sec. 5, and said water to be used for the irrigation of the following described land:

24.0 acres in NW¼ NE¼, Sec. 8, T. 3 S., R. 1 E., S.B.B. and M.

24. GEORGE R. HICKS

is entitled to divert from the natural flow of Upper Little Morongo Creek, through the Hicks Pipe Line Ditch,

(a) during the period between March first and November first of each year,

2.50 cubic feet per second--priority April 24, 1917,

or as much thereof as he directly applies to beneficial use for domestic and stock watering purposes and for the irrigation of the lands hereinafter described in this paragraph;

(b) during the period between November first of each year and March first of the succeeding year,

0.50 cubic foot per second--priority April 24, 1917,

or as much thereof as he directly applies to beneficial use for domestic and stock watering purposes;

all of said water to be diverted at a point (designated on Division of

Water Rights Map as Diversion 57) which bears approximately N. 30° 00' E., approximately 3600 feet distant from the southwest corner of Sec. 2, T. 1 S., R. 4 E., S.B.B. and M., being within the SE¼ NW¼ of said Sec. 2, and all of said water to be used upon the following described lands;

160.0 acres in SE¼ Sec. 12, T. 1 S., R. 4 E., S.B.B. and M.
80.0 acres in N½ SE¼, Sec. 14, T. 1 S., R. 4 E., S.B.B. and M.
240.0 acres--Total.

25. GERTRUDE C. HITTSON

is entitled to divert from the natural or developed flow of Thousand Palms Canyon Creek through the Bedwell and Richey Ditch and Pipe Line,

0.35 cubic foot per second priority January 31, 1913, or as much thereof as she directly applies to beneficial use for the purposes hereinafter set forth, throughout the entire year; said water to be diverted from said Thousand Palms Canyon Creek at a point (designated on Division of Water Rights Map as Diversion 63) which bears approximately S. 77° 11' E., approximately 2345 feet distant from the west quarter corner of Sec. 12, T. 4 S., R. 6 E., S.B.B. and M., being within the NE¼ SW¼ of said Sec. 12, and said water to be used for domestic and stock watering purposes and for the irrigation of

40.0 acres of land in the S½ Sec. 22, T. 4 S., R. 6 E., S.B.B. and M.

26. MARSHALL G. JOST

is entitled to divert from the natural or developed flow of an unnamed spring situated in Dunlap Canyon at a point which bears approximately N. 14° 30' E., approximately 125 feet distant from the west quarter corner of Sec. 32, T. 2 S., R. 1 E., S.B.B. and M., being within the SW¼ NW¼ of said Sec. 32, through the Marshall Jost Pipe Line,

0.04 cubic foot per second--priority July 31, 1900, or as much thereof as he directly applies to beneficial use for the purpose hereinafter set forth, throughout the entire year; said water to be diverted at said spring and to be used for stock watering purposes in the

NE¼ SE¼, Sec. 31, T. 2 S., R. 1 E., S.B.B. and M.

27. CHARLES C. LEARY

is entitled to divert from the natural or developed flow of an unnamed spring situated at a point (designated on Division of Water Rights Map as Diversion 33) which bears approximately S. 7° 30' E., approximately 1780 feet distant from the west quarter corner of Sec. 20, T. 3 S., R. 2 E., S.B.B. and M., being within the SW¼ SW¼ of said Sec. 20, through the Leary Pipe Line,

0.025 cubic foot per second--priority October 18, 1913, or as much thereof as he directly applies to beneficial use for the purpose hereinafter set forth, during the period between March first and November first of each year; said water to be diverted at said spring, and to be used for the irrigation of the following described land:

7.0 acres in Lot 4 of NW¼ of Sec. 20, T. 3 S., R. 2 E., S.B.B. and M.

28. CHARLES C. LEARY

is entitled to divert from the natural or developed flow of an unnamed spring situated at a point (designated on Division of Water Rights Map as Diversion 32) which bears approximately S. 14° 00' E., approximately 1420 feet distant from the west quarter corner of Sec. 20, T. 3 S., R. 2 E., S.B.B. and M., being within the SW¼ SW¼ of said Sec. 20, through the Leary Pipe Line,

(a) during the period between March first and November first of each year,

0.05 cubic foot per second--priority October 18, 1913, or as much thereof as he directly applies to beneficial use for domestic and stock watering purposes and for the irrigation of his lands hereinafter described;

(b) during the period between November first of each year and March first of the succeeding year,

0.025 cubic foot per second--priority October 18, 1913, or as much thereof as he directly applies to beneficial use for

domestic and stock watering purposes;

all of said water to be diverted at said spring, and to be used upon the following described land:

14.0 acres in Lot 4 of NW¼ of Sec. 20, T. 3 S., R. 2 E., S.B.B. and M.

29. HERMAN LUHRMAN

is entitled to divert from the natural flow of the West Fork of Stubby Creek, through the Jost West Ditch and Pipe Line,

0.10 cubic foot per second--priority April 23, 1886,

or as much thereof as he directly applies to beneficial use for the purposes hereinafter set forth, throughout the entire year; said water to be diverted from said West Fork of Stubby Creek at a point (designated on Division of Water Rights Map as Diversion 36) which bears approximately S. 69° 00' W., approximately 1950 feet distant from the northeast corner of Sec. 36, T. 2 S., R. 2 E., S.B.B. and M., being within the NW¼ NE¼ of said Sec. 36, and said water to be used for domestic, stock watering, irrigation and bee culture purposes within the

S½ NE¼, Sec. 36, T. 2 S., R. 2 E., S.B.B. and M.

30. HERMAN LUHRMAN

is entitled to divert from the natural flow of the East Fork of Stubby Creek, through the Jost East Ditch,

0.10 cubic foot per second--priority April 23, 1886,

or as much thereof as he directly applies to beneficial use for the purposes hereinafter set forth, throughout the entire year; said water to be diverted from said East Fork of Stubby Creek at a point (designated on Division of Water Rights Map as Diversion 37) which bears approximately S. 82° 30' W., approximately 1050 feet distant from the northeast corner of Sec. 36, T. 2 S., R. 2 E., S.B.B. and M., being within the NE¼ NE¼ of said Sec. 36, and said water to be used for domestic, stock watering, irrigation and bee culture purposes within the

NE¼ NE¼, Sec. 36, T. 2 S., R. 2 E., S.B.B. and M.

31. THE MORONGO VALLEY MUTUAL WATER COMPANY

is entitled to divert from the natural flow of Big Morongo

Creek, through the Morongo Valley Mutual Water Company Pipe Line,

0.14 cubic foot per second--priority June 14, 1915,

or as much thereof as said company directly applies to beneficial use for the purposes hereinafter set forth, throughout the entire year; said water to be diverted from said Big Morongo Creek at a point (designated on Division of Water Rights Map as Diversion 54) which bears approximately N. 30° 20' W., approximately 1575 feet distant from the southeast corner of Sec. 18, T. 1 S., R. 4 E., S.B.B. and M., being within the NE¼ SE¼ of said Sec. 18, and said water to be used for domestic and stock watering purposes and for the irrigation of the following described lands:

160.0	acres in	N½	Sec. 28, T. 1 S., R. 4 E., S.B.B. and M.
80.0	acres in	W½ SW¼,	Sec. 28, T. 1 S., R. 4 E., S.B.B. and M.
40.0	acres in	NE¼ SW¼,	Sec. 28, T. 1 S., R. 4 E., S.B.B. and M.
80.0	acres in	E½ SE¼,	Sec. 29, T. 1 S., R. 4 E., S.B.B. and M.
40.0	acres in	SW¼ SE¼,	Sec. 29, T. 1 S., R. 4 E., S.B.B. and M.
80.0	acres in	N½ NE¼,	Sec. 32, T. 1 S., R. 4 E., S.B.B. and M.
40.0	acres in	NW¼ NW¼,	Sec. 33, T. 1 S., R. 4 E., S.B.B. and M.
520.0	acres--Total.		

32. THE PALM VALLEY WATER COMPANY

is entitled to divert from the natural flow of Chino Creek, through the Chino Creek Pipe Line,

2.00 cubic feet per second--priority October 2, 1897,

or as much thereof as said company applies to beneficial use for the purpose hereinafter set forth, throughout the entire year; said water to be diverted from said Chino Creek at a point (designated on Division of Water Rights Map as Diversion 59) which bears approximately S. 60° 30' W., approximately 725 feet distant from the northeast corner of Sec. 7, T. 4 S., R. 4 E., S.B.B. and M., being within the NE¼ NE¼ of said Sec. 7, and said water to be used by said company for the purpose of supplying water for domestic and municipal uses in the territory within and adjacent to the town of Palm Springs, Riverside County, California .

33. GEORGE W. PARKER AND F. E. MATTHEWS

jointly, are entitled to divert from the natural flow of the stream flowing in Water Canyon, through the Parker and Matthews Water

Canyon Pipe Line,

0.04 cubic foot per second--priority January 1, 1909,

or as much thereof as they directly apply to beneficial use for the purpose hereinafter set forth, throughout the entire year; said water to be diverted from said stream at a point which bears approximately S. 78° 30' W., approximately 2080 feet distant from the northeast corner of Sec. 24, T. 3 S., R. 1 E., S.B.B. and M., being within the NW¼ NE¼ of said Sec. 24, and said water to be used for the irrigation of the following described land:

8.2 acres in NW¼ NE¼, Sec. 13, T. 3 S., R. 1 E., S.B.B. and M.

54. GEORGE W. PARKER AND F. E. MATTHEWS

jointly, are entitled to divert from the natural or developed flow of Tunnel No. 1 Spring, through the Tunnel No. 1 Pipe Line,

0.04 cubic foot per second--priority October 20, 1894,

or as much thereof as they directly apply to beneficial use for the purpose hereinafter set forth, throughout the entire year; said water to be diverted from said spring at a point (designated on Division of Water Rights Map as Diversion 24) which bears approximately N. 87° 00' W., approximately 1280 feet distant from the southeast corner of Sec. 13, T. 3 S., R. 1 E., S.B.B. and M., being within the SE¼ SE¼ of said Sec. 13, and said water to be used for the irrigation of the following described lands:

2.2 acres in SE¼ NE¼, Sec. 13, T. 3 S., R. 1 E., S.B.B. and M.
4.3 acres in NE¼ SE¼, Sec. 13, T. 3 S., R. 1 E., S.B.B. and M.

6.5 acres--Total

35. GEORGE W. PARKER AND F. E. MATTHEWS

jointly, are entitled to divert from the natural or developed flow of Newland Spring, through the Newland Spring Pipe Line,

0.08 cubic foot per second--priority January 3, 1898,

or as much thereof as they directly apply to beneficial use for the purposes hereinafter set forth, throughout the entire year; said water to be

diverted from said spring at a point (designated on Division of Water Rights Map as Diversion 23) which bears approximately N. 71° 00' W., approximately 2450 feet distant from the southeast corner of Sec. 13, T. 3 S., R. 1 E., S.B.B. and M., being within the SW¼ SE¼ of said Sec. 13, and said water to be used for domestic and stock watering purposes and for the irrigation of the following described lands:

2.6 acres in SW¼ NE¼, Sec. 13, T. 3 S., R. 1 E., S.B.B. and M.
1.0 acre in SE¼ NE¼, Sec. 13, T. 3 S., R. 1 E., S.B.B. and M.
7.0 acres in NE¼ SE¼, Sec. 13, T. 3 S., R. 1 E., S.B.B. and M.

10.6 acres--Total.

36. GEORGE W. PARKER AND F. E. MATTHEWS

jointly, are entitled to divert from the natural or developed flow of South Spring, through the South Spring Pipe Line,

0.06 cubic foot per second--priority January 3, 1898,

or as much thereof as they directly apply to beneficial use for the purpose hereinafter set forth, throughout the entire year; said water to be diverted from said spring at a point (designated on Division of Water Rights Map as Diversion 26) which bears approximately S. 2° 30' W., approximately 1340 feet distant from the northeast corner of Sec. 24, T. 3 S., R. 1 E., S.B.B. and M., being within the SE¼ NE¼ of said Sec. 24, and said water to be used for the irrigation of the following described lands:

1.2 acres in NW¼ NE¼, Sec. 13, T. 3 S., R. 1 E., S.B.B. and M.
9.4 acres in SE¼ NE¼, Sec. 13, T. 3 S., R. 1 E., S.B.B. and M.

10.6 acres--Total.

37. GEORGE W. PARKER AND F. E. MATTHEWS

jointly, are entitled to divert from the natural or developed flow of Head Spring, through the Head Spring Pipe Line,

0.02 cubic foot per second--priority June 20, 1894,

or as much thereof as they directly apply to beneficial use for the purpose hereinafter set forth, throughout the entire year; said water to be diverted from said spring at a point (designated on Division of Water Rights Map as

Diversion 25) which bears approximately S. 67° 00' W., approximately 3050 feet distant from the northeast corner of Sec. 24, T. 3 S., R. 1 E., S.B.B. and M., being within the NE¼ NW¼ of said Sec. 24, and said water to be used for the irrigation of the following described lands:

1.2 acres in SE¼ NE¼, Sec. 13, T. 3 S., R. 1 E., S.B.B. and M.
2.2 acres in NE¼ SE¼, Sec. 13, T. 3 S., R. 1 E., S.B.B. and M.

3.4 acres--Total.

38. THE SOUTHERN PACIFIC COMPANY AND THE SOUTHERN PACIFIC RAILROAD COMPANY

jointly, are entitled to divert from the natural flow of Snow Creek through the Southern Pacific Snow Creek Ditch and Pipe Line,

2.00 cubic feet per second--priority October 24, 1899,

or as much thereof as they apply to beneficial use for the purposes hereinafter set forth, throughout the entire year; said water to be diverted from said Snow Creek at a point (designated on Division of Water Rights Map as Diversion 39) which bears approximately S. 54° 52' E., approximately 1300 feet distant from the northwest corner of Sec. 33, T. 3 S., R. 3 E., S.B.B. and M., being within the NW¼ NW¼ of said Sec. 33, and said water to be used for railroad and domestic purposes at and adjacent to Whitewater and Garnet stations on the Southern Pacific Railroad, in Riverside County, California and for domestic, stock watering and irrigation purposes upon the following described lands:

7.8 acres in SE¼ SE¼, Sec. 20, T. 3 S., R. 3 E., S.B.B. and M.
7.0 acres in NE¼ SE¼, Sec. 20, T. 3 S., R. 3 E., S.B.B. and M.
4.3 acres in SW¼ SW¼, Sec. 21, T. 3 S., R. 3 E., S.B.B. and M.
20.9 acres in NW¼ SW¼, Sec. 21, T. 3 S., R. 3 E., S.B.B. and M.

40.0 acres--Total.

39. THE SOUTHERN PACIFIC COMPANY AND THE SOUTHERN PACIFIC RAILROAD COMPANY

jointly, are entitled to divert from the natural or developed flow of springs rising in Millard Canyon near the center of Sec. 32, T. 2 S., R. 2 E., S.B.B. and M., through the Southern Pacific Millard

Canyon Conduit,

0.23 cubic foot per second--priority January 1, 1877,
0.27 cubic foot per second--priority January 3, 1917

0.50 cubic foot per second--Total

or as much thereof as they apply to beneficial use for the purpose hereinafter set forth, throughout the entire year; said water to be diverted from said springs at a point (designated on Division of Water Rights Map as Diversion 28) which bears approximately N. 39° 53' E., approximately 3350 feet distant from the southwest corner of Sec. 32, T. 2 S., R. 2 E., S.B.B. and M., being within the NE¼ SW¼ of said Sec. 32, and said water to be used for railroad and domestic purposes at and adjacent to Cabazon Station on the Southern Pacific Railroad in Riverside County, California.

40. THE SOUTHERN PACIFIC LAND COMPANY

is entitled to divert from the natural or developed flow of springs rising in Millard Canyon near the center of Sec. 32, T. 2 S., R. 2 E., S.B.B. and M., through the Southern Pacific Millard Canyon Conduit,

0.12 cubic foot per second--priority January 1, 1877,
0.16 cubic foot per second--priority January 3, 1917,

0.28 cubic foot per second--Total.

or as much thereof as said company applies to beneficial use for the purposes hereinafter set forth, throughout the entire year; said water to be diverted from said springs at a point (designated on Division of Water Rights Map as Diversion 28) which bears approximately N. 39° 53' E., approximately 3350 feet distant from the southwest corner of Sec. 32, T. 2 S., R. 2 E., S.B.B. and M., being within the NE¼ SW¼ of said Sec. 32, and said water to be used for domestic, stock watering and irrigation purposes upon the following described lands:

18.7 acres in NE¼ SW¼, Sec. 32, T. 2 S., R. 2 E., S.B.B. and M.
13.0 acres in SE¼ SW¼, Sec. 32, T. 2 S., R. 2 E., S.B.B. and M.
0.8 acre in SW¼ SW¼, Sec. 32, T. 2 S., R. 2 E., S.B.B. and M.

32.5 acres--Total.

41. FRANK L. TALMADGE, JOHN W. TALMADGE, AND WILLIAM S. TALMADGE, (hereinafter referred to as Talmadge Brothers),

jointly, are entitled to divert from the natural flow of Whitewater River, through the Whitewater Ranch Ditch,

3.75 cubic feet per second--priority January 1, 1850,

or as much thereof as they directly apply to beneficial use for the purpose hereinafter set forth, throughout the entire year; said water to be diverted from said Whitewater River at or near a point (designated on Division of Water Rights Map as Diversion 44) which bears approximately S. 87° 30' W., approximately 1950 feet distant from the northeast corner of Sec. 11, T. 3 S., R. 3 E., S.B.B. and M., being within the NW¼ NE¼ of said Sec. 11, and said water to be used for domestic and stock watering purposes and for the irrigation of 100 acres of land within and upon the following described tracts:

SW¼, Sec. 10, T. 3 S., R. 3 E., S.B.B. and M.
NW¼ NW¼, Sec. 15, T. 3 S., R. 3 E., S.B.B. and M.

provided, however, that nothing herein contained shall be deemed to or shall in any manner limit or restrict the right of said Talmadge Brothers, or their successors in interest, from transferring the use of said water from said lands to the community known as Palm Springs for domestic use within such community, and it is expressly provided that such water may be diverted and transported to said Palm Springs district for domestic use only within such district whenever said Talmadge Brothers, or their successors in interest, deem such transfer and use desirable. The diversion and use of water under this right is subject to the provisions of that certain stipulation dated March 17, 1926, between the Banning Water Company, the Banning Heights Mutual Water Company and the San Gorgonio Power Company on the one part, and Julia B. Berry, Talmadge Brothers, and Andrew J. Warner and Clara J. Warner on the other part, which stipulation is on file and of record in these proceedings, and by the terms of which stipulation said Julia B. Berry, Talmadge Brothers, and Andrew J.

Warner and Clara J. Warner recognize that said Banning Water Company, Banning Heights Mutual Water Company and San Gorgonio Power Company are the owners of the paramount right to divert water from the South Fork of Whitewater River through the consolidated Reservoir and Power Company Canal as hereinbefore set forth in paragraph 5, regardless of the fact that the priority of the right set forth in said paragraph 5 is subsequent to the priority of the right of said Talmadge Brothers as set forth in this paragraph.

42. THE UNITED STATES OF AMERICA

is entitled to divert from the natural flow of Hathaway Creek, through the Hathaway Canyon Pipe Line,

2.00 cubic feet per second--priority January 1, 1890,

or as much thereof as it applies to beneficial use for the purposes hereinafter set forth, throughout the entire year; said water to be diverted from said Hathaway Creek at a point within the NW¼ NE¼ of Sec. 34, T. 2 S., R. 1 E., S.B.B. and M., and said water to be used for domestic, stock watering, power development and irrigation purposes within the Morongo Indian Reservation, comprising some 30,600 acres of land described as follows:

All of Secs. 10, 12, 13, 14, 15, 22, 23, 25, 26, 27, 34, 35 and 36, T. 2 S., R. 1 E., S.B.B. and M.
All of Secs. 8, 9, 17, 18, 25, 26, 27, 28, 30, 31, 33, 34 and 35, T. 2 S., R. 2 E., S.B.B. and M.
E½, Sec. 16, T. 2 S., R. 2 E., S.B.B. and M.
N½, Sec. 19, T. 2 S., R. 2 E., S.B.B. and M.
SW¼, Sec. 19, T. 2 S., R. 2 E., S.B.B. and M.
N½, Sec. 20, T. 2 S., R. 2 E., S.B.B. and M.
SW¼, Sec. 20, T. 2 S., R. 2 E., S.B.B. and M.
N½ SE¼, Sec. 20, T. 2 S., R. 2 E., S.B.B. and M.
E½, Sec. 21, T. 2 S., R. 2 E., S.B.B. and M.
S½ SW¼, Sec. 21, T. 2 S., R. 2 E., S.B.B. and M.
E½, Sec. 29, T. 2 S., R. 2 E., S.B.B. and M.
W½, Sec. 36, T. 2 S., R. 2 E., S.B.B. and M.
SE¼, Sec. 36, T. 2 S., R. 2 E., S.B.B. and M.
All of Secs. 2, 12, 22, 24 and 26, T. 3 S., R. 1 E., S.B.B. and M.
N½, Sec. 1, T. 3 S., R. 1 E., S.B.B. and M.
NE¼, Sec. 6, T. 3 S., R. 1 E., S.B.B. and M.
S½ S½, Sec. 14, T. 3 S., R. 1 E., S.B.B. and M.
E½, Sec. 34, T. 3 S., R. 1 E., S.B.B. and M.
SW¼, Sec. 34, T. 3 S., R. 1 E., S.B.B. and M.
NE¼ NW¼, Sec. 34, T. 3 S., R. 1 E., S.B.B. and M.
N½ NW¼ NW¼, Sec. 34, T. 3 S., R. 1 E., S.B.B. and M.

Water Rights Map as Diversion 45) which bears approximately S. 45° 00' W., approximately 1580 feet distant from the northeast corner of Sec. 11, T. 3 S., R. 3 E., S.B.B. and M., being within the NE¼ NE¼ of said Sec. 11, and said water to be used for domestic and stock watering purposes upon the following described land and for the irrigation of said land:

50.0 acres in S½ SE¼, Sec. 10, T. 3 S., R. 3 E., S.B.B. and M.

48. WHITEWATER MUTUAL WATER COMPANY

is entitled to divert from the natural or developed flow of Whitewater River, through the Palm Valley Water Company System (later known as the "Stevens Pipe Line"),

10.00 cubic feet per second--priority September 19, 1913, or as much thereof as said company applies to beneficial use for the purpose hereinafter set forth, throughout the entire year; said water to be diverted from said Whitewater River, all or in part, through any of the following described works:

(1) Through the main intake ditch leading to the "Stevens Pipe Line", the head of which ditch is situated at a point which bears approximately S. 84° 30' E., approximately 440 feet distant from the northwest corner of Lot 2 of Sec. 2, T. 3 S., R. 3 E., S.B.B. and M., being within said Lot 2,

(2) Through Infiltration Pipe Line "A" as shown on the map prepared by Davidson & Fulmor, Engineers, dated April, 1927, and entitled "Map Showing the Prescott T. Stevens Intake and Infiltration Pipe Lines from Whitewater River, Riverside County, Cal.," the head of which pipe line is situated approximately 727 feet due east of the northwest corner of Lot 2 of Sec. 2, T. 3 S., R. 3 E., S.B.B. and M., and approximately on the north line of said Sec. 2,

(3) Through Infiltration Pipe Line "B" as shown on said map prepared by Davidson and Fulmor, the head of which pipe line is situated approximately 122 feet due east of the northwest corner of

Lot 2 of Sec. 2, T. 3 S., R. 3 E., S.B.B. and M., and approximately on the north line of said Sec. 2,

(4) Through Infiltration Pipe Line "C" as shown on said map prepared by Davidson and Fulmor, the head of which pipe line is situated at a point which bears approximately S. 62° 15' W., approximately 278 feet distant from the northeast corner of Lot 3 of Sec. 2, T. 3 S., R. 3 E., S.B.B. and M., being within said Lot 3;

and said water to be used for domestic purposes on the following described tracts and for the irrigation of approximately 725 acres of land within the following described tracts:

SE¼ NE¼, Sec. 3, T. 4 S., R. 4 E., S.B.B. and M.
E½, Sec.10, T. 4 S., R. 4 E., S.B.B. and M.
N½, Sec.11, T. 4 S., R. 4 E., S.B.B. and M.
SW¼, Sec.11, T. 4 S., R. 4 E., S.B.B. and M.
NE¼, Sec.15, T. 4 S., R. 4 E., S.B.B. and M.

XXVII

No costs or disbursements are allowed herein to any of the parties to this proceeding and each of said parties shall respectively bear their own costs.

XXVIII

If at any time the natural flow of said Whitewater River and its tributaries, or any thereof, is insufficient to furnish all parties entitled thereto with the full amount of water awarded herein, then and in said event the said natural flow shall be distributed in accordance with the priorities as herein decreed.

XXIX

Each and every of the parties hereto, their servants, agents, attorneys, employees, successors in interest and all persons acting under their authority and on their behalf are enjoined and restrained from any and all interference with, or diversion or use of, the waters herein decreed, except in the manner, and to the extent, and for the purposes provided herein, whenever such interference, diversion or use in any manner interferes with the diversion or use of the said waters as decreed herein.

9th day of December, 1938.

Subject: **Beaumont Basin Watermaster**
Draft Annual Report for Calendar Year 2016

Dear Mr. Vela:

ALDA Inc., in association with Thomas Harder & Co. is pleased to submit to you, as Chairman of the Beaumont Basin Watermaster, the Beaumont Basin Watermaster Annual Report for Calendar Year 2016. This draft report expands on the earlier format of the annual report by incorporating information previously presented in the biannual Engineering Report. As such, this Annual Report summarizes all production, spreading, and storage activities that took place during calendar year 2016. Further, it documents changes in water levels and storage conditions, as well as, an estimate of the Basin Operating Safe Yield for 2016. Finally, the report presents an evaluation of water quality conditions for the 2012-2016 five year period.

We will make a formal presentation to the Watermaster Committee during the upcoming Board meeting on August 2nd, 2016. We welcome your review and comments on this report and look forward to answering any questions you may have.

Should you have any questions on this matter, please contact us at 909-587-9916 during normal business hours.

Very truly yours

ALDA Inc.

F. Anibal Blandon, P.E.

Section 1
Background

The Fourteen Annual Report of the Beaumont Basin Watermaster Committee (Watermaster) consolidates the information about the basin previously presented in Annual Reports with the information presented in the bi-annual Engineer's Report. This report documents activities in the Beaumont Basin for Calendar Year 2016. Section 3 of the original annual report has been expanded and retitled as "Status of the Basin" to document the Administration of the Judgment as well as to provide a status of conditions in the basin addressing water production, water levels, and storage activities. In addition, a Water Quality section, Section 4, has been added to document historical water quality of selected compounds at selected wells, as well as, basin wide concentrations.

1.1 History of the Beaumont Basin Stipulated Judgment

In January 2001, the City of Beaumont (Beaumont), the Beaumont-Cherry Valley Water District (BCVWD), the South Mesa Water Company (SMWC), and the Yucaipa Valley Water District (YVWD) formed the San Timoteo Watershed Management Authority (STWMA). One of the initial tasks of STWMA was to develop a watershed-wide program to develop and implement a comprehensive management program for the San Timoteo watershed.

Phase I of the management program, documented in the San Timoteo Watershed Management Program, Phase I Report (WEI, 2002), included the following goals:

- Enhancing water supplies
- Protecting and enhancing water quality
- Optimizing the management of STWMA area groundwater basins
- Protecting riparian habitat in San Timoteo Creek and protecting/enhancing habitat in the STWMA area
- Equitably distributing the benefits and costs of developing the Integrated Regional Watershed Management Program for the San Timoteo watershed

One of the elements identified in the management plan to achieve the listed goals consisted in the establishment of a groundwater management entity for the Beaumont Basin. As a result of this initiative, two groups representing overlying users and water agencies with interest in this basin began negotiations in May 2002.

Over the next 18 months of negotiations, a Stipulated Agreement was developed and submitted to the Court. Honorable Judge Gary Tranbarger of the Superior Court of the State of California for the County of Riverside signed the Agreement, titled "San Timoteo Watershed Management Authority, vs. City of Banning, et al." (Case No. RIC 389197), on February 4, 2004, (the Judgment).

Pursuant to the Judgment, the Court appointed a five-member Watermaster Committee, consisting of representatives from each of the Appropriator parties: City of Banning, City of

Beaumont, Beaumont Cherry Valley Water District (BCVWD), South Mesa Water Company (SMWC), and Yucaipa Valley Water District (YVWD). The effective date of the Judgment for accounting purposes was retroactively established to July 1, 2003.

The Court gave the responsibility of managing the Basin to the Watermaster by approving the Stipulated Agreement but retained continuing jurisdiction should there be any future need to resolve difficult questions among the Parties.

1.2 Essential Elements of the Judgment

Elements of the 2004 Judgment are as follows:

- All producers shall be allowed to pump sufficient water from the Basin to meet their respective requirements.
- The Safe Yield of the Basin was established at 8,650 ac-ft/yr to be distributed among the Overlying Producers. The Safe Yield of the Basin is to be re-evaluated every 10 years, at a minimum.
- The Overlying Parties can extract a combined total of 8,650 ac-ft/yr. with individual rights set for each Overlying Producer. If an Overlying Party pumps more than five times its share of the operating safe yield in any five consecutive years, the overlying producer shall provide Watermaster with sufficient funds to replace the overproduction.
- A controlled overdraft of the basin is allowed to create enough additional storage capacity to prevent the waste of water. This controlled overdraft, also known as Temporary Surplus, allows Appropriators to extract up to 160,000 ac-ft of water from the basin over the 10-year period immediately following the Judgment inception. The Temporary Surplus will cease after the initial 10 years of operations.
- During the first ten years after adoption of the Judgment, the Appropriators have the right to extract, as a whole, a maximum of 16,000 ac-ft/yr not including storage credits from spreading supplemental water or transfers from Overlying Parties. The Temporary Surplus has been divided among the Appropriators as follows:

  - ✓ Beaumont Cherry Valley WD — 42.51 percent or 6,802 ac-ft/yr
  - ✓ City of Banning — 31.43 percent or 5,029 ac-ft/yr
  - ✓ South Mesa Water Company — 12.48 percent or 1.997 ac-ft/yr
  - ✓ Yucaipa Valley Water District — 13.58 percent or 2,173 ac-ft/yr

- After the first 10 years of operation, Appropriators can extract only the amount each has in storage or credited to them. An Appropriator shall provide Watermaster with sufficient funds to replace any amount of overproduction that may have occurred over a five-year consecutive period.
- The Watermaster has the authority to enter into Groundwater Storage Agreements with producers for the storage of supplemental water, wellhead protection and recharge, well

abandonment, well construction, monitoring, replenishment, mitigation of overdraft, and collection of assessments.

- Supplemental replenishment water can be in the form of recycled water, imported State Project Water, or other imported water. Replenishment can be accomplished by spreading and percolation, injection, or in-lieu use of surface water or imported water.
- A minimum of 200,000 ac-ft of groundwater storage capacity shall be reserved for conjunctive use. Any person, party to the Judgment can make reasonable beneficial use of the groundwater storage capacity for storage of supplemental water provided that it is in accordance with a storage agreement with Watermaster.
- Minimal producers, those producing less than 10 ac-ft/yr from the basin, and not listed in the Judgment, are exempt from the provisions of the Judgment.

1.3 Watermaster Responsibilities

Under the Judgment, the Watermaster is granted discretionary powers to develop and implement a groundwater management plan for the Beaumont Basin, including water quality and quantity considerations and being reflective of the provisions of the Judgment.

In carrying out its duties, Watermaster is responsible for providing the legal and practical means of ensuring that the waters of the Basin are put to maximum beneficial use. Specific responsibilities are summarized below.

1.- Administer the Beaumont Basin Judgment. Watermaster operates under the Judgment and the Rules and Regulations, which were originally adopted June 8, 2004, and subsequently amended in 2006 and 2008. The Judgment and the Rules and Regulations establish the procedures by which Watermaster accounts for the water resources of the Basin. Watermaster has the power to collect administrative assessments from all Appropriators and replenishment assessments from those parties (Appropriative and Overlying) pumping in excess of their pumping right to fund its operations. Each year, Watermaster publishes an Annual Report, which documents production and recharge activities in the Beaumont Basin.

2.- Approve Producer Activities. All producers must notify and obtain approval, as necessary, from Watermaster for activities, such as recharging water, transferring or exchanging water, storing local water, and storing or recovering supplemental water.

3.- Maintain and Improve Water Supply. On an annual basis, Watermaster determines the amount of groundwater that each producer is entitled to pump from the Basin without incurring a replenishment obligation. Further, Watermaster is responsible for facilitating and coordinating the acquisition, recharge, and storage of imported water or other local supplemental water to replenish and/or conjunctively manage the Basin to increase local supplies.

4.- Monitor and Understand the Basin. Watermaster is responsible for collecting information from producers, and other cooperating agencies, in order to enhance its knowledge of how the Basin works and manage it more effectively. Information collected by the Watermaster includes:

- Water production, water level, and water quality information from the Appropriator Parties.
- Water production and water level information from the Overlying Parties.
- Water level and water quality data collected by local agencies as part of their Maximum Benefit and Monitoring Program for the Beaumont Management Zone.
- Ground surface elevations from periodic surveys conducted to determine whether ground subsidence may be occurring as a result of over pumping from the basin.

5.- Maintain and Improve Water Quality. Watermaster coordinates and participates in local efforts to preserve and/or enhance the quality of groundwater in the Basin. It assists and encourages regulatory agencies to enforce water quality regulations that may have an effect on the Basin groundwater sources and its surrounding resources. One of these programs is the Maximum Benefit Monitoring Program of the Beaumont Management Zone.

6.- Develop and Administer a Well Policy. Watermaster is responsible for developing a policy on the proper construction and abandonment of wells in the Basin. Through the adoption of Resolution 2004-04, the Watermaster adopted minimum standards for the construction, repair, abandonment and destruction of groundwater extraction wells in the Beaumont Basin. As part of this resolution, Watermaster adopted Riverside County Ordinance No. 682.3 and expanded it to require the installation of a sounding tube in order to facilitate the measurement of water levels on all future wells.

7.- Develop Contracts for Beneficial Programs and Services. Watermaster is responsible for developing and entering into contracts for programs and services that are beneficial to the Basin on behalf of the Parties to the Judgment. This includes programs for conjunctively utilizing the Basin for the storage of supplemental water with other agencies and programs to implement and expand the direct or indirect use of recycled water.

8.- Provide Cooperative Leadership. Watermaster may act jointly or cooperate with other local, state, and/or federal agencies to develop and implement regional scale programs for the management of the Basin and its surrounding resources.

1.4 Watermaster Address

For the purposes of conducting Watermaster business and maintaining records, Watermaster's official address remains as follows:

Office of the Watermaster Secretary
C/O Beaumont-Cherry Valley Water District
560 Magnolia Avenue
Beaumont, CA 92223

1.5 Watermaster Website

Watermaster website address is www.beaumontbasinwatermaster.org. This website is maintained by the YVWD and it is used by the Watermaster to communicate its activities to the Parties and the public. The website contains copies of the Judgment, the Rules and

Regulations, Annual Reports, and Engineer's Reports. In addition, it contains meeting minutes, meeting agendas, and other documents of interest.

1.6 Mission Statement

Watermaster adopted the following mission statement in October 2004:

> *"Watermaster's mission is to manage the yield of and storage within the Beaumont Basin to provide maximum benefit to the people dependent on it."*

Section 2
Watermaster Activities

2.1 Makeup of the Board

During the December 4, 2013 regular meeting of the Beaumont Basin Watermaster, elections were held; the officers to the Watermaster Committee listed below were appointed for calendar year 2014. During the February 4, 2015 regular meeting a recommendation was made for the members of the Watermaster Committee to reaffirm the existing officers or conduct nominations for the appointment of new officers; however, no action was taken.

- Mr. Duane Burk – Chairman
- Mr. George Jorritsma – Vice Chairman
- Mr. Eric Fraser – Secretary
- Mr. Joseph Zoba – Treasurer

The Committee Representatives serving each Appropriator Party during CY 2015 were as follows:

- City of Banning - Duane Burk, Director of Public Works
- City of Beaumont – Kyle Warsinski, as an alternate member
- Beaumont-Cherry Valley Water District – Eric Fraser, General Manager
- South Mesa Water Company - George Jorritsma, General Manager
- Yucaipa Valley Water District - Joseph B. Zoba, General Manager

It should be noted that Mr. Burk only served as representative of the City of Banning during the first meeting in 2015. The City of Banning was represented by its alternate member, Mr. Art Vela for the remainder of the year.

Legal counsel during CY 2015 was provided by Alvarado Smith APC, represented by Keith McCullough and Thierry Montoya, while Engineering Services were provided by ALDA Inc., represented by Hannibal Blandon, in association with Thomas Harder & Company, represented by Thomas Harder.

2.2 Watermaster Accomplishments and Activities During 2016

2.2.1 Watermaster Meetings

A total of six regular meetings were held during CY 2016 on the following dates:

- February 3, 2016
- April 6, 2016
- June 1, 2016
- August 3, 2016
- October 5, 2016
- December 7, 2016

Agendas and approved minutes from each of the above meetings can be viewed at and/or downloaded from Watermaster's website or by making a request to the Watermaster Secretary. Pursuant to Resolution 2009-001, all of Watermaster's public records are open for inspection during office hours, provided that a written request to inspect said records has been submitted.

2.2.2 Watermaster Committee Resolutions

Resolution No. 2015-01 was adopted at the April 1st, 2015 Regular Watermaster Committee meeting. Through this resolution, the Final 2013 Reevaluation of the Beaumont Basin Safe Yield Report and Redetermination of the Safe Yield of the Beaumont Basin were adopted. See Technical Memorandum 15-07 for details.

2.2.3 Items Discussed in 2016

This section is simply an unofficial summary of topics addressed at Watermaster meetings. The Beaumont Basin Watermaster maintains official meeting minutes that report the items discussed and actions taken during normal and special meetings. Official meeting minutes may be accessed at: www.beaumontbasinwatermaster.org

The following items were discussed during the six meetings held in CY 2015 along with their resulting outcome.

Items Discussed During the February 3, 2016 Regular Watermaster Committee Meeting

- Reorganization of the Beaumont Basin Watermaster Committee [Memorandum 16-01]. Members Vela and Jorritsma were nominated and confirmed as Chairman and Vice-Chairman respectively. Members Fraser and Zoba were reaffirmed as Secretary and Treasurer respectively.

- Status Report on Water Level Monitoring throughout the Beaumont Basin [Memorandum 16-02]. Mr. Blandon gave a status report of the water level monitoring project.

- Discussion Regarding Task Order No. 9 for the Preparation of the 2015 Consolidated Annual Report, Estimate of the Basin Safe Yield, Update of the Groundwater Model, and Associated Consulting Services [Memorandum 16-03]. Watermaster Committee approved Task Order No. 9 for a sum not to exceed $81,940.00.

- Discussion Regarding Task Order No. 10 with ALDA Inc. for the Installation, Maintenance, and Data Collection of Water Level Monitoring Equipment in 2016 [Memorandum 16-04]. Watermaster Committee approved Task Order No. 10 for a sum not to exceed $18,840.00.

- Overview of the Sustainable Groundwater Management Act and Proposed Basin Boundary Revisions [Memorandum 16-05]. Member Zoba presented a proposed revision to the Beaumont Basin boundaries under the Sustainable Groundwater Management Act. After much discussion, member Fraser motioned and the Watermaster Committee approved to accept the proposed boundary as identified, and to develop a memorandum of understanding between the BCVWD and Beaumont Basin Watermaster to establish a groundwater sustainability agency (GSA) to manage the proposed sub-basin.

Items Discussed During the April 6, 2016 Regular Watermaster Committee Meeting

- Status Report on Water Level Monitoring throughout the Beaumont Basin [Memorandum 16-06]. A status report was presented, questions answered, and feedback from the Committee members provided.

- Consideration of Task Order No. 11 – Recalibration of the northwest portion of the Beaumont Basin groundwater model to more accurately represent water levels in the area [Memorandum 16-07]. Mr. Harder provided a background on the widening discrepancy between actual and estimated water levels in the northwest portion of the basin. The Watermaster Committee approved the task order to enhance the groundwater flow model for an amount not to exceed $ 10,850.00.

Items Discussed During the June 1, 2016 Regular Watermaster Committee Meeting

- Status Report on Water Level Monitoring throughout the Beaumont Basin [Memorandum 16-08]. A status report was presented, questions answered, and feedback from the Committee members provided.

- Status Update on the Refinement of the Beaumont Basin Groundwater Flow Model [Memorandum 16-09]. Mr. Harder highlighted how modifications to the model improved the overall model calibration. He further indicated that the enhanced model will be used to evaluate the change in storage for 2015.

- Engineer's Opinion on the Application by the San Gorgonio Pass Water Agency (SGPWA) for a Groundwater Storage Agreement in the Beaumont Basin [Memorandum 16-10]. Mr. Blandon provided engineering feedback on the application submitted by SGPWA. This was followed by significant discussion between members of the Watermaster Committee and Mr. Davis, SGPWA's General Manager. A motion was introduced to continue discussion at the August meeting to allow the development of contingencies guarantying that the account will be used to store water that is surplus to everyone's needs in the basin.

- Consideration of the Proposed Budget for Fiscal Year 2016-17 [Memorandum 16-11]. Member Zoba presented the proposed budget before adoption by the Watermaster Committee.

Items Discussed During the August 3, 2016 Regular Watermaster Committee Meeting

- Status Report on Water Level Monitoring throughout the Beaumont Basin [Memorandum 16-12]. Mr. Blandon gave a status report of the water level monitoring project.

- 2015 Consolidated Annual Report and Engineering Report [Memorandum No. 16-13]. Mr. Blandon presented information from the report including accomplishments of the Committee in 2015, groundwater conditions, production, and recharge, transfers and adjustments of rights, accounting of storage, and water quality in the basin.

Items Discussed During the October 5, 2016 Regular Watermaster Committee Meeting

- Status Report on Water Level Monitoring throughout the Beaumont Basin [Memorandum 16-14]. Mr. Blandon gave a status report of the water level conditions in the Beaumont Basin.

- Overview of Total Dissolved Solids (TDS) and Nitrate (N) in the Beaumont Basin and Surrounding Area [Memorandum 16-15]. Mr. Blandon reported on water quality issues documented in the 2015 Annual Report. Discussion ensued regarding the potential reasons for TDS spikes at various locations in the Beaumont Basin.

- Adoption of the 2015 Consolidated Annual Report and Engineering Report [Memorandum No. 16-16]. The Watermaster Committee adopted the 2015 Report.

- Concept for the Formation of a Groundwater Sustainability Agency (GSA) for the San Timoteo Basin [Memorandum 16-17]. Member Zoba provided background on the reasons for creating a GSA and explained that the Watermaster is already considered to be sustainable by virtue of the stipulated judgment. No decision was needed and none was made.

- Application by the San Gorgonio Pass Water Agency (SGPWA) for a Groundwater Storage Agreement in the Beaumont Basin [Memorandum 16-18]. Member Zoba reported that he had met with the General Manager to discuss the application and presented five stipulations or conditions to a potential agreement. Member Fraser suggested that the conditions be sent to the SGPWA's Board of Directors for vetting prior to drafting a final resolution. Further discussion of this item was postponed to the next meeting.

Items Discussed During the December 7, 2016 Regular Watermaster Committee Meeting

- Status Report on Water Level Monitoring throughout the Beaumont Basin [Memorandum 16-19]. Mr. Blandon gave a status report of the water level conditions in the Beaumont Basin and fielded questions by members of the Committee. He also indicated of field equipment troubles and the unresponsive support for Solinst. Member Fraser suggested looking at different vendors for monitoring equipment and to make a presentation at the next meeting.

- Discussion Regarding the Creation of a Return Flow Policy for the Beaumont Basin [Memorandum 16-20]. After an overview, Member Fraser motioned to direct staff to develop a return policy in which individual retail agencies are credited appropritately for the return

flows that occur within their service area as a result of their activities. The return policy is to be brought back to the Committee for additional discussion.

- Conditions Related to the Groundwater Storage Agreement in the Beaumont Basin for the San Gorgonio Pass Water Agency (SGPWA) [Memorandum 16-21]. Member Zoba reported that the Committee is ready to move forward with the agreement subject to the five conditions and that an update will be provided at the next meeting. SGPWA's General Manager made a commitment to have something for Committee consideration at the February 2017 regular meeting.

2.2.4 Redetermination of Safe Yield

Under the Judgment (2003) the Safe Yield of the Beaumont Basin was established at 8,650 ac-ft/yr. to be distributed among the Overlying Producers. The Judgment indicates that the Safe Yield of the Beaumont Basin shall be redetermined at least every 10 years beginning 10 years after the date of entry of the Judgment (February 4, 2004).

At the February 2013 Watermaster meeting, the Watermaster Committee authorized a study to develop a hydrologic model of the groundwater basin to be used as a tool in the re-evaluation of the safe yield of the basin. At the February 2015 Watermaster meeting a formal presentation of the final-draft document was made to provide members of the Committee with an opportunity to ask questions and addressed any unresolved issues. The final document was presented for approval and adoption at the April 2015 Watermaster meeting.

Resolution No. 2015-01 was adopted at the April 1st, 2015 Regular Watermaster Committee meeting. Through this resolution, the Final 2013 Reevaluation of the Beaumont Basin Safe Yield Report and Redetermination of the Safe Yield of the Beaumont Basin were adopted.

The Beaumont Basin Watermaster re-determined the Safe Yield of the Beaumont Basin to be 6,700 ac-ft per year.

2.3 Storage Applications and Agreements

The first applications to use the Basin for storage purposes were approved in FY 2005-06 when Watermaster approved applications by Banning, BCVWD, SMWC, and YVWD to store up to 135,000 ac-ft of water in the Basin. The City of Beaumont's application to store water was approved by Watermaster in FY 2007-08 bringing the total storage allocation to 157,000 ac-ft. In FY 2009-10, Watermaster approved additional applications by Banning, BCVWD, Beaumont, and YVWD to increase the total storage allowed to 260,000 ac-ft. It is our understanding that the Watermaster Committee has not yet amended the respective Storage Agreements to reflect the current storage limits.

An application for a storage agreement was received by the Watermaster from the San Gorgonio Pass Water Agency (SGPWA) in mid 2010 and brought for discussion at the summer of 2012. The application was rejected because it was determined to be incomplete.

An application for a storage agreement was also received from the Morongo Band of Mission Indians at the December 2012 meeting. Watermaster deemed the application incomplete and

requested further information from the applicant to address questions posed by members of the Watermaster Committee. The application was subsequently approved at the June 5, 2013 meeting allowing the Morongo Band of Mission Indians to store up to 20,000 ac-ft of imported water in the basin.

As of December 31, 2015, the total storage allowed stands at 280,000 ac-ft; storage limits by participant are as follows:

- City of Banning 80,000 ac-ft
- City of Beaumont 30,000 ac-ft
- Beaumont Cherry Valley WD 80,000 ac-ft
- South Mesa Water Company 20,000 ac-ft
- Yucaipa Valley Water District 50,000 ac-ft
- Morongo Band of Mission Indians 20,000 ac-ft

A new application for Groundwater Storage Agreement was developed in early 2013; the application was presented and discussed at several Watermaster Committee meetings where input was received and questions were addressed. The new application was approved by the Watermaster Committee in August 2013 and will be used for future applicants.

After development of new forms and procedures, a new application by SGPWA was received in early 2016 to develop a Groundwater Storage Agreement. This application has been discussed over several Watermaster Committee meetings and is anticipated to be approved in mid 2017.

2.4 Rules and Regulations

The original Rules and Regulations of the Watermaster were adopted on June 8, 2004. The Judgment provides for their periodic update as deemed necessary by the Watermaster. On September 9, 2008, the Watermaster adopted Rule and Regulation 7.8, entitled “Availability of Unused Overlying Production and Allocation to the Appropriator Parties”. The objective of this rule is to define the process through which unused production by Overlying Parties is allocated to the Appropriator Parties. The unused water will be allocated based on each Appropriator’s percent share of the operating safe yield, as described in Exhibit C of the Judgment. This allocation will have no impact on the legal water rights owned by the Overlying Parties in subsequent years. The initial allocation to take place on or after February 4, 2009.

No changes to the Rules and Regulations were made during Calendar Year 2016.

2.5 Active Party List

Part VII, Paragraph 1 of the Judgment, indicates that Watermaster shall maintain an updated list of parties to whom notices are to be sent for service. Said list should include names, addresses for the Parties or their successors. A copy of the list has been included with this annual report as Appendix A.

2.6 Financial Management

The Watermaster must develop and administer a budget for all administrative, operational, and capital costs it incurs. The following discussion summarizes the budget established for the Fiscal Year 2016 operations.

2.6.1 Budget

The budget for Fiscal Year 2016 was initially approved at the June 1, 2016 Watermaster Committee meeting. The approved budget provided funding for Administrative expenses in the amount of $128,050.00 , an increase of $15,000.00 or 13.3 percent from the prior year of $113,050.00. Funding for administrative expenses was covered from a carryover of $15,000.00 and water agencies contributions of $22,610.00 each. The approved budget did not include any funds for Special Projects as the basin model update and the Safe Yield studies were completed in the previous two years.

The proposed budget for FY 2017 includes $183,050.00 for administrative expenses; no budget was allocated for special projects. Funding for administrative expenses is expected to be cover from water agencies contributions of $ 36,610.00 each. The following table presents a comparison between the final budgets for FY 2014-15, final budget for FY 2015-16, and approved budget for FY 2016-17.

Operating Expense	*FY 2014-15 Approved Budget*	*FY 2015-16 Approved Budget*	*FY 2016-17 Approved Budget*
Administrative Expenses			
Bank Fees and Interest	$ 50.00	$ 50.00	$ 50.00
Miscellaneous and Meetings	$ 500.00	$ 500.00	$ 500.00
Acquisition/computation & Annual Report	$ 75,000.00	$ 85,000.00	$ 90,000.00
Annual Audit	$ 2,500.00	$ 2,500.00	$ 2,500.00
Engineering Services	$ 10,000.00	$ 10,000.00	$ 20,000.00
Monitoring and Data Acquisition			$ 25,000.00
Meter Installation and Repair			$ 10,000.00
Legal Expenses	$ 15,000.00	$ 20,000.00	$ 20,000.00
Reserve Funding	$ 10,000.00	$ 10,000.00	$ 15,000.00
	$ 113,050.00	**$ 128,050.00**	**$ 183,050.00**
Special Project Expenses			
Engineering	$ 22,500.00	$ 0.00	$ 0.00
Litigation	$ 2,500.00	$ 0.00	$ 0.00
	$ 25,000.00	**$ 0.00**	**$ 0.00**
Total Operating Expense	**$ 138,050.00**	**$ 128,050.00**	**$ 183,050.00**

2.6.2 Financial Audit

The Beaumont Basin Watermaster has a financial audit performed on annually on a fiscal year basis. The audit assists in properly accounting for the revenues and expenses of the Watermaster and tracking the financial resources of the agency. The detailed audit report for FY 2016, prepared by Rogers, Anderson, Malody, and Scott, LLP, has been completed, but not presented to the Watermaster Committee as of the time of this writing.

It is anticipated that the financial audit report will be presented at the June 7, 2017 meeting as an agenda item. This report will be included in the final 2016 Annual Report, scheduled for delivery at the October 2017 meeting.

Section 3
Status of the Basin and Administration of the Judgment

The Beaumont Basin Watermaster is responsible for the accounting of groundwater production, recharge of supplemental water, groundwater transfers and storage activities in the Beaumont Basin. Since the inception of the Judgment accounting has been conducted on a fiscal year basis starting on July 1, 2003.

Through the adoption of Resolution No. 2011-01, on September 21, 2011, Watermaster changed the accounting from a fiscal year basis to a calendar year basis starting in CY 2011. The conversion of Fiscal Year basis to Calendar Year basis was documented in the Annual Report for CY 2011 adopted by the Board in early 2013. The annual report for CY 2016 builds on the information presented in previous annual reports.

3.1 Climate, Hydrology and Hydrogeology

3.1.1 Climate

The Beaumont Basin is located in a semi-arid region characterized by warm summers and mild winters with average summer high temperatures in the mid to upper 90s (Fahrenheit) and average winter low temperatures in the mid to low 40s. Precipitation in the region occurs as snowfall in the upper elevations of the San Bernardino Mountains to the north and rainfall in the Basin. Annual precipitation in the Beaumont Basin, as recorded at the County of Riverside's Beaumont Station 013 averaged 17.15 inches over the 100-year period between 1917 and 2016. On the average, 11.94 inches of precipitation, or 70 percent of total, fell during the winter between December and March.

Figure 3-1 illustrates annual precipitation at this station for the reporting period including a plot of the cumulative departure from the mean (CDFM) precipitation. This parameter is used to assess the occurrence, duration, and extent of wet and dry precipitation cycles. Upper trending periods in the graph represent periods with above average precipitation such as the 1913-46 period; average precipitation during this period was 20.5 inches or close to 16 percent above the long-term average. Other above average precipitation periods include the 1977-83 and 1990-98 periods. Conversely, down trending periods indicate periods of below average precipitation as in the 1947-77 period when average precipitation was only 15.2 inches. The 1984-90 period with seven consecutive years of below average precipitation was also characterized as a dry period.

Currently, the Basin is in a dry period that began in 1999. During this 17-year period three of the five years with the lowest precipitation ever recorded at Station 13 have occurred; 6.3 inches (lowest ever) in 1999, 7.40 inches in 2013, and 8.07 inches in 2009. It should be noted that the average precipitation during the base period (1997-2001) used to determine the safe yield of the Basin was 13.43 inches, close to 25 percent below the long-term average for the Basin.

3.1.2 Surface Water Hydrology

There are three significant drainage systems that overlie the Beaumont Basin: the San Timoteo Creek drainage system which is tributary to the Santa Ana River; the Potrero Creek drainage system in the San Jacinto watershed; and the Smith Creek drainage system tributary to the White Water River which is part of the Salton Sea drainage basin.

Surface water flows originate in the San Bernardino Mountains to the north of the Basin. The streams and creeks that flow into the Beaumont Basin are dry for most of the year with occasional runoff during rainfall events. There are no stream gages in the Basin that can be used to estimate surface water recharge to the Basin or discharge from the Basin.

3.1.3 Hydrogeology

3.1.3.1 Regional Geologic Context

The Beaumont Basin is located in the San Gorgonio Pass, a low-relief highland that is bordered on the north by the San Bernardino Mountains, on the southeast by the San Jacinto Mountains, and on the west by the San Timoteo Badlands. Surface sediments in the Beaumont Basin and nearby lowlands consist of unconsolidated to semiconsolidated Quaternary alluvium. Surrounding the alluvial sediments are semiconsolidated rocks of the San Timoteo Formation and igneous and metamorphic rocks that make up the San Jacinto and San Bernardino Mountains (see Figure 3-2). The San Timoteo Formation is composed primarily of sandstone, conglomerate, siltstone, and mudstone (Rewis, et al., 2007). The igneous and metamorphic rocks form the crystalline basement rocks in the area (Bloyd, 1971). The unconsolidated Quaternary alluvium and the upper portion of the underlying San Timoteo Formation constitute the water-bearing aquifer of the Beaumont Basin (Rewis, et al., 2007).

3.1.3.2 Faults

The boundaries of the Beaumont Basin are based on faults that often form barriers to groundwater flow (Bloyd, 1971). Major faults in the area include the Banning and Cherry Valley faults, which form the northern boundary of the basin (see Figure 3-2). Groundwater levels within the Beaumont Basin are generally lower than groundwater levels in the surrounding areas. Along the Banning Fault, groundwater levels on the north side of the fault and outside the basin are as much as 400 ft higher than groundwater levels on the south side of the fault and inside the basin. The same condition has been observed along the southern Beaumont Basin boundary.

3.1.3.3 Groundwater Occurrence and Flow

Groundwater in the Beaumont Basin occurs at depth in the Quaternary alluvium and the underlying San Timoteo Formation. Groundwater flow within the Beaumont Basin generally depends on location with respect to a groundwater flow divide which occurs in the center of the basin, approximately coincident with the Noble Creek drainage (see Figure 3-2). West of the Noble Creek drainage, groundwater generally flows to the northwest and ultimately as

underflow beneath San Timoteo Wash. East of the Noble Creek drainage, groundwater flows to the southeast towards the City of Banning.

The groundwater system in the Beaumont Basin is replenished from multiple sources. These include:

- Infiltration of precipitation within the unlined portions of natural streams
- Subsurface seepage across fault boundaries
- Return flow from irrigation and individual septic systems
- Artificial recharge in man-made basins (e.g. Noble Creek Recharge Facility).

Groundwater discharges from the Beaumont Basin primarily occur from:

- Groundwater production
- Underflow out of the basin at the downgradient margins
- Rising water in San Timoteo Creek
- Evapotranspiration

3.2 Production

The Beaumont Basin Watermaster is responsible for the tracking and accounting of groundwater production by all producers named in the Judgment regardless of the amount of groundwater produced. Other producers, not listed in the Judgment, and pumping less than 10 ac-ft /yr., also known as minimal producers, are exempt from the provisions of the Judgment. Figure 3-3 illustrates the location of all production wells that belong to the Appropriators and Overlying parties of the Judgment.

3.2.1 Appropriative Party Production

There are five Appropriative Producers; namely, City of Banning, City of Beaumont, the BCVWD, the SMWC, and the YVWD. The amount that each Appropriator produces in any given year, without incurring a replenishment obligation, varies from year to year and results from a combination of:

- Their share of the Operating Yield, based on the Temporary Surplus of 16,000 ac-ft/yr for all Appropriators,
- Transfers from other Appropriators,
- Transfers of unused production from Overlying Producers,
- Water withdrawn from their storage account, and
- New yield created by the Appropriator.

It should be noted that beginning in 2014, the Temporary Surplus is no longer available to the Appropriators as it officially ended during Fiscal Year 2013.

Annual production by well for each of the five Appropriative Parties for the CY 2003-2011 period is summarized in Table 3-1A while monthly production for the last five years of operation (CY 2012-16) are presented in a series of tables starting with Table 3-1B for CY 2012 and continuing on an annual basis through Table 3-1F for CY 2016. Tables 3-1B (2012) and 3-1C (2013) also include the overall Temporary Surplus Allocation and the amount of unused production that is eligible for storage for each Appropriator. The year 2013 was the last year that the Temporary Surplus was allocated. It should be noted that all production by Appropriators is currently being metered; however, no information is available as to the accuracy of existing meters.

During CY 2016, Appropriators pumped a combined amount of 11,989.70 ac-ft of groundwater from the Beaumont Basin representing the fifth lowest annual production year since the inception of the Judgment. While groundwater production by Appropriators in CY 2016 was 8.1 percent higher than 2015 production, it was approximately 10 percent lower than the 10-year running average of 13,270 ac-ft/yr.

Compared to groundwater production totals for CY 2015, production for individual agencies in CY 2016 was mixed. The City of Banning production dropped by 12 percent; however, production by BCVWD and SMWC increased by 13 percent and 11 percent respectively. Production by YVWD was rather minimal as less than five ac-ft were pumped during the year. A comparison of production against a 10-yr running average, all agencies underproduced. BCVWD production was lower by less than one percent while production by the City of Banning and SMWC were lower by 23 and 17 percent respectively. YVWD production was less than one percent of the 10-yr average.

3.2.2 Overlying Party Production

Overlying Parties are defined in the Judgment as persons, or their assignees, that are part of the Judgment and who are owners of land which overlies the Beaumont Basin and have exercised Overlying Water Rights to pump therefrom. Overlying Parties include successors in interest and assignees. Overlying Producers were assigned a share of the Basin's Safe Yield, estimated in 2003 at 8,650 ac-ft/yr. Individual Overlying Producers may not pump more than five times their assigned share of the Basin's Safe Yield in any five-year consecutive period without incurring a replenishment obligation.

Currently, there are 17 Overlying Producers in the Basin pumping from 22 groundwater wells. All active wells operated by the larger producers are metered. Meters were installed by individual owners or as part of an effort initiated by Watermaster in 2013 to obtain a closer production accounting from Overlying Parties. Production from metered wells represented close to 99 percent of the total production by Overlying Parties in CY 2016.

The remaining wells, operated by smaller producers, did not have meters for some or most of 2016 and their production is estimated using the water duty method. This method was initially proposed by Wildermuth Environmental Inc. (WEI), during the preparation of the 2005-06 Annual Report. After being accepted by the Watermaster, an updated water duty method was developed by WEI and it has been used since. The estimate of unmetered production for the CY 2016 Annual Report uses the updated method developed by WEI as detailed in Appendix C.

Similar to the production reported for the Appropriators, a series of tables was developed to report monthly and annual production from the Overlying Parties on a calendar year basis. Starting with Table 3-2A, annual production is documented for CY 2003-11; Table 3-2B through 3-2F summarize monthly production by Overlying well for CY 2012 through CY 2016. In addition, these tables show their share of the safe yield and the amount of unused water for each Overlying Party is shown. It should be noted that these tables have been revised to reflect updated production records from Sharondale Mesa Owner Association since 2011.

During CY 2016, Overlying Producers produced an estimated 1,683 ac-ft; this level of production is approximately 7.7 percent lower than in 2015 and the lowest on record since accounting began in 2003. Part of the reason is related to revisions made to production totals by Oak Valley Partners in CY 2015. Production by this Overlying Party has been reported in the past at approximately 310 ac-ft per year under the assumption that a significant amount of water has been produced for agricultural purposes. A field visit to the property conducted in early April 2015 revealed that agricultural production has not taken place in that area since 2008. In addition, two of the four wells have been abandoned and the other two produce minimally; annual production has been conservatively estimated at 2.5 ac-ft/yr. Production quantities from this Overlying Producer were revised for CY 2008 through 2016.

3.2.3 2003-2015 Annual Production Summary

Annual production for all Appropriators and Overlying Parties since 2003 is summarized in Table 3-3 on a calendar year basis. Production from 2003 only includes production for the second half of the year. Since July 2003, a total of 211,999 ac-ft have been pumped from the Beaumont Basin; an estimated 83 percent of this total has been pumped by Appropriators. The percentage of groundwater production from Appropriators has steadily increased since the Judgment inception from a low of 74.3 percent registered in CY 2003 to a high of 89 percent recorded in CY 2014 and has averaged 87.2 percent over the last five calendar years.

Groundwater production peaked in CY 2007 when close to 20,000 ac-ft were pumped from the basin; since, it declined steadily through 2010 to approximately 13,600 ac-ft; however, production during the 2011-14 period increased by 23.6 percent. Total groundwater production from the basin in CY 2016 was only 13,673 ac-ft; the fourth lowest recorded since the inception of the judgment. Of this amount, 11,989.7 ac-ft were pumped by Appropriators representing close to 88 percent of total production. Annual production for each of the Appropriators and for the Overlying Producers combined is depicted in Figure 3-4.

3.3 Groundwater Recharge

The Watermaster is responsible for maintaining an annual account of all water artificially recharged in the Beaumont Basin and any losses of water supplies or Safe Yield resulting from such recharge water. Sources of groundwater recharge include imported water from the State Water Project (SWP), recycled water, and new yield sources developed in the basin since the Judgment inception in July 2003. The Watermaster has maintained the accounting of groundwater recharge; however, losses from the basin, if any, have not been estimated. Table 3-4 presents a summary of the annual groundwater recharge in the Beaumont Basin since 2003 on a calendar year basis.

3.3.1 State Water Project Water Recharge

BCVWD's Noble Creek spreading facility, located in the vicinity of Beaumont Avenue and Cherry Valley Boulevard, is the only facility in the Beaumont Basin where deliveries of imported water can be used to recharge the groundwater basin. The location of this spreading facility is depicted in Figure 3-3. Deliveries of imported water are conducted through the San Gorgonio Pass Water Agency, which is the State Water Contractor for this area.

The BCVWD began taking deliveries of imported water for groundwater recharge in the Fall of 2006 when 3,501 ac-ft were spread pursuant to the storage and recharge agreement on file with Watermaster. Deliveries of imported water for BCVWD increased over the next five years peaking in CY 2011 at 7,979 ac-ft and declining through 2015 to an all-time low of 2,773 ac-ft. Spreading of imported water in CY 2016 at 9,319 ac-ft was the highest recorded. A total of 58,531 ac-ft of imported water have been spread by the BCVWD since 2006 as illustrated in Table 3-4. Values provided by the SGPWA for CY 2016 need to be checked against information to be provided by the BCVWD.

The City of Banning began purchasing imported water for recharge at the BCVWD's Noble Creek facility in July 2008 and has since recharged 10,592 ac-ft. in accordance with their storage agreement on file with Watermaster. During CY 2012 and 2013, the City of Banning spread an average of 100 ac-ft per month; spreading in CY 2014 and 2015 was reduced to approximately half of the amount spread during the previous two years. However, spreading in CY 2016 increased again to 1,477 ac-ft.

In addition to imported water deliveries to BCVWD's Noble Creek facility, SGPWA has also delivered significant quantities of imported water at the Little San Gorgonio Creek Spreading Ponds. These spreading ponds are located outside the adjudicated boundary of the Beaumont Basin and to the north of the Banning Fault, as shown in Figure 3-3. Spreading of imported water at these spreading ponds is likely to be a source of subsurface recharge to the Beaumont Basin; however, Watermaster has not adopted this finding. Subsurface recharge across the Banning Fault was investigated as part of the Safe Yield of the Basin determination study, completed in early 2015.

Deliveries of imported water by the SGPWA to the Little San Gorgonio Creek Spreading Ponds began in August 2003; the agency has since recharged a total of 10,507 ac-ft averaging 808 ac-ft/yr. Deliveries in CY 2013, at 881 ac-ft, were less than half of the amount spread in CY 2011 and CY 2012. Deliveries in CY 2014 through CY 2016 were basically non-existent as less than 44 ac-ft were spread in those three years combined. Currently, the SGPWA is in the process of finalizing a storage agreement with the Beaumont Basin Watermaster.

3.3.2 Recycled Water Recharge

Prior to March 2010, Beaumont's recycled water from Wastewater Treatment Plant No. 1 was discharged at Discharge Point No. 1 (DP-001) in Cooper's Creek where it infiltrates into the San Timoteo Management Zone and outside the Beaumont Basin. Starting in March

2010, Beaumont began deliveries of recycled water to Discharge Point No. 7 (DP-007), located along an unnamed tributary of Marshall Creek, as shown in Figure 3-3. It is believed that a portion of the recycled water discharged at this location reaches and recharges the Beaumont Basin; should this be the case, this would be considered a new source of supplemental water for which Beaumont should receive credit pursuant to the storage agreement with the Watermaster and Section 5.4 of the Rules and Regulations. Technical documentation of the amount of recycled water that reaches and recharges the Beaumont Basin would need to be prepared by Beaumont and considered and accepted by Watermaster. It should be noted that deliveries to DP-007 ceased in the Fall of 2015 due to mechanical failure of a pump station.

In CY 2016, the City of Beaumont discharged an estimated 3,533 ac-ft of recycled water at DP-001 in Cooper's Creek; no discharges were made at DP-007. Recycled water discharges in CY 2016 were approximately five percent higher than in CY 2015. Monthly discharges at DP-001 vary slightly monthly from a low 3.01 mgd in March to a high of 3.26 mgd in August; the average for the year was 3.15 mgd. Monthly recycled water discharges by the City of Beaumont since 2007 are summarized in Table 3-5.

3.3.3 New Yield Stormwater Recharge

Before accounting for any new yield resulting from the recharge of local surface water, not initially considered as part of the Basin Safe Yield, Watermaster needs to develop a methodology to quantify and credit the New Yield to the party that creates the new recharge. According to Part VI Paragraph 5.V of the Judgment, Watermaster shall make an independent scientific assessment of the estimated new yield created by each proposed project. It is our understanding that the City of Beaumont has been recharging local waters at various locations in the Basin and would like to receive credit for the New Yield developed. For Beaumont to receive credit however, Watermaster will need to develop the methodology to compute and credit the New Yield dating back to the Judgment inception in February 2003 or since delivery of flows began, whichever is latest.

3.4 Water Transfers and Adjustments of Rights

Section 7 of the Watermaster Rules and Regulations, as amended in September 2008, provides for the adjustment of rights by and between Appropriators and Overlying Parties. This section indicates that Watermaster shall maintain an accounting for all transfers and include said transfers in the Annual Report or other relevant document. There are three types of transfers that Watermaster accounts for: a) transfer of water rights and/or water in storage between Appropriator Producers, b) transfer of water rights from Overlying Producers to an Appropriator Producer in exchange for water service, and c) the allocation of unused Overlying Water to the Appropriator Parties based on their share of the Operating Safe Yield.

According to Part VI, Administration, Paragraph 5Y of the Judgment, the Safe Yield of the Beaumont Basin shall be redetermined at least every 10 years after the date of entry of the Judgment, February 4, 2004. In 2015 the Safe Yield of the Beaumont Basin was redetermined and estimated at 6,700 ac-ft/yr. This amount represents a 22.54 percent reduction from the previous estimate of 8,650 ac-ft/yr. Table 3-6 presents the initial and

revised production rights from individual Overlying Producers and compares them against actual groundwater production during the 2012-16 five year period for each user. Annual average groundwater production during this period for all Overlying Producers combined was estimated at 1,893 ac-ft/yr; representing approximately 28 percent of the revised safe yield. Individually, none of the Overlying Producers produced more than their allowable production rights during this five year period; Sharondale Mesa Owners Association produced the highest percentage of their respective allocation at 78.6 percent followed by California Oak Valley Golf and Resort LLC at 77.8 percent and Tukwet Canyon Golf Club at 60.7 percent.

3.4.1 Transfers between Appropriators

According to Section 7.3 of the Rules and Regulations, an Appropriator may transfer all or a portion of its production right or water in storage that exceeds its supply needs to another Appropriator. In January 2008, the SMWC and the BCVWD entered into a transfer agreement that allows BCVWD the option to purchase all water that SMWC determines to be available for transfer from their storage account. As part of the agreement, each year the SMWC estimates the amount of water available for transfer and offers it to the BCVWD for purchase prior to offering it to other Appropriators. Since the beginning of the agreement, SMWC has transferred 9,500 ac-ft of water to BCVWD with 3,500 ac-ft transferred in CY 2011. SMWC also transferred 1,500 ac-ft of water to Banning in CY 2007. The purchase agreements and transfers between these agencies are on file with Watermaster. Water transfers between Appropriators were not reported during CY 2016.

3.4.2 Transfers of Overlying Rights for Service by an Appropriator

The Judgment, under Part III, Paragraph 3, provides that to the extent an Overlying Party request water service from an Appropriator Party, and uses its adjudicated water rights to obtain said service; an equivalent volume of groundwater shall be reserved for the Appropriator Party providing the service to the Overlying Party. Further, Section 7 of the Rules and Regulations indicates that both the Overlying and Appropriator will file a Notice of Adjustments of Rights with Watermaster within 30 days after entering a service agreement.

The BCVWD has given verbal notification to Watermaster that is providing potable service to certain Overlying Parties; however, formal notification by either party for the adjustment of water rights has not been received by Watermaster. A formal notification will be required to complete the transfer of water rights from one or more Overlying Producers to BCVWD; the notification should be retroactive to the time service began. Upon formal completion of the transfer, Watermaster will be required to recalculate the allocation of unused Overlying Water to the Appropriators, as documented in Section 7 of the Rules and Regulations.

In early 2013, BCVWD provided detailed documentation of all the parcels now served by the District that were previously owned by Overlying Users including parcels owned by Oak Valley Partners, Southern California PGA, and Plantation on the Lake. The accounting of this information has been challenged by the Morongo Band of Mission Indians representatives. As of the time of this writing, the accuracy of the information has not been corroborated and it is therefore not included in this report.

3.4.3 Allocation of Unused Overlying Water

Section 7.8 of the Rules and Regulations, adopted on September 9, 2008, by Watermaster, outlines the process for distributing the volume of adjudicated water not produced by the Overlying Parties to the Appropriators. Under this section, if an Overlying Party produces less than five times of their share of the safe yield in any five-year period, the quantity of groundwater not produced by that Overlying Party shall be made available for allocation to the Appropriators. Transferring of unused production from Overlying Users does not diminish their legal right to produce in subsequent years.

Since the inception of the Judgment, transfers of unused production by Overlying Users has been made on a fiscal year basis coinciding with the preparation of the annual report. Preparing the annual report on a calendar year basis required that the transfers of unused production also be made on the same basis. Based on the five-year format used in the Rules and Regulations, transfers to the Appropriator Parties for CY 2016 were based on unused production from Overlying Users in CY 2011. This required the recalculation of Overlying Users production, back to July 2003, on a calendar year basis. Under this format, unused production from the second half of 2003, with adjusted water rights for half of the year, was allocated to Appropriators for CY 2008. Table 3-7 summarizes the volume of unused Overlying water for CY 2003 through CY 2016. While groundwater production by Overlying Users has decreased by over 40 percent since 2004, the volume of unused overlying water has correspondingly increased from 5,053 ac-ft/yr in CY 2006 to a maximum of 6,679 ac-ft during CY 2011. The amount of unused production decreased significantly in CY 2014 and CY 2015 to slightly over 4,800 ac-ft/yr because of reduced Overlying allocations resulting from the new basin Safe Yield of 6,700 ac-ft/yr.

Table 3-7 presents the allocation of unused Overlying water to each Appropriator based on their shares of the safe yield and the schedule set forth under Section 7.8 of the Rules and Regulations. It should be noted that this schedule has been modified to reflect a calendar year basis for allocation. Under the modified schedule, unused Overlying production in CY 2011, estimated at 6,679 ac-ft, is allocated to Appropriators during CY 2016. Unused Overlying production during CY 2016, estimated at 5,017 ac-ft and subject to revision, would be allocated to Appropriators during CY 2021.

3.5 Storage Accounting

Section 6.7 of the Watermaster Rules and Regulations indicates that Watermaster shall calculate additions, extractions, and losses of all water stored and any losses of water supplies or Safe Yield resulting from such water stored. This section further indicates that Watermaster shall keep and maintain for public record an annual accounting thereof. While additions (spreading) and extractions (pumping) are easily quantifiable, losses from storage are more difficult to estimate. A methodology for estimating groundwater losses from the Basin is anticipated to be developed after the completion of the groundwater model update of the Beaumont Basin in CY 2015.

3.5.1 Annual Storage Consolidation

Consistent with the new reporting format to document extractions, spreading and other groundwater activities on a calendar year basis, Table 3-8 represents the consolidation of each Appropriator's storage account from CY 2003 through CY 2016. This table includes annual production by Appropriator, their share of Temporary Surplus, supplemental water recharge in its various forms, transfers between Appropriators, potable deliveries to parcels previously owned by Overlying Users, and transfers of unused water from Overlying Users. At the end of 2015, an overall total of 95,629.9 ac-ft of water were stored in the Basin for future use; this total increased in CY 2016 by 5,795 ac-ft to a cumulative total of 101,425.0 ac-ft. Increased spreading of imported water by BCVWD and the City of Banning along with low production totals by YVWD and SMWC were the primary reasons for the increase in groundwater storage. Despite of the expiration of the Temporary Surplus allocation at the end of CY 2013, the amount of water in storage at the end of CY 2016 was 612 ac-ft higher. The amount of water in storage by party at the beginning and end of CY 2016 is as follows:

Agency / Party to the Judgment	Calendar Year 2016 (ac-ft)		
	Beginning	Ending	Change
City of Banning	47,887.5	49,990.8	2,103.4
BCVWD	25,567.6	27,565.9	1,998.3
City of Beaumont	0.0	0.0	0.0
South Mesa Water Company	8,198.4	8,987.5	789.1
Yucaipa Valley Water District	13,976.4	14,880.8	904.4
Morongo Band of Mission Indians	0.0	0.0	0.0
TOTAL in storage	95,629.9	101,425.0	5,795.1

3.6 Changes in Groundwater Levels in the Beaumont Basin

3.6.1 Analysis of Groundwater Level Changes

Changes in groundwater flow and groundwater levels between 2015 and 2016 were evaluated using a calibrated groundwater flow model that was previously developed to reevaluate the safe yield of the Beaumont Basin (TH&Co, 2015). For this analysis, the existing calibrated model was updated with groundwater pumping, recharge, and groundwater levels through the end of 2016. A model-generated groundwater contour map was created for Fall 2016 and compared to the model-generated Fall 2015 groundwater contour map in order to evaluate changes in groundwater flow patterns and basin-wide changes in groundwater levels. The model-generated groundwater contour maps for 2015 and 2016 are shown on Figures 3-5 and 3-6, respectively.

Groundwater flow within the Beaumont Basin generally depends on location with respect to a groundwater flow divide which occurs in the center of the basin approximately coincident with the Noble Creek drainage. West of the Noble Creek drainage, groundwater generally flows to the northwest and ultimately towards San Timoteo Wash. East of the Noble Creek drainage, groundwater flows to the southeast towards the City of Banning. The groundwater flow directions did not change significantly between 2015 and 2016 except near the Noble Creek Recharge Facility where a localized mount can be seen in 2016.

Basin-wide groundwater level trends in the Beaumont Basin were evaluated based on hydrographs from eights key wells and the groundwater level change map developed by subtracting the 2015 groundwater surface from the 2016 groundwater surface (See Figures 3-7 and 3-8). In the northwest portion of the basin (YVWD 34 and Singleton Ranch 7), groundwater levels remained stable or increased between November 2015 and November 2016. At Tukwet Canyon Golf Club C, groundwater levels continued a steady decline in 2016 that has been observed since 2003. When evaluated on a long-term basis, groundwater levels in wells in the western portion of the basin have shown a general long-term decline since approximately 2005.

As shown on Figure 3-8, groundwater levels in the north central portion of the basin rose as much as 40 ft in 2016 as a result of renewed recharge at the Noble Creek Artificial Recharge facility. Conversely, groundwater levels in TW-1, located on the northeast corner of the recharge facility continued a decline that had started in 2014. This well is perforated in the lower aquifer and typically shows a delayed response to groundwater recharge relative to wells perforated in the upper aquifer.

In the south-central portion of the basin, groundwater levels at Oak Valley No. 1 increased in 2016 by over 10 feet. At BCVWD Well No. 2, groundwater levels rose in March 2016 to the highest levels in eleven years, declined in the summer, and have been rising since September. At Banning Well C-4 (southeast Beaumont Basin), groundwater levels were rising in April, declined in the summer, and began increasing in October.

The variability of groundwater levels at BCVWD Well No. 2 and Banning Well C4 are likely due to seasonal pumping patterns in these areas. Groundwater levels in the northeast portion of the basin (335714116565002) have been trending upward since 2010 and have remained mostly stable in 2016.

3.6.2 Analysis of Change in Groundwater Storage

Basin-wide change in groundwater storage between Fall 2015 and Fall 2016 was analyzed as a function of the difference in groundwater levels across the basin and the specific yield of the aquifer sediments. Groundwater level change across the basin was analyzed using the following procedure:

1. The Fall 2014 and Fall 2015 model-generated groundwater contour maps were each converted into three-dimensional raster surfaces.
2. The basin was discretized into 100-ft by 100-ft grid cells.

3. Attributes were assigned to each grid cell including groundwater level change and specific yield.
4. The resulting attribute table was processed in a Geographic Information System (GIS) for calculating the change in storage.

The specific yield distribution used for the analysis was obtained from the calibrated groundwater flow model used to evaluate the safe yield of the Beaumont Basin, as summarized in TH&Co (2015).

Results of the analysis show an increase in groundwater storage within the adjudicated basin of approximately 1,279 acre-ft between Fall 2015 and Fall 2016. The net storage increase is attributable to artificial recharge of imported water at the Noble Creek Artificial Recharge facility. Most of the western and southern areas showed decreases in groundwater in storage

3.7 Operating Safe Yield

For purposes of this annual report, the annual operating safe yield (OSY) describes the net infiltration to the adjudicated groundwater basin (not including artificial recharge) for any given year. It is noted that the OSY is different than the Operating Yield, which is a function of the unused overlyer production (Appropriative Water) and Temporary Surplus, as described in the Beaumont Basin Judgment (San Timoteo Management Authority v. Banning et al., 2004).

Operating safe yield is estimated based on the following equation:

$$OSY = \frac{\Sigma P + \Delta S - \Sigma AR}{\Delta T}$$

where:

ΣP	=	The sum of groundwater production (ac-ft)
ΔS	=	The change in groundwater storage (ac-ft)
ΣAR	=	The sum of groundwater recharge (ac-ft)
ΔT	=	The time over which the OSY is estimated (years)

Total Beaumont Basin groundwater production in calendar year 2016 was 13,777 ac-ft (see Table 3-3). Total artificial recharge in calendar year 2016 was 10,746 ac-ft (see Table 3-4). It is noted that only the Noble Creek Recharge Facility recharge was used in the analysis of OSY (recharge at the Little San Gorgonio Creek facility is not included because it is outside the adjudicated area). The change in groundwater storage estimate is based on the analysis of groundwater levels described earlier in this TM. The period of time over which the OSY is evaluated is one year. The resulting OSY is estimated as:

$$OSY = \frac{13,777 + 1,279 - 10,796}{1} = 4,260 \text{ ac-ft}$$

It is emphasized that the OSY, as presented herein, is based on one year of data. When evaluated on a long-term basis, this methodology can be used to estimate the long-term Safe Yield of the basin, as defined in the Beaumont Basin Judgment. As required by the Judgment, the Safe Yield of the basin was reevaluated in 2013.

It is also noted that there are a number of data limitations that could impact the OSY estimate. These limitations include:

- Accuracy of Overlyer Production Data – Production data from many of the Overlying Parties is not metered but is estimated based on a water duty method (Wildermuth Environmental, 2012). In addition to inherent limitations in this methodology, there are, in some cases, discrepancies between groundwater production estimated using the water duty method and production reported by individual parties to the California State Water Resources Control Board. Resolution of Overlyer Production is anticipated to affect the OSY (plus or minus) on the order of hundreds of ac-ft (not thousands).

- Change in Storage Calculation – Although groundwater storage change estimates will always have inherent uncertainty, it is possible to develop more representative results through collection and analysis of additional data. These data include:

    - ✓ Static groundwater levels from dedicated non-pumping wells. There is evidence that groundwater levels measured in some wells had not recovered fully between pumping cycles in the w ell and were not, therefore, representative of true static conditions. This can be addressed by waiting longer after pumping to collect groundwater levels or constructing/designating non-pumping groundwater monitoring wells in strategic areas.
    - ✓ Measurement of surface water flow in selected drainages, hydrogeological data near Noble Creek and San Timoteo Creek, and hydrogeological analysis of faults in the basin to help achieve a better calibrated model, resulting in more accurate groundwater head distributions. Bettering our understanding of the hydrogeology of this area will help improve the accuracy of the model and its output.

3.8 Recommendations

The Rules and Regulations, initially adopted in June 2004, were developed with the understanding that they should be revisited and/or revised from time to time to make sure they were consistent with the provisions of the Judgment. Revisions to the Rules and Regulations have been made over the years with the latest revision changing the reporting of Watermaster activities from a fiscal year basis to a calendar year basis.

Since the completion of the previous report, Watermaster is in the process of conducting additional groundwater studies, expected to be completed by early 2015, that may be used to address some of the recommendations from previous years including:

- The development of a methodology to account for new yield from capturing local stormwater in the basin.
- The development of a methodology to account for groundwater storage losses in the basin resulting from the spreading of additional water sources.
- The development of a methodology to account for recycled water recharge.

In preparing this annual report and through the review of previous annual reports, we have identified a number of issues/activities that should be considered by the Watermaster to ensure accurate accounting of production, transfers, recharge, and storage. It should be noted that many of the recommendations provided in this section have been previously documented in prior annual reports. Our recommendations are as follows:

- Develop a protocol to increase the accuracy and consistency of data reported to the Watermaster. Watermaster should identify a person and/or entity to be the central repository for data collection, transfer, and exchange. This person/entity shall be responsible for the collection and distribution of all groundwater production, water level, groundwater recharge, and water quality information. Quality control of the data in its various forms including checks for errors, omissions, and inconsistencies between the reporting agencies and/or parties should be part of this process.
- Develop a policy to account for transfers of water that may result when an Appropriator provides water service to an Overlying Party. Section 7 of the Rules and Regulations, Adjustments for Rights, provides initial guidelines to execute this transfer; however, it needs to be enhanced in the following areas: a) data requirements to complete the transfer, b) review process by Watermaster, c) schedule for completion so that proper accounting of transfers can be given and documented in the annual report.

As indicated earlier, Watermaster should revisit the Rules and Regulations to ensure that its activities are consistent with the requirements of the Judgment. The following inc onsistencies between guidelines provided in this document and current Watermaster activities were identified:

- Watermaster has not conducted a meter maintenance program, as required under Section 3.1 of the Rules and Regulations, to make sure groundwater production is reported accurately. Individual parties may or may not maintain and calibrate their production meters at acceptable intervals.
- Under Section 3.2 of the Rules and Regulations, producers producing in an excess of 10 ac-ft/yr. should report on a monthly basis by the 15th day of the ensuing month while those producing less should file on an annual basis by the 15th of July. This

provision should be revised as it was written for fiscal year accounting. Overlying Parties producing less than 10 ac-ft/yr should report by the 15th of January now that calendar year accounting is used. Proper supporting information should be provided.

- Watermaster has not enforced the submittal of notices of transfers prior to accounting for said transfers as defined in Sections 7.1 through 7.5 of the Rules and Regulations.
- Watermaster has not filed its annual reports with the Court. The Watermaster Board should make a formal determination as to whether the annual reports should be filed with the Court.

1.- Calendar Year Production. All values rounded and subject to revision based on receipt of more accurate information.

2.- 2003 Production only includes from July to December to account for first half of Fiscal Year 2004 Production.

3.- Pursuant to Part I, Paragraph 3 B of the Judgment, and a separate Agreement (a copy of which is on file with the Watermaster).

4.- Volume of water available for storage is equal to the positive difference between the temporary surplus allocation and the volume of groundwater produced by each agency. Temporary surplus based on 16,000 ac-ft/yr allocated from Fiscal Year 2004 to Fiscal Year 2013. Annual allocation is as follows: a) City of Banning, 5,029 ac-ft/yr, b) Beaumont Cherry Valley Water District, 6,802 ac-ft/yr, c) South Mesa Water Company, 1,996 ac-ft/yr, and d) Yucaipa Valley Water District, 2,173 ac-ft/yr. Allocations for 2003 are based on 50 percent of the annual allocation to acount for the second half of the year only.

1.- All values rounded and subject to revision based on receipt of more accurate information

2.- Volume of water available for storage is equal to the positive difference between the temporary surplus allocation and the volume of groundwater produced by each agency. Temporary surplus based on 16,000 ac-ft/yr allocated from Fiscal Year 2004 to Fiscal Year 2013. Annual allocation is as follows: a) City of Banning, 5,029 ac-ft/yr, b) Beaumont Cherry Valley Water District, 6,802 ac-ft/yr, c) South Mesa Water Company, 1,996 ac-ft/yr, and d) Yucaipa Valley Water District, 2,173 ac-ft/yr.

3.- Pursuant to Part I, Paragraph 3 B of the Judgment, and a separate Agreement (a copy of which is on file with the Watermaster).

1.- All values rounded and subject to revision based on receipt of more accurate information

2.- Volume of water available for storage is equal to the positive difference between the temporary surplus allocation and the volume of groundwater produced by each agency. Temporary surplus for 2013 is based on 8,000 ac-ft corresponding to half of the 16,000 ac-ft allocated between 2004 and 2012 . Annual allocation is as follows: a) City of Banning, 2,514.5 ac-ft/yr, b) Beaumont Cherry Valley Water District, 3,401 ac-ft/yr, c) South Mesa Water Company, 998 ac-ft/yr, and d) Yucaipa Valley Water District, 1,086.5 ac-ft/yr.

3.- Pursuant to Part I, Paragraph 3 B of the Judgment, and a separate Agreement (a copy of which is on file with the Watermaster).

1.- All values rounded and subject to revision based on receipt of more accurate information.

2.- Annual production is estimated for Overlying parties with un-metered wells.

3.- Metering began in late 2004 and was not reported monthly. One total production value for each well was reported to Watermaster for FY 2003/04 . For the conversion to CY accounting, it was assumed that CY 2004 production for this entity was equal to FY 2003/04 production (1,227.4 acre-ft).

4.- Provided copies of state filing with annual calendar year totals for each well. Production values for Singleton Ranch #5 and Irrigation Stokes are estimated by Oak Valley Partners through 2007. Starting in 2008, production was reduced to ar estimated 2.5 ac-ft/yr as agricultural use of the land ended. Estimate based on water use by a single farm house and a small cattle population.

5.- The Southern California Section of the PGA of America changed to East Valley Golf Club in 2007 and to Tukwet Canyon Golf Course in 2010. Monthly production provided by the Morongo Band of Mission Indians - 03/14.

TOTAL														**2,085.4**	**8,650.0**	**6,564.6**

1.- All values rounded and subject to revision based on receipt of more accurate information in the future.

2.- Total production is estimated for Overlying parties with un-metered wells.

3.- Monthly production provided by BCVWD - Feb 2013. Production by Plantation on the Lake for 2012 was not available; 2011 production values were used.

4.- Starting in 2008, the parcels owned by Oak Valley Partners were no longer used for agricultural purposes. Groundwater production was estimated at 2.5 ac-ft/yr based on water use by a single farm house and a small cattle population.

5.- Monthly production since 2011 provided by Clearwater Solutions, a company in charge of operating the water system.

6.- Actual monthly production provided by the Morongo Band of Mission Indians - March 2014.

1.- All values rounded and subject to revision based on receipt of more accurate information in the future.

2.- Total production is estimated for Overlying parties with un-metered wells.

3.- Monthly production provided by BCVWD - Feb 2014

4.- Starting in 2008, the parcels owned by Oak Valley Partners were no longer used for agricultural purposes. Groundwater production was estimated at 2.5 ac-ft/yr based on water use by a single farm house and a small cattle population.

5.- Monthly production since 2011 provided by Clearwater Solutions, a company in charge of operating the water syste

6.- Actual monthly production provided by the Morongo Band of Mission Indians - March 2014.

1.- 2003 groundwater production only includes Jul-Dec time period.

2.- Formerly known as the East Valley Golf Course and the Southern California Section of the PGA of America.

3.- Formerly Known as Sunny Cal North - Manheim, Manheim & Berman.

1.- SWP water recharged in the BCVWD Noble Creek Recharge Facility

2.- The City of Beaumont is seeking credit for recycled water recharge in the Beaumont Basin from DP-007 in an unnamed tributary to Marshall Creek. A technical demonstration of the estimated amount of recharge in the Beaumont Basin is pending.

3.- SWP water recharged in the Pass Agency's Little San Gorgonio Creek Spreading Ponds

1 – Negative values of under production indicate that the appropriator pumped more than its share of the operating yield.

Section 4
Water Quality Conditions

The purpose of this section is to document the water quality conditions in the Beaumont Basin during the 2011-2015 reporting period. TDS and nitrate concentrations in the basin are compared against groundwater quality objectives for anti-degradation and maximum benefit as established by the Regional Board for TDS and nitrate-nitrogen in the Beaumont Management Zone (BMZ). In addition, water quality concentrations for a number of compounds are compared against Federal and State Drinking Water Standards. Figure 4-1 depicts all the wells that have groundwater quality data for the reporting period.

4.1 Comparison with Management Zone Objectives

Groundwater quality objectives for anti-degradation and maximum benefit have been established by the Regional Board for TDS and nitrate-nitrogen in the BMZ, which encompasses portions of the Beaumont Basin, the Singleton and South Beaumont basins, and limited portions of Edgar Canyon above the Banning Fault as illustrated in Figure 4-1. The anti-degradation objectives are based on the historic ambient TDS and nitrate-nitrogen concentration of 230 mg/L and 1.5 mg/L respectively.

The maximum benefit objectives were adopted by the Regional Board in 2004 at the request of STWMA and Beaumont to allow for recharge of imported water and the reuse of recycled water. The maximum benefit object ives, set to 330 mg/L for TDS and 5.0 mg/L for Nitrate-N, are relatively low compared to other basins and are protective of the beneficial uses of the Basin groundwater. According to the Basin Plan, salt mitigation will be required once the ambient TDS and nitrate-nitrogen concentration exceeds the BMZ maximum benefit objectives.

4.1.1 Total Dissolved Solids

Figure 4-2 shows the maximum TDS concentrations for 58 wells measured within and in the vicinity of the Beaumont Basin wells during the 2012-2016 reporting period. A total of 40 wells are located inside the basin with the remaining 18 in the Singleton Basin / Edgar Canyon and the South Beaumont Basin areas.

The maximum TDS concentrations for domestic wells within the basin ranged from 170 to 370 mg/L and averaged 246 mg/L; this average value is 9 mg/L lower than the average maximum TDS concentration reported in the 2008-11 Engineering Report indicating that TDS concentrations have been fairly stable in the last 10 years.

In the Singleton Basin / Edgar Canyon area, the maximum TDS concentration ranged from 260 to 550 mg/L and averaged 330 mg/L. The average TDS concentration for all samples in this area was 311 mg/L.

In the South Beaumont Basin, the maximum TDS concentration ranged from 220 to 780 mg/L and averaged 510 mg/L. The average TDS concentration for all samples in this area was 475 mg/L.

Average and maximum TDS concentrations for all sampled wells within the basin are as follows:

Well Classification	Count	Samples	Average Concentration	Avg Max Concentration
Beaumont Groundwater Basin				
Appropriators	23	65	234	248
Overlyiers	10	14	226	244
Other	7	8	244	244
Total	50	87	234	246
Singleton Basin / Edgar Canyon Area				
All Wells	8	16	311	330
South Beaumont Basin				
All Wells	10	44	475	510

Of the 33 potable wells, 15 wells had a maximum concentration below the anti-degradation objective of 230 mg/L, 16 wells were between the anti-degradation and maximum benefit objective of 330 mg/L, and two exceeded the maximum benefit objective for the BMZ. None of the production wells samples exceeded the secondary federal or state drinking water standard for TDS (500 mg/L). BCVWD wells along Edgar Canyon were not included in the analysis of domestic wells.

In the Singleton Basin / Edgar Canyon area, one well had a maximum concentration below the anti-degradation objective, three wells were between the anti-degradation and maximum benefit objective of 330 mg/L, and the remaining four wells exceeded the maximum objective. In the South Beaumont Basin, one well had a maximum TDS concentration below the anti-degradation objective, one well was between this and the maximum objective, and the remaining eight wells exceeded the maximum objective. Most of the wells with the highest TDS concentrations are located in the South Beaumont Basin. Table 4-1 presents the average and maximum TDS and Nitrate (as N) concentration for all the wells in the Beaumont Basin and surrounding areas.

4.1.2 Nitrate-Nitrogen

Figure 4-3 shows the maximum Nitrate-N concentrations for 58 wells measured within and in the vicinity of the Beaumont Basin wells during the 2012-2016 reporting period. A total of 40 wells are located inside the basin with the remaining 18 in the Singleton Basin / Edgar Canyon and the South Beaumont Basin areas.

The maximum Nitrate-N concentrations for domestic wells owned by Appropriators ranged from 0.6 to 3.6 mg/L and averaged 2.3 mg/L. Maximum concentrations for overlying wells was slightly higher as it ranged from 1.2 to 6.1 mg/L and averaged 2.9 mg/L. The average concentration for all potable wells was 2.0 mg/L.

In the Singleton Basin / Edgar Canyon area, the maximum Nitrate-N concentration ranged from 1.9 to 19.0 mg/L and averaged 7.5 mg/L. The average concentration for all samples in this area was 6.3 mg/L.

In the South Beaumont Basin, the maximum Nitrate-N concentration ranged from 4.0 to 22.0 mg/L and averaged 12.3 mg/L. The average concentration for all samples in this area was 10.7 mg/L.

Average and maximum Nitrate-N concentrations for all sampled wells within the basin are as follows:

Well Classification	Count	Samples	Average Concentration	Avg Max Concentration
Beaumont Groundwater Basin				
Appropriators	23	159	1.7	2.3
Overlyiers	10	21	2.8	2.9
Other	7	8	3.0	3.0
Total	50	188	2.2	2.6
Singleton Basin / Edgar Canyon Area				
All Wells	8	16	6.3	7.5
South Beaumont Basin				
All Wells	10	44	10.7	12.3

Of the 33 potable wells, 14 wells had a maximum concentration below the anti-degradation objective of 1.5 mg/L, 22 wells were between the anti-degradation and maximum benefit objective of 5.0 mg/L, and four exceeded the maximum benefit objective for the BMZ. None of the production wells samples exceeded the primary federal or state drinking water standard for Nitrate-N (10 mg/L). BCVWD wells along Edgar Canyon were not included in the analysis of domestic wells.

In the Singleton Basin / Edgar Canyon area, four wells had a maximum concentration below the anti-degradation objective and four wells exceeded the maximum benefit objective of 5.0 mg/L. There were no wells with nitrate concentrations between the anti-degradation and maximum objectives.

In the South Beaumont Basin, one well had a maximum concentration below the anti-degradation objective; all other nine wells in this area exceeded the maximum objective of 5.0 mg/L. There were no wells with nitrate concentrations between the anti-degradation and

maximum objectives. Table 4-1 presents the average and maximum TDS and Nitrate (as N) concentration for all the wells in the Beaumont Basin and surrounding areas.

4.1.3 Nitrate Studies in the Beaumont Management Zone

Rising nitrate concentrations observed in 2005 along the northern portion of the Basin prompted STWMA to launch an investigation in 2006 to determine the potential impact on groundwater quality from on-site waste disposal systems (OSWDS) commonly used in the Cherry Valley Community of Interest (CVCOI). STWMA retained the services of Wildermuth Environmental Inc. (WEI) to conduct this study.

The results of this study were disputed by the Beaumont Board of Supervisors' Groundwater Quality Evaluation Committee (Committee) as they identified potential shortcomings in sampling design and project execution. The Committee recommended that an independent assessment be conducted. They recommended that the second study should expand the study area, consider reasonable build-out projections and other sources of groundwater contamination. This independent study was conducted by scientist at the University of California, Riverside and funded as a Supplemental Environmental Project by the State Water Resources Control Board. The results of this study were published in early 2012. A brief summary and their findings is presented below for information purposes only.

Summary of Wildermuth Environmental Inc. Study

This study is titled: "*Water Quality Impacts from On-Site Waste Disposal Systems in the Cherry Valley Community of Interest" (WEI, 2007).* The bases for this study include the following:

- A review of scientific literature,
- A field study to estimate nitrogen concentrations in soil water below selected OSWDS,
- A tracer study of nitrogen isotope and pharmaceutical and personal care products (PPCP) to confirm the presence of effluent from OSWDS,
- An estimation of current and future discharge from OSWDS to groundwater,
- A planning-level evaluation of basin impacts using the groundwater flow and nitrate transport model, and
- A review of the threshold used in California to compel sewering when OSWDS contaminate or threaten to contaminate groundwater

The results of the investigation are summarized as follows:

- Parcel density in the CVCOI violates the minimum half-acre parcel size requirement of the Regional Board to be on a septic system.
- Water produced from high nitrate wells in the area has a nitrogen isotopic signature and contain PPCPs consistent with discharge from OSWDS.
- Present contribution of OSWDS discharges is estimated at 665 ac-ft/yr.; this represents about five percent of total recharge to the BMZ. At ultimate buildout, there will be between 4,900 to 8,800 OSWDS in the CVCOI. Discharge contribution from these

OSWDS is estimated between 1,700 and 3,100 ac-ft/yr. representing 13 to 21 percent of total recharge to the BMZ.

- At 4,900 lots, the contributions from OSWDS will significantly impact water quality to the point that well head treatment will be required at certain well locations in order to meet drinking water standards. At 8,800 lots, the contributions from OSWDS will rendered the entire BMZ non-potable.
- Left unmitigated, OSWDS discharges will contribute enough nitrate to exceed the Basin Plan objectives for the BMZ.
- There is sufficient evidence of groundwater contamination by OSWDS to warrant the Regional Board to issue a prohibition on new OSWDS in the CVCOI.

According to WEI, as a result of this investigation, the County of Riverside issued a moratorium, followed by a permanent prohibition on the installation of septic systems in Cherry Valley unless the septic system is designed to remove at least 50 percent of the nitrogen in the wastewater. In 2009, the County passed a new ordinance that removed the prohibition on conventional OSWDS. WEI further indicates that the Regional Board initiated a process in 2009 that may lead to amending the Basin Plan prohibiting conventional OSWDS and regulating the discharges to meet antidegradation objectives.

Summary of University of California, Riverside Study

This study is titled: *"Water Quality Assessment of the Beaumont Management Zone: Identifying Sources of Groundwater Contamination Using Chemical and Isotopic Tracers" (UCR, 2012).*

The study divides the BMZ into four distinct zones; their location is depicted in Figure 2 of the UCR report (not included here). A brief description of the zones is as follows:

Zone 1 – Region Influenced by Wastewater Treatment Plant Effluent. This zone occupies the southernmost area of the BMZ. Water quality in this zone is influenced by effluent from the City of Beaumont wastewater treatment plant.

Zone 2 – Wildland and Low Density Septic Disposal Region. This zone is defined as the area uphill of Edgar Canyon to the north of Cherry Valley. Water quality in this area had low to moderate concentrations of TDS and nitrate.

Zone 3 – Urban Region with On-site Septic Disposal Systems. This zone overlies the Cherry Valley area including the area around the Noble Creek and Little San Gorgonio Spreading Ponds. Human waste from homes and business in this zone is primarily disposed of in on-site waste disposal systems.

Zone 4 – Urban Region with Consolidate Sewer System. Zone 4 comprises those portions of the City of Beaumont utilizing a municipal wastewater system.

The UCR report attempted to answer a series of questions; the questions and a summary of their response is provided below.

1.- Can different groundwater regions within the BMZ be defined using isotope, PPCP, and general chemical parameters?

According to the study,

- Zone 1 was characterized by relatively high levels of PPCPs and it has the highest likelihood for nitrate contamination from human waste.
- Zone 2 had detectable levels of some PPCPs. Septic contributions to groundwater are relatively minor.
- Zone 3 had several wells with clear signs of contamination by septic systems. Groundwater in the central portion of Cherry Valley appeared to be more strongly affected by septic systems than on the periphery of Cherry Valley.
- Zone 4 shows the fewest signs of human waste as most homes are served by consolidated sewer systems.

1A.- Do areas with septic systems have different chemistry than areas with sewers?

The report indicates that there are statistically significant differences between groundwater in areas with septic systems and groundwater where sewer service is available. The concentrations of PPCPs, TDS, Nitrate-N, the sum of base cations, Boron, and Isotopes of Nitrate were all significantly higher in areas with septic systems than in areas with sewer service.

1B.- Do areas where groundwater recharge with water from the State Water Project or wastewater treatment plant effluent have different chemistry from other areas?

Strong evidence of nitrate deriving from human waste was detected in Zone 1 as well as strong biological attenuation of nitrate transported in groundwater.

2.- What sources contribute nitrate to groundwater of the BMZ?

The report indicates that in Zone 1 the isotopes of nitrate values overlap those expected for human or animal waste. Similarly, in Zone 3 the isotopic composition of water suggest a high probability of inputs of nitrate from human or animal waste. The presence of PPCPs in most samples indicates the possibility that septic systems are contaminating groundwater within the central part of Cherry Valley.

3.- How much nitrate from human waste is making its way into the groundwater of the BMZ?

The report documents the following findings:

- Mixing models suggest that between 18 to 30 percent of the nitrate in central Cherry Valley groundwater is derived from septic systems.
- If septic systems were completely phased out, nitrate concentrations in central Cherry Valley groundwater could decline by 30 percent once a steady state condition is achieved. The time to reach a steady state is anticipated to be shorter than in other portions of the BMZ due to relatively high rates of recharge in Zone 3.
- Mass balance calculations show that nitrate-nitrogen inputs from septic systems is one of the largest inputs of nitrogen to groundwater in the BMZ.

- If the waste from septic tanks were to be conveyed to the City of Beaumont WWTP, about 30 percent of the current input of nitrate from human waste to groundwater would be removed.

4.2 Comparison with Federal and State Drinking Water Standards

The California Department of Health Services (CDPH) maintains an active water quality database of all public and private drinking water wells throughout the state. This database, available at CDPH's website, was assessed for the 2012-2016 reporting period for 23 domestic production wells in the Beaumont Basin. The objective of this analysis was to determine whether any of these potable wells had exceeded the Primary or Secondary Federal and State standards or the notification levels set by the state. Federal standards are set by the United States Environmental Protection Agency (USEPA) while state standards in California are set by CDPH. Primary standards at the federal and state level are enforceable criteria that have been established to protect the public against consumption of drinking water contaminants that present a risk to human health. Secondary standards are not enforceable standards; they have been established for aesthetic qualities of water, such as taste, color, and other. Contaminants with a secondary MCL are not considered to present a risk to human health at the established maximum level. Notification levels (NL) are not enforceable standards; however, they require that municipal water suppliers notify the public if the NL for a chemical has been exceeded.

A total of 1,464 water quality results were extracted from the CDPH database for the 23 production wells in the Beaumont Basin. Results were obtained for 176 analytes sampled between 2012 and 2016. The results of the analysis indicate that not a single production well exceeds either the primary or secondary federal and state standards during the reporting period. However, the California Notification Limit for Vanadium (100 ug/day) was exceeded once at SMWC Well No. 4 during the reporting period.

Additional water quality information from 2012 through 2016 was obtained from Dudek Engineering as part of the Maximum Benefit Monitoring Program. A total of 1,356 water quality results were analyzed to determine if the water quality at non-domestic wells exceeded drinking water standards. Drinking standards were exceeded for a limited number of constituents as follows:

- Nitrate-N – Nine of the 17 monitoring wells sampled for Nitrate-N exceeded the federal and state primary MCL of 10 mg/L – Total of 98 readings. All of these wells are located outside the Beaumont Basin.
- pH – Nine of the 16 monitoring wells sampled for pH exceeded the secondary federal MCL of 8.5 – Total of 77 readings. One of these wells is located in the Beaumont Basin.
- Total Dissolved Solids – Nine of the 16 monitoring wells exceeded the federal and state secondary MCL of 500 mg/L – Total of 75 readings. These wells are located outside the Beaumont Basin.

Appendix D contains summary statistics of the analytical results for the 2012-2016 period for all chemicals that have a federal or state drinking water standard whether maximum contaminant levels were exceeded.

4.2.1 Trace Metals

As indicated earlier, not a single domestic well exceeded either the primary or secondary federal and state standards during the reporting period. This represents a significant improvement over previous reporting periods when several wells exceeded the MCL for trace metals. Trace metals are briefly discussed here and compared to previous reporting periods.

Aluminum. There were 42 water samples taken during the reporting period and tested for aluminum. Aluminum concentration at all wells was below 50 ug/L, significantly below the secondary MCL of 200 ug/L. Aluminum above the MCL can add color to water. One well exceeded the MCL during the FY 2004-08 reporting period.

Arsenic. There were 43 water samples collected and tested for arsenic during the reporting period. The highest arsenic concentration was observed at SMWC's Well No. 4; arsenic concentration at this well has increased from 4.2 mg/L in 2009, to 4.6 mg/L in 2012, to the highest value of 5.2 mg/L in April 2013. Latest value, recorded in April 2016, arsenic concentration was down to 4.4 mg/L. One well exceeded the MCL during the FY 2004-08 reporting period.

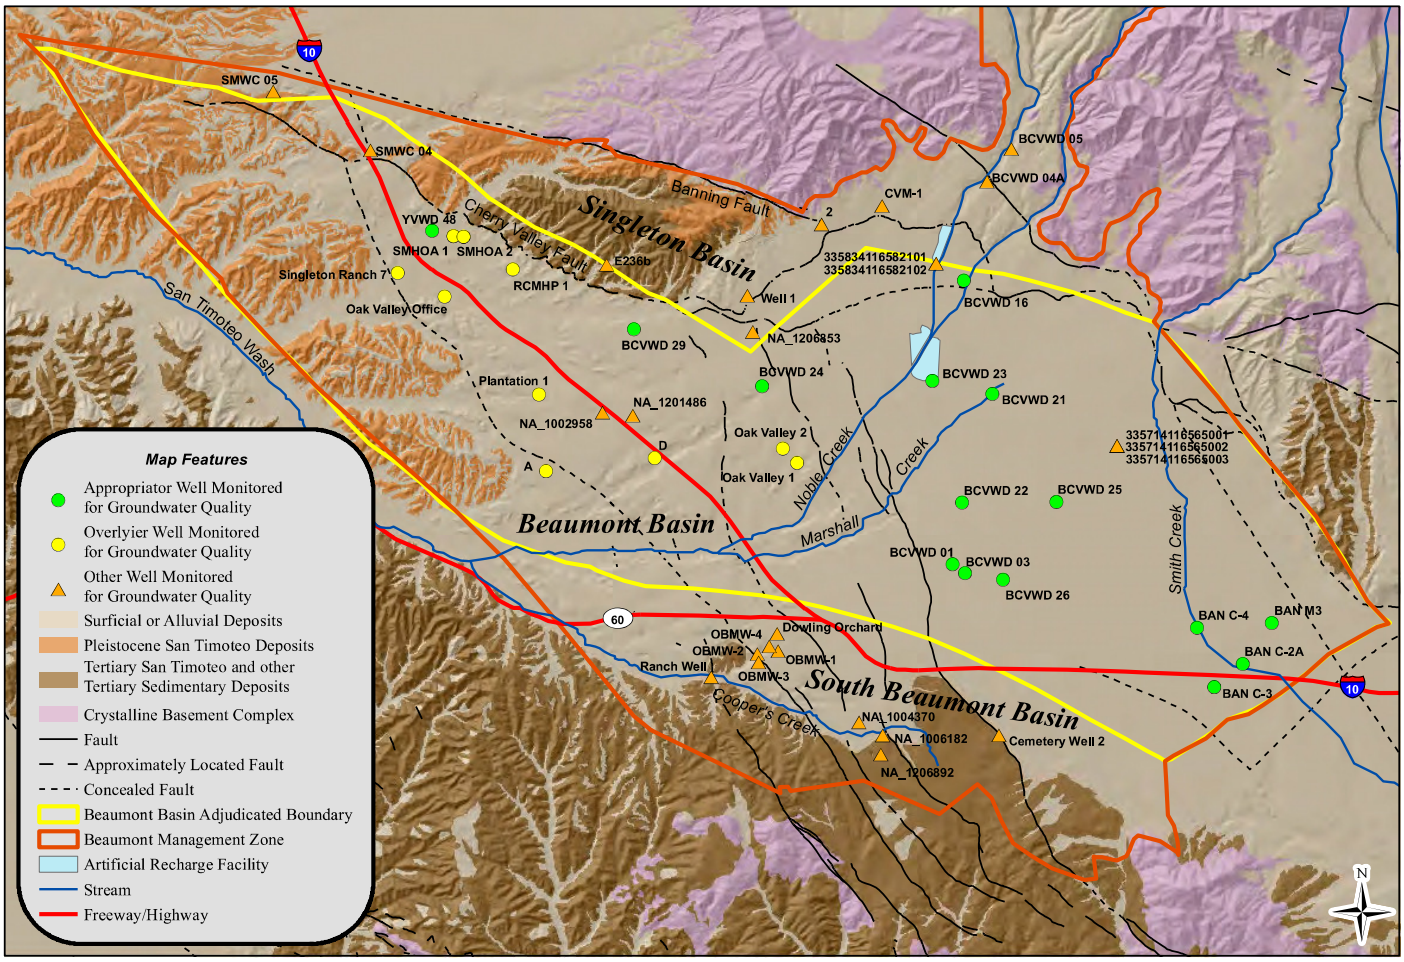
Iron. A total of 42 water samples were taken during the reporting period and tested for iron. In most cases iron concentration was below 100 ug/L., which is significantly below the current secondary MCL of 300 ug/L. However, there is one well that exceeded the MCL during the 2012-16 period; BCVWD Well No. 3 at 450 mg/L. Iron at a concentration above the MCL can impact color, odor, and taste in water. Five wells exceeded the MCL during the FY 2004-08 reporting period.

Lead. There were 42 water samples collected and tested for lead during the reporting period. The highest concentration reported were 0.0065 mg/L at BCVWD Well No. 25 and 0.0058 mg/L at Rancho Calimesa Mobile Home Park Well No. 1. Both of these concentrations are significantly below the current primary MCL for Lead of 0.015 mg/L. Lead concentrations in water above the MCL can have significant impacts on human health. One well exceeded the MCL during the FY 2004-08 reporting period.

Manganese. There were 42 water samples taken during the reporting period and tested for Manganese. Manganese concentration at all wells was below 20 ug/L, significantly below the secondary MCL of 50 ug/L. Manganese can significantly impact color and taste in water at concentrations above the MCL. One monitoring well exceeded the MCL during the FY 2004-08 reporting period.

Total Chromium. A total of 42 water samples were taken during the reporting period and tested for total chromium. The highest reported concentrations of total chromium were observed in January 2012 at Banning C-02A at 17 ug/L and in March 2014 at Banning C-3 at 14 ug/L. Both of these values are significantly below the current state primary MCL of 50 ug/L. One well exceeded the state primary MCL during the FY 2004-08 reporting period.

Vanadium. Three water samples were tested for vanadium during the reporting period from SMWC's Well 4 and YVWD No. 48. Vanadium at the SMWC well has been consistently hovering around 100 ug/L doubling the state notification level of 50 ug/L. Vanadium concentration at YVWD No. 48 was 25 ug/L, which is half the state notification level.

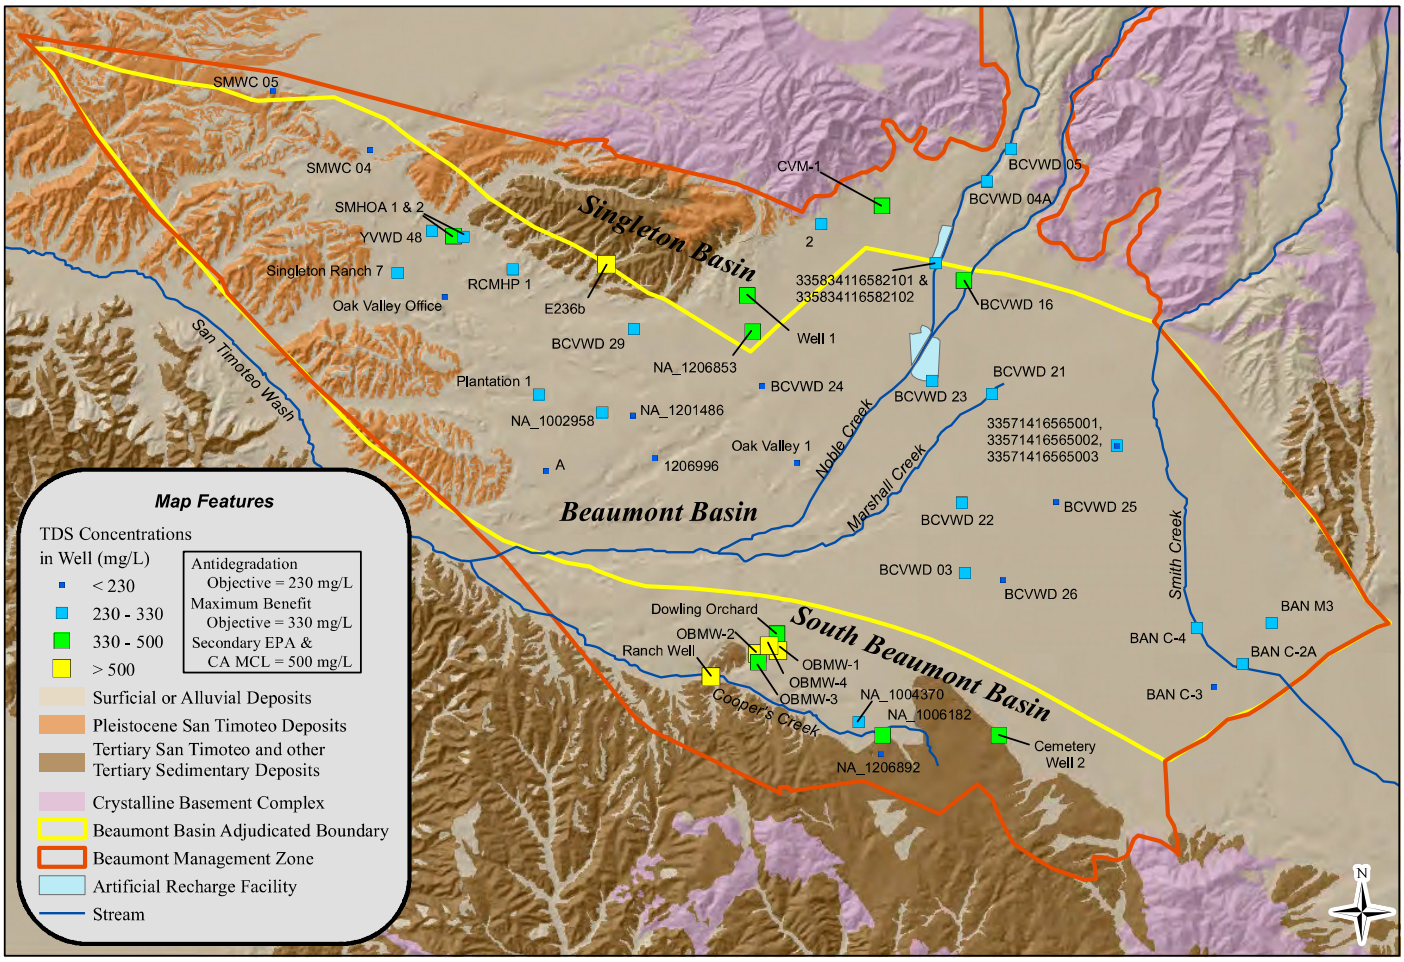


Copper. There were 42 water samples collected and tested for copper during the reporting period. Over the last five years only one well has exceeded the detection limit of 50 ug/L; the Rancho Calimesa Well No. 2 at 62 ug/L (Feb 2013). This concentration is significantly below the state primary MCL of 1,000 ug/L. This is consistent with previous reporting periods.

4.2.3 pH

There are two secondary standards for pH, a lower limit of 6.5 and an upper limit of 8.5. With the exception of one well, all other production wells were within these limits. pH concentrations ranging from a low of 7.0 to a high of 8.9 (SMWC Well No. 4) with most wells in the 7.8 to 8.0 range. Four wells in the basin exceeded the upper limit for pH during the FY 2004-08 reporting period.

4.2.4 Turbidity



Turbidity is a measure of the cloudiness of water, and is used to indicate water quality and filtration effectiveness. All production wells in the Basin were tested for turbidity and none exceeded the primary federal and state MCL of 5 NTU.

Section 5
Land Subsidence

In the first ten years of operations under the Judgment, a temporary surplus was established that allows up to 160,000 acre-ft of overdraft within the Basin. The purpose of the temporary surplus was to create room for the safe storage of supplemental water and to reduce losses from the basin. A major concern is that overdraft of the groundwater basin may lead to the lowering of groundwater levels and, subsequently, to land subsidence and ground fissuring. To proactively address this concern, the STWMA and the Watermaster developed a monitoring program specifically to assess the occurrence of subsidence from past groundwater pumping and future pumping. To implement this program, the STWMA, on behalf of the Watermaster, successfully applied for an AB303 Grant from the California Department of Water Resources (DWR)

The Subsidence Monitoring Program was established in 2005. Initially, ground level information for the 1928 to 2000 period was analyzed. In mid to late 2006, 72 benchmark monuments were installed across the Basin and in nearby basins and an initial ground-level survey conducted to establish the initial elevations of all benchmarks. A second survey was conducted in 2007. A comparison analysis of the two surveying efforts reveals little vertical change; in addition, this minimum subsidence was fairly evenly distributed across the Basin. According to the program, the ground level survey of all benchmarks was to be conducted on a tri-annual basis with the next round of survey scheduled for the spring of 2009. The 2009 survey was not conducted by Watermaster since it was determined that the level of subsidence was minimal. No additional surveys are scheduled at this time.

MAXIMUM PERENNIAL YIELD ESTIMATES FOR THE BANNING AND CABAZON STORAGE UNITS, AND AVAILABLE WATER SUPPLY FROM THE BEAUMONT BASIN

1.0 EXECUTIVE SUMMARY

This report presents the data, findings and conclusions of a geohydrologic study to evaluate the maximum perennial yield for ground water storage units within the City of Banning water resource area. The City of Banning water resource area is located within the San Gorgonio Pass Area, in Riverside County, California. *The maximum perennial yield* is defined as, the long-term average quantity of ground water that can be extracted from a ground water basin on an average annual basis without causing undesirable results, including the gradual reduction of natural ground water in storage over long-term hydrologic cycles, and adverse impact to ground water quality.

Specifically, the Study Area includes an approximately 158-square mile watershed area encompassing the Banning, Banning Bench, Banning Canyon and Cabazon Storage Units. In addition, for water supply planning purposes, this report provides an estimate of long-term supply available from the Beaumont Basin--an adjudicated basin located at the western portion of the City of Banning. The scope of the study included:

1) Comprehensive analysis of previous studies, and collection of current data;
2) Evaluation of data to delineate the aquifer systems in the City of Banning area;
3) Preparation of a geohydrologic basemap;
4) Evaluation of the maximum perennial yield using multiple methods;
5) Assessment of anticipated available water supply from the Beaumont Basin; and
6) Preparation of this report.

Data reviewed to conduct the study and prepare this report included previous investigations in the area, which comprised boring logs, water level data, ground water production data, precipitation, streamflow and ground water quality data. Data were obtained from multiple sources including the City of Banning

Public Works (CBPW), the San Gorgonio Pass Water Agency (SGPWA) the United States Geological Survey (USGS), and the Beaumont Basin Watermaster.

The project area overlies the San Gorgonio Pass Subbasin. The San Gorgonio Pass Subbasin is bounded on the north by the San Bernardino Mountains and on the south by the San Jacinto Mountains. The western boundary of the ground water basin is defined by the surface drainage divide which separates the Whitewater River Drainage Basin on the east from the Santa Ana River Watershed on the west. This divide also forms the basis for the boundary between the Regional Water Quality Control Board designated South Coastal Hydrologic Area on the west from the Colorado River Hydrologic Area on the east. The eastern boundary of the ground water basin is formed by a bedrock constriction at the western boundary of the Indio Subbasin (DWR Bulletin 118).

The San Gorgonio Pass Groundwater Basin includes five hydraulically-connected ground water storage units, which constitute the City of Banning ground water resource area: the Banning Storage Unit, the Banning Bench Storage Unit, the Banning Canyon Storage Unit, the Cabazon Storage Unit, and the Beaumont Storage Unit. A map showing the location of the project area is provided as Figure 1. For purposes of this report, the Beaumont Storage Unit, which was adjudicated in 2004, will not be assessed for maximum perennial yield since the available water supply to the City of Beaumont is set by the Judgment and is to be re-evaluated every 10 years. However, a discussion of potential available water supply from City of Banning water rights in the Beaumont Basin will be provided in Section 8.0 of this report.

The current Storage Unit boundaries used in this analysis are those most recently defined in the 2006 USGS Scientific Investigations Report 2006-5026[1]. The ground water storage units are defined by ground water levels, bedrock outcrops and geologic faults, which were delineated based on significant differences in static water levels between wells or lack of pumping effects observed across storage unit boundaries (USGS 2006). The effect of the faults on ground water movement is not well defined.

[1] The storage unit boundaries were not changed in the previous GEOSCIENCE 2009 report, because the report was an update of the 2003 Safe-Yield Study for the Banning Storage Units only. The current evaluation also addresses the Cabazon Storage Unit and the Beaumont Storage Unit, and for that reason the USGS (2006) boundaries were used.

However, it is generally known that they impede normal flow causing a difference in ground water levels across the fault, but do not prevent flow from crossing the fault.

Ground water recharge to the Banning area is obtained from precipitation infiltrating into the ground within the surface water catchments and particularly in the canyons north of the city. An additional source of recharge is subsurface inflow (i.e. underflow) from storage unit to storage unit, infiltration of Whitewater River diversions in the Banning Canyon, and from percolation of wastewater into the Cabazon Storage Unit.

Analysis of maximum perennial yield for the study area was conducted using the following methods:

- Zero Net Draft Method,
- Hill Method, and
- Hydrologic Budget

For purposes of this study, previous maximum perennial yield values will not be compared to values from this analysis. The reason for this is the ground water storage unit boundaries have been modified, as defined in the 2006 USGS Scientific Investigations Report 2006-5026; therefore, the values representing previous investigations would not be applicable to the current storage unit boundaries.

The following table provides a summary of maximum perennial yield estimates using hydrologic information updated to 2010. The supporting technical data for these values is provided in the following sections of this report.

MAXIMUM PERENNIAL YIELD

[Acre-ft/year]

Storage Unit	Zero Net Draft	Hill Method	Hydrologic Budget	Average
Banning	1,580	680	N/A	**1,130**
Banning Bench	1,980	1,930	N/A	**1,960**
Banning Canyon	4,310	3,830	N/A	**4,070**
Cabazon	N/A	N/A	5,265	**5,265**
Total	**7,870**	**6,440**	**5,265**	**12,425**

Based on the average of maximum perennial yield estimates for the Banning Storage Units (Banning, Banning Bench, and Banning Canyon) and the Cabazon Storage Unit is 7,160 acre-ft/yr and 5,265 acre-ft/yr respectively, for a total of 12,425 acre-ft/yr.

2.0 INTRODUCTION

2.1 Purpose and Scope

This report presents the data, findings and conclusions of a geohydrologic study prepared for the City of Banning by GEOSCIENCE Support Services, Inc. (GEOSCIENCE). The study was conducted to determine the maximum perennial yield of the City of Banning water resource area (see Figure 1 for location) and to determine the anticipated future available water supply from the Beaumont Basin.

Specifically, the study consisted of the following principal phases of work:

1) Comprehensive analysis of previous studies, and collection of current data;
2) Evaluation of data to delineate the aquifer systems in the ground water resource area of the City of Banning;
3) Preparation of a detailed geohydrologic basemap;
4) Evaluation of the maximum perennial yield using multiple methods for the Banning Storage Units;
5) Evaluation of the maximum perennial yield using the hydrologic budget method for the Cabazon Storage Unit;
6) Assessment of anticipated available water supply from the Beaumont Basin; and
7) Preparation of this report.

While the scope of this work focused on the City of Banning area, data from the adjacent areas (such as Beaumont) were also used for areas in which the potential for hydrologic communication between storage units existed. Data reviewed included:

- Driller's logs;
- Geophysical borehole logs;
- Well completion data including total casing depths and screen intervals;
- Pumping test data;
- Well production data;
- Water level data;

- Water quality data;
- Wastewater percolation data;
- Climatic data;
- Geologic reports and maps;
- Previous geohydrologic investigations in the Banning, Beaumont and Cabazon areas; and
- Beaumont Basin Ground Water Adjudication.

2.2 Previous Investigations

Numerous investigations of the water resources of the City of Banning and San Gorgonio Pass have been conducted. One of the earliest investigations of the Beaumont Basin hydrology was conducted in 1938 (Rule, 1938). Several later investigations by the United States Department of Agriculture (USDA) assessed the impact of the Colorado River Aqueduct's San Jacinto Tunnel to the ground water of the San Jacinto Basin (USDA, 1941). In 2006 the USGS issued a *Scientific Investigations Report* which summarized the findings of a calibrated ground-water flow model. The USGS updated ground water storage boundaries previously delineated by Bloyd in 1971 (USGS, 1971) for the Banning and Cabazon Storage Units. Other relevant studies include:

- A Water Resources Investigation and Water System Master Plan for the City of Banning conducted by VTN Consulting in 1973.
- A Water Report for the City of Banning was prepared by C.M. Engineering Associates (1978). This report reviewed the entire water system and outlined improvements, as well as a long-term water plan.
- Boyle Engineering Corporation (1988) carried out a Ground Water Dependable Yield investigation for the San Gorgonio Pass Water Agency.
- GEOSCIENCE Support Services, Inc. (1990) conducted a geohydrologic investigation and well site evaluation in the City of Banning area.
- GEOSCIENCE Support Services, Inc. (1991) prepared the results of drilling, construction, testing, and pump design for four new wells for the City of Banning.
- A Safe Yield Study of the adjacent Beaumont Unit was conducted by Boyle Engineering Corporation (1995).

- San Gorgonio Pass Water Agency's 2000 – 2001 Engineer's Report on water conditions.
- GEOSCIENCE Support Services, Inc. (2003) conducted a geohydrologic investigation to determine maximum perennial yield for the Banning Storage Units.
- An Urban Water Management Plan was prepared by Wildermuth Environmental in 2005.
- San Gorgonio Pass Water Agency's 2008 Annual Report on Water Conditions.
- Riverside County Regional Detention Center Environmental Impact Report prepared by LSA, Associates, Inc. in 2009.
- GEOSCIENCE Support Services, Inc. (GEOSCIENCE, 2009) conducted a geohydrologic investigation to update the maximum perennial yield for the East and West Banning and Banning Bench Storage Units.

Since GEOSCIENCE conducted its 2009 geohydrologic investigation in the City of Banning area, additional water level and production histories have become available. Additional driller's logs have been collected, supplementing lithologic and hydrologic data for the area. Additionally, the storage unit boundaries presented in the 2006 USGS report have become accepted as the refined boundaries by the SGPWA, as evidenced by these boundaries being reflected in their most recent reports.

2.3 Sources of Data

Sources of data used in the present study included driller's logs, geophysical borehole logs, production data, water level data, weather data, pumping test data, wastewater percolation data and water quality data. These were obtained mostly from the City of Banning and other public agencies. Production data for the Cabazon Storage Unit were obtained from SGPWA Conditions of the Basin 2008 report. The Morongo Indian Tribe which pumps water from the Cabazon Storage Unit does not report annual pumping volumes. The pumping data for the Morongo Tribe used for this report was obtained from the Water Supply Assessment conducted for the Riverside County Regional Detention Center prepared by LSA Associates Inc., dated 2009. The data analysis task involved tabulating and summarizing information from documented and undocumented reports, public and private files, as well as personal communication with local and state agencies. Detailed references to sources of data and information are presented in Section 10.0.

3.0 OVERVIEW OF STUDY AREA

3.1 Study Area

The City of Banning and its surrounding water resource area encompass an area of approximately 158-square miles, in the San Gorgonio Pass and within the immediate highland areas of the San Bernardino and San Jacinto Mountains, in Riverside County, California (see Figure 1).

The study area has defined geohydrologic and hydrologic regions. Previous investigations have referred to geologic storage units (such as the Banning, Beaumont, Banning Bench and Cabazon storage units), which were delineated by Bloyd in 1971 based on geologic faults and bedrock outcrops. Since Bloyd's study in 1971, new data has been collected allowing refinement of the storage unit boundaries. The current storage unit boundaries, as defined in the USGS Scientific Investigations Report 2006-5026, are defined by bedrock outcrops and geologic faults, which were delineated based on significant differences in static water levels between wells or lack of pumping effects observed across storage unit boundaries (USGS 2006). The effect of the faults on ground water movement is not well defined; however, it is generally known that they impede but do not completely prevent flow across them.

3.2 Topography and Physiography

The City of Banning is situated at an elevation of approximately 2,500 feet above mean sea level (amsl) in the San Gorgonio Pass between the Transverse and Peninsular Ranges of Southern California (see Figure 1). The City includes portions of Banning Canyon and the Banning Bench[2], and is located north of the San Jacinto Mountains. The tallest mountain peaks in the area are Mt. San Jacinto to the southeast (10,834 feet amsl) and Mt. San Gorgonio to the north (11,502 ft amsl). Surface water flows from the slopes of the steep mountain front drainages out of the canyons to the lowlands of the San Gorgonio Pass. Surface flow is primarily from the San Bernardino Mountains to the north, but also from drainages coming from the San Jacinto Mountains to the south. Surface drainages conduct flow to the San Gorgonio River (see Figure 1).

[2] The Banning Bench comprises tectonically uplifted remnants of an older fan exiting Banning Canyon.

3.3 Climate

The Banning area is generally characterized by a typical Mediterranean climate of hot, dry summers and short, mild, moist winters.

3.3.1 Temperature

Air temperature in the City of Banning area follows a pattern of high summer and low winter temperatures. Winter temperatures are lower than those recorded in the lower basin areas of Southern California as the City of Banning is further inland and lacks the buffering effect from the Pacific Ocean. Average winter temperatures range from high daily temperatures of 60 to 69 degrees Fahrenheit to lows between 39 and 43 degrees Fahrenheit (see Table 1). The summer maximum average temperatures range from 88 to 96 degrees Fahrenheit with the lows from 53 to 59 degrees Fahrenheit (see Table 1).

3.3.2 Precipitation

Long-term annual precipitation in the Banning area is based on data collected at three representative weather stations in and around the Banning water resource area. Long-term annual precipitation was based on the Beaumont station rain gauge from 1888 through 2009 (see Figure 2 and Appendix A). Annual precipitation ranges from a minimum of 6.4 inches (1999) to a maximum of 36.37 inches (1978). The average annual precipitation is 17.77 inches per year. The average annual precipitation at the Banning Bench gauge is 22.31 inches per year (see Figure 2 and Appendix A). The average annual precipitation at the Cabazon gauge is 12.49 inches per year (see Figure 2 and Appendix A). Precipitation in the western portion of the San Gorgonio Pass is slightly higher than in the eastern portion (see Figure 2). This precipitation distribution pattern is due to the rain-shadow effect of the mountains on storms migrating inland from the Pacific Ocean.

Historical annual precipitation and cumulative departure from mean annual precipitation for the above mentioned stations are shown on Figures 3 through 5. The severity and extent of dry and wet periods can be readily observed from the plot of the cumulative summation of departures of annual precipitation from the long-term mean annual precipitation. The data indicate seven cyclical variations in the precipitation pattern from 1888 to 2009 (see Figure 3):

(1) 1893-1904: a dry period,

(2) 1905-1946: a prolonged overall wet period;

(3) 1947 to 1977: a dry period;

(4) 1978 to 1983: a wet period;

(5) 1984 to 1990: a dry period;

(6) 1991-1998: a wet period; and

(7) 1999 to present: a relatively dry period.

3.3.3 Evaporation

Evaporation rates for the Banning area are measured using an evaporation pan located at Beaumont 1E Station (see Figure 2) and are summarized in Table 1. Evaporation at this station is typically highest during the hot and dry summer months (9 to 11 inches) and lower (3 to 4 inches) in the winter months. No significant proportion of days with evaporation data occurred during freezing temperatures so these estimates were not necessary.

3.4 Existing Water Purveyors and Wells

Figure 6 shows the City of Banning production well locations[3]. The table below summarizes the known groundwater users within each ground water storage unit.

[3] Due to the close proximity of wells in some areas, only the section/subsection designations are shown on the Figure. Therefore please note the Township and Range lines shown on the Figure to determine the complete State Well Identification.

GROUND WATER USERS BY STORAGE UNIT

Storage Unit	Groundwater Users
Banning	City of Banning
Banning Bench	City of Banning Private users
Banning Canyon	City of Banning Banning Heights Mutual Water Company Private users
Cabazon	City of Banning Cabazon Water District Desert Hills Premium Outlets Mission Springs Water District Robertson's Ready Mix Morongo Indian Tribe Arrowhead Jenson's Water Company Private users

Source: SGPWA Report on Water Conditions, 2008.

The City of Banning currently operates 21 ground water production wells (personal communication with Mr. Perry Gerdes, 2010). The City also co-owns 3 production wells within the Beaumont Storage Unit. These wells are co-owned and operated by Banning and BCVWD. The City is entitled to half of the water produced from these wells. An additional five wells are available but are not equipped, and one well is abandoned (total of 29 wells). The table below summarizes the number of operable wells owned by the City reported by storage unit.

**SUMMARY OF CITY OF BANNING
ACTIVE PRODUCTION WELLS
(AS OF MAY 2010)**

Storage Unit	Number of Active Wells
Banning	4
Banning Bench	3
Banning Canyon	8
Cabazon	1
Beaumont	8

3.5 Ground Water Production

Table 2 shows annual production values for the City of Banning water resource area by storage unit for Banning, Banning Bench, Banning Canyon, and Cabazon Storage Units which includes extraction by municipal and private users.

Ground water production over the entire Banning water resource area has been increasing steadily since 1959 at an average rate of approximately 92 acre-ft/year (see Figure 7a). Currently, most production for the City of Banning takes place in the Canyon Storage Unit. See Table 2 for annual production values by storage unit.

Well production by the City of Banning within the Banning Storage Unit began in 1992, with the extraction of 406 acre-ft of water. Between 1992 and 2009, the annual extraction from the Banning Storage Unit has increased (on average) approximately 102 acre-ft/yr (see Figure 7b). The greatest amount of production occurred in 2003 with the extraction of approximately 2,381 acre-ft of water in that year. Ground water extraction is the result of production from Wells C-5, M-10, M-11, and M-12.

Annual ground water extraction from the Banning Bench Storage Unit between 1959 and 2009 has decreased at an average rate of approximately 14 acre-ft/yr (Figure 7c). The greatest amount of production occurred in 1983 with the extraction of approximately 4,036 acre-ft of water in that year. Ground water extraction is the result of production from Wells 1, 2, and 3 as well as private producers.

Annual ground water extraction from the Banning Canyon Storage Unit between 1959 and 2009 has increased at an average rate of approximately 13 acre-ft/yr (Figure 7d). The greatest amount of production occurred in 2001 with the extraction of approximately 5,604 acre-ft of water in that year. Ground water extraction is the result of production from the City of Banning Wells 4, 5, 7, 8, 9, 10, 11, and 12, Banning Heights Mutual Water Company and private producers.

Annual ground water extraction from the Cabazon Storage Unit between 1989 and 2009 has increased at an average rate of approximately 217 acre-ft/yr (Figure 7e). The greatest amount of production occurred in 2007 with the extraction of approximately 4,100 acre-ft of water in that year (see Table 2).

Ground water extraction by the City of Banning is the result of production from the City of Banning Well C6. Well C-6 began extraction from the Cabazon Storage Unit in 2004. In addition to City of Banning pumping, Cabazon Water District, Mission Springs Water District as well as private producers also pump from the Cabazon Storage Unit. A summary of ground water producers in the Cabazon Storage Units is provided on Table 3.

4.0 GEOLOGY

4.1 Regional Geology

The City of Banning is located in the San Gorgonio Pass between the Transverse and Peninsular Mountains of Southern California. Faulting and subsequent erosion has resulted in continental alluvial deposits, ranging in age from Tertiary to Quaternary, overlying consolidated basement complex. The basement complex is composed of igneous and metamorphic rocks, specifically the San Jacinto granodiorite, gneisses, schists, and quartz monzonite of pre-Tertiary age. The surrounding mountains in the area are composed of these basement rocks.

The Banning Fault is an important structure within the City of Banning water resource area. The Banning Fault forms the boundary between the Banning Canyon and the Banning Bench Storage Units (see Figure 8a). The Banning Fault zone was characterized by a right-lateral strike-slip displacement during the late Miocene (approximately 10 to 5 million years ago) (USGS, 2006). The USGS describes another fault zone, The San Gorgonio Pass Fault Zone, which includes a group of reverse, thrust, and tear faults which extend westward from the Whitewater area to the Calimesa area. According to the USGS, the fault zone exhibits the same general attitude as the Banning Fault but has no evolutionary relationship. The San Gorgonio Pass Fault Zone has a distinctive zig-zag geometry, which is illustrated by the mapped locations of the Banning, Central Banning and Eastern Banning Barrier Faults (see Figures 8a and 8c). These three concealed faults are delineated based on differences in ground water elevations and lack of observed effects during pumping of wells on the other side of the barrier (USGS, 2006). The Banning, Central and Eastern Banning Barrier Faults bound the Banning Storage unit and form the Banning and Cabazon Storage Unit boundaries reflected in this report.

4.2 Study Area Geology

4.2.1 Bedrock Complex

The bedrock in the Banning area predominantly consists of slightly gneissic granite of pre-Cretaceous age (Ransome, 1932). The consolidated rocks (pTb) in the area are comprised primarily of gneiss, schist, and quartz monzonite (see Figure 8a). Cross-section A-A' presented on Figure 8b depicts the subsurface

relationship between the geologic units described below. The explanation for the geologic symbols shown on Figure 8a and Figure 8b is provided on Figure 8c.

4.2.2 Quaternary Alluvial Deposits

The alluvial deposits in the vicinity of the City of Banning consist of many hundreds of feet of Quaternary and upper Tertiary gravels that were washed from the adjacent San Gorgonio highlands. These alluvial materials are generally poorly sorted sands and gravels, intermingled with silts and clays. Although the material near the surface is comparatively young, true recent alluvium is limited almost entirely to the areas immediately adjacent to washes and gullies. The recent alluvium contains no ground water except in areas where the water table is perched near the surface. Coarser-grained beds within the San Timoteo formation yield significant quantities of water.

Alluvial deposits in the Banning area include three general groups: Quaternary younger alluvium (Qya), Tertiary to Quaternary older alluvium (Qoa), and Tertiary to Quaternary Continental deposits (Qtcv) (see Figures 8a, 8b, and 8c).

The most recent alluvial deposits in the Banning area occur in the valley floor of the Banning Storage Units as younger alluvium (Qya). The younger alluvium consists of unconsolidated, angular boulders, sand and cobbles, and small quantities of silt, clay, and aeolian sand. Depths range from several feet to a maximum of approximately 50 feet.

Older alluvial deposits (Qoa) underlie the Qya. These deposits consist of poorly sorted, unconsolidated clay, silt, sand, and gravel ranging from approximately 10 ft to a maximum of approximately 450 ft in thickness. Qoa deposits are found in stream channels, valley floors, and flood plains over the majority of the Beaumont and Banning Bench Storage Units. Qoa deposits include the old (Qo) and very old deposits (Qvo) shown on Figure 8b. The subsurface units designated as Qsu and Qsl on Figure 8b are not exposed within the study area but are exposed to the northwest near Calimesa. Units Qsu and Qsl are the primary water-bearing units in the study area.

Tertiary to Quaternary Continental deposits (Qtcv) consist of poorly sorted cobbles, sand, silt and clay, and include the San Timoteo Beds of Frick (1921) and some volcanic rocks north of the Banning-Cabazon area.

5.0 GEOHYDROLOGY

5.1 Hydrologic Subunits

The surface water drainage catchment or hydrologic subunits encompassing the City of Banning are present in an area of approximately 158 square miles and include the surface flows from surrounding mountain runoff (see Figure 9). The significance of this hydrologic subunit area is that precipitation falling anywhere within the hydrologic subunit has the potential to contribute to the recharge of the ground water storage units which ultimately supplies water to the City of Banning.

The total drainage catchment tributary to the ground water storage units was delineated using a USGS 10 m x 10 m digital elevation model (DEM) in ESRI ArcView 9.3[4] (ESRI ArcView 9.3 is a Geographic Information System (GIS) software package). Specifically, the drainage catchment was delineated by computing flow directions from the DEM, which was then used by Arc Hydro. Arc Hydro is an ArcGIS-based system geared to support water resources applications to automatically delineate the hydrologic subunits within an area of study.

The area of the watershed catchment was used to calculate the potential water crop specifically for the Cabazon Storage Unit based on the weighted average annual precipitation for each contributing watershed (i.e. Potrero Subunit, Millard Subunit, One Horse Subunit, etc.).

5.2 Ground Water Storage Units

Ground water storage units which have been referred to in numerous investigations have been delineated in the San Gorgonio Pass area of the City of Banning by Bloyd in 1971, which were delineated based on water level differences between wells. Since Bloyd's study in 1971, more data has become available, resulting in refined storage unit boundaries by the USGS in 2006.

[4] ESRI ArcView 9.3 is a Geographic Information System (GIS) software package.

Figure 9 shows the Banning Storage Units, (Banning, Banning Bench and Banning Canyon), and the Cabazon Storage Unit as reflected in the 2006 USGS report in relationship to the hydrologic units. These boundaries, as presented in the 2006 USGS report, have been generally accepted as the refined boundaries by the USGS and SGPWA, as these boundaries are reflected in their most recent reports.

The ground water storage units are hydraulically connected generally across fault boundaries, which imply that the faults which form the storage unit boundaries leak, allowing movement of ground water from one storage unit into the adjacent storage unit. Values of leakance used by the USGS for modeling ground water flow across barriers in the study area were used in this study to estimate flow from the Banning Storage Unit into the Cabazon Storage Unit and for a portion of the underflow from the Banning Bench Storage Unit into the Cabazon Storage Unit. However, a portion of the underflow from the Banning Canyon Storage Unit into Banning Bench Storage Unit and subsequently into the Cabazon Storage Unit occurs through alluvial channel and across the fault mapped at the boundary of the Banning Bench and Cabazon Storage units.

5.3 Surface Water

Surface water in the City of Banning water resource area has an intermittent nature. Temporary runoff occurs after precipitation, ranging from small trickles to flash flooding which occurs usually in winter. Although some streamflow does occur in the steep mountain areas, it percolates rapidly into the sands and gravels in the canyons and San Gorgonio Pass area.

Surface water flow in the watersheds located both north and south of San Gorgonio Pass is tributary to the San Gorgonio River which joins the Whitewater River approximately four miles east of the Cabazon Storage Unit in the Coachella Valley. The San Gorgonio River has two USGS surface water gages (see Figure 2). The upper gage (10256200) has data for the period October 1975 to September 1977; and the lower gage (10256300) only has data for the period February 1981 to September 1981. These data sets did not contain enough data to characterize streamflow patterns for the San Gorgonio River.

Diversion of surface water from the upper reaches of the Whitewater River Drainage into Banning Canyon (Banning Canyon Storage Unit) was initiated in 1913. The diverted water flows along steep mountain slopes for approximately 14 miles in a mostly concrete lined conveyance system known as The

Flume (see Figure 9). Portions of the flume have significantly deteriorated over the years and are in need of repair. Along the flume system, Southern California Edison historically operated two powerhouses to generate hydroelectric power. Banning Heights Mutual Water Company utilizes approximately 1,000 acre-ft/year from below the second powerhouse (see Figure 2). The remainder of the diverted water flows into the San Gorgonio River below the Banning Heights Mutual Water Company abstraction point. Flows have diminished since the 1980's due to a loss of canal system capacity due to deterioration (C.M. Engineering Associates, 1978; San Gorgonio Pass Water Agency, 2002). Since 1961, on average, 1,500 acre-ft/year had been diverted into the Canyon subunit from the Whitewater River (San Gorgonio Pass Water Agency, 2002). Due to damage along sections of the flume, currently, surface flow is diverted into Burnt Canyon to the north, and then back to the Flume upstream of Powerhouse No. 1 where it continues downstream through Powerhouse No. 2 to the reservoir operated by Banning Heights Mutual Water Company. It is uncertain exactly how much of the diverted water is currently recharged into the aquifer of the Canyon subunit as the flows are not metered (personal communication with Mr. Perry Gerdes, 2010).

5.4 Ground Water

5.4.1 Aquifer Systems

The water-bearing rocks in the vicinity of Banning consist of many hundreds of feet of Quaternary and upper Tertiary gravels washed down from the adjacent San Gorgonio highlands. These alluvial materials are generally poorly sorted sand and gravels intermingled with silts and clays. Although the material near the surface is comparatively young, younger alluvium (Qya on Figure 8a) is limited almost entirely to the immediate areas around the washes and gullies. The younger alluvium contains no ground water except in areas where the water table is near the surface.

The older alluvium (Qoa on Figure 8a) occurring at the surface in the Banning areas is of Plio-Pleistocene age and unconformably overlies coarse sand and gravel layers of the San Timoteo Formation (Qtcv). Ground water is present in an upper and lower aquifer system shown as Qsu and Qsl on Figure 8b. The San Timoteo Formation dips underneath the older alluvium at low angles towards the northeast. In general, stratification in the San Timoteo Formation is better developed than the older alluvium with the result of the coarser beds within the formation yielding good quantities of water to wells. The

transmissivity of the aquifers in the Banning Storage Unit is approximately 15,000 - 34,000 gpd/ft based on pumping test data from well C-5. The aquifer ranges in thickness from 40 - 1,200 ft with an average thickness of 600 ft. The hydraulic conductivity ranges from 15 - 60 gpd/ft^2 (2 - 8 ft/day; GEOSCIENCE, 1991). DWR estimates that wells in the San Gorgonio Pass Subbasin can yield 1,000 from the San Timoteo formation. Aquifer transmissivity or hydraulic conductivity data in the Canyon and Banning Bench Storage Units was not available. However, saturated thickness ranges from 30 ft to 160 ft.

5.4.2 Ground Water Occurrence and Movement

The majority of ground water in the Banning area occurs in the permeable alluvial sediments that underlies the valley floors and canyon beds. The aquifers within the younger alluvial sediments are generally unconfined to semi-confined, while ground water within the older alluvial sediments is generally confined beneath sediments of recent deposits.

Ground water flows by gravity drainage from areas of high elevation (the canyons and mountain slopes) into areas of low elevation (see Figure 10), ultimately collecting in the sediments beneath the valley floor. Hydraulic gradients in the canyon areas are relatively steep (approximately 300-500 ft/mile) but flatten out in the valley areas (approximately 90 ft/mile) (see Figure 10).

Ground water in the Banning and Banning Bench subunits generally flows southeast into the west portion of the Cabazon Storage Unit and to a lesser degree enters fractures and joints in the San Jacinto Mountains. Ground water flows east within the Cabazon Storage Unit to the Indio Subbasin.

Due to construction of the San Jacinto tunnel for the Colorado Aqueduct, ground water from the southwest portion of the Cabazon Storage Unit near the vicinity of the east portal of the San Jacinto Tunnel and from crystalline rocks in the San Jacinto Mountains flows into the tunnel through joints and fractures as well as through a series of southeast-trending geologic faults (see Figure 8a). Although the tunnel has been constructed in bedrock and is lined with concrete, an estimated 1,500 acre-ft/year of ground water seeps into the tunnel from the west portion of the Cabazon storage unit (33% of the total 5,000 acre-ft per year tunnel seepage; Boyle, 1995; personal communication, FlowScience, 2001).

5.4.3 Historical Ground Water Level Trends

Historical ground water level hydrographs for wells in the Banning Storage Units and Cabazon Storage Unit are provided in Appendix B. The locations of wells discussed in this investigation are shown on Figure 6. Figure 10 contains insets which show selected hydrographs for the storage units. Static water level elevations have been observed to fluctuate as much as 80 to 100 feet, and when plotted against the cumulative departure from mean precipitation, it is observed that there is a direct relationship of precipitation trends and ground water elevation trends. An increase in cumulative departure is mirrored by an increase in water level elevations, and a decrease in cumulative departure from mean precipitation is mirrored by a decrease in ground water elevations.

5.4.4 Recharge and Discharge

Ground water recharge in the Banning area occurs through infiltration and percolation of rainfall and surface runoff in stream channels that flow from local mountains and hills. Recharge to the Banning and Cabazon Storage Units occurs through underflow from the Beaumont Storage Unit in the western part of the study area. Additionally, underflow from the Banning Canyon Storage Unit flows into the Banning Bench, and from the Banning Bench to the Cabazon Storage Unit.

The majority of the rainfall in the lower basin elevations (valleys) is evaporated or taken up by plants before it enters the ground water system. The primary sources of replenishment to the ground water basins are infiltration of precipitation at the higher watershed elevations and surface water infiltration in the streams and drainages during major storm events or prolonged periods of high precipitation.

Recharge rates are generally highest during spring runoff when soils are saturated, temperatures are low and vegetation is inactive. Recharge is minimal during summer when most precipitation is transpired back to the atmosphere. In the fall, recharge rates increase again as photosynthesis shuts down. Frost during the winter months precludes recharge.

The primary source of ground water discharge in the storage units is pumping, and subsurface outflow into the downstream storage units; a minor amount of ground water discharge is lost by evapotranspiration. Ground water flows out of the eastern end of the Cabazon Storage Unit at a bedrock constriction at the boundary with the Indio Subbasin. The amount of ground water outflow is a

function of the saturated thickness or depth to water. As discussed in the previous section, ground water levels follow the trend of rainfall. Therefore ground water level rises occurring during wet climactic cycles would result in increased outflow at the eastern end of the Cabazon Storage Unit. In addition to subsurface outflow, water is lost from the Cabazon Storage Unit through the San Jacinto Mountains (through joints and fractures).

5.4.4.1 Infiltration of Treated Wastewater, Cabazon Storage Unit

The City of Banning operates recycled water infiltration basins in the Cabazon Storage Unit. The infiltration basins receive secondary effluent water from the wastewater treatment plant which was constructed in 1968[5] and is operated by United Water Service, a public/private partnership. The average amount of effluent infiltrated between 2000 and 2009 is 2,655 acre-ft/yr. The following table is a summary of effluent discharges to the infiltration basins from 2000 to 2009.

SECONDARY EFFLUENT DISCHARGES INTO THE CABAZON STORAGE UNIT

Year	2000	2001	2002	2003	2004	2005	2006	2007	2008	2009
Acre-ft/yr	2,568	2,532	2,538	2,547	2,602	2,974	2,955	2,737	2,639	2,461

Source: City of Banning Public Works, 2010

The Wastewater infiltration basins are located approximately 1,500 feet southwest of Well R-1 (see Figure 6). Well R-1 was constructed with the intent of capture and distribution of secondary treated effluent after it has had residence time in the subsurface sediments. Discharge from the well will be placed into a recycled water system for use within the City of Banning.

[5] Page 3 of Initial Study/Mitigated Negative Declaration Wastewater Treatment Plant Expansion and Phase I Recycled Water System, May, 2008

5.4.4.2 Infiltration of Surface Water in Banning Canyon

When surface flow is present in Banning Canyon, flows are diverted by the City of Banning into off-stream recharge basins to facilitate ground water recharge (see Figure 2). According to the City of Banning, Department of Public Works (personal communication with Mr. Perry Gerdes, 2008), the off-stream infiltration basins are located in Banning Canyon approximately one mile north of the Banning Bench Storage Unit (see Figure 6). The basin surfaces were scarified (breaking up the surface of topsoil) in 2006 and surface water from San Gorgonio River has been diverted into the basins since that time. The basins are un-gauged and there has been no recordation of the volume of water that has been infiltrated into the basins. The infiltration basins are located north of the Banning Fault which forms the north boundary of the Banning Bench Storage Unit. The contribution of the infiltration basins to subsurface flow into the Banning Bench Storage unit is unknown since no gauge is currently present at the percolation basins. It is estimated that approximately 350 acre-ft/yr exit the Banning Canyon and Banning Bench Storage Units into the Cabazon Storage unit in the form of subsurface flow, or underflow.

5.4.5 Ground Water Storage

The amount of ground water in storage within the City of Banning water resource area (not including Beaumont Storage Unit) is estimated to be approximately 1.1 – 1.2 million acre-ft. This volume was estimated using ArcView GIS 10 Spatial Analyst[6] to calculate the saturated thickness within each storage unit and multiply by the estimated effective porosity (i.e. specific yield). The table below summarizes the ground water storage available to the City.

[6] ArcView GIS 10 Spatial Analyst is a Geographic Information System (GIS) software package.

GROUND WATER STORAGE AVAILABLE TO THE CITY OF BANNING

IN BANNING AND CABAZON STORAGE UNITS

Ground Water Storage Unit	Ground Water Basin Area [acres]	Average Saturated Thickness [ft]	Effective Porosity [%]	Ground Water Storage [acre-ft][7]
Banning	2,489	600	15 – 17	211,000 – 240,000
Banning Bench	3,753	30	15 – 17	1,200– 1,500
Banning Canyon	1,058	161	15 – 17	12,000 – 13,500
Cabazon[8]	17,222	350	15 – 17	880,000 – 1,000,000

The surface area of the ground water basins (excluding bedrock) was calculated using the polygonal area feature of the geographic information system (GIS) from the Storage Unit boundaries (USGS, 2006). Saturated thickness was estimated based on the depth between the current (2010) ground water levels and depth to bedrock. Depth to bedrock was estimated from lithology logs, of which only two encountered bedrock. Wells in the central parts of the basin do not intercept bedrock; as such, it is assumed that the depth to bedrock is (1) greater than the total depth of known wells in these locations, and (2) decreases towards the edges of the basin. In the Banning Storage Unit, bedrock was encountered at a depth of approximately 1,400 ft below ground surface (ft bgs). In the Cabazon Storage Unit, wells did not encounter bedrock but ranged in total depth from 500 to 1,200 ft bgs. Depth to bedrock in the Banning Canyon and Banning Bench are anticipated to be approximately 110-150 ft bgs. Water level elevations used to calculate storage are shown on Figure 10. Based on these data, the conservative saturated thickness for the Banning Storage Unit is estimated to average approximately 600 ft ranging between thicknesses of 35 – 1,170 ft. Estimates for the Banning Bench saturated thickness averages approximately 30 ft, ranging from 1 – 60 ft. The City' Banning Bench wells are

[7] As a reference, the full capacity of MWD's Diamond Valley Reservoir is 800,000 acre-ft.

[8] The volume of storage is approximate since the data confirming the depth to the base of the aquifer in the Cabazon Storage Unit is lacking.

located in Banning Canyon in the Banning Bench Storage Unit, saturated thickness may be greater outside the canyon area. Saturated thickness in the Banning Canyon Storage Unit averages approximately 160 ft, ranging from 2 – 360 ft. The average saturated thickness in the Cabazon Storage Unit is approximately 350 ft, ranging from 1 – 700 ft thick.

The effective porosity for the saturated sediments was determined by calculating the sand/clay ratio based on lithologic logs from seven wells in different parts of the Banning and Cabazon Storage Units. The average sand/clay ratio is approximately 60/40 which when weighted to the corresponding aquifer materials results in an average effective porosity of approximately 17 to 20 percent. A conservative value of effective porosity of 15 to 17 percent was used to estimate ground water storage volume (see above table).

5.4.6 Water Quality

Water quality is considered very good in the Banning area, with current total dissolved solids (TDS) concentrations (Spring 2009) ranging from approximately 140 to 250 milligrams per liter (mg/L). Figure 11 shows the spatial distribution of TDS in the City of Banning water resource area. The variation of TDS concentrations in wells within close proximity to one another can likely be explained by storm events flushing out the surrounding valleys which have a variation in rock type and TDS concentrations. (See Appendix C for summary of selected water quality tabulated parameters).

Most other water quality concentrations, including nitrate (as NO_3), are currently under the maximum contaminant level (MCL) or action levels. Historically, the only constituents occurring above MCLs were iron and aluminum in most wells. Lead was also detected in Wells 5, 8, 11, 12 and C3 above the US EPA Treatment Technique value which requires systems to control the corrosiveness of their water. If more than 10% percent of tap water samples exceed the action level, water systems must take additional steps. Lead has not been detected above the Treatment Technique value in any wells since 2006 (see Appendix C). Fluoride was also detected above the Secondary MCL in Well C3 in March of 1994.

Water quality samples were taken during drilling and construction of Well R-1 in 1990 (see Figure 6 for location). Well R-1 is located 1,500 feet southeast of the City's Wastewater Treatment Plant. Four aquifer zone tests were conducted within the following intervals:

Zone 1 - 600 to 620 ft bgs,
Zone 2 - 550 to 570 ft bgs,
Zone 3 - 480 to 500 ft bgs, and
Zone 4 - 410 to 430 ft bgs.

The results of the water quality testing were reviewed for this investigation to assess whether secondary effluent from the WWTP was impacting the ground water quality in the aquifer. The results of the water quality testing are provided in Appendix C. Total dissolved solids (TDS) concentration in the lower three intervals is similar to that of other City of Banning Wells [which is lower than 250 mg/L]. TDS in Zone 4 (shallowest zone at 410-430 feet bgs) had a concentration exceeding the maximum contaminant level (MCL) of 500 mg/L. Additionally Iron exceeds the MCL in all zones and Manganese exceeds the MCL in Zone 4. However, the high iron and manganese concentrations may in part be due to adsorption onto fine sediment particles[9] due to sample collection from the zones. The USGS installed a nested monitoring well system (multiple wells screened at various depths) north of the City of Banning Wastewater Treatment Plant near the Interstate 10 Freeway (see Figure 6 for location). Ground water collected from Well 3S/1E - 11F4 screened between 600 and 610 feet bgs had a TDS concentration of 338 mg/L and elevated nitrate, iron, and manganese concentrations. (See water quality results in Appendix C). Ground water samples collected from screens below this depth had decreasing TDS concentrations with depth. The TDS concentrations ranged from 296 mg/L (680 ft bgs) to 232 mg/L (1,060 ft bgs).

According to Parsons (Parsons, 2008), the TDS ranged from 336 to 461 mg/L between 2004 and 2007 with an average of 379 mg/L during that period. These values are below the values detected during shallow zone testing suggesting that either TDS concentrations from the effluent were greater prior to 1990 or there is another source for the elevated TDS in the shallow portion of the aquifer. The incomplete record of ground water levels in City of Banning Well R1 does not allow assessment of the affect on ground water levels due to infiltration of wastewater in the Cabazon Storage Unit.

[9] More recent zone testing protocol developed by GEOSCIENCE uses 0.45 micron filters during field sample collection to eliminate the potential for elevated metals due to sediment in the sample water.

6.0 METHODOLOGY FOR DETERMINATION OF MAXIMUM PERENNIAL YIELD

Maximum perennial yield is defined as the maximum amount of ground water that can be extracted on an average annual basis without causing environmental damage or adverse impacts. This maximum amount is a function of the amount of ground water recharge that the aquifers receive from precipitation, underflow, artificial recharge, local irrigation and return flows on an average annual basis.

Calculation of maximum perennial yield involves relating geohydrologic and operational factors in a quantitative form. It requires a detailed understanding of the basin's inflow terms (including precipitation, infiltration, and other recharge), and outflow terms (including exploitation, evapotranspiration, and losses to the surface and/or adjacent ground water reservoirs). The reliability of any maximum perennial yield calculation is a direct function of the accuracy and comprehensiveness of the data available for the area, and any assumptions upon which the various calculations are based.

The methodology used to calculate the maximum perennial yield relied upon:

1) Complete and correct geohydrologic data (current and historical);
2) A thorough understanding of the geologic and hydrologic parameters for the study area; and
3) Independent maximum perennial yield calculations based on two methods, thereby allowing a comparison of safe yield estimates.

The following sections describe in detail the methodology used in determining the final safe yield estimates.

6.1 Data Collection

The data collection and compilation procedures were designed to ensure data accuracy and thoroughness. For this project, data collection consisted of two phases:

1) Obtaining historic data for municipal water purveyors and private water users within the study area (data obtained from CBPW, SGPWA and DHS); and
2) Supplementing the information with data from previous investigations (geologic and hydrologic) and other agencies within the area.

A rigorous date analysis and review was conducted. Where possible, both the original field data and the resulting tabular compilations and reports were obtained. This was done in order to identify mistakes and/or inconsistencies within the original data as well as to analyze estimations used during the original data collection. Data compilation consisted of three principal phases:

- Data entry (including updating and revising GEOSCIENCE's existing City of Banning area data);
- Data checking (to minimize typographical or data entry errors); and
- Analysis of data for incongruous and statistically inconsistent data.

The analysis phase of data compilation included identification of missing data and incorporation of estimates where actual data was not available.

6.2 Field Investigations

In 2003, GEOSCIENCE conducted a field investigation to accurately determine the coordinates of all the City of Banning wells. The well locations were determined using a global positioning system (GPS) which recorded the coordinates in North American Datum (NAD) of 1983. Two GPS units were utilized in order to verify each other, and thus ensure greater accuracy.

6.3 Initial Data Analysis

Initial data analysis consisted of delineation of hydrologic subunits (watersheds) and aquifers within the study area, and preparation of the geohydrologic basemap.

The hydrologic subunits were delineated using the hydrologic modeling extension for ArcView GIS. This hydrologic modeling extension provides functionality to delineate watersheds from a DEM (a grid data source representing elevation), and calculates physical and geometric properties of the subunits. The subunits to be used for this study have been named according to the associated creek (see Figure 9).

6.4 Calculation of Maximum Perennial Yield – Banning Storage Units

To estimate the amount of ground water development possible in the Banning Storage Units (Banning, Banning Bench and Banning Canyon), two methods of calculating maximum perennial yield were used in

the assessment for the City of Banning water resource area. Each method represents a varied approach, thereby resulting in a cross check on the final safe yield estimate.

The methods considered during the assessment of the maximum perennial yield were:

- Zero Net Draft Method; and
- Hill Method

The Zero Net Draft and Hill methods consider total production and its effect on water level elevations and are direct means to evaluation of the ground water conditions assessed based on extensive historical pumping and ground water level data.

6.4.1 Method of Zero Net Draft

The Method of Zero Net Draft (Chow, 1964) is a useful technique for estimating maximum perennial yield. This method involves plotting average depth to water for a selected period of time and comparing it to ground water production for the same period. If the mean ground water elevation at the beginning and end of the period is the same, the production during the period is taken as a measure of the maximum perennial yield.

6.4.2 Hill Method

The Hill Method (Chow, 1964) is a simplification of the Equation of Hydrologic Equilibrium. By plotting annual change in ground water elevations against annual draft, Hill measured the maximum perennial yield as the draft corresponding to a zero change in elevation. For the maximum perennial yield to be representative, using the Hill Method, the precipitation should approximate the long-term mean.

6.5 Calculation of Maximum Perennial Yield – Cabazon Storage Unit

The Zero Net Draft Method and the Hill Method were not used to evaluate the maximum perennial yield for the Cabazon Storage Unit because of the limited available historical pumping data and the limited availability of ground water level data representative of the entire storage unit. Therefore, an

Estimate of the maximum perennial yield for the Cabazon Storage Unit was developed using the equation of hydrologic equilibrium[10] namely:

INFLOW = OUTFLOW +/- CHANGE IN STORAGE

The hydrologic period selected for the water balance was the long term average represented by hydrologic conditions for the year 2003 (USGS, 2006). However, as data were available for the ground water pumping and recharge of treated wastewater from 2003 through 2009, these values were used. As this period was somewhat below normal, to be conservative, the highest values of pumping and average annual recharge of treated wastewater were used in the balance. As was done for the Banning Storage Units, the boundary for the Cabazon Storage Unit (used for this analysis) was obtained from the USGS - SIR 2006-5026 dated 2006.

6.5.1 Inflow terms for Water Balance

Inflow from Cabazon Basin consists of subsurface inflow from the Banning and Banning bench Storage Units, Mountain front and areal recharge from the upstream tributary drainages, and percolation of treated wastewater at the City of Banning Wastewater Treatment Plant.

6.5.1.1 Subsurface Inflow Banning Storage Unit

The underflow was calculated using the continuity equation and Darcian velocity:

$$Q=Av=Lb(K'/b')\,\Delta h / 119.34$$

where:

Q = subsurface flow [acre-ft/yr]

A = cross sectional area of flow area of flow [ft^2]

$v = K'\Delta h/b'$

L= length along boundary (ft) = 11,500 ft

b = saturated thickness (ft) = 740 ft

K'/b' = leakance[11] = 6.0×10^{-4} /day (Layer 1, at thickness 420 ft)

[10] Also known as a water balance, a hydrologic balance, or a water budget.

[11] Leakance values were obtained from USGS model values for Layers 1 and 2 along ground water barrier F6 (see Figure 39 and Table 10, USGS,2006)

$= 7.0 \times 10^{-4}$ (Layer 2 at thickness 320 ft)

Δh = change in hydraulic head across boundary (50 ft)

Using the above relationship and values, the underflow from the Banning Storage Unit to the Cabazon Storage Unit was calculated to be approximately 2,300 acre-ft/yr.

6.5.1.2 Subsurface Inflow Banning Bench Storage Unit

Underflow estimates through the alluvium at the mouth of Banning Canyon and across the fault which forms the eastern storage unit boundary between Banning Bench and Cabazon Storage Units was again, calculated using continuity equation and Darcian velocity for calculating underflow.

The underflow at the mouth of Banning Canyon at the boundary of the Cabazon Storage Unit:

$$Q = Av / 119.34,$$

where:

Q = subsurface flow [acre-ft/yr]

v = Kdh/dx

K = hydraulic conductivity (10 ft/day)[12]

dh/dx = hydraulic gradient (0.05)

A = cross sectional area of flow (60,000 ft^2)

Using the relationship and values above, the subsurface outflow from the Banning Bench Storage Unit at the mouth of Banning Canyon was estimated to be approximately 250 acre-ft/yr.

Subsurface outflow leaking across the fault at the storage unit boundary east of the mouth of Banning Canyon was estimated using the continuity equation and Darcian velocity:

$$Q=Av=Lb(K'/b')\,\Delta h / 119.34$$

[12] Table 10, USGS 2006

where: Q = subsurface flow [acre-ft/yr]

A = cross sectional area of flow (L x b)[ft^2]

v = K'Δh/b'

L= length of fault boundary (11,500 ft)

b = saturated thickness (40 ft)

K'/b' = leakance (6.5×10^{-4}/day)[13]

Δh = change in hydraulic head across boundary (40 ft)

Using the above equation and values, the underflow along the eastern portion of the Banning Bench Storage Unit to the Cabazon Storage Unit was estimated to be approximately 100 acre-ft/yr. The total underflow from the Banning Bench into the Cabazon Storage Unit was estimated to be approximately 350 acre-ft/yr (250 acre-ft/yr + 100 acre-ft/yr).

6.5.1.3 Mountain Front Runoff and Areal Recharge from Upstream Tributary Drainages

Mountain front runoff and areal recharge were estimated based on the weighted average precipitation falling within the Cabazon Storage Unit and tributary catchment areas. The Calibrated USGS model (SIR-2006-5026) estimated mountain front recharge within the USGS model area to be 2,674 acre-ft/yr over a catchment area of 17,442 acres. This is approximately 8% of the weighted average annual rainfall for the model watershed area (21.9 inches per year).

The watershed areas for the upstream drainages were determined using GIS (see Section 5.1) and are shown on Figure 9. The area of each tributary watershed is tabulated on Table 4. The weighted average annual rainfall for the total watershed areas tributary to Cabazon Storage Unit was calculated to be 130,755 acre-ft[14]. The mountain front and areal recharge contribution to the water balance was estimated as 8% of the weighted average annual precipitation over the watershed, or 10,460 acre-ft/yr.

[13] Average of 6.0×10^{-4}/day for Layer 1 and 7.0×10^{-4}/day for Layer 2.

[14] Although the Banning Canyon Watershed is tributary to the Cabazon Storage Unit, it was not included in this calculation since underflow from Banning Canyon/ Banning Bench is treated as a separate underflow inflow term to the Cabazon Storage Unit.

6.5.1.4 Infiltration of Wastewater Flows

For the years 2000 through 2009, the average annual volumes of wastewater flows of 2,655 acre-ft/yr was used as the inflow term in the water balance (See Section 3.3.3).

6.5.2 Outflow Terms for Water Balance

Outflow from Cabazon Basin consists of ground water pumping and subsurface outflow to the Indio Subbasin and outflow to the San Jacinto Tunnel.

6.5.2.1 Ground Water Pumping

Table 3 provides a tabulation of ground water pumping from the Cabazon Storage Unit, including pumping from Potrero and Millard Canyons which are tributary to the Cabazon Storage Unit. The greatest amount of pumping from the Cabazon Unit occurred in 2007 and was approximately 4,160 acre-ft. Average production for the period from 2003-2009 is approximately 3,360 acre-ft/yr. The ground water pumping values are approximate, as the Morongo Tribe does not report their annual pumping volumes.

6.5.2.2 Subsurface Outflow to Indio Subbasin

The California Department of Water Resources estimates that underflow from the Cabazon Storage Unit to the Indio Subbasin is approximately 9,000 acre-ft/yr (USGS, 1978, 1992, DWR, 2004).

6.5.2.3 Subsurface Outflow to San Jacinto Tunnel

As stated previously, although the tunnel has been constructed in bedrock and is lined with concrete, an estimated 1,500 acre-ft/year of ground water seeps into the tunnel from the west portion of the Cabazon storage unit (33% of the total 5,000 acre-ft per year tunnel seepage; Boyle, 1995; personal communication, FlowScience, 2001).

7.0 ESTIMATES OF MAXIMUM PERENNIAL YIELD

This section presents the summary of analyses and the results of the maximum perennial yield estimates for the four Storage Units included in this study:

1) Banning Storage Unit,
2) Beaumont Storage Unit,
3) Banning Bench Storage Unit, and
4) Cabazon Storage Unit.

7.1 Banning Storage Unit

The Banning Storage unit lies south of the Banning Bench Storage Unit and east of the Beaumont Storage Unit (see Figure 1). The total surface area is approximately 2,489 acres. The area is underlain by alluvial sediments, with bedrock occurring to the north in the San Bernardino Mountains. The City of Banning currently operates four active production wells within the Banning Storage Unit, Wells M10, M11, M12 and C-5. The City of Banning estimates a design capacity of 3,500 gpm for the above mentioned wells based on historical water use records (Banning, 2010).

7.1.1 Zero Net Draft Method – Banning Storage Unit

Figure 12 shows a plot of ground water levels and annual pumping from wells in the Banning Storage Unit (Wells M10, M11, M12 and C-5). A review of Figure 12 indicates that ground water levels in December 2003 were similar to levels in December 2009 (see Appendix B). During this period, the average annual ground water production was 1,582 acre-ft/year.

7.1.2 Hill Method – Banning Storage Unit

Figure 13 shows a plot of the average annual change in ground water elevations in the Banning Storage Unit Production Wells (Well M10, M11, M12 and C-5) versus annual extraction within the Storage Unit. As shown on the figure, the maximum perennial yield was calculated using the best-fit line through the data, namely:

$$y = -0.0067x + 4.5282$$

where:

y = Annual Change in Ground Water Elevation [ft]

x = Annual Extraction [acre-ft]

Using this method, the maximum perennial yield is estimated as the production for an average water level change of zero (i.e. y = 0), or 676 acre-ft/year (4.5282/0.0067).

7.2 Banning Bench Storage Unit

The Banning Bench Storage Unit is located to the north of the Banning Storage Unit (see Figure 1). The total surface area of the storage unit is approximately 3,753 acres. The City of Banning currently operates three production wells within the Banning Bench, Wells 1, 2 and 3 with a total design capacity of 3,650 gpm, based on historical water use records (Banning, 2010)..

7.2.1 Zero Net Draft Method – Banning Bench Storage Unit

Ground water levels from City of Banning Wells 1, 2 and 3 located within the Banning Bench Storage Unit were used to evaluate the historic time period when the ground water levels were similar. City of Banning Wells 1, 2 and 3 indicate that ground water elevations in January 1979 and December 2009 were similar (see Appendix B). The average annual ground water production within the Banning Bench Storage Unit during this time period was approximately 1,982 acre-ft/year (see Figure 14).

7.2.2 Hill Method – Banning Bench Storage Unit

Figure 15 shows a plot of the average annual change in ground water elevations in the Banning Bench Storage Unit Production Wells (Well 1, 2, and 3,) versus annual extraction within the Storage Unit. As shown on the figure, the maximum perennial yield was calculated from the best-fit line through the data:

y = -0.0046x + 8.8834

where:

y = Annual Change in Ground Water Elevation [ft]

x = Annual Extraction [acre-ft]

The maximum perennial yield was estimated as the annual extraction corresponding to a zero change in ground water elevation, or approximately 1,931 acre-ft/year (8.8834/0.0046).

7.3 Banning Canyon Storage Unit

The Banning Canyon Storage Unit is located to the north of the Banning Bench Storage Unit (see Figure 1). The total surface area of the Storage Unit is approximately 1,058 acres. The primary surface water drainage feature within this Storage Unit is the San Gorgonio River. The canyon bottom comprises alluvium and the canyon sides are bedrock. Most of the City of Banning's ground water is produced from the aquifer within this subunit. The City of Banning estimates a design capacity of 8,600 gpm for the above mentioned wells based on historical water use records (Banning, 2010).

7.3.1 Zero Net Draft Method - Banning Canyon Storage Unit

Representative wells within the Banning Canyon Storage Unit were used to evaluate the time period when the ground water levels were similar. Ground water level plots for City of Banning Wells 4, 5, 6, 7, 8, 9, 10, 11 and 12 indicate that the ground water elevations in January 1984 and December 2000 were similar (see Appendix B). The average annual ground water production within the Storage Unit during this time period was approximately 4,310 acre-ft/year (see Figure 16).

7.3.2 Hill Method – Banning Canyon Storage Unit

Figure 17 shows a plot of the average annual change in ground water elevations in the Banning Canyon Storage Unit Production Wells (Well 4, 5, 6, 7, 8, 9, 10, 11 and 12) versus annual extraction within the Storage Unit. As shown on the figure, the maximum perennial yield was calculated from the best-fit line through the data:

$$y = -0.0054x + 20.678$$

where:

y = Annual Change in Ground Water Elevation [ft]

x = Annual Extraction [acre-ft]

The maximum perennial yield was estimated as the annual extraction corresponding to a zero change in ground water elevation, or approximately 3,829 acre-ft/year (20.678/0.0054).

7.4 Hydrologic Budget – Cabazon Storage Unit

Ground water recharge to the Cabazon Storage Unit is obtained from precipitation infiltrating into the ground within the surface water catchments tributary to the unit and from subsurface inflow from the Banning and Banning Bench/Canyon Storage Units. Percolation of secondary treated wastewater from the City of Banning Wastewater Treatment Plant in also included as a recharge term. Outflow terms include pumping, and subsurface outflow to the Indio area.

7.4.1 Inflow Terms – Cabazon Storage Unit

Ground water recharge to the Cabazon Storage Unit is from precipitation infiltrating within surface water catchments tributary to the unit as well as subsurface inflow from the Banning and Banning Bench/Canyon Storage Units. Percolation of secondary treated wastewater from the City of Banning's Wastewater Treatment Plant in also included as a recharge term.

7.4.1.1 Inflow Terms

- Subsurface inflow from the Banning Storage Unit was calculated using hydrologic parameters provided in USGS (2006) for 2003 average year conditions (approximately 2,300 acre-ft/yr).
- Subsurface inflow from the Banning Bench/Canyon Storage Units (was estimated from an underflow calculation through the alluvium of Banning Canyon) (approximately 350 acre-ft/yr).
- Mountain front runoff and areal recharge to all watersheds tributary to the Cabazon Storage Unit was estimated based on 8% of the weighted average annual precipitation for the Cabazon Storage Unit and tributary drainage areas (10,460 acre-ft/yr).
- Percolation of treated wastewater (i.e. secondary Effluent from the City of Banning Wastewater Treatment Plant between 1999 - 2009 (2,655 acre-ft/yr).

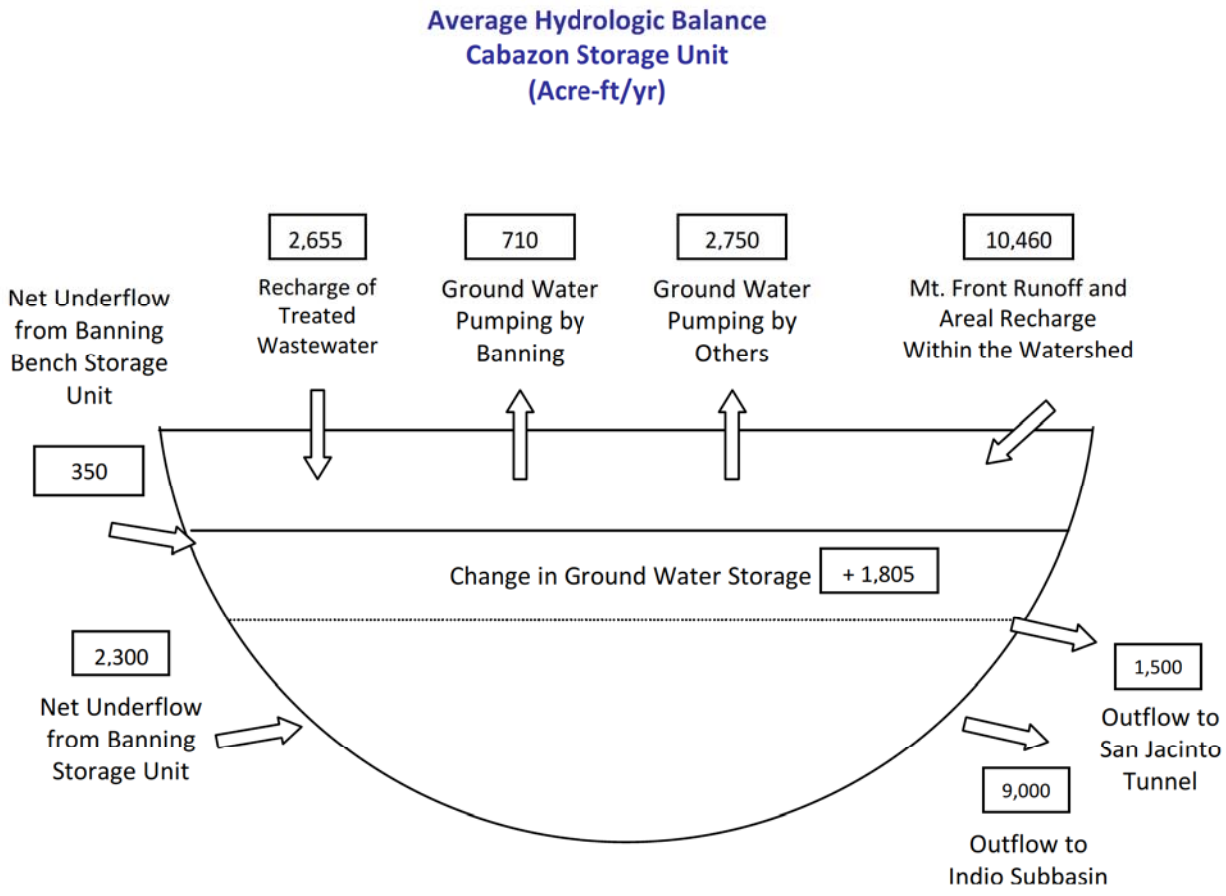
TOTAL AVERAGE INFLOW = approximately 15,765 acre-ft/yr

7.4.2 Outflow Terms – Cabazon Storage Unit

Ground water outflow from the Cabazon Storage Unit includes ground water pumping, subsurface outflow to the Indio Subbasin, and subsurface outflow to the San Jacinto Tunnel. The ground water outflow terms are summarized below:

7.4.2.1 Outflow Terms

- Annual ground water pumping for the Cabazon Storage Unit, and Millard and Potrero Canyons (3,460 acre-ft/yr)[15].
- Subsurface outflow to the Indio Subbasin (9,000 acre-ft/yr).
- Outflow to the San Jacinto Tunnel (1,500 acre-ft/yr).



TOTAL AVERAGE OUTFLOW = 14,600 acre-ft/yr

Hydrologic Budget - Cabazon Storage Unit
Acre-ft/yr

[1]	[2]	[3]	[4]	[5]	[6]	[7]	[8]	[9]
INFLOW					OUTFLOW			
Underflow from Banning Storage Unit	Underflow from Banning Bench Storage Unit	Mountain Front Runoff and Areal recharge	Recharge of Treated Wastewater	Total Inflow	Subsurface Outflow to Indio Subbasin and the San Jacinto Tunnel	Ground Water Pumping	Total Outflow	Average Annual Change in Storage
2,300	350	10,460	2,655	15,765	10,500	3,460	13,960	1,805

Note:
[1] Determined from 2003 USGS Modeled outflow for the Banning Storage Unit.
[2] Calculated underflow across the storage unit boundary at Banning Canyon and underflow across the mountain front fault along the storage unit boundary.
[3] Basin recharge estimated as 8% of the average annual precipitation in the Cabazon Storage Unit and the upstream watersheds.
[4] Percolation of secondary treated wastewater from the City of Banning Wastewater Treatment Plant.
[5] = [1] + [2] + [3] + [4].
[6] DWR Bulletin 118 *San Gorgonio Pass Ground Water Basin 2004.*
[7] Average ground water extraction from the Cabazon Storage Unit, and Millard and Potrero Canyons.
[8] = [6] + [7].
[9] = [5] - [8].

[15] Based on the average pumping during the period 2003 to 2009.

7.4.3 Change in Storage

Review of historical ground water levels and historical precipitation for the Cabazon Storage Unit indicates that ground water levels closely follow the pattern of rainfall (see Figure 10 and Hydrographs in Appendix B). Ground water level records for Wells 3S/3E–7M1 and 8M1 for periods ranging from 1946 through 2009 (which includes wet, dry and average precipitation) show that ground water levels decline during dry periods and rise during wet periods. Overall, the long-term change in ground water in storage (based on the hydrographs and precipitation – see Appendix B) appears to remain the same (i.e. no long-term declines or increases).

7.4.4 Additional Water Supply from the Cabazon Storage Unit

Available water supply from the Cabazon Storage Unit above existing production is approximately 1,805 acre-ft/yr (on average). The City of Banning Well C-6 annually extracts approximately 710 acre-ft/yr on average since it came online in 2004. The City estimates that the total design capacity for Well C-6 is 900 gpm or 1,450 acre-ft/yr based on historical production records (City of Banning, 2010). If the City utilizes Well C-6 at full capacity (1,450 ac-ft/yr) an additional 350 acre-ft/yr is available if an additional well is constructed. The closest non-City of Banning pumping well to Well R-1 is located approximately one mile away. Based on a storage coefficient of between 0.15 and 0.17 and a transmissivity of 49,900 gpd/ft[16], additional pumping from R-1 could result in an drawdown at the closest well of approximately 1.2 to 1.4 feet after one year of continuous pumping from R-1. This additional drawdown would not result any significant impact to the well or operation of the well. If an additional well is constructed to maximize use of the Cabazon Storage Unit for ground water development, the well can be located so as to not result in impacts to existing wells.

Additional water supply for the Cabazon Storage Unit may also be developed by reducing subsurface outflow to the Indio Subbasin. This could be achieved using a series of wells which changes hydraulic gradients near the eastern Cabazon Storage Unit boundary and reduces ground water flowing eastward to the Indio Subbasin. For example, if hydraulic control is achieved whereby an average subsurface outflow to the Indio Subbasin is reduced by 25%, an additional 2,250 acre-ft/yr of potential production could be available in the Cabazon Storage Unit. This amounts to an additional annual extraction of approximately 4,055 acre-ft/yr above the existing production without causing a long-term decline in storage.

[16] GEOSCIENCE, 1991

8.0 ANTICIPATED FUTURE WATER SUPPLY BEAUMONT BASIN

Pursuant to the Beaumont Basin Judgment (Superior Court of the State of California for the County of Riverside, 2004), the City has the right to pump 5,910 acre-ft annually (see Appendix D) until the year 2014 at which time the Beaumont Basin Watermaster shall re-evaluate the safe yield of the basin. The allotted 5,910 acre-ft/yr pumping rights to the City of Banning is comprised of:

- 882 acre-ft/yr which is 31.43% of the remainder of the Beaumont Basin safe yield (8,650 acre-ft/yr) is an initial estimate of appropriative rights (see Column 4 of Exhibit C of the Judgment) after appropriations by overlying producers (5,845 acre-ft/yr) and,
- 5,029 acre-ft/yr which is 31.43% of the controlled overdraft/temporary surplus or annual operating yield of 16,000 acre-ft/yr for a total of 160,000 acre-ft over the ten year period of 2004 to 2014.

If the overlying producers increase or reduce production in the future, or if water districts provide direct service to the appropriators within their service areas, then the City's 882 acre-ft/yr will change. In the Sixth Annual Report of the Beaumont Basin Watermaster, dated April 2010, it was reported that less water has been extracted from the basin than anticipated. In addition, the Beaumont Basin Watermaster Biennial Engineer's Report – July 2003 through June 2008, states that the estimated safe yield of the basin may be approximately 10,290 acre-ft/yr[17] rather than the 8,650 acre-ft/yr, which was stipulated as the initial estimate in the Judgment for the first 10-year period. However, a change in the safe yield for Beaumont Storage Unit can only occur after re-evaluation of the basin by the Watermaster scheduled every 10 years.

Table 5 of the Sixth Annual Beaumont Basin Watermaster Report, 2010 states that the City of Banning has an allocation of unused overlying water of 1,405, 1,645, 1,659, 1,618, 1,830, and 1,805 acre-ft for the years 2008/09, 2009/10, 2010/11, 2011/12, 2012/13, and 2013/14 respectively. These values are derived from 31.43% of the actual amount produced by the overlying producers from the period 2003/04 to 2007/08 (5 years) and applied at the beginning of the subsequent 5- year period. The

[17] Page 4-4, Biennial Engineers Report – July 2003 through June 2008, Beaumont Basin Watermaster

following table provides an estimate of the projected volume of the City of Banning ground water in storage within the Beaumont Basin which is their estimated production right.

The City of Banning's
Ground Water in Storage within the Beaumont Basin (Production Right)

Year	Appropriative Rights After Overlying Producers[1]	Controlled Overdraft of Annual Operating Yield[2]	Recharge of SWP[3]	Banning Production from Beaumont Storage Unit[4]	Transfers Among Appropriators[5]	Estimated Total Water in Storage[6] (Production Right)
2004	0	5,029	0	3,605		1,424
2005	0	5,029	0	1,879		4,575
2006	0	5,029	0	2,012	1,500	9,092
2007	0	5,029	0	2,962		11,159
2008	0	5,029	0	3,417		12,771
2009	1,492	5,029	1,200	2,355		18,138
2010	1,645	5,029	1,200	1,372		24,640
2011	1,659	5,029	1,298	2,514		30,111
2012	1,618	5,029	1,298	2,514		35,541
2013	1,830	5,029	1,298	2,514		41,184
2014	1,805	0	2,595	2,514		43,069
2015	1,805	0	2,595	2,514		44,955
2016	1,805	0	2,595	2,514		46,841
2017	1,805	0	2,595	2,514		48,726
2018	1,805	0	2,595	2,514		50,612
2019	1,805	0	2,595	2,514		52,498
2020	1,635	0	2,595	2,514		54,214
2021	1,613	0	2,595	2,514		55,907
2022	1,591	0	2,595	2,514		57,579
2023	1,569	0	2,595	2,514		59,229
2024	1,547	0	2,595	2,514		60,856
2025	1,478	0	2,595	2,514		62,415
2026	1,456	0	2,595	2,514		63,952
2027	1,434	0	2,595	2,514		65,466
2028	1,411	0	2,595	2,514		66,958
2029	1,389	0	2,595	2,514		68,428
2030	1,328	0	2,595	2,514		69,837
2031	1,306	0	2,595	2,514		71,223
2032	1,284	0	2,595	2,514		72,588
2033	1,262	0	2,595	2,514		73,931
2034	1,240	0	2,595	2,514		75,251
2035	1,194	0	2,595	2,514		76,526

- It should be noted that there is a discrepancy between the reported City of Banning unused overlying water right allocation in 2009 as reported by the Sixth Annual Beaumont Basin Watermaster Report (1,405 acre-ft) and the value of 1,492 acre-ft as listed in the Draft Beaumont Management Zone Maximum Benefits Program Modeling Scenarios, 2011 Appendix A-3.

1 Projected allocation of pumping rights per Appendix A-3 ("Projected Allocation of Pumping Rights for the 2004 Beaumont Basin Judgment") of the Draft Beaumont Management Zone Maximum Benefits Program Modeling Scenarios, prepared by Wildemuth Environmental, Inc. dated March 18, 2011.

[2] Controlled overdraft assigned by the Beaumont Basin Judgment for the ten year period 2004 through 2012 (Exhibit C in Appendix D).

[3] State Water project purchases reported by Watermaster for 2009 year. Values for purchases for 2010 year provided by the City of Banning. Projected Purchases (2011-2035) assumed to be 25% of annual delivery to SGPWA anticipated by the SWP Reliability Report (60% of the maximum annual delivery of 8,650 acre-ft per year until 2013, when EBXII is assumed be online, 17,300 will be accessible).

[4] City of Banning production as reported by the City of Banning for years 2004-2010 which includes water received from BCVWD, extracted from the Beaumont Storage Unit. For years 2011 through 2020, City of Banning pumping is assumed at the average annual pumping value 2,514 acre-ft/yr.

[5] Transfer reported by Watermaster in the Sixth Annual Report of the Beaumont Basin Watermaster dated 2010.

[6] Sum of columns 1, 2, 3 and 5 minus column 4, the product is added to the previous year Estimated Total Water in Storage.

For the purposes of providing projected water supplies from the Beaumont Basin, it is anticipated that the City will extract an average of 2,514 ac-ft/yr, (average City production since adjudication in 2004, as reported by the City of Banning, 2011) however, as demand increases, additional water will be extracted as needed from the Beaumont Storage Unit to meet demand.

Watermaster is required by law[18] to re-determine the safe-yield of the Beaumont basin at least every 10 years beginning 10 years after the date of the entry of the Judgment (2004) or at the year 2014. Pursuant to the Judgment, the City is allowed to pump sufficient water from the Beaumont Basin in order to meet its water demand. Should this amount exceed the City's rights, the Beaumont Basin Watermaster has an obligation to replenish the overproduction.

8.1 The City of Banning's Current and Projected Ground Water Supply

The following table summarizes the current and projected available water supply from the Banning, Cabazon and Beaumont Storage Units available to the City of Banning as well as projected available water supply in 2014. Available water supply for the Beaumont Basin beyond 2014 will be a function of:

1. Ground water recharge credit,
2. The amount of pumping by overlying producers, and
3. The remaining operating yield available to the City.

[18] Beaumont Basin Judgment, VI Administration (5)(Y)

However, the following table provides an estimate of potential water supply from the Beaumont Storage Unit based on accruing an amount of ground water in storage from the un-used portion of ground water from adjudicated rights in the Beaumont Storage Unit.

CITY OF BANNING CURRENT AND PROJECTED GROUND WATER SUPPLY

(AVERAGE YEAR CONDITIONS)

Storage Unit	Year 2010	Year 2015
Banning	1,130	1,130
Banning Bench	1,960	1,960
Banning Canyon	4,070	4,070
Cabazon	2,515[19]	2,515
Beaumont	2,514[20]	2,514
Beaumont Basin - Recharge (SWP)	**1,200**[21]	**2,595**[22]
Total Ground Water Supply Per Year	**13,368**	**14,793**

[19] Cabazon Production includes approximately 1,805 acre-ft/yr of potential additional pumping reported in this technical memorandum and 710 acre-ft/yr which has been the average annual production from the City of Banning Well C-6 (as reported by the City of Banning)
[20] City of Banning production as reported by Watermaster in the Sixth Annual Report of the Beaumont Basin Watermaster dated 2010. For years 2011 through 2035, City of Banning pumping is assumed at the average annual pumping value (2,514 acre-ft/yr).
[21] 2010 City of Banning purchases of SWP water from SGPWA to recharge in the BCVWD spreading grounds on Noble Creek.
[22] Projected values assume Banning will receive 25% of SWP water received by the SGPWA, DWR SWP Reliability Report estimates SGPWA will receive 60% of the maximum annual delivery. SGPWA is entitled to 8,650 acre-ft per year until 2013 (when EBXII is assumed to be online) when the full allotment of 17,300 acre-ft/yr can be utilized.

9.0 SUMMARY AND RECOMMENDATIONS

9.1 Summary

The table below provides a summary of the available water supply to the City of Banning. The water supply from the Banning Storage Units (Banning, Banning Bench, and Banning Canyon) represents the maximum perennial yield for those storage units since the City of Banning is the major producer in those storage units. The available water supply from the Cabazon Storage unit represents additional water supply that can be developed from the storage unit as determined from this study (see Section 7.4).

AVAILABLE WATER SUPPLY FROM BANNING STORAGE UNITS

AND CABAZON STORAGE UNIT

Acre-ft/year

Storage Unit	Zero Net Draft	Hill Method	Hydrologic Budget	Average
Banning	1,580	680	N/A	1,130
Banning Bench	1,980	1,930	N/A	1,960
Banning Canyon	4,310	3,830	N/A	4,070
Total of All Banning Storage Units	**7,870**	**6,440**	**N/A**	**7,160**
Cabazon	**N/A**	**N/A**	**2,515**[23]	**2,515**

[23] The water supply available to the City of Banning from the Cabazon Storage Unit equals average production from Well C-6 (710 acre-ft/yr) plus the average annual change in storage of 1,805 acre-ft/yr.

- The average maximum perennial yield for the Banning Storage Units (Banning, Banning Bench and Banning Canyon) is approximately 7,160 acre-ft/yr. Production within these Storage Units for 2009 is approximately 6,500 acre-ft.
- The Hydrologic Budget for the Cabazon Storage Unit indicates that approximately 1,805 acre-ft/yr above current ground water production might be available for future development. Current production within the Cabazon Storage Unit is approximately 3,460 acre-ft for 2009, of which 710 acre-ft/yr is by the City of Banning.
- Ground water level records taken from the Cabazon Storage Unit for periods ranging from 1946 through 2009 (which includes wet, dry and average precipitation) show that ground water levels decline during dry periods and rise during wet periods.
- Overall, the long-term change in ground water in storage for the Cabazon Storage Unit (based on the hydrographs and precipitation) appears to remain the same (i.e. no long-term declines or increases).
- Further ground water development can take place in the Cabazon Storage Unit to achieve hydraulic control to decrease the amount of outflow to the Indio Subbasin.
- The Beaumont Basin Watermaster report, dated April 2010, reported that less water has been extracted from the basin than anticipated. An estimated safe yield of the basin may be approximately 10,290 acre-ft/yr, which could result in a greater allocation of water to the City of Banning.
- The amount of ground water in storage within the City of Banning area, not including the Beaumont Storage Unit which falls within the City of Banning water resource area, is estimated to be approximately between 1.1 – 1.2 million acre-ft.

9.2 Recommendations

- To increase the available water supply, continuing and/or increasing the diversion of water from the Whitewater River into the Banning Canyon from the Flume (Canyon subunit) should be pursued. A maximum water right of 13.26 cfs exists for the diversion.
- Diversions to Banning Canyon should be gauged as well as diversion from the San Gorgonio River into the off-stream recharge basins in Banning Canyon.

- The ground water levels in Well R-1 should be included as part of the monitoring effort of the City of Banning. In addition, ground water quality data should be collected on an annual basis to allow development of ground water quality trends in this area of the Cabazon Storage Unit.
- Ground water pumping should be managed in order to develop a continuing history of ground water extractions in the unadjudicated storage units of the San Gorgonio Pass Ground Water Basin (Banning, Banning Bench, Banning Canyon, and Cabazon Storage Units).
- Potential capture of stormwater run-off from mountain front watersheds as well as capture of urban run-off should be included in long-term planning for development of additional water supply.
- For the future, managing the ground water basin through an annual ground water audit should be considered for long-term planning and operation. This process involves evaluating ground water level trends, production rates, ground water quality or other aquifer/well/pump considerations from the previous year (through use of a on-going ground water monitoring and data collection system). The water audit should be performed six months prior to the start of the water accounting year, and information from this audit will be used to make recommendations for pumping in the following year.[24] This management approach focuses more on maintaining ground water levels within acceptable limits rather than maintaining pumping within a predetermined safe yield; although refinement of the safe yield is part of the audit process.
- Future ground water management strategy should include development of a ground water model to allow accurate simulation of ground water flow and ground water quality (including potential impacts by recharge of recycled water) in the City of Banning ground water resource area.

[24] Typical water accounting years may be the "actual" water year, October 1 to September 30 or, fiscal years such as July 1 to June 30.

Sources of Data: City of Banning (2010), SGPWA Conditions of the Basin Report (various years) and Riverside County Regional Detention Center EIR, LSA Associates Inc., 2009 report.

Note:

* Values unknown

[1] Banning includes M10, M11, M12 and C-5.

[2] Banning Bench data includes City of Banning Wells 1 through 3 and private producers.

[3] Banning Canyon Storage Unit includes City of Banning Wells 4 through 12, Banning Heights Mutual Water Company and private producers.

[4] Cabazon includes extraction from City of Banning Well C6, Cabazon Water District, Mission Springs Water District as well as private producers within the Cabazon Storage Unit.

[5] Total annual production for the Banning water resource area.

[1] Table 2 - San Gorgonio Pass Water Agency Report on Water Conditions (report period 2008) Data for 2009 is the average for previous years.

[2] Table 2 -San Gorgonio Pass Water Agency Report on Water Conditions (report period 2008) Arrowhead values for 2008-2009 are an average of 2001-2007 usage. The location of pumpage is assumed to be in the Morongo Indian Reservation in Potrero Canyon.

[3] Table 2 - San Gorgonio Pass Water Agency Report on Water Conditions (report period 2008) The 2009 value for the Cabazon WD is an average of values from 2000-2008.

[4] Table 2 - San Gorgonio Pass Water Agency Report on Water Conditions (report period 2008). Desert Hills Outlets usage for 2008-2009 were defined as an average from the 2000-2007 interval. 2000 Values obtained from Riverside County Regional Detention Center EIR, LSA Associates Inc., 2009 report.

[5] 1990 to 2008 values are from Table 2 - San Gorgonio Pass Water Agency Report on Water Conditions (various years). The 2009 value reflects an average of 1997-2000 and 2004-2007 values.

[6] Riverside County Regional Detention Center EIR, LSA Associates Inc., 2009 report. Per this report - Morongo tribe does not publish its GW extraction data. The source of water supply information for the 2009 LSA report is: Water Supply Assessment for the Riverside County Regional Detention Center, Krieger & Stewart, November 2009. Therefore, the values 2000-2007 are estimates from the LSA Associates 2009 report. A best fit straight line for data from 2000-2007 was used to determine 2008-2009 values.

[7] C-6 production from City of Banning (well became operational in 2004).

[8] Information for years 1994 to 2009 from Page 22 of Ron Barto and Associates, Hydrogeology of the Cabazon Basin, August 20, 1990. Data for previous years are compiled from various years of the San Gorgonio Pass Water Agency Report on Water Conditions.

Re: Phase 1 Environmental Site Assessment
Undeveloped 58.3 Acre Tract of Land
North of the Banning Airport
Banning, California

Dear Ms. Smith:

Enclosed is the Environmental Site Assessment report on the undeveloped 58.3 acre tract of land to the north of the Banning Airport in the City of Banning in Riverside County, California. All of the agencies responded to our requests for information. Information obtained in the process of completing this assessment does not indicate the presence of recognized environmental conditions.

HEI Corporation appreciates this opportunity to be of service to you and to Pacific Newport Properties, Inc. If you have any questions regarding this report, don't hesitate to contact me at chayden@heicorporation.com or at 714-875-1362.

Sincerely,

Christopher M. Hayden
President

PROFESSIONAL CERTIFICATION

This Phase 1 Environmental Site Assessment (ESA) was conducted consistent with generally accepted environmental consulting practices within the limitations included as Appendix A. The site visits and records reviews were performed by Chris Hayden, consistent with the proposal submitted to Pacific Newport Properties, Inc. (Client). The information contained in this ESA was obtained from personal inspection, from sources deemed to be reliable, and from various government agencies.

PHASE 1
ENVIRONMENTAL SITE ASSESSMENT

Undeveloped 58.3 Acre Tract of Land
North of the Banning Airport
Banning, California

Project 17-3444

I declare that, to the best of my professional knowledge and belief, I meet the definition of **Environmental Professional** (EP) as defined in 40 C.F.R. § 312.10(b).

I have the specific qualifications based on education, training and experience to assess a property of the nature, history, and setting of the Subject Property. I have developed and performed the all appropriate inquiries in conformance with the standards and practices set forth in 40 C.F.R. § 312.10(b).

Christopher M. Hayden
Environmental Professional

1 SUMMARY

This ESA was performed on the three parcels of land, which total approximately 58.3 acre and are located to the north of the Banning Airport in the City of Banning, California (hereinafter collectively referred to as the "Subject Property").

After inspecting the Subject Property; reviewing its past uses; observing surrounding properties; searching through the Federal Environmental Protection Agency, State of California, Riverside County, City of Banning records and reviewing previously conducted Phase 1 Environmental Site Assessments, it can be concluded that there is no evidence of recognized environmental conditions", as defined by the ASTM, in connection with the Subject Property. No further action is required at this time.

2 INTRODUCTION

2.1 Purpose

The purpose of this Environmental Site Assessment is to identify "recognized environmental conditions" in connection with the Subject Property. The ASTM Standard Practice for Environmental Site Assessments E 1527-13 defines "recognized environmental condition" as "the presence or likely presence of any hazardous substances or petroleum products in, on or at a property: (1) due to any release to the environmental; (2) under conditions indicative of a release to the environment; or (3) under conditions that pose a material threat of a future release to the environment."

2.2 Scope of Work

As agreed to between HEI Corporation and Pacific Newport Properties, Inc., the scope of work for this ESA included the following:

- Site Inspection
- Surrounding Property Observation
- Interviews With Individuals Having Knowledge of the Operations on the Subject Property
- Inspection of City or County Building Permits
- Inspection of County Health Care Agency Files
- State and Federal Regulatory Agency Database Search For Posted Properties Within An ASTM Designated Radius of the Subject Property
- Inspection of City or County Fire Department Records
- Search for Records of Permits for Underground or Aboveground Storage Tanks
- Inspection of Owner/Operator's Books and Records
- Evaluate the Likelihood of Vapor Encroachment Onto the Subject Property or Vapor Intrusion Into Structures on the Subject Property

- Inspection of Historical Aerial Photographs, Sanborn Map Company Maps and/or Archive Cross Directories

- Preparation and Presentation of One pdf Report

2.3 Limitations and Exceptions of Assessments

This ESA is based upon the information available from a variety of sources and on the inspection of the Subject Property. The ESA was performed in accordance with industry standards and using appropriate methods. It is intended to allow a party to make an informed decision regarding the Subject Property.

HEI Corporation is not responsible or liable for the accuracy of the information provided by others. This ESA is not a guaranty that there is no subsurface contamination, nor can it be warranted that those areas of environmental concern herein noted are the only areas of potential contamination at the Subject Property.

There was no sampling or testing for the possible presence or absence of, nor is any statement made in this ESA regarding the possible presence or absence of any of the following:

1) Asbestos Containing Materials

2) Radon

3) Lead Based Paints

4) Lead in the Drinking Water

2.4 Limiting Conditions

There were no limiting conditions with regard to the ability of HEI Corporation to conduct the property inspection portion of this ESA. Access was made available to all parts of the Subject Property.

2.5 Previous Environmental Site Assessments/Investigations

A Phase 1 Environmental Site Assessment, November 15, 2004, was prepared by HEI Corporation for Mr. Brandon Hughes (2004 HEI ESA). The 2004 HEI ESA concluded that "...there is no evidence of 'recognized environmental conditions', as defined by the ASTM, in connection with the Subject Property. No further action is required at this time."

A Phase 1 Environmental Site Assessment Update, dated in April 2006, was prepared by Hayden Environmental for Messenger Investment Company (2006 HEI ESA-U). The 2006 HEI ESA-U

concluded that "...there is no evidence of 'recognized environmental conditions', as defined by the ASTM, in connection with the Subject Property. No further action is required at this time."

2.6 Data Gaps

Data gaps occur in this report in two (2) areas. In the past uses of the Subject Property, the earliest aerial photographs obtained for this report was taken in 1967. Also in the past uses section, there is a gap of twenty-four (24) years in the aerial photographs obtained, from 1972 to 1996. These were the aerial photographs readily available from NETR Online. These data gaps do not impair the ability of HEI Corporation to form an opinion or arrive at a conclusion as to the environmental condition of the Subject Property.

3 SUBJECT PROPERTY DESCRIPTION AND USE HISTORY

3.1 Site and Improvement Description

The Subject Property consists of three parcels of land which total approximately 2,560,893 square feet (58.79 acres). It is located adjoining and to the north of the Banning Airport. Southern Pacific Railroad tracks are adjoining to the north, with Interstate 10 (the Christopher Columbus Transcontinental Highway) further to the north. The eastern terminus of John Street is to the west. The eastern terminus of Lincoln Street is to the southwest. Hargrave Street is to the west and Ramsey Street is to the northwest. No addresses have been assigned to the Subject Property. It appears that the Subject Property is currently located within the Banning city limits. The assessor's parcel numbers are 532-130-001 (20.63 acres), 532-130-002 (20.0 acres) and 532-110-006 (18.16 acres).

The topography for the Subject Property is mostly flat, as is this portion of the San Gorgonio Pass. The elevation is approximately 2,150 feet above sea level. The Santa Jacinto Mountains are to the south, and San Gorgonio Mountain is to the northeast. An unnamed creek crosses the southern portion of the Subject Property, two other small creeks cross the parcels and Smith Creek is to the south. The San Gorgonio River is to the northeast. Information regarding groundwater was sought on the GeoTracker database. A Case Closure Summary, dated January 26, 1995, was found for a leaking underground storage tank (LUST) site 0.47 miles to the northwest at 2033 East Ramsey Street. This summary stated that groundwater was estimated to be more than 200 feet below ground surface (bgs). The direction of groundwater flow was said to be to the southwest in this summary. A second Case Closure Summary, dated January 5, 1998, for a LUST site 1.25 miles to the west-northwest, at 775 East Ramsey Street. This summary stated that groundwater was 400 feet bgs, and the direction of groundwater flow was shown to be to the south-southeast in this summary.

Structure There are no structures on the Subject Property.

Parking and Landscaping There are no parking surfaces on Subject Property. There is no formal landscaping on the site. Vegetation consists of trees, shrubs, cacti and weedy groundcover. The plants are in good condition and no signs of stressed vegetation were observed. No stained soil was observed on the Subject Property.

Utilities The utility service to the properties in the area of the Subject Property is provided by a variety of vendors. Gas is provided by Southern California Gas Corp.; electricity, water and sewage treatment by the City of Banning; and trash removal by private vendors such as Waste Management.

3.2 Subject Property Use History

The Subject Property is currently an undeveloped 58.3 acre parcel of land. No evidence of recent activity was observed.

3.2.1 Past Site Uses

Past uses for the Subject Property were determined by examining aerial photographs dating back to 1967 as obtained from NETR Online. No aerial photographs taken prior to 1967 were available from NETR Online. Because the Subject Property has not been assigned an address, there was no permit file at the Building and Safety Division of the City of Banning Community Development Department. For the same reason, archive city directories were not researched. No Sanborn Map Company maps were found for the area of the Subject Property on the City of Los Angeles Public Library's online database.

The aerial photographs from 1967 to 2012 showed no structures or evidence of activity on the Subject Property. The 2005 aerial photograph showed what appeared to be more or less rectangular foot paths on the Subject Property.

3.3 Adjoining Properties - Use History

A number of properties adjoin the Subject Property. The current uses are as follows:

North Adjoining to the north are Southern Pacific Railroad tracks, and, north of the tracks, is Interstate 10.

East Adjoining to the east is a large tract of undeveloped land.

South and West Adjoining to the south and west is the Banning Airport. A large above ground storage tank was observed in the southern portion of the airport property.

Nothing was observed on any of these properties that appeared to be of environmental concern to the Subject Property.

3.3.1 Adjoining Properties - Past Uses

Prior uses for the properties discussed above were determined by viewing aerial photograph dating back to 1967 as obtained from NETR Online and from the Cabazon, California USGS Topographic Map. The aerial photographs and the USGS Map are discussed in Section 3.4 below.

3.4 Aerial Photograph and USGS Map Analysis

Historic aerial photographs were examined in order to determine what may have existed on a site prior to the construction of the existing buildings. Aerial photographs for the Subject Property were obtained from NETR Online. The aerial photographs showed the following:

- An aerial photograph taken in **1967** showed the Subject Property and the adjoining property to the east to be undeveloped, with no evidence of activity observed. A creek was shown along the southern side of the Subject Property. Adjoining to the north were railroad tracks, with Interstate 10 shown to the north of the tracks. Adjoining to the south and west was the Banning Airport. Structures associated with the airport and industrial buildings were shown to the southwest. What appeared to be a sewage treatment plant was shown to the south-southwest. What may have been a quarry was shown to the south. Commercial, retail and residential properties were shown to the west, along and to the north of Ramsey Street. A copy of this aerial photograph can be seen as Figure C-1 in Appendix C.

- An aerial photograph taken in **1972** showed the Subject Property and the adjoining property to the east to be undeveloped, with no evidence of activity observed. A creek was shown along the southern side of the Subject Property. Adjoining to the north were railroad tracks, with Interstate 10 shown to the north of the tracks. Adjoining to the south and west was the Banning Airport. A newer facility was shown to the northwest. Structures associated with the airport and industrial buildings were shown to the southwest. What appeared to be a sewage treatment plant was shown to the south-southwest. No evidence of recent activity was observed on what may have been a quarry to the south. Commercial, retail and residential properties were shown to the west, along and to the north of Ramsey Street. A copy of this aerial photograph can be seen as Figure C-2 in Appendix C.

- An aerial photograph taken in **1996** showed the Subject Property and the adjoining property to the east to be undeveloped, with no evidence of activity observed. A creek was shown along the southern side of the Subject Property. Adjoining to the north were railroad tracks, with Interstate 10 shown to the north of the tracks. Adjoining to the south and west was the Banning Airport. A facility was shown to the northwest that appeared to be a maintenance yard. Further to the northwest was what appeared to be a building materials operation. Structures associated with the airport and industrial buildings were shown to the southwest. What appeared to be a sewage treatment plant was shown to the south-southwest. No evidence of recent activity was observed on what may have been a quarry to the south. Commercial, retail and residential properties were shown to the west, along and to the north of Ramsey Street. A large quarry operation was observed to the northwest. A copy of this aerial photograph can be seen as Figure C-3 in Appendix C.

- An aerial photograph taken in **2005** showed the Subject Property and the adjoining property to the east to be undeveloped, however, what appeared to be more or less rectangular foot paths were observed on the Subject Property. A creek was shown along the southern side of the Subject Property. Adjoining to the north were railroad tracks, with Interstate 10 shown to the

north of the tracks. Adjoining to the south and west was the Banning Airport. A facility was shown to the northwest that appeared to be a maintenance yard. Further to the northwest was what appeared to be a building materials operation. The CalTrans weight station to the northeast was shown to have added a large parking lot. Structures associated with the airport and industrial buildings were shown to the southwest. What appeared to be a sewage treatment plant was shown to the south-southwest. No evidence of recent activity was observed on what may have been a quarry to the south. Commercial, retail and residential properties were shown to the west, along and to the north of Ramsey Street. A large quarry operation was observed to the northwest. A copy of this aerial photograph can be seen as Figure C-4 in Appendix C.

- An aerial photograph taken in **2012** showed the Subject Property and the adjoining property to the east to be undeveloped, with no evidence of activity observed. A creek was shown along the southern side of the Subject Property. Adjoining to the north were railroad tracks, with Interstate 10 shown to the north of the tracks. Adjoining to the south and west was the Banning Airport. A facility was shown to the northwest that appeared to be a maintenance yard. Further to the northwest was what appeared to be graded pads, a large graded parcel of land and a building materials operation. The CalTrans weight station was shown to the northeast. Structures associated with the airport and industrial buildings were shown to the southwest. What appeared to be a sewage treatment plant was shown to the south-southwest. Evidence of recent activity, possibly landfill activity, was observed on the former quarry to the south. Commercial, retail and residential properties were shown to the west, along and to the north of Ramsey Street. A large quarry operation was observed to the northwest. A copy of this aerial photograph can be seen as Figure C-5 in Appendix C.

USGS Map Analysis The 7.5 Minute Series United States Geological Survey Topographic Map for the area of the Subject Property is named the Cabazon, California map. The map, which was laid out in 1956, showed no structures or evidence of activity on the Subject Property or in the area to the east. Railroad tracks were shown adjoining to the north. The adjoining properties to the south and west were shown to be the Banning Airport, including an item labeled "Radio Far Beacon". Structures were shown to the west, along Ramsey Street, that appeared to be commercial or retail in use. Smaller structures, indicative of residences, were shown to the northwest. Smith Creek was shown to the southeast and the San Gorgonio River was shown to the northeast. The map showed mush of the surrounding land to be part of the Morongo Indian Reservation The map was photorevised (updated based on a review of aerial photographs) in 1987. The revised map showed that Interstate 10 had been built to the north (newer roads and building are shown in a purple tint on the revised map). Newer structures that were associated with the airport were shown to the west and southwest. A newer facility was shown to the northwest. Newer structures that appeared to be industrial in use was shown to the southwest. A newer facility labeled "Sewage Disposal" was shown to the south. An area to the east of the sewage disposal plant was labeled "Pit", and it may have been an abandoned quarry. A portion of the Cabazon USGS Map is reproduced as Figure B-1 in Appendix B.

4 RECORDS SEARCH

4.1 Regulatory Agencies Database Search

The following Federal, State of California, tribal and local government agency databases and sources were searched for postings within designated radii of the Subject Property:

FEDERAL SOURCES

- National Priority List (NPL) Within 1.0 Mile
- Delisted National Priority List (DELISTED NPL) Within 1.0 Mile
- Proposed National Priority List (PROPOSED NPL) Within 1.0 Mile
- Superfund Enterprise Management System (SEMS) Within 0.50 Miles
- CERCLIS No Further Remedial Action Planned (SEMS Archive) Within 0.50 Miles
- RCRA Corrective Action (CORRACTS) Within 1.0 Mile
- RCRA Treatment Storage and Disposal Facilities (RCRA-TSDF) Within 0.50 Miles
- RCRA Hazardous Waste Generator (RCRA-SQG) Within 0.25 Miles
- Federal EPA Institutional Controls/Engineering Controls (FEDERAL IC/FEDERAL EC) Within 0.50 Miles
- Emergency Response Notification System for Spills (ERNS) Within 0.25 Miles

STATE OF CALIFORNIA AND LOCAL GOVERERNMENT SOURCES

- State NPL (Response) Within 1.0 Mile
- California Department of Toxic Substances Control (EnviroStor) Within 0.50 Mile
- California/Tribal Landfills and/or Solid Waste (SWF/LF) Within 0.50 Miles
- California/Tribal Leaking Underground Storage Tanks (LUST) Within 0.50 Miles

- California/Tribal Spills, Leaks, Investigations and Cleanups (SLIC) Within 0.50 Miles
- California/Tribal Hazardous Substance Storage Containers (UST/AST) Within 0.25 Miles
- California/Tribal EPA Voluntary Cleanup Program (VCP) Within 0.50 Miles
- Local Landfill and Solid Waste Disposal Sites (WMUDS/SWAT) Within 0.50 Miles
- Local Underground Storage Tanks (UST, SWEEPS) Within 0.25 Miles
- California Hazardous Waste Information System (HAZNET) Within 0.50 Miles
- Environmental Liens (LIENS) for Subject Property Only
- Deed Restricted Sites (DEED) Within 0.50 Mile

The environmental database report is included in Appendix D.

SUBJECT PROPERTY The Subject Property is not posted onto databases.

ADJOINING PROPERTIES One of the adjoining properties is posted onto databases.

- The adjoining properties to the south and west, at 200 South Hathaway Street, is posted onto EnviroStor list. The occupant is shown to be Banning Municipal Airport. The EnviroStor posting states that the airport is a Formally Used Defense Site (FUDS). The Status is given as "Inactive - Needs Evaluation". A review of this site on the online EnviroStor database showed that the airport was never acquired by the military, and that the airport was built by private citizens in 1927 on 68 acres of land. The U.S. Army did conduct a training program at the airport in 1943, during World War II, specifically, on how to build an airport in Italy. The result was a lengthened and oiled landing strip. In that the EnviroStor posting does not indicate that any soil or groundwater impacts occurred, it is unlikely that the activities in 1943 would have affected the environmental condition of the Subject Property. A copy of the Defense Environmental Restoration Program Finding of Fact for Banning Airport can be seen in Appendix E.

NEARBY PROPERTIES No sites within 0.125 miles of the Subject Property are posted onto databases.

OTHER PROPERTIES The Subject Property is located in an undeveloped area, with industrial properties located to the west and southwest.

- A site 0.50 miles to the west, at 2033 East Ramsey Street, is posted onto LUST and SWF/LF lists. The occupant is shown to be California Department of Transportation Banning Maintenance Station. The LUST posting states that only the soil was affected by an unauthorized release of waste oil. The Status is given as "Completed - Case Closed" as of August 30, 1995. The SWF/LF

posting states that this is a limited volume transfer station which handles dead animals; inert, landscape and metal debris; mixed municipal trash; and used tires. In that the LUST case has been closed, and given that this a transfer station and not a disposal facility, it is unlikely that the unauthorized release or activities on this site would have affected the environmental condition of the Subject Property.

- A site 0.65 miles to the south-southeast, to the east of the sewage treatment plant, is posted onto EnviroStor list. The facility is said to have been the Banning Rifle Range. The EnviroStor posting states that the soil on this site had been impacted by explosives, lead, munitions debris and perchlorate. The Status is given as "Inactive - Action Required". In that only the soil was affected, it is unlikely that the activities on this site would have affected the environmental condition of the Subject Property.

- A site 0.84 miles to the southwest, at 700 South Hathaway Street, is posted onto EnviroStor list. The occupant is shown to be Tyco Electronics Corporation. The EnviroStor posting states that this site had been impacted by tetrachloroethylene (PCE), trichloroethylene (TCE) and cadmium compounds. The Status is given (on the online EnviroStor database) as "Certified O&M - Land Use Restrictions Only" as of March 15, 2017. In that it has been certified, it is unlikely that the impacts on this site would have affected the environmental condition of the Subject Property.

- A site 0.99 miles to the southwest, at 1284 East Lincoln Street, is posted onto EnviroStor list. The occupant is shown to be Perfection Plating. The EnviroStor posting states that this site had been impacted by PCE, TCE and chromium compounds. The Status is given as "Refer: 1248 Local Agency", in this case, the Riverside County Department of Environmental Health. A review of this site on the online EnviroStor database showed that the RCDEH and Perfection Plating entered into a voluntary cleanup agreement in 2004. In that it is not proximal, it is unlikely that the impacts on this site would have affected the environmental condition of the Subject Property.

There is no indication that any of the posted sites are of environmental concern to the Subject Property. There is no known regional groundwater impact in the area.

4.1.2 State of California Department of Oil, Gas and Geothermal Resources

The State of California Department of Conservation Division of Oil, Gas and Geothermal Resources (DOGGR) maintains maps that show the exact location of oil wells located in the state. The DOGGR Well Finder online mapping service was searched for oil wells in the immediate area of the Subject Property. No oil wells were shown to be located on, near, or within one mile of the Subject Property.

4.1.3 California State Department of Toxic Substance Control (DTSC)

The State of California Department of Toxic Substance Control (DTSC) is the agency that tracks sites on which there have been placed deed restrictions and land use restrictions. The DTSC web site for deed restricted sites and for land use restriction sites was searched. Neither the Subject Property nor any of the adjoining properties were included on these lists.

4.2 Regional Sources

4.2.1 Regional Water Quality Control Board

The California Regional Water Quality Control Board, San Diego Region (SDRWQCB) maintains a list of sites with leaking underground storage tanks (LUST) and the spills and leaks investigations and cleanups (SLIC) list. The GeoTracker database was searched, and the Subject Property was not included on the LUST or the SLIC lists.

4.3 County Sources

4.3.1 Riverside County Department of Environmental Health

The Riverside County Department of Environmental Health (RCDEH) is the agency responsible for supervising the remediation of sites impacted by hazardous materials or hazardous wastes; for permitting and inspecting USTs; and for inspecting facilities that use and store hazardous materials and generate hazardous waste. Because there are no addresses, and because the aerial photos showed no evidence of activity on the site, no request to review the files for the Subject Property was submitted.

4.3.2 Riverside County Waste Resources Management District

The Waste Resources Management District (WRMD) deals with solid waste management in the County of Riverside. The WRMD compiled a map of inactive landfills in the county. The map shows no inactive landfills to be within one mile of the Subject Property. One active landfill, named the Lamb Canyon Sanitary Landfill, was shown to be more than one mile to the southwest.

4.3.2 Riverside County Transportation and Land Management Agency

The Transportation and Land Management Agency (TLMA) deals with land development in the County of Riverside. The three parcel numbers which comprise the Subject Property were entered into the TLMA online search engine. The search result for parcel number 532-130-001 was Map 32335. This map was not found on the TLMA website. No permits were found to have been issued to any of the parcels.

4.4 Municipal Sources

4.4.1 City of Banning Building & Safety Department

The City of Banning Building & Safety Department is the repository for all building permits taken out in the city. Its files are examined as part of an ESA to determine the age of buildings and to obtain additional information of environmental significance. There is no permit file for the Subject Property.

5 SUBJECT PROPERTY INSPECTION

The Subject Property was inspected on April 18, 2017 by Chris Hayden, EP. The purpose of the site visits were to seek out and to report on visible environmental concerns, or to note use and storage of hazardous materials which could effect the environment condition of the Subject Property.

5.1 Use and Storage of Hazardous Materials

The Subject Property consists of an undeveloped 58.3 acre parcel of land. No evidence of recent activity was observed, as can be seen in Photographs 1 - 5 in Appendix C. The route of the public street was also assessed. As can be seen in Photograph 6, no evidence of recent activity was observed along the proposed route of the public street. The fire access route is within the airport property, and could not be directly examined, however, no evidence of activity was observed along the route. Markers were observed along the eastern side of the Subject Property which indicated that a gas pipeline was located in this area. Additional pipeline markers were observed in the railroad right-of-way to the north of the Subject Property.

5.2 Indications of PCBs

There is no indication that polychlorinated biphenyls (PCBs) were used or stored at the Subject Property. There are no transformers on the site. Transformers in the area would be the property of the City of Banning.

5.3 Indications of Solid Waste Disposal

Solid wastes are not currently generated on the Subject Property. Those generated in the area are placed into containers that are provided and serviced by Waste Management.

5.4 Indications of Hazardous Waste Disposal

Hazardous wastes are not currently generated on the Subject Property. There is no documentation to indicate that hazardous wastes were generated on the site in the past.

5.5 Indications of Asbestos Containing Materials

There are no structures on the Subject Property.

5.6 Indications of Vapor Intrusion/Vapor Encroachment

Impacted soil or groundwater on a site may result in vapor intrusion; and impacted groundwater migrating towards a site may result in vapor encroachment. There is no indication that the soil on the Subject Property has been impacted. There are no LUST cases within 0.25 miles of the Subject Property. Therefore, it is unlikely that vapor intrusion or vapor encroachment would be of concern for the Subject Property.

6 INTERVIEW

An important part of any Phase 1 is interviews with individuals having knowledge of the facilities and the operations at the property being assessed. For this ESA, there are no operations or structures on the Subject Property. James Thompson, Public Works Inspector with the City of Banning provided access to the Subject Property and gave some indication of the boundaries of the parcels.

7 FINDINGS, OPINIONS AND CONCLUSIONS

Prior to arriving at these conclusions, the following tasks were completed:

- The Subject Property was inspected.
- The surrounding properties were observed.
- Aerial photographs dating back to 1967 were examined.
- Information was requested from various governmental and regulatory agencies for environmental information pertaining to the Subject Property.
- The databases from local, tribal, state and federal regulatory agencies were examined.

Findings included the following:

- The aerial photographs from 1967 to 2012 showed the Subject Property to be undeveloped, with no evidence of activity observed.
- The 2005 aerial photograph showed rectangular foot paths on the Subject Property.
- The Subject Property is not posted onto any of the environmental databases searched in Section 4.1.
- No use or storage of hazardous materials were observed on the Subject Property on the day of the inspection.

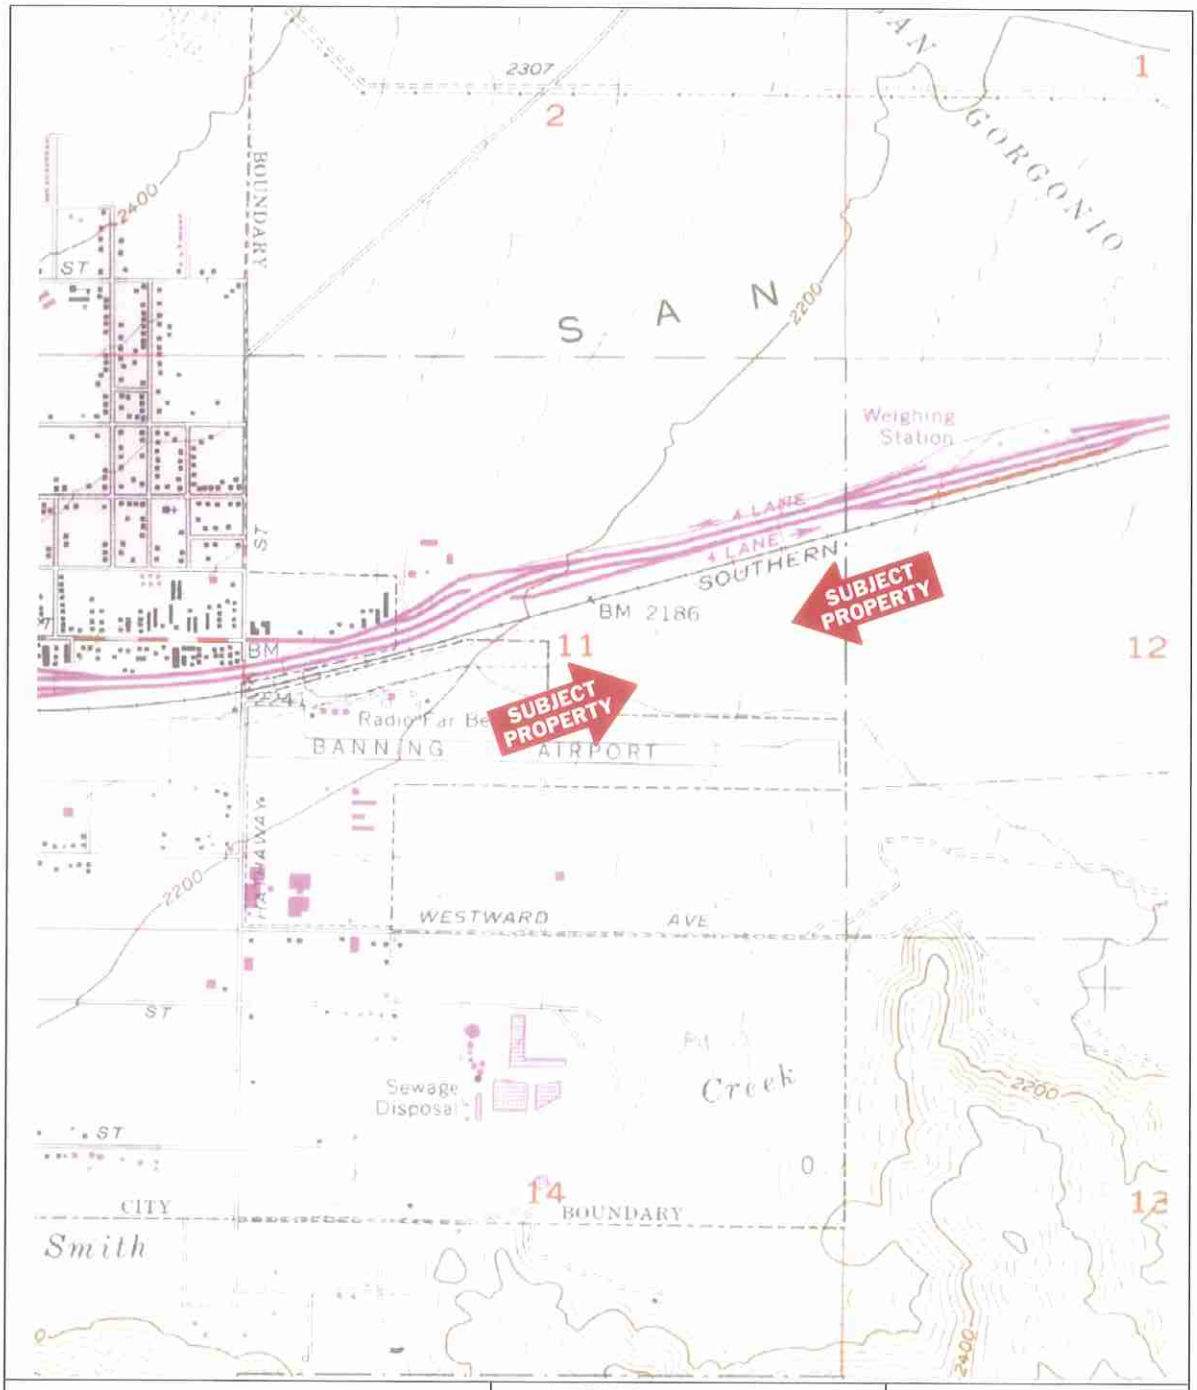
The Environmental Site Assessment on the 58.3 acres of land located to the north of the Banning Airport in the area of Banning in Riverside County, was performed in conformance with the scope and limitations of ASTM Standard Practice E 1527-13. In the opinion of HEI Corporation, this assessment has revealed no evidence of "recognized environmental conditions", as defined by the ASTM, in connection with the Subject Property. Therefore, it can be concluded that no further action is required at this time.

APPENDIX A

LIMITATIONS

LIMITATIONS

The services described in this report were performed consistent with generally accepted consulting principles and practices. No other warranty, expressed or implied, is made. These services were performed consistent with our agreement with the Client. This report is solely for the use and information of the Client unless otherwise noted. Any reliance on this report by a third party is at such party's sole risk.



Opinions and recommendations contained in this report apply to conditions existing when services were performed and are intended only for the Client, purposes, locations, time frames, and project parameters indicated. We are not responsible for the impacts of any changes in environmental standards, practices, or regulations subsequent to the performance of services. We do not warrant the accuracy of information supplied by others.

The purpose of an environmental assessment is to reasonable evaluate the potential for or actual impact of past and current practices on the Subject Property. In performing an environmental assessment, it is understood that a balance must be struck between a reasonable inquiry into the environmental issues and an exhaustive analysis of each conceivable issue of potential concern. The following paragraph discuss the assumptions and parameters under which such an opinion is rendered.

No investigation is thorough enough to exclude the presence of hazardous materials at a given site. If hazardous conditions have not been identified during the assessment, such a finding should not therefore be construed as a guarantee of the absence of such materials on the site, but rather as the services performed within the scope, limitations, and cost of the work performed. Environmental conditions may exist on the Subject Property that cannot be identified by visual observation.

Database Descriptions

NPL: NPL National Priorities List (Superfund). The NPL is a subset of CERCLIS and identifies over 1,200 sites for priority cleanup under the Superfund Program. NPL sites may encompass relatively large areas. As such, EDR provides polygon coverage for over 1,000 NPL site boundaries produced by EPA's Environmental Photographic Interpretation Center (EPIC) and regional EPA offices. NPL - National Priority List Proposed NPL - Proposed National Priority List Sites.

NPL Delisted: Delisted NPL The National Oil and Hazardous Substances Pollution Contingency Plan (NCP) establishes the criteria that the EPA uses to delete sites from the NPL. In accordance with 40 CFR 300.425.(e), sites may be deleted from the NPL where no further response is appropriate. Delisted NPL - National Priority List Deletions

CERCLIS: SEMS SEMS (Superfund Enterprise Management System) tracks hazardous waste sites, potentially hazardous waste sites, and remedial activities performed in support of EPA's Superfund Program across the United States. The list was formerly know as CERCLIS, renamed to SEMS by the EPA in 2015. The list contains data on potentially hazardous waste sites that have been reported to the USEPA by states, municipalities, private companies and private persons, pursuant to Section 103 of the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA). This dataset also contains sites which are either proposed to or on the National Priorities List (NPL) and the sites which are in the screening and assessment phase for possible inclusion on the NPL. SEMS - Superfund Enterprise Management System

NFRAP: SEMS-ARCHIVE SEMS-ARCHIVE (Superfund Enterprise Management System Archive) tracks sites that have no further interest under the Federal Superfund Program based on available information. The list was formerly known as the CERCLIS-NFRAP, renamed to SEMS ARCHIVE by the EPA in 2015. EPA may perform a minimal level of assessment work at a site while it is archived if site conditions change and/or new information becomes available. Archived sites have been removed and archived from the inventory of SEMS sites. Archived status indicates that, to the best of EPA's knowledge, assessment at a site has been completed and that EPA has determined no further steps will be taken to list the site on the National Priorities List (NPL), unless information indicates this decision was not appropriate or other considerations require a recommendation for listing at a later time. The decision does not necessarily mean that there is no hazard associated with a given site; it only means that. based upon available information, the location is not judged to be potential NPL site. SEMS-ARCHIVE - Superfund Enterprise Management System Archive

RCRA COR ACT: CORRACTS CORRACTS identifies hazardous waste handlers with RCRA corrective action activity. CORRACTS - Corrective Action Report

RCRA TSD: RCRA-TSDF RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Transporters are individuals or entities that move hazardous waste from the generator offsite to a facility that can recycle, treat, store, or dispose of the waste. TSDFs treat, store, or dispose of the waste. RCRA-TSDF - RCRA - Treatment, Storage and Disposal

RCRA GEN: RCRA-LQG RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Large quantity generators (LQGs) generate over 1,000 kilograms (kg) of hazardous waste, or over 1 kg of acutely hazardous waste per month. RCRA-LQG - RCRA - Large Quantity Generators RCRA-SQG - RCRA - Small Quantity Generators. RCRA-CESQG - RCRA - Conditionally Exempt Small Quantity Generators.

Federal IC / EC: US ENG CONTROLS A listing of sites with engineering controls in place. Engineering controls include various forms of caps, building foundations, liners, and treatment methods to create pathway elimination for regulated substances to enter environmental media or effect human health. US ENG CONTROLS - Engineering Controls Sites List US INST CONTROL - Sites with Institutional Controls.

Database Descriptions

ERNS: ERNS Emergency Response Notification System. ERNS records and stores information on reported releases of oil and hazardous substances. ERNS - Emergency Response Notification System

State/Tribal NPL: RESPONSE Identifies confirmed release sites where DTSC is involved in remediation, either in a lead or oversight capacity. These confirmed release sites are generally high-priority and high potential risk. RESPONSE - State Response Sites

State/Tribal CERCLIS: ENVIROSTOR The Department of Toxic Substances Control's (DTSC's) Site Mitigation and Brownfields Reuse Program's (SMBRP's) EnviroStor database identifes sites that have known contamination or sites for which there may be reasons to investigate further. The database includes the following site types: Federal Superfund sites (National Priorities List (NPL)); State Response, including Military Facilities and State Superfund; Voluntary Cleanup; and School sites. EnviroStor provides similar information to the information that was available in CalSites, and provides additional site information, including, but not limited to, identification of formerly-contaminated properties that have been released for reuse, properties where environmental deed restrictions have been recorded to prevent inappropriate land uses, and risk characterization information that is used to assess potential impacts to public health and the environment at contaminated sites. ENVIROSTOR - EnviroStor Database

State/Tribal SWL: SWF/LF (SWIS) Active, Closed and Inactive Landfills. SWF/LF records typically contain an inve ntory of solid waste disposal facilities or landfills. These may be active or i nactive facilities or open dumps that failed to meet RCRA Section 4004 criteria for solid waste landfills or disposal sites. SWF/LF (SWIS) - Solid Waste Information System

State/Tribal LTANKS: LUST REG 6L SAN FRANCISCO CO. LUST - Local Oversite Facilities. SONOMA CO. LUST - Leaking Underground Storage Tank Sites. SAN MATEO CO. LUST - Fuel Leak List. State/Tribal Tanks: UST Active UST facilities gathered from the local regulatory agencies UST - Active UST Facilities AST - Aboveground Petroleum Storage Tank Facilities. INDIAN UST R6 - Underground Storage Tanks on Indian Land. INDIAN UST R5 - Underground Storage Tanks on Indian Land. INDIAN UST R4 - Underground Storage Tanks on Indian Land. INDIAN UST R9 - Underground Storage Tanks on Indian Land. INDIAN UST R8 - Underground Storage Tanks on Indian Land. INDIAN UST R7 - Underground Storage Tanks on Indian Land. INDIAN UST R10 - Underground Storage Tanks on Indian Land. INDIAN UST R1 - Underground Storage Tanks on Indian Land.

Database Descriptions

State/Tribal VCP: VCP Contains low threat level properties with either confirmed or unconfirmed releases and the project proponents have request that DTSC oversee investigation and/or cleanup activities and have agreed to provide coverage for DTSC's costs. VCP - Voluntary Cleanup Program Properties

US Brownfields: US BROWNFIELDS Brownfields are real property, the expansion, redevelopment, or reuse of which may be complicated by the presence or potential presence of a hazardous substance, pollutant, or contaminant. Cleaning up and reinvesting in these properties takes development pressures off of undeveloped, open land, and both improves and protects the environment. Assessment, Cleanup and Redevelopment Exchange System (ACRES) stores information reported by EPA Brownfields grant recipients on brownfields properties assessed or cleaned up with grant funding as well as information on Targeted Brownfields Assessments performed by EPA Regions. A listing of ACRES Brownfield sites is obtained from Cleanups in My Community. Cleanups in My Community provides information on Brownfields properties for which information is reported back to EPA, as well as areas served by Brownfields grant programs. US BROWNFIELDS - A Listing of Brownfields Sites

Other SWF: CA LA LF SAN DIEGO CO. LF - Solid Waste Facilities. WMUDS/SWAT - Waste Management Unit Database. LOS ANGELES CO. LF - List of Solid Waste Facilities. VENTURA CO. LF - Inventory of Illegal Abandoned and Inactive Sites. Solid Waste Facilities in Los Angeles County. VENTURA CO. LF - List of Solid Waste Facilities

Other Haz Sites: SCH This category contains proposed and existing school sites that are being evaluated by DTSC for possible hazardous materials contamination. In some cases, these properties may be listed in the CalSites category depending on the level of threat to public health and safety or the environment they pose. SCH - School Property Evaluation Program SAN DIEGO CO. HMMD - Hazardous Materials Management Division Database. US CDL - Clandestine Drug Labs.

Other Tanks: SWEEPS UST Statewide Environmental Evaluation and Planning System. This underground storage tank listing was updated and maintained by a company contacted by the SWRCB in the early 1990's. The listing is no longer updated or maintained. The local agency is the contact for more information on a site on the SWEEPS list. SWEEPS UST - SWEEPS UST Listing ALAMEDA CO. UST - Underground Tanks. KERN CO. UST - Underground Storage Tank Sites & Tank Listing. MARIN CO. UST - Underground Storage Tank Sites. NAPA CO. UST - Closed and Operating Underground Storage Tank Sites. ORANGE CO. UST - List of Underground Storage Tank Facilities. RIVERSIDE CO. UST - Underground Storage Tank Tank List. SAN FRANCISCO CO. UST - Underground Storage Tank Information. SOLANO CO. UST - Underground Storage Tanks. SUTTER CO. UST - Underground Storage Tanks. VENTURA CO. UST - Underground Tank Closed Sites List. YOLO CO. UST - Underground Storage Tank Comprehensive Facility Report. EL SEGUNDO UST - City of El Segundo Underground Storage Tank. LONG BEACH UST - City of Long Beach Underground Storage Tank. UST SAN JOAQUIN - San Joaquin Co. UST. TORRANCE UST - City of Torrance Underground Storage Tank. UST MENDOCINO - Mendocino County UST Database. CA FID UST - Facility Inventory Database.

Local Land Records: DEED Site Mitigation and Brownfields Reuse Program Facility Sites with Deed Restrictions & Hazardous Waste Management Program Facility Sites with Deed / Land Use Restriction. The DTSC Site Mitigation and Brownfields Reuse Program (SMBRP) list includes sites cleaned up under the program's oversight and generally does not include current or former hazardous waste facilities that required a hazardous waste facility permit. The list represents deed restrictions that are active. Some sites have multiple deed restrictions. The DTSC Hazardous Waste Management Program (HWMP) has developed a list of current or former hazardous waste facilities that have a recorded land use restriction at the local county recorder's office. The land use restrictions on this list were required by the DTSC HWMP as a result of the presence of hazardous substances that remain on site after the facility (or part of the facility) has been closed or cleaned up. The types of land use restriction include deed notice, deed restriction, or a land use restriction that binds current and future owners. DEED - Deed Restriction Listing

Spills: HMIRS Hazardous Materials Incident Report System. HMIRS contains hazardous material spill incidents reported to DOT. HMIRS - Hazardous Materials Information Reporting System CHMIRS - California Hazardous Material Incident Report System. Orange Co. Industrial Site - List of Industrial Site Cleanups.

Database Descriptions

Other: RCRA NonGen / NLR RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). DEFENSE ENVIRONMENTAL RESTORATION PROGRAM
FORMERLY USED DEFENSE SITES
FINDINGS AND DETERMINATION OF ELIGIBILITY

BANNING AIRPORT
BANNING, CALIFORNIA
SITE NO. J09CA732600

FINDINGS OF FACT

1. The Department of Defense (DOD) is not known to have acquired nor have had any controlling interest in Banning Airport, Banning California. Real estate records were neither specific nor complete. The airport was established by private parties in 1927 on 68 acres of privately owned land.

2. In 1943, the U.S. Army conducted a training program for Army engineers in airport construction at the airport. As a result of the training program, the landing strip was lengthened and oiled. DOD made no other improvements to the site. The landing strip continues to be beneficially used. Anecdotal evidence supports ad hoc use of the airport during World War II by General Patton.

3. No DOD disposal actions were necessary. The airport is currently owned and operated by the City of Banning, which has enlarged the airport site to 127.15 acres. It is primarily used by the general public and North American Jet Charters.

DETERMINATION

Based on the foregoing Findings of Fact, it has been determined that this site has been formerly used by the Department of Defense. It is therefore eligible for the Defense Environmental Restoration Program-Formerly Used Defense Sites, established under 10 USC 2701 et seq.

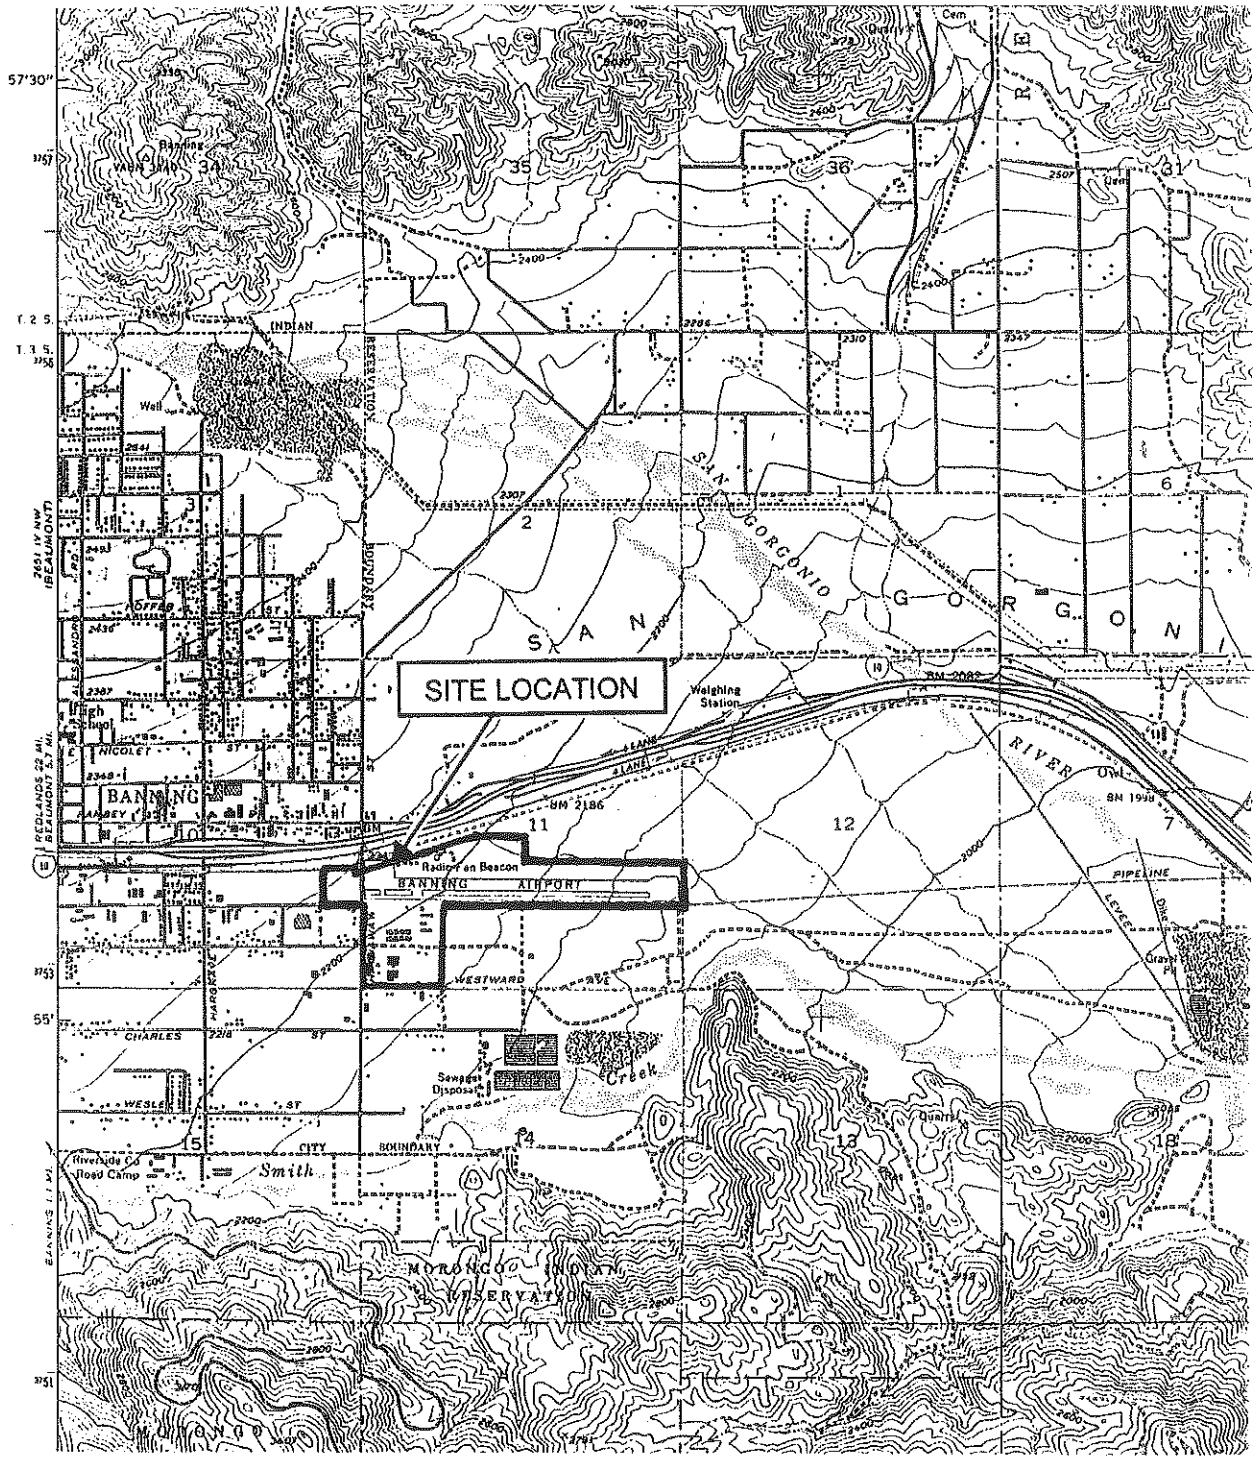
SITE SURVEY SUMMARY SHEET
FOR
DERP-FUDS SITE NO. J09CA732600
BANNING AIRPORT
20 August 1999

SITE NAME: BANNING AIRPORT; also known as Banning Landing Strip; Banning Flight Strip; Rogers Airport.

LOCATION: Banning Airport is located within the City of Banning, at its eastern boundary. It is immediately south of Interstate Highway 10.

SITE HISTORY: Banning airport was established in 1927 on 68 acres of land purchased from the Southern Pacific Railroad Company by members of the Banning Kiwanis Club and the Banning Post of the American legion. The airport comprised a hangar and 2,240 feet dirt landing strip. In the mid 1930s the airport was annexed by the City of Banning, which subsequently improved the site and enlarged it to 127.15 acres. The airport remains in operation and is principally used by the general public. Recently North American Jet Charter started operation of flights to Europe and South America from the airport.

Military use of the airport is well known. In 1943 the U.S. Army conducted a training program for Army engineers in airport construction at the airport. The program, known as *Project X: How to Build an Air Field in Italy*, resulted in improvement of the landing strip and extension of the strip to 5,000 feet. No other improvements were made to the airport by the military. The landing strip continues to be beneficially used. Listing of the airport in various military publications supports its use by the U.S. Army and the U.S. Army Air Corps during WWII. There is anecdotal evidence that General Patton used the airport during WWII to travel between the Third Army headquarters in Banning and his field headquarters in the California Arizona Maneuver Area. No evidence was found of ordnance use or storage at the airport.



SITE VISIT: The site was visited on 9 June 1999 by Joyce Clarke and John Pacetti of Science Applications International Corporation, Fountain Valley, California. The primary site contact was Mr. Earl Seay, owner of Banning Aviation Services, Banning Municipal Airport, Banning, California.

CATEGORY OF HAZARD: None.

PROJECT DESCRIPTION: No potential Projects at this site.

AVAILABLE STUDIES AND REPORTS: A history of Banning Airport has been compiled by the San Gorgonio Pass Pilots' Association and is held by the San Gorgonio History Association.

DISTRICT POC: Jeffery B. Armentrout, Los Angeles District (213) 452-3720.

APPENDIX F

STATEMENT OF QUALIFICATIONS FOR HEI CORPORATION

HEI CORPORATION

HEI Corporation was established in 1992 to respond to a need that exists in the environmental industry. There were many outstanding "full service" environmental firms in Southern California. Very few, however, specialized in performing Phase I Environmental Site Assessments (ESA's). For many firms, the ESA was and is approached as a way of positioning themselves to get any additional work recommended therein. This had led many to recognize the inherent conflict of interest that this represents. HEI Corporation eliminates this potential conflict in that no other environmental services are offered.

HEI Corporation, which also does business as Hayden Environmental, recognizes the importance of an ESA. The company was formed with the expressed purpose of providing the best, most complete, most thoroughly researched report available. At HEI Corporation, our fees are always competitive. Also, because we are not in the business of conducting Site Investigations (phase II's) there is no undue incentive to recommend them.

Our assessments are grounded in a solid understanding of the primary function of an ESA. Liability for environmental contamination can be expensive and time consuming in the extreme. While there is no guarantee that it will, an ESA is designed to allow a party coming into possession of real property, either as a tenant, buyer or lender forced to foreclose, to avail themselves of the "innocent landowner" defense. ESA's can also be a very valuable tool for an owner or tenant to establish a baseline condition of a property proper to the commencement of a lease.

Hayden Environmental has researched the law and adheres to the standards for environmental assessments promulgated by the ASTM Designation E 1527-13.

All Hayden Environmental Phase I assessments will include these five basic components:

- Subject property inspection and surrounding property observation
- Federal, state, tribal and local agency environmental database review
- County and /or municipal government record review
- Historical use review using aerial photographs, Sanborn maps and/or archive city directories
- Interviews with the current and former owners and occupants of the subject property

Hayden Environmental is fully insured, with policy coverage of $2,000,000 for Professional Liability and $1,000,000 for General Liability.

CHRISTOPHER M. HAYDEN

Chris Hayden, EP, has been in the environmental field since 1991. He began with a large multinational firm as the regional sales and marketing representative for Western U.S. He dealt primarily with firms in the energy, mining and real estate development fields. Seeking to broaden his "hands on" experience, he began working with a local firm in 1992. While there, he had the opportunity to work on a variety of projects, including environmental site assessments and site investigations. Seeing the need for a firm that specialized in conducting reliable, thorough and reasonably priced environmental site assessments while avoiding potential conflicts of interest, he formed Hayden Environmental in 1992. Hayden, through his years of experience, has earned the designation of Environmental Professional (EP) as defined in Section 40 C.F.R. § 312.10(b).

Mr. Hayden also serves on the ASTM E50 Committee which reviews, revises and enforces the standards for environmental assessments currently promulgated by the ASTM Designation E 1527-13.

Prior to 1991 Hayden had been in the real estate industry for twelve years. He last worked as an industrial real estate broker with Grubb & Ellis in Newport Beach, CA.

Hayden has a Bachelors of Arts in Biology from Humboldt State University in Arcata, California. He has taken several classes in the Environmental Site Investigation and Remediation Certification program at the University of California at Irvine.

OWNER'S CERTIFICATION

This project-specific Water Quality Management Plan (WQMP) has been prepared for:

Banning Industrial, LP
for the project known as **Banning Distribution Center** located north of the Banning Airport, south of I-10, east of Hargrave Street, and west of the San Gorgonio River, Banning, CA

This WQMP is intended to comply with the requirements of **City of Banning** for **TENTATIVE PARCEL MAP #34335**, which includes the requirement for the preparation and implementation of a project-specific WQMP.

The undersigned, while owning the property/project described in the preceding paragraph, shall be responsible for the implementation of this WQMP and will ensure that this WQMP is amended as appropriate to reflect up-to-date conditions on the site. This WQMP will be reviewed with the facility operator, facility supervisors, employees, tenants, maintenance and service contractors, or any other party (or parties) having responsibility for implementing portions of this WQMP. At least one copy of this WQMP will be maintained at the project site or project office in perpetuity.

The undersigned is authorized to certify and to approve implementation of this WQMP. The undersigned is aware that implementation of this WQMP is enforceable under Error! Reference source not found. Water Quality Ordinance (Municipal Code Section 13.24).

If the undersigned transfers its interest in the subject property/project, the undersigned shall notify the successor in interest of its responsibility to implement this WQMP.

"I, the undersigned, certify under penalty of law that I am the owner of the property that is the subject of this WQMP, and that the provisions of this WQMP have been reviewed and accepted and that the WQMP will be transferred to future successors in interest."

Statewide Construction General Permit Coverage	Y ☒ N☐
Statewide Industrial General Permit Coverage	Y ☐ N☒
Other *(please list in the space below as required)*	

The proposed project consists of a rail serviced warehouse/distribution building with 1,000,000 square feet of warehouse space, 10,000 square feet of office space, 392 truck and trailer parking spaces, 223 automobile parking spaces, 205 loading docks, and landscaped areas on a 63.90 acre site.

Existing runoff from the site generally flows southeast for approximately a half miles before entering Smith Creek. Flows continue in Smith Creek for 1.5 miles before flowing into the San Gorgonio River, which then empties into the Whitewater River (11.5 miles to the east). The Whitewater River flows for about 50 miles before reaching the Salton Sea.

The site was subdivided into 2 Drainage Management Areas (DMAs). DMA-1 consists of 20.1 acres of warehouse building, parking and landscape areas. DMA-1 generates water quality treatment volume of 16,781 cubic feet which will be directed to the proposed retention basin (Basin 1) via combination of surface flow and underground storm drain. DMA-2 consists of 37.8 acres of warehouse building, parking and landscape areas. DMA-2 generates water quality treatment volume of 41,164 cubic feet which will be directed to the proposed retention basin (Basin 2) via combination of surface flow and underground storm drain.

In order to minimize the discharge and transport of pollutants from the site and comply with the City of Banning stormwater requirements, the site will be constructed to retain100% of the 100-year 3-hour storm runoff volume. As a result, the retention basins are capable of storing storm volumes in excess of the water quality volumes. Proposed onsite drainage system will capture and convey the entire 100-year runoff volume into two retention basins located near the southern boundary of the site. Infiltration tests have been performed by SCST Engineering indicating average infiltration rate of 3.63 inches per hour at the location of the proposed retention basins. A minimum factor of safety of 3 will be applied to the infiltration rate to ensure better long term performance of the infiltration basins.

City of Banning requires that the 100-year 3-hour storm event must be completely infiltrated within 72 hours of the event. However, the project site is located within the sphere of influence of the Banning Municipal Airport; the Riverside County Airport Land Use Commission (ALUC) is requiring a maximum 48 hour retention time for the onsite retention basins.

It should be noted that infiltrating the required water quality volumes in the ground is a Low Impact (Development (LID) BMP and as such complies with the latest principles in addressing the storm water quality.

Appendix A of this project-specific WQMP includes a complete copy of the final Conditions of Approval. Appendix B of this project-specific WQMP includes:

a. A Vicinity Map identifying the project site and surrounding planning areas in sufficient detail; and

b. A Site Plan for the project. The Site Plan included as part of Appendix B depicts the following project features:

   - Location and identification of all structural BMPs, including Source Control, LID/Site Design and Treatment Control BMPs.
   - Landscaped areas.

- Paved areas and intended uses (i.e., parking, outdoor work area, outdoor material storage area, sidewalks, patios, tennis courts, etc.).
- Number and type of structures and intended uses (i.e., buildings, tenant spaces, dwelling units, community facilities such as pools, recreation facilities, tot lots, etc.).
- Infrastructure (i.e., streets, storm drains, etc.) that will revert to public agency ownership and operation.
- Location of existing and proposed public and private storm drainage facilities (i.e., storm drains, channels, basins, etc.), including catch basins and other inlets/outlet structures. Existing and proposed drainage facilities should be clearly differentiated.
- Location(s) of Receiving Waters to which the project directly or indirectly discharges.
- Location of points where onsite (or tributary offsite) flows exit the property/project site.
- Delineation of proposed drainage area boundaries, including tributary offsite areas, for each location where flows exit the project site and existing site (where existing site flows are required to be addressed). Each tributary area should be clearly denoted.
- Pre- and post-project topography.

Appendix I is a one page form that summarizes pertinent information relative to this project-specific WQMP.

II. Site Characterization

Land Use Designation or Zoning:

Current Property Use: **UNDEVELOPED**

Proposed Property Use: **INDUSTRIAL (WAREHOUSE/ DISTRIBUTION)**

Availability of Soils Report: Y ☒ N ☐ *Note: A soils report is required if infiltration BMPs are utilized. Attach report in Appendix E.*

Phase 1 Site Assessment: Y ☐ N ☒ *Note: If prepared, attached remediation summary and use restrictions in Appendix H.*

Receiving Waters for Urban Runoff from Site

Receiving Waters	EPA Approved 303(d) List Impairments	Designated Beneficial Uses	Proximity to RARE Beneficial Use Designated Receiving Waters
Smith Creek	None	No beneficial uses listed in WQMP Guidance	N/A
San Gorgonio River	None	MUN, AGR, GWR, REC I, REC II, COLD, WILD	N/A
Whitewater River	None	MUN, AGR, GWR, REC I, REC II, WARM, COLD,WILD, POW	N/A
Coachella Valley Stormwater Channel	Pathogens, Toxaphene	FRSH, REC I, REC II, WARM, WILD, RARE	43.3
Salton Sea	Nutrients, Salinity, Selenium	AQUA, IND, RECI, RECII, WARM, WILD, RARE	64.3

III. Pollutants of Concern

Table 1. Pollutant of Concern Summary

Pollutant Category	Potential for Project and/or Existing Site	Causing Receiving Water Impairment
Bacteria/Virus	Yes	Yes
Heavy Metals	Yes	Yes
Nutrients	Yes	Yes
Toxic Organic Compounds	Yes	Yes
Sediment/Turbidity	Yes	No
Trash & Debris	Yes	No
Oil & Grease	Yes	No
Other (specify pollutant):		
Other (specify pollutant):		

Hydrologic Conditions of Concern

Local Jurisdiction Requires On-Site Retention of Urban Runoff:

Yes ☒ The project will be required to retain urban runoff onsite in conformance with local ordinance (See Table 6 of the WQMP Guidance document, "Local Land use Authorities Requiring Onsite Retention of Stormwater"). This section does not need to be completed; however, retention facility design details and sizing calculations must be included in Appendix F.

No ☐ This section must be completed.

This Project meets the following condition:

☐ **Condition A**: 1) Runoff from the Project is discharged directly to a publicly-owned, operated and maintained MS4 or engineered and maintained channel, 2) the discharge is in full compliance with local land use authority requirements for connections and discharges to the MS4 (including both quality and quantity requirements), 3) the discharge would not significantly impact stream habitat in proximate Receiving Waters, **and** 4) the discharge is authorized by the local land use authority.

☐ **Condition B**: The project disturbs less than 1 acre and is not part of a larger common plan of development that exceeds 1 acre of disturbance. The disturbed area calculation must include all disturbances associated with larger plans of development.

☐ **Condition C**: The project's runoff flow rate, volume, velocity and duration for the post-development condition do not exceed the pre-development condition for the 2-year, 24-hour and 10-year 24-hour rainfall events. This condition can be achieved by, where applicable, complying with the local land use authority's on-site retention ordinance, or minimizing impervious area on a site and incorporating other Site-Design BMP concepts and LID/Site Design BMPs that assure non-exceedance of pre-development conditions. This condition must be substantiated by hydrologic modeling methods acceptable to the local land use authority.

☐ **None:** Refer to Section 3.4 of the Whitewater River Region WQMP Guidance document for additional requirements.

Supporting engineering studies, calculations, and reports are included in Appendix C.

	2 year – 24 hour		10 year – 24 hour	
	Precondition	**Post-condition**	**Precondition**	**Post-condition**
Discharge (cfs)				
Velocity (fps)				
Volume (cubic feet)				
Duration (minutes)				

IV. Best Management Practices

This project implements Best Management Practices (BMPs) to address the Pollutants of Concern that may potentially be generated from the use of infiltration. These BMPs have been selected and implemented to comply with Section 3.5 of the WQMP Guidance document, and consist of Site Design BMP concepts, Source Control, LID/Site Design and, if/where necessary, Treatment Control BMPs as described herein.

V.1 Site Design BMP Concepts, LID/Site Design and Treatment Control BMPs

Local Jurisdiction Requires On-Site Retention of Urban Runoff:

Yes ☒ The project will be required to retain Urban Runoff onsite in conformance with local ordinance (See Table 6 of the WQMP Guidance document, "Local Land use Authorities Requiring Onsite Retention of Stormwater). **The LID/Site Design measurable goal has thus been met (100%), and Sections V.1.A and V.1.B do not need to be completed**; however, retention facility design details and sizing calculations must be included in Appendix F, and '100%' should be entered into Column 3 of Table 6 below.

No ☐ Section V.1 must be completed.

This section of the Project-Specific WQMP documents the LID/Site Design BMPs and, if/where necessary, the Treatment Control BMPs that will be implemented on the project to meet the requirements detailed within Section 3.5.1 of the WQMP Guidance document. Section 3.5.1 includes requirements to implement Site Design Concepts and BMPs, and includes requirements to address Pollutants of Concern with BMPs. Further, sub-section 3.5.1.1 specifically requires that Pollutants of Concern be addressed with LID/Site Design BMPs to the extent feasible.

LID/Site Design BMPs are those BMPs listed within Table 2 below which promote retention and/or feature a natural treatment mechanism; off-site and regionally-based BMPs are also LID/Site Design BMPs, and therefore count towards the measurable goal, if they fit these criteria. This project incorporates LID/Site Design BMPs to fully address the Treatment Control BMP requirement where and to the extent feasible. If and where it has been acceptably demonstrated to the local land use authority that it is infeasible to fully meet this requirement with LID/Site Design BMPs, Section V.1.B (below) includes a description of the conventional Treatment Control BMPs that will be substituted to meet the same requirements.

In addressing Pollutants of Concern, BMPs are selected using Table 2 below.

Table 2. BMP Selection Matrix Based Upon Pollutant of Concern Removal Efficiency [(1)]

(Sources: Riverside County Flood Control & Water Conservation District Design Handbook for Low Impact Development Best Management Practices, dated September 2011, the Orange County Technical Guidance Document for Water Quality Management Plans, dated May 19, 2011, and the Caltrans Treatment BMP Technology Report, dated April 2010 and April 2008)

Pollutant of Concern	Landscape Swale[2, 3]	Landscape Strip[2, 3]	Biofiltration (with underdrain)[2, 3]	Extended Detention Basin[2]	Sand Filter Basin[2]	Infiltration Basin[2]	Infiltration Trench[2]	Permeable Pavement[2]	Bioretention (w/o underdrain)[2, 3]	Other BMPs Including Proprietary BMPs[4, 6]
Sediment & Turbidity	M	M	H	M	H	H	H	H	H	Varies by Product[5]
Nutrients	L/M	L/M	M	L/M	L/M	H	H	H	H	
Toxic Organic Compounds	M/H	M/H	M/H	L	L/M	H	H	H	H	
Trash & Debris	L	L	H	H	H	H	H	L	H	
Bacteria & Viruses (also: Pathogens)	L	M	H	L	M	H	H	H	H	
Oil & Grease	M	M	H	M	H	H	H	H	H	
Heavy Metals	M	M/H	M/H	L/M	M	H	H	H	H	

Abbreviations:

L: Low removal efficiency M: Medium removal efficiency H: High removal efficiency

Notes:

(1) Periodic performance assessment and updating of the guidance provided by this table may be necessary.

(2) Expected performance when designed in accordance with the most current edition of the document, "Riverside County, Whitewater River Region Stormwater Quality Best Management Practice Design Handbook".

(3) Performance dependent upon design which includes implementation of thick vegetative cover. Local water conservation and/or landscaping requirements should be considered; approval is based on the discretion of the local land use authority.

(4) Includes proprietary stormwater treatment devices as listed in the CASQA Stormwater Best Management Practices Handbooks, other stormwater treatment BMPs not specifically listed in this WQMP (including proprietary filters, hydrodynamic separators, inserts, etc.), or newly developed/emerging stormwater treatment technologies.

(5) Expected performance should be based on evaluation of unit processes provided by BMP and available testing data. Approval is based on the discretion of the local land use authority.

(6) When used for primary treatment as opposed to pre-treatment, requires site-specific approval by the local land use authority.

V.1.A SITE DESIGN BMP CONCEPTS AND LID/SITE DESIGN BMPS

This section documents the Site Design BMP concepts and LID/Site Design BMPs that will be implemented on this project to comply with the requirements detailed in Section 3.5.1 of the WQMP Guidance document.

- Table 3 herein documents the implementation of the Site Design BMP Concepts described in sub-sections 3.5.1.3 and 3.5.1.4.
- Table 4 herein documents the extent to which this project has implemented the LID/Site Design goals described in sub-section 3.5.1.1.

Table 3. Implementation of Site Design BMP Concepts

Design Concept	Technique	Specific BMP	Included			Brief Reason for BMPs Indicated as No or N/A
			Yes	No	N/A	
Site Design BMP Concept 1	**Minimize Urban Runoff, Minimize Impervious Footprint, and Conserve Natural Areas (See WQMP Section 3.5.1.3)**	Conserve natural areas by concentrating or clustering development on the least environmentally sensitive portions of a site while leaving the remaining land in a natural, undisturbed condition.	☐	☐	☐	
		Conserve natural areas by incorporating the goals of the Multi-Species Habitat Conservation Plan or other natural resource plans.	☐	☐	☐	
		Preserve natural drainage features and natural depressional storage areas on the site.	☐	☐	☐	
		Maximize canopy interception and water conservation by preserving existing native trees and shrubs, and planting additional native or drought tolerant trees and large shrubs.	☐	☐	☐	
		Use natural drainage systems.	☐	☐	☐	
		Where applicable, incorporate Self-Treating Areas	☐	☐	☐	
		Where applicable, incorporate Self-Retaining Areas	☐	☐	☐	
		Increase the building floor to area ratio (i.e., number of stories above or below ground).	☐	☐	☐	
		Construct streets, sidewalks and parking lot aisles to minimum widths necessary, provided that public safety and a walkable environment for pedestrians are not compromised.	☐	☐	☐	
		Reduce widths of streets where off-street parking is available.	☐	☐	☐	
		Minimize the use of impervious surfaces, such as decorative concrete, in the landscape design.	☐	☐	☐	
		Other comparable and equally effective Site Design BMP concept(s) as approved by the local land use authority (Note: Additional narrative required to describe BMP and how it addresses site design concept).	☐	☐	☐	

Table 3. Site Design BMP Concepts (continued)

Design Concept	Technique	Specific BMP	Included			Brief Reason for Each BMP Indicated as No or N/A
			Yes	No	N/A	
Site Design BMP Concept 2	**Minimize Directly Connected Impervious Area (See WQMP Section 3.5.1.4)**	Design residential and commercial sites to contain and infiltrate roof runoff, or direct roof runoff to landscaped swales or buffer areas.	☐	☐	☐	
		Drain impervious sidewalks, walkways, trails, and patios into adjacent landscaping.	☐	☐	☐	
		Incorporate landscaped buffer areas between sidewalks and streets.	☐	☐	☐	
		Use natural or landscaped drainage swales in lieu of underground piping or imperviously lined swales.	☐	☐	☐	
		Where soil conditions are suitable, use perforated pipe or gravel filtration pits for low flow infiltration.	☐	☐	☐	
		Maximize the permeable area by constructing walkways, trails, patios, overflow parking, alleys, driveways, low-traffic streets, and other low-traffic areas with open-jointed paving materials or permeable surfaces such as pervious concrete, porous asphalt, unit pavers, and granular materials.	☐	☐	☐	
		Use one or more of the following:				
		Rural swale system: street sheet flows to landscaped swale or gravel shoulder, curbs used at street corners, and culverts used under driveways and street crossings.	☐	☐	☐	
		Urban curb/swale system: street slopes to curb; periodic swale inlets drain to landscaped swale or biofilter.	☐	☐	☐	
		Dual drainage system: first flush captured in street catch basins and discharged to adjacent vegetated swale or gravel shoulder; high flows connect directly to MS4s.	☐	☐	☐	
		Other comparable and equally effective Site Design BMP concept(s) as approved by the local land use authority (Note: Additional narrative required to describe BMP and how it addresses site design concept).	☐	☐	☐	
		Use one or more of the following for design of driveways and private residential parking areas:				
		Design driveways with shared access, flared (single lane at street), or wheel strips (paving only under the tires).	☐	☐	☐	
		Uncovered temporary or guest parking on residential lots paved with a permeable surface, or designed to drain into landscaping.	☐	☐	☐	

Table 3. Site Design BMP Concepts (continued)

Design Concept	Technique	Specific BMP	Included			Brief Reason for Each BMP Indicated as No or N/A
			Yes	No	N/A	
Site Design BMP Concept 2 (cont'd)	**Minimize Directly Connected Impervious Area (See WQMP Section 3.5.1.4)**	Other comparable and equally effective Site Design BMP concept(s) as approved by the local land use authority (Note: Additional narrative required to describe BMP and how it addresses site design concept).	☐	☐	☐	
		Use one or more of the following for design of parking areas:				
		Where landscaping is proposed in parking areas, incorporate parking area landscaping into the drainage design.	☐	☐	☐	
		Overflow parking (parking stalls provided in excess of the Permittee's minimum parking requirements) may be constructed with permeable pavement.	☐	☐	☐	
		Other comparable and equally effective Site Design BMP (or BMPs) as approved by the local land use authority (Note: Additional narrative required describing BMP and how it addresses site design concept).	☐	☐	☐	

Project Site Design BMP Concepts:

Infiltration basins will be implemented to allow for 100% infiltration of the 100 year, 3 hour event. This will reduce the total amount of stormwater leaving the site and maintain water quality.

Alternative Project Site Design BMP Concepts:

Not applicable

Table 4. LID/Site Design BMPs Meeting the LID/Site Design Measurable Goal N/A

(1) DRAINAGE SUB-AREA ID OR NO.	(2) LID/SITE DESIGN BMP TYPE* (See Table 2)	(3) POTENTIAL POLLUTANTS OF CONCERN WITHIN DRAINAGE SUB-AREA (Refer to Table 1)	(4) POTENTIAL POLLUTANTS WITHIN SUB-AREA CAUSING RECEIVING WATER IMPAIRMENTS (Refer to Table 1)	(5) EFFECTIVENESS OF LID/SITE DESIGN BMP AT ADDRESSING IDENTIFIED POTENTIAL POLLUTANTS (U, L, M, H/M, H; see Table 2)	(6) BMP MEETS WHICH DESIGN CRITERIA? (Identify as V_{BMP} OR Q_{BMP})	(7) TOTAL AREA WITHIN DRAINAGE SUB-AREA (Nearest 0.1 acre)
TOTAL PROJECT AREA TREATED WITH LID/SITE DESIGN BMPs (NEAREST 0.1 ACRE)						

*** LID/Site Design BMPs listed in this table are those that <u>completely</u> address the 'Treatment Control BMP requirement' for their drainage sub-area.**

Justification of infeasibility for sub-areas not addressed with LID/Site Design BMPs

Insert text here listing each drainage sub-area wherein the design criteria of VBMP and/or QBMP are not treated using LID/Site Design BMPs as required in WQMP Guidance Section 3.5.1.1, and provide justification of infeasibility for each.

V.1.B TREATMENT CONTROL BMPS N/A

Conventional Treatment Control BMPs shall be implemented to address the project's Pollutants of Concern as required in WQMP Section 3.5.1 where, and to the extent that, Section V.1.A has demonstrated that it is infeasible to meet these requirements through implementation of LID/Site Design BMPs.

☒ The LID/Site Design BMPs described in Section V.1.A of this project-specific WQMP completely address the 'Treatment Control BMP requirement' for the entire project site (and where applicable, entire existing site) as required in Section 3.5.1.1 of the WQMP Guidance document. Supporting documentation for the sizing of these LID/Site Design BMPs is included in Appendix F. ***Section V.1.B does not need to be completed**.

☐ The LID/Site Design BMPs described in Section V.1.A of this project-specific WQMP do **NOT** completely address the 'Treatment Control BMP requirement' for the entire project site (or where applicable, entire existing site) as required in Section 3.5.1.1 of the WQMP. ***Section V.1.B must be completed.**

The Treatment Control BMPs identified in this section are selected, sized and implemented to treat the design criteria of V_{BMP} and/or Q_{BMP} for all project (and if required, existing site) drainage sub-areas which were not fully addressed using LID/Site Design BMPs. Supporting documentation for the sizing of these Treatment Control BMPs is included in Appendix F.

Table 5: Treatment Control BMP Summary

	TOTAL PROJECT AREA TREATED WITH TREATMENT CONTROL BMPs (NEAREST 0.1 ACRE)					

V.1.C MEASURABLE GOAL SUMMARY

This section documents the extent to which this project has met the measurable goal described in WQMP Section 3.5.1.1 of addressing 100% of the project's 'Treatment Control BMP requirement' with LID/Site Design BMPs. Projects required to retain Urban Runoff onsite in conformance with local ordinance are considered to have met the measurable goal; for these instances, '100%' is entered into Column 3 of the Table.

Table 6: Measurable Goal Summary

*Details demonstrating proper design must be included in Appendix F.

Education of Owners, Maintenance Crews, and Associated Contractors:

The OWNER will maintain general WQMP education materals published by the Riverside County Storm Water program and/or the Regional Water quality Control Board-Whitewater region, or other appropriate sources. These educational materials shall include general housekeeping and street maintenance practices that prevent pollutant loading in site runoff (http://www.floodcontrol.co.riverside.ca.us/stormwater/). In addition, the OWNER will be responsible for providing training to street maintenance crews and contractors regarding the requirements of the FWQMP including, but not limited to, associated BMPs, and activity restrictions. Copies of training attendance records will be retained for up to five years. Examples of the educational materials that will be used in implementing the FWQMP are provided in Appendix D.

Street Sweeping Private Streets and Parking Lots:

The OWNER shall ensure that the streets are swept monthly in accordance with local City ordinances and maintenance frequency.

Drainage Facility Inspection and Maintenance:

The OWNER shall ensure that routine maintenance procedures include inspection and maintenance of all on-site catch basins, drainage facilities, and the water quality infiltration basin with its associated dry/infiltration wells. Frequency shall be once each year prior to the onset of the rainy season. Rainy season in this area is from August 1 to October 1 and November 1 to May 1. Catch basins observed to have accumulated a volume of sediment and debris equal to 25% of its capacity shall be cleaned prior to the rainy season. Deficiencies in the system that may impact water quality shall be immediately repaired.

Storm Drain Inlet Stenciling and Signage:

Stenciling and signage shall employ the phrase "NO DUMPING-ONLY RAIN IN DRAIN" or an equally effective phrase, consistent with the City of Banning requirements, that will be stenciled on all catch basins ("STORM WATER ONLY") to alert maintenance personnel to the destination of pollutants discharged into the storm drains. Legibility will be checked annually and repainted if necessary within 30 days after inspection. The signs will be located at storm drain inlets in impervious areas and will be either stenciled or placarded. Refer to the educational materials in Appendix D.

Protect Slopes and Channels:

All slopes of the water quality infiltration basin and shall be adequately vegetated with native drought tolerant species, stabilized, and maintained to continue optimum performance. Bare areas shall be re-vegetated. Inspections shall be performed prior, during, and after rain events. Implementation is post construction and maintenance operations and funding are the responsibility of the building OWNERs.

Trash Storage Areas:

The OWNER shall ensure that routine inspection and maintenance of all on-site trash storage areas.

Appendix D includes copies of the educational materials (described in Section 3.5.2.1 of the WQMP Guidance document) that will be used in implementing this project-specific WQMP.

V.3 EQUIVALENT TREATMENT CONTROL BMP ALTERNATIVES

V. Operation and Maintenance Responsibility for BMPs

Appendix G of this project-specific WQMP includes copies of CC&Rs, Covenant and Agreements, BMP Maintenance Agreement and/or other mechanisms used to ensure the ongoing operation, maintenance, funding, transfer and implementation of the project-specific WQMP requirements.

BMP	***O&M Requirements***	***Start-up Dates***	***O&M Frequency***	***Parties Responsible***	***Inspection and Record Keeping***	***Water Quality Monitoring***
Education of Owners, Maintenance Crews, and Associated Contractors	*Distribute educational materials and conduct annual awareness training.*	*Post-construction*	*Upon first occupancy and yearly thereafter*	*OWNER*	*Maintain Training records.*	*None*
Activity Restrictions	*Develop activity restrictions*	*Upon first occupancy.*	*Continuous*	*OWNER*	*Lease Agreements*	*None*
Irrigation System and Landscape Maintenance	*Regular maintenance of landscaping and water quality basins*	*Upon installation of landscaping & irrigation systems*	*Inspect twice annually, before & after rainy season. Maintain every 2 weeks*	*OWNER*	*Maintain inspection & maintenance records*	*None*
Common Areas Litter Control	*Trash & debris to be removed as part of regular landscape maintenance*	*Post-construction*	*Inspect twice annually, before & after rainy season. Maintena-nce every 2 weeks*	*OWNER*	*Maintain inspection & maintenance records*	*None*
Parking Sweeping	*Sweep parking lot. Do not use water to clean.*	*Post-construction*	*Monthly*	*OWNER*	*Maintain inspection & maintenance records*	*None*
Drainage Facility Inspection and Maintenance	*Inspect at a minimum, before and after the rainy season to remove sediment/debris build-up.*	*Post-construction*	*Quarterly or as needed*	*OWNER*	*Maintain inspection & maintenance records*	*None*
Storm Drain Inlet	*Inspect annually.*	*Post-construction*	*Repair or replace*	*Owner*	*Maintain inspection &*	*None*

Stenciling and Signage	*Maintain legibility*		*as needed*		*maintenance records*	
Protect Slopes and Channels	*Inspect for standing water, slope stability.*	*Post-construction*	*Semi-annually and after extreme storm events*	*OWNER*	*Maintain inspection & maintenance records*	*None*
Trash Storage Areas	*Inspect weekly. Have trash hauled away when containers are full and on a regular basis. Maintain trash receptacles and enclosures in good working order.*	*Post-construction*	*Check Daily and empty as needed.*	*OWNER*	*Maintain inspection & maintenance records*	*Trash Storage Areas*
Pre-treatment facility - CDS Unit or Dry Well (See Appendix F for more O&M information)	*Inspect at a minimum twice a year for blockages or obstruction in the inlet and separation screen for accumulation of hydrocarbons, trash and sediment*	*Post-construction*	*Maintenance, at a minimum, before and after the rainy season. Clean when sediment has reached 75% of the isolated sump capacity, or when appreciable level of hydrocarbons and trash has accumulated. Repair any deficiencies that may impact water quality.*	*OWNER*	*Maintain inspection & maintenance records*	*None*
Infiltration Basin (See Appendix F for more O&M information)	*Inspect quarterly, or at a minimum, before and after the rainy season, for standing water, odors, insects, sediment accumulation, trash, debris, structural integrity. Inflow structures*	*Post-construction*	*Maintenance, at a minimum, before and after the rainy season to remove sediment/debris build-up, repair any deficiencies that may impact water quality.*	*OWNER*	*Maintain inspection & maintenance records*	*None*

VI. Funding

Funding for all O&M of the site design and treatment control BMP's will be by the OWNER.

SCST No. 150390N
Report No. 1

Ms. Sue Smith
Pacific Newport Properties, Inc.
17842 Mitchell North, Suite 100
Irvine, California 92614

Subject: INFILTRATION TESTING
BANNING AIRPORT INDUSTRIAL PARK
BANNING, CALIFORNIA

Dear Ms. Smith:

This report presents our findings of the infiltration testing performed for the design of water quality facilities associated with the subject project in Banning, California. This testing was performed in accordance with our proposal number 15-0202 dated June 4, 2015.

SCOPE OF WORK

Southern California Soil and Testing, Inc. (SCST) performed three double-ring infiltrometer tests within the location identified on the project Conceptual Site Plan as the detention basin and obtained samples for examination and laboratory testing. The laboratory testing consisted of particle size analysis. Results of the testing are summarized in this report with field and laboratory test data.

SITE DESCRIPTION

The subject site encompasses approximately 65 acres located just north of the Banning Municipal Airport in Banning, California. The site is currently undeveloped and is fenced on the south, east, and west sides. The site is bound on the south by the Banning Municipal Airport, on the north by the Union Pacific Railroad, and to the east and west by undeveloped land. Figure 1 shows the general location of the project location. The site slopes gently down to the south and east, with shallow northwest-southeast trending drainages randomly distributed across the site. Much of the site is covered with low lying grasses and scrub brush.

FIELD AND LABORATORY TESTING

An SCST engineer performed double ring infiltration tests and obtained soil samples at 3 locations on August 13, 2015. Figure 2 shows the infiltration testing locations. Figures I-1 through I-3 present the field test results. Laboratory tests consisted of particle size analysis, and a brief description of the laboratory test procedures and the test results are presented in Appendix II. Soils were classified according to the Unified Soil Classification System (USCS). The results of the infiltration testing are summarized in Table 1. These values do not include a factor of safety, which is appropriately evaluated by the civil engineer based on factors of the design.

Table 1
Infiltration Testing Results

Location	Soil Type (USCS)	Infiltration Rate (inches/hour)
I-1 West End	SM	2.3
I-2 Center	SW-SM	4.7
I-3 East End	SM	3.9

LIMITATIONS

SCST should be advised of any changes in the project scope so that the data contained in this report can be evaluated with respect to the revised plans. The findings in this report are valid as of the date of this report. Changes in the condition of the project location can, however, occur with the passage of time, whether they are due to natural processes or work in this or adjacent areas. In addition, changes in the standards of practice and government regulations can occur. Thus, the findings in this report could be invalidated wholly or in part by changes beyond our control. This report should not be relied upon after a period of two years without a review by us verifying the suitability of the data to site conditions at that time.

In the performance of our professional services, we comply with that level of care and skill ordinarily exercised by members of our profession currently practicing under similar conditions and in the same locality. The client recognizes that subsurface conditions may vary from those encountered at the test pit locations, and that our data, interpretations, and recommendations are based solely on the information obtained by us. We will be responsible for those data and interpretations but will not be responsible for interpretations by others of the information developed. Our services consist of professional consultation and observation only, and no warranty of any kind whatsoever, express or implied, is made or intended in connection with the work performed or to be performed by us, or by our proposal for consulting or other services, or by our furnishing of oral or written reports or findings.

If you have any questions, please call our office at (619) 280-4321.

Respectfully Submitted,
SOUTHERN CALIFORNIA SOIL AND TESTING, INC.

APPENDIX II
LABORATORY TESTING

The laboratory test program was design to fit the specific need of this project and was limited to testing on-site materials. A brief description of each type of test is presented below. Results are given on the following pages.

- **CLASSIFICATION:** Field classifications were verified in the laboratory by visual examination. The final soil classifications are in accordance with the Unified Soil Classification System.
- **GRAIN SIZE DISTRIBUTION:** The grain size distribution was determined for two samples in accordance with ASTM D 422. The results are presented on Figures II-1 and II-2.

Appendix F

Structural BMP and/or Retention Facility Sizing Calculations and Design Details

Whitewater Watershed

BMP Design Volume, V_{BMP} (Rev. 06-2014)

Legend: Required Entries / Calculated Cells

Company Name	Albert A Webb Associates	Date	11/1/2017
Designed by	MJS	County/City Case No	
Company Project Number/Name	15-0233		
Drainage Area Number/Name	DMA-1		

Enter the Area Tributary to this Feature (A_{TRIB}) A_{TRIB} = 20.10 acres

Determine the Impervious Area Ratio

Determine the Impervious Area within A_{TRIB} (A_{IMP}) A_{IMP} = 15.70 acres

Calculate Impervious Area Ratio (I_f) I_f = 0.78

$I_f = A_{IMP}/A_{TRIB}$

Calculate the composite Runoff Coefficient, C for the BMP Tributary Area

Use the following equation based on the WEF/ASCE Method

$C_{BMP} = 0.858I_f^3 - 0.78I_f^2 + 0.774I_f + 0.04$ C_{BMP} = 0.58

Determine Design Storage Volume, V_{BMP}

Calculate V_U, the 80% Unit Storage Volume $V_U = 0.40 \times C_{BMP}$ V_u = 0.23 (in*ac)/ac

Calculate the design storage volume of the BMP, V_{BMP}.

$$V_{BMP}\ (ft^3) = \frac{V_U\ (in\text{-}ac/ac) \times A_T\ (ac) \times 43{,}560\ (ft^2/ac)}{12\ (in/ft)}$$

V_{BMP} = 16,781 ft^3

Notes:

Infiltration Basin - Design Procedure (Rev. 06-2014)	BMP ID Basin 1	Legend:	Required Entries / Calculated Cells

Company Name: Albert A. Webb Associates — Date: 11/7/2017

Designed by: MJS — County/City Case No.:

Design Volume

a) Tributary Drainage Area (BMP subarea)	A_{TRIB} =	20.1	acres
b) Enter V_{BMP} determined from Section 4.3 of this Handbook	V_{BMP}=	16,781	ft^3

Maximum Depth

a) Infiltration rate	I =	3.6	in/hr
b) Factor of Safety (See Table 1, Appendix B: "Infiltration Testing" from this BMP Handbook)	FS =	3	
c) Calculate D_1 $D_1 = \frac{I\ (in/hr) \times 48\ hrs}{12\ (in/ft) \times FS}$	D_1 =	4.8	ft
d) Enter the depth of freeboard (at least 1 ft)		1	ft
e) Enter depth to historic high ground water (measured from **top** of basin)		50	ft
f) Enter depth to top of bedrock or impermeable layer (measured from **top** of basin)		50	ft
g) D_2 is the smaller of: Depth to groundwater - (10 ft + freeboard) and Depth to impermeable layer - (5 ft + freeboard)	D_2 =	39.0	ft
h) D_{MAX} is the smaller value of D_1 and D_2 but shall not exceed 5 feet	D_{MAX} =	4.8	ft

Basin Geometry

a) Basin side slopes (no steeper than 4:1)	Slope no steeper than 4:1	z =	3	:1
b) Proposed basin depth (excluding freeboard)	Depth may not exceed Dmax	d_B =	6	ft
c) Minimum bottom surface area of basin ($A_S = V_{BMP}/d_B$)		A_S =	2797	ft^2
d) Proposed Design Surface Area		A_D =	55900	ft^2

Forebay

a) Forebay volume (minimum 0.5% V_{BMP})	Volume =	84	ft^3
b) Forebay depth (height of berm/splashwall. 1 foot min.)	Depth =	1	ft
c) Forebay surface area (minimum)	Area =	84	ft^2
d) Full height notch-type weir	Width (W) =	6.0	in

Whitewater Watershed

BMP Design Volume, V_{BMP} (Rev. 06-2014)

Legend: Required Entries / Calculated Cells

Company Name	Albert A Webb Associates	Date	11/1/2017
Designed by	MJS	County/City Case No	
Company Project Number/Name	15-0233		
Drainage Area Number/Name	DMA-2		

Enter the Area Tributary to this Feature (A_{TRIB}) A_{TRIB} = 37.80 acres

Determine the Impervious Area Ratio

Determine the Impervious Area within A_{TRIB} (A_{IMP}) A_{IMP} = 34.70 acres

Calculate Impervious Area Ratio (I_f) I_f = 0.92

$I_f = A_{IMP}/A_{TRIB}$

Calculate the composite Runoff Coefficient, C for the BMP Tributary Area

Use the following equation based on the WEF/ASCE Method

$C_{BMP} = 0.858I_f^3 - 0.78I_f^2 + 0.774I_f + 0.04$ C_{BMP} = 0.76

Determine Design Storage Volume, V_{BMP}

Calculate V_U, the 80% Unit Storage Volume $V_U = 0.40 \times C_{BMP}$ V_u = 0.30 (in*ac)/ac

Calculate the design storage volume of the BMP, V_{BMP}.

$$V_{BMP}\ (ft^3) = \frac{V_U\ (in\text{-}ac/ac) \times A_T\ (ac) \times 43{,}560\ (ft^2/ac)}{12\ (in/ft)}$$

V_{BMP} = 41,164 ft^3

Notes:

Infiltration Basin - Design Procedure (Rev. 06-2014)	BMP ID: Basin 2	Legend:	Required Entries / Calculated Cells

Company Name: Albert A. Webb Associates — Date: 11/7/2017

Designed by: MJS — County/City Case No.:

Design Volume

a) Tributary Drainage Area (BMP subarea)	A_{TRIB} =	37.8	acres
b) Enter V_{BMP} determined from Section 4.3 of this Handbook	V_{BMP} =	41,164	ft^3

Maximum Depth

a) Infiltration rate	I =	3.6	in/hr
b) Factor of Safety (See Table 1, Appendix B: "Infiltration Testing" from this BMP Handbook)	FS =	3	
c) Calculate D_1 $D_1 = \frac{I\ (in/hr) \times 48\ hrs}{12\ (in/ft) \times FS}$	D_1 =	4.8	ft
d) Enter the depth of freeboard (at least 1 ft)		1	ft
e) Enter depth to historic high ground water (measured from **top** of basin)		50	ft
f) Enter depth to top of bedrock or impermeable layer (measured from **top** of basin)		50	ft
g) D_2 is the smaller of: Depth to groundwater - (10 ft + freeboard) and Depth to impermeable layer - (5 ft + freeboard)	D_2 =	39.0	ft
h) D_{MAX} is the smaller value of D_1 and D_2 but shall not exceed 5 feet	D_{MAX} =	4.8	ft

Basin Geometry

a) Basin side slopes (no steeper than 4:1)	Slope no steeper than 4:1	z =	3	:1
b) Proposed basin depth (excluding freeboard)	Depth may not exceed Dmax	d_B =	6	ft
c) Minimum bottom surface area of basin ($A_S = V_{BMP}/d_B$)		A_S =	6861	ft^2
d) Proposed Design Surface Area		A_D =	34540	ft^2

Forebay

a) Forebay volume (minimum 0.5% V_{BMP})	Volume =	206	ft^3
b) Forebay depth (height of berm/splashwall. 1 foot min.)	Depth =	1	ft
c) Forebay surface area (minimum)	Area =	206	ft^2
d) Full height notch-type weir	Width (W) =	6.0	in

Infiltration Basin
Drawdown Calculation

Designer:	MJS
Date:	11/2/2017
Project:	Banning Distribution Center
Location:	North of the Banning Municple Airport and South of I-10 Freeway
Area:	DMA 1 & DMA 2

(1)	Combined $V_{100Y\text{-}3H}$ =	389,971	ft^3
(2)	Combined Basin Bottom Area=	90440	ft^2**
(3)	Infiltration Rate =	1.21	in/hr ***

$$Drawdown = \frac{V_{100Y-3H}\ (ft^3)}{Infiltration\ Rate\left(\frac{in}{hr}\right) \times \left(\frac{1ft}{12in}\right) \times Bottom\ Area\ (ft^2)}$$

Drawdown Time= 42.8 hr

***The Geotechnical Infiltration Test Report shows acceptable soil infiltration capability. The average measured infiltration rate is 3.63 in/hr at the expected depth at the bottom of the underground system, used a safety factor of 3 to achive 1.21 in/hr.

**For preliminary purposes, the combined basin bottom areas for both Basin-1 and Basin-2 were used to prove that the basins will drain within 48 hours. The basin bottoms will be indivdually analyzed during final engineering and a drawdown calculation will be submitted for each basin. The basin bottoms will be finalnized during final engineering.

City Clerk _____

Water Quality Management Plan and Urban Runoff BMP Transfer, Access and Maintenance Agreement

OWNER: _____

PROPERTY ADDRESS: _____

_____

APN: _____

THIS AGREEMENT is made and entered into in

_____, California, this _____day of

_____, by and between

_____, herein after

referred to as "Owner" and the CITY OF _____, a municipal corporation, located in the County of Riverside, State of California hereinafter referred to as "CITY";

WHEREAS, the Owner owns real property ("Property") in the City of

_____, County of Riverside, State of California, more specifically described in Exhibit "A" and depicted in Exhibit "B", each of which exhibits is attached hereto and incorporated herein by this reference;

WHEREAS, at the time of initial approval of development project known as

_____within the Property described herein, the City required the project to employ Best Management Practices, hereinafter referred to as "BMPs," to minimize pollutants in urban runoff;

WHEREAS, the Owner has chosen to install and/or implement BMPs as described in the Water Quality Management Plan, on file with the City, hereinafter referred to as "WQMP", to minimize pollutants in urban runoff and to minimize other adverse impacts of urban runoff;

WHEREAS, said WQMP has been certified by the Owner and reviewed and approved by the City;

WHEREAS, said BMPs, with installation and/or implementation on private property and draining only private property, are part of a private facility with all maintenance or replacement, therefore, the sole responsibility of the Owner in accordance with the terms of this Agreement;

WHEREAS, the Owner is aware that periodic and continuous maintenance, including, but not necessarily limited to, filter material replacement and sediment removal, is required to assure peak performance of all BMPs in the WQMP and that, furthermore, such maintenance activity will require compliance with all Local, State, or Federal laws and regulations, including those pertaining to confined space and waste disposal methods, in effect at the time such maintenance occurs;

NOW THEREFORE, it is mutually stipulated and agreed as follows:

1. Owner hereby provides the City of City's designee complete access, of any duration, to the BMPs and their immediate vicinity at any time, upon reasonable notice, or in the event of emergency, as determined by City's Director of Public Works no advance notice, for the purpose of inspection, sampling, testing of the Device, and in case of emergency, to undertake all necessary repairs or other preventative measures at owner's expense as provided in paragraph 3 below. City shall make every effort at all times to minimize or avoid interference with Owner's use of the Property.

2. Owner shall use its best efforts diligently to maintain all BMPs in a manner assuring peak performance at all times. All reasonable precautions shall be exercised by Owner and Owner's representative or contractor in the removal and extraction of any material(s) from the BMPs and the ultimate disposal of the material(s) in a manner consistent with all relevant laws and regulations in effect at the time. As may be requested from time to time by the City, the Owner shall provide the City with documentation identifying the material(s) removed, the quantity, and disposal destination.

3. In the event Owner, or its successors or assigns, fails to accomplish the necessary maintenance contemplated by this Agreement, within five (5) days of being given written notice by the City, the City is hereby authorized to cause any maintenance necessary to be done and charge the entire cost and expense to the Owner or Owner's successors or assigns, including administrative costs, attorneys fees and interest thereon at the maximum rate authorized by the Civil Code from the date of the notice of expense until paid in full.

4. The City may require the owner to post security in form and for a time period satisfactory to the city to guarantee the performance of the obligations state herein. Should the Owner fail to perform the obligations under the Agreement, the City may, in the case of a cash bond, act for the Owner using the proceeds from it, or in the case of a surety bond, require the sureties to perform the obligations of the Agreement. As an additional remedy, the Director may withdraw any previous Urban Runoff-related approval with respect to the property on which BMPs have been installed and/or implemented until such time as Owner repays to City its reasonable costs incurred in accordance with paragraph 3 above.

5. This agreement shall be recorded in the Office of the Recorder of Riverside County, California, at the expense of the Owner and shall constitute notice to all successors and assigns of the title to said Property of the obligation herein set forth, and also a lien in such amount as will fully reimburse the City, including interest as herein above set forth, subject to foreclosure in event of default in payment.

6. In event of legal action occasioned by any default or action of the Owner, or its successors or assigns, then the Owner and its successors or assigns agree(s) to pay all costs incurred by the City in enforcing the terms of this Agreement, including reasonable attorney's fees and costs, and that the same shall become a part of the lien against said Property.

7. It is the intent of the parties hereto that burdens and benefits herein undertaken shall constitute covenants that run with said Property and constitute a lien there against.

8. The obligations herein undertaken shall be binding upon the heirs, successors, executors, administrators and assigns of the parties hereto. The term "Owner" shall include not only the present Owner, but also its heirs, successors, executors, administrators, and assigns. Owner shall notify any successor to title of all or part of the Property about the existence of this Agreement. Owner shall provide such notice prior to such successor obtaining an interest in all or part of the Property. Owner shall provide a copy of such notice to the City at the same time such notice is provided to the successor.

9. Time is of the essence in the performance of this Agreement.

10. Any notice to a party required or called for in this Agreement shall be served in person, or by deposit in the U.S. Mail, first class postage prepaid, to the address set forth below. Notice(s) shall be deemed effective upon receipt, or seventy-two (72) hours after deposit in the U.S. Mail, whichever is earlier. A party may change a notice address only by providing written notice thereof to the other party.

Infiltration Basin
Sample Inspection and Maintenance Checklist

Property Address: _____ Property Owner: _____

Treatment Measure No.: _____ Date of Inspection: _____ Type of Inspection: ☐Monthly ☐Pre-Rainy Season ☐After heavy runoff ☐End of Rainy Season

Inspector(s): _____ ☐Other:_____

Defect	Conditions When Maintenance Is Needed	Maintenance Needed? (Y/N)	Comments (Describe maintenance completed and if any needed maintenance was not conducted, note when it will be done.)	Results Expected When Maintenance Is Performed
General				
Trash & Debris	• Trash and debris accumulated in basin. • Visual evidence of dumping.			Trash and debris cleared from site and disposed of properly.
Poisonous Vegetation and noxious weeds	Poisonous or nuisance vegetation or noxious weeds, e.g., morning glory, English ivy, reed canary grass, Japanese knotweed, purple loosestrife, blackberry, Scotch broom, poison oak, stinging nettles, or devil's club.			Use Integrated Pest Management techniques to control noxious weeds or invasive species.
Contaminants and Pollution	Any evidence of oil, gasoline, contaminants or other pollutants.			No contaminants or pollutants present.
Rodent Holes	If facility acts as a dam or berm, any evidence of rodent holes, or any evidence of water piping through dam or berm via rodent holes.			The design specifications are not compromised by holes. Any rodent control activities are in accordance with applicable laws and do not affect any protected species.
Insects	Insects such as wasps and hornets interfere with maintenance activities.			Insects do not interfere with maintenance activities.

Infiltration Basin Inspection and Maintenance Checklist

Date of Inspection:_____

Property Address: _____

Treatment Measure No.:_____

Defect	**Conditions When Maintenance Is Needed**	**Maintenance Needed? (Y/N)**	**Comments** (Describe maintenance completed and if any needed maintenance was not conducted, note when it will be done.)	**Results Expected When Maintenance Is Performed**
Tree/Brush Growth and Hazard Trees	• Growth does not allow maintenance access or interferes with maintenance activity. • Dead, diseased, or dying trees.			• Trees do not hinder maintenance activities. • Remove hazard trees as approved by the City. (Use a certified Arborist to determine health of tree or removal requirements).
Drainage time	Standing water remains in basin more than 72 hours.			Correct any circumstances that restrict the flow of water from the system. Restore drainage to design condition.
				Sediment removed, basin bottom scarified by tilling or disking. Infiltration capacity restored
				Minimum use of pesticides, especially before the rainy season (Oct 1 to May 1).
Outfall structure	Debris or silt build-up obstructs an outfall structure.			Remove debris and/or silt build-up and dispose of properly.
Side Slopes				
Erosion	• Eroded over 2 in. deep where cause of damage is still present or where there is potential for continued erosion. • Any erosion on a compacted berm embankment.			Cause of erosion is managed appropriately. Side slopes or berm are restored to design specifications, as needed.
Storage Area				
Sediment	Accumulated sediment >10% of designed basin depth or affects inletting or outletting condition of the facility.			Sediment cleaned out to designed basin shape and depth; basin reseeded if necessary to control erosion. Sediment disposed of properly.
Emergency Overflow/ Spillway and Berms				

Infiltration Basin Inspection and Maintenance Checklist

Date of Inspection:_____

Property Address: _____

Treatment Measure No.:_____

Defect	**Conditions When Maintenance Is Needed**	**Maintenance Needed? (Y/N)**	**Comments** (Describe maintenance completed and if any needed maintenance was not conducted, note when it will be done.)	**Results Expected When Maintenance Is Performed**
Settlement	Berm settlement 4 inches lower than the design elevation.			Dike is built back to the design elevation.
Tree Growth	Tree growth on berms or emergency spillway >4 ft in height or covering more than 10% of spillway.			• Trees should be removed. If root system is small (base less than 4 inches) the root system may be left in place. Otherwise the roots should be removed and the berm restored. • A civil engineer should be consulted for proper berm/spillway restoration.
Emergency Overflow/ Spillway	Rock is missing and soil is exposed at top of spillway or outside slope.			Rocks and pad depth are restored to design standards.
Hydraulic Structures				
Trash and Debris	Trash or debris is plugging openings in the pipe riser (or grated inlet).			Trash or debris is removed and disposed of properly.
Damaged structures	Bars in trash rack of inlet are missing, loose, bent out of shape, or deteriorating due to excessive rust.			Bars are repaired or replaced to allow proper functioning of trash rack.
Outlet and sediment forebay	Excessive accumulation of sediment.			Sediment removed to allow proper functioning of forebay.
Structural integrity	Check for cracks, spalling, joints failures, etc.			

Infiltration Basin Inspection and Maintenance Checklist

Date of Inspection:_____

Property Address: _____

Treatment Measure No.:_____

Defect	**Conditions When Maintenance Is Needed**	**Maintenance Needed? (Y/N)**	**Comments** (Describe maintenance completed and if any needed maintenance was not conducted, note when it will be done.)	**Results Expected When Maintenance Is Performed**
Fencing and Gates				
Missing or broken parts	Any defect in or damage to the fence or gate that permits easy entry to a facility.			Fencing and gate are restored to design specifications.
Deteriorating Paint or Protective Coating	Part or parts that have a rusting or scaling condition that has affected structural adequacy.			Paint or protective coating is sufficient to protect structural adequacy of fence or gate.
Risers, orifices and screens	Any debris or clogging			Restore unobstructed flow through discharge structure; to meet original design; dispose of debris properly.
Miscellaneous				
Miscellan-ous	Any condition not covered above that needs attention to restore extended detention basin to design conditions.			Meets the design specifications.

Infiltration BMPs Inspection Checklist*

Project Location: _____

Date/Time: _____

Inspector: _____

Maintenance Item	Satisfactory/ Unsatisfactory	Recommended Inspection Frequency	Comments
Inlet/Outlet			
Structural integrity of inlet/outlet		A	
Inlet/outlet clear of debris		M	
Overflow spillway clear of debris		M	
Erosion control at inlet in place (e.g., rock, mat)/ evidence of erosion		A	
Erosion control at outlet in place/evidence of erosion		A	
Inspect/clean catch basin upstream of BMP		A	
Pretreatment for sediment			
Device functioning to trap sediment		A	
Remove accumulated sediment		A	
Overall functionality			
Ensure infiltration device is functioning properly (professional civil engineer is recommended)		A	
BMP infiltration surface			
Any evidence of sedimentation in BMP		A	
Does sediment accumulation currently require removal		A	
Debris in BMP		S	
Evidence of erosion present		A	
Aggregate (if applicable)			
Surface of aggregate clean		A	
Any replacement of aggregate needed? If clogged with sediment replacement is necessary for contin- ued proper function.		A	

Inspection frequency key — A = Annual, M = Monthly, S = After major storm
*Prior to field inspection, it is recommended to review the as-built plans.

Maintenance Item	Satisfactory/ Unsatisfactory	Recommended Inspection Frequency	Comments
Vegetated surface (if applicable)			
Vegetative cover exists		A	
Optional considerations			
Inspect BMP for invasive species.		A	
Qualified professional applicator selectively herbicide invasive species		A	
Increase plant diversity by planting additional vegetation or creating a native plant infiltration basin area.		A	
Complaints from residents (note on back)		A	
Mowing done when necessary		A	
No fertilizer unless testing requires it		A	

Inspection frequency key — A = Annual, M = Monthly, S = After major storm
*Prior to field inspection, it is recommended to review the as-built plans.

Summary

Inspector's remarks:

Overall condition of facility (acceptable or unacceptable):

Dates any maintenance must be completed by:

3.1 INFILTRATION BASIN

Type of BMP	LID - Infiltration
Treatment Mechanisms	Infiltration, Evapotranspiration (when vegetated), Evaporation, and Sedimentation
Maximum Treatment Area	50 acres
Other Names	Bioinfiltration Basin

Description

An Infiltration Basin is a flat earthen basin designed to capture the design capture volume, V_{BMP}. The stormwater infiltrates through the bottom of the basin into the underlying soil over a 72 hour drawdown period. Flows exceeding V_{BMP} must discharge to a downstream conveyance system. Trash and sediment accumulate within the forebay as stormwater passes into the basin. Infiltration basins are highly effective in removing all targeted pollutants from stormwater runoff.

Figure 1 – Infiltration Basin

See Appendix A, and Appendix C, Section 1 of *Basin Guidelines*, for additional requirements.

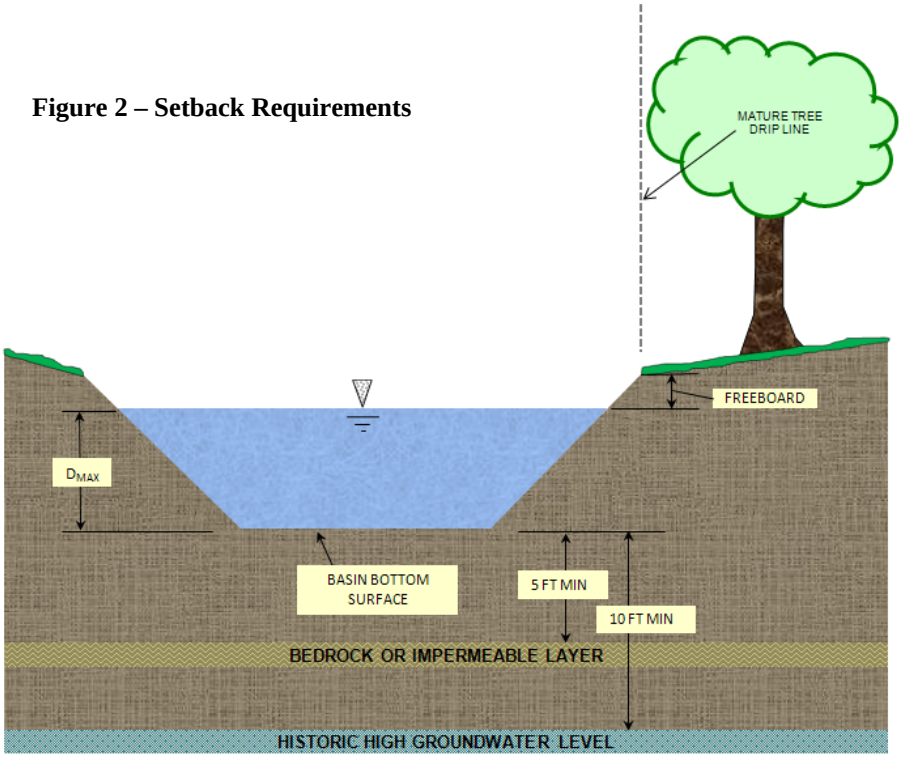
Siting Considerations

The use of infiltration basins may be restricted by concerns over ground water contamination, soil permeability, and clogging at the site. See the applicable WQMP for any specific feasibility considerations for using infiltration BMPs. Where this BMP is being used, the soil beneath the basin must be thoroughly evaluated in a geotechnical report since the underlying soils are critical to the basin's long term performance. To protect the basin from erosion, the sides and bottom of the basin must be vegetated, preferably with native or low water use plant species.

In addition, these basins may not be appropriate for the following site conditions:

- Industrial sites or locations where spills of toxic materials may occur
- Sites with very low soil infiltration rates
- Sites with high groundwater tables or excessively high soil infiltration rates, where pollutants can affect ground water quality
- Sites with unstabilized soil or construction activity upstream
- On steeply sloping terrain
- Infiltration basins located in a fill condition should refer to Appendix A of this Handbook for details on special requirements/restrictions

Setbacks



Always consult your geotechnical engineer for site specific recommendations regarding setbacks for infiltration trenches. Recommended setbacks are needed to protect buildings, existing trees, walls, onsite or nearby wells, streams, and tanks. Setbacks should be considered early in the design process since they can affect where infiltration facilities may be placed and how deep they are allowed to be. For instance, depth setbacks can dictate fairly shallow facilities that will have a larger footprint and, in some cases, may make an infiltration basin infeasible. In that instance, another BMP must be selected.

Infiltration basins typically must be set back:

- 10 feet from the historic high groundwater (measured vertically from the bottom of the basin, as shown in Figure 2)
- 5 feet from bedrock or impermeable surface layer (measured vertically from the bottom of the basin, as shown in Figure 2)
- From all existing mature tree drip lines as indicated in Figure 2 (to protect their root structure)
- 100 feet horizontally from wells, tanks or springs

Setbacks to walls and foundations must be included as part of the Geotechnical Report. All other setbacks shall be in accordance with applicable standards of the District's *Basin Guidelines* (Appendix C).

Figure 2 – Setback Requirements

Forebay

A concrete forebay shall be provided to reduce sediment clogging and to reduce erosion. The forebay shall have a design volume of at least 0.5% V_{BMP} and a minimum 1 foot high concrete splashwall / berm. Full height notch-type weir(s), offset from the line of flow from the basin inlet to prevent short circuiting, shall be used to outlet the forebay. It is recommended that two weirs be used and that they be located on opposite sides of the forebay (see Figure 2).

Overflow

Flows exceeding V_{BMP} must discharge to an acceptable downstream conveyance system. Where an adequate outlet is present, an overflow structure may be used. Where an embankment is present, an emergency spillway may be used instead. Overflows must be placed just above the design water surface for V_{BMP} and be near the outlet of the system. The overflow structure shall be similar to the District's Standard Drawing CB 110. Additional details may be found in the District's *Basin Guidelines* (Appendix C).

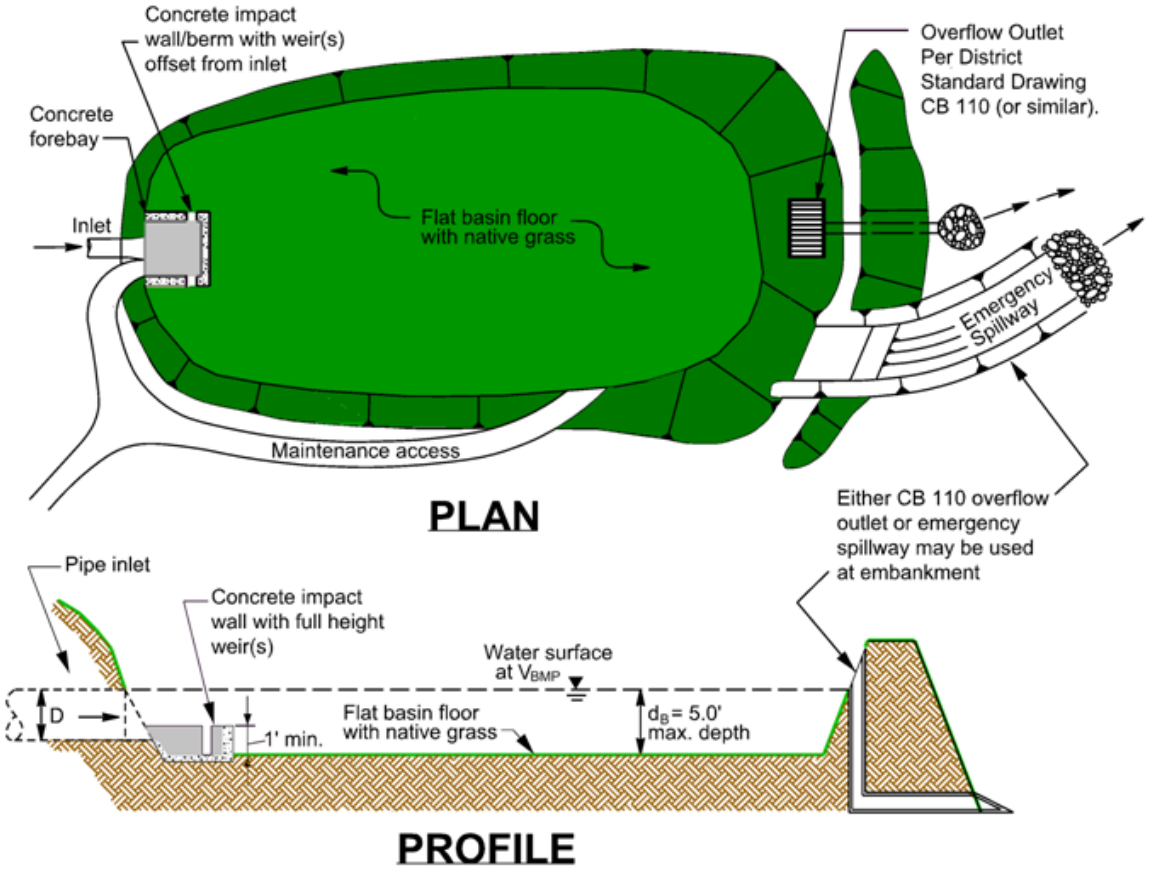


Figure 3 – Infiltration Basin

Landscaping Requirements

Basin vegetation provides erosion protection, improves sediment removal and assists in allowing infiltration to occur. The basin surface and side slopes shall be planted with native grasses. Proper landscape management is also required to ensure that the vegetation does not contribute to water pollution through pesticides, herbicides, or fertilizers. Landscaping shall be in accordance with County of Riverside Ordinance 859 and the District's *Basin Guidelines* (Appendix C), or other guidelines issued by the Engineering Authority.

Maintenance

Normal maintenance of an infiltration basin includes the maintenance of landscaping, debris and trash removal from the surface of the basin, and tending to problems associated with standing water (vectors, odors, etc.). Significant ponding, especially more than 72 hours after an event, may indicate that the basin surface is no longer providing sufficient infiltration and requires aeration. See the District's *Basin Guidelines* (Appendix C) for additional requirements (i.e., fencing, maintenance access, etc.).

Table 1 - Inspection and Maintenance

Schedule	Inspection and Maintenance Activity
Ongoing including just before annual storm seasons and following rainfall events.	• Maintain vegetation as needed. Use of fertilizers, pesticides and herbicides should be strenuously avoided to ensure they don't contribute to water pollution. If appropriate native plant selections and other IPM methods are used, such products shouldn't be needed. If such projects are used, o Products shall be applied in accordance with their labeling, especially in relation to application to water, and in areas subjected to flooding. o Fertilizers should not be applied within 15 days before, after, or during the rain season. • Remove debris and litter from the entire basin to minimize clogging and improve aesthetics. • Check for obvious problems and repair as needed. Address odor, insects, and overgrowth issues associated with stagnant or standing water in the basin bottom. There should be no long-term ponding water. • Check for erosion and sediment laden areas in the basin. Repair as needed. Clean forebay if needed. • Revegetate side slopes where needed.
Annually. If possible, schedule these inspections within 72 hours after a significant rainfall.	• Inspection of hydraulic and structural facilities. Examine the inlet for blockage, the embankment and spillway integrity, as well as damage to any structural element. • Check for erosion, slumping and overgrowth. Repair as needed. • Check basin depth for sediment build up and reduced total capacity. Scrape bottom as needed and remove sediment. Restore to original cross-section and infiltration rate. Replant basin vegetation. • Verify the basin bottom is allowing acceptable infiltration. Use a disc or other method to aerate basin bottom only if there is actual significant loss of infiltrative capacity, rather than on a routine basis[1]. • No water should be present 72 hours after an event. No long term standing water should be present at all. No algae formation should be visible. Correct problem as needed.

1. **CA Stormwater BMP Handbook for New Development and Significant Redevelopment**

Table 2 - Design and Sizing Criteria for Infiltration Basins

Design Parameter	Infiltration Basin
Design Volume	V_{BMP}
Forebay Volume	0.5% V_{BMP}
Drawdown time (maximum)	72 hours
Maximum tributary area	50 acres [2]
Minimum infiltration rate	Must be sufficient to drain the basin within the required Drawdown time over the life of the BMP. The WQMP may include specific requirements for minimum tested infiltration rates.
Maximum Depth	5 feet
Spillway erosion control	Energy dissipators to reduce velocities[1]
Basin Slope	0%
Freeboard (minimum)	1 foot [1]
Historic High Groundwater Setback (max)	10 feet
Bedrock/impermeable layer setback (max)	5 feet
Tree setbacks	Mature tree drip line must not overhang the basin
Set back from wells, tanks or springs	100 feet
Set back from foundations	As recommended in Geotechnical Report

1. **Ventura County's Technical Guidance Manual for Stormwater Quality Control Measures**
2. **CA Stormwater BMP Handbook for New Development and Significant Redevelopment**

Note: The information contained in this BMP Factsheet is intended to be a summary of design considerations and requirements. Additional information which applies to all detention basins may be found in the District's Basin Guidelines (Appendix C). In addition, information herein may be superseded by other guidelines issued by the co-permittee.

INFILTRATION BASIN SIZING PROCEDURE

1. Find the Design Volume, V_{BMP}.
   a) Enter the Tributary Area, $A_{T.}$
   b) Enter the Design Volume, V_{BMP}, determined from Section 2.1 of this Handbook.
2. Determine the Maximum Depth.
   a) Enter the infiltration rate. The infiltration rate shall be established as described in Appendix A: "Infiltration Testing".
   b) Enter the design Factor of Safety from Table 1 in Appendix A: "Infiltration Testing".
   c) The spreadsheet will determine D_1, the maximum allowable depth of the basin based on the infiltration rate along with the maximum drawdown time (72 hours) and the Factor of Safety.

$$D_1 = [(t) \times (I)] / 12s$$

Where I = site infiltration rate (in/hr)
s = safety factor
t = drawdown time (maximum 72 hours)

d) Enter the depth of freeboard.

e) Enter the depth to the historic high groundwater level measured from the top of the basin.

f) Enter the depth to the top of bedrock or other impermeable layer measured from the finished grade.

g) The spreadsheet will determine D_2, the total basin depth (including freeboard, if used) of the basin, based on restrictions to the depth by groundwater and an impermeable layer.

D_2 = Depth to groundwater – (10 + freeboard) (ft);

or

D_2 = Depth to impermeable layer – (5 + freeboard) (ft)

Whichever is least.

h) The spreadsheet will determine the maximum allowable effective depth of basin, D_{MAX}, based on the smallest value between D_1 and D_2. D_{MAX} is the maximum depth of water only and does not include freeboard. D_{MAX} shall not exceed 5 feet.

3. Basin Geometry

a) Enter the basin side slopes, z (no steeper than 4:1).

b) Enter the proposed basin depth, d_B excluding freeboard.

c) The spreadsheet will determine the minimum required surface area of the basin:

$$A_s = V_{BMP} / d_B$$

Where A_s = minimum area required (ft^2)
V_{BMP} = volume of the infiltration basin (ft^3)
d_B= proposed depth not to exceed maximum allowable depth, D_{MAX} (ft)

d) Enter the proposed bottom surface area. This area shall not be less than the minimum required surface area.

4. Forebay

A concrete forebay with a design volume of at least 0.5% V_{BMP} and a minimum 1 foot high concrete splashwall shall be provided. Full-height rectangular weir(s) shall be used to outlet the forebay. The weir(s) must be offset from the line of flow from the basin inlet. It is recommended that two weirs be used and that they be located on opposite sides of the forebay (see Figure 2).

a) The spreadsheet will determine the minimum required forebay volume based on 0.5% V_{BMP}.

b) Enter the proposed depth of the forebay berm/splashwall (1foot minimum).

c) The spreadsheet will determine the minimum required forebay surface area.

d) Enter the width of rectangular weir to be used (minimum 1.5 inches). Weir width should be established based on a 5 minute drawdown time.

▲ Medium

Description

An infiltration basin is a shallow impoundment that is designed to infiltrate stormwater. Infiltration basins use the natural filtering ability of the soil to remove pollutants in stormwater runoff. Infiltration facilities store runoff until it gradually exfiltrates through the soil and eventually into the water table. This practice has high pollutant removal efficiency and can also help recharge groundwater, thus helping to maintain low flows in stream systems. Infiltration basins can be challenging to apply on many sites, however, because of soils requirements. In addition, some studies have shown relatively high failure rates compared with other management practices.

California Experience

Infiltration basins have a long history of use in California, especially in the Central Valley. Basins located in Fresno were among those initially evaluated in the National Urban Runoff Program and were found to be effective at reducing the volume of runoff, while posing little long-term threat to groundwater quality (EPA, 1983; Schroeder, 1995). Proper siting of these devices is crucial as underscored by the experience of Caltrans in siting two basins in Southern California. The basin with marginal separation from groundwater and soil permeability failed immediately and could never be rehabilitated.

Advantages

- Provides 100% reduction in the load discharged to surface waters.
- The principal benefit of infiltration basins is the approximation of pre-development hydrology during which a

CASQA
CALIFORNIA STORMWATER QUALITY ASSOCIATION

significant portion of the average annual rainfall runoff is infiltrated and evaporated rather than flushed directly to creeks.

- If the water quality volume is adequately sized, infiltration basins can be useful for providing control of channel forming (erosion) and high frequency (generally less than the 2-year) flood events.

Limitations

- May not be appropriate for industrial sites or locations where spills may occur.
- Infiltration basins require a minimum soil infiltration rate of 0.5 inches/hour, not appropriate at sites with Hydrologic Soil Types C and D.
- If infiltration rates exceed 2.4 inches/hour, then the runoff should be fully treated prior to infiltration to protect groundwater quality.
- Not suitable on fill sites or steep slopes.
- Risk of groundwater contamination in very coarse soils.
- Upstream drainage area must be completely stabilized before construction.
- Difficult to restore functioning of infiltration basins once clogged.

Design and Sizing Guidelines

- Water quality volume determined by local requirements or sized so that 85% of the annual runoff volume is captured.
- Basin sized so that the entire water quality volume is infiltrated within 48 hours.
- Vegetation establishment on the basin floor may help reduce the clogging rate.

Construction/Inspection Considerations

- Before construction begins, stabilize the entire area draining to the facility. If impossible, place a diversion berm around the perimeter of the infiltration site to prevent sediment entrance during construction or remove the top 2 inches of soil after the site is stabililized. Stabilize the entire contributing drainage area, including the side slopes, before allowing any runoff to enter once construction is complete.
- Place excavated material such that it can not be washed back into the basin if a storm occurs during construction of the facility.
- Build the basin without driving heavy equipment over the infiltration surface. Any equipment driven on the surface should have extra-wide ("low pressure") tires. Prior to any construction, rope off the infiltration area to stop entrance by unwanted equipment.
- After final grading, till the infiltration surface deeply.
- Use appropriate erosion control seed mix for the specific project and location.

Performance

As water migrates through porous soil and rock, pollutant attenuation mechanisms include precipitation, sorption, physical filtration, and bacterial degradation. If functioning properly, this approach is presumed to have high removal efficiencies for particulate pollutants and moderate removal of soluble pollutants. Actual pollutant removal in the subsurface would be expected to vary depending upon site-specific soil types. This technology eliminates discharge to surface waters except for the very largest storms; consequently, complete removal of all stormwater constituents can be assumed.

There remain some concerns about the potential for groundwater contamination despite the findings of the NURP and Nightingale (1975; 1987a,b,c; 1989). For instance, a report by Pitt et al. (1994) highlighted the potential for groundwater contamination from intentional and unintentional stormwater infiltration. That report recommends that infiltration facilities not be sited in areas where high concentrations are present or where there is a potential for spills of toxic material. Conversely, Schroeder (1995) reported that there was no evidence of groundwater impacts from an infiltration basin serving a large industrial catchment in Fresno, CA.

Siting Criteria

The key element in siting infiltration basins is identifying sites with appropriate soil and hydrogeologic properties, which is critical for long term performance. In one study conducted in Prince George's County, Maryland (Galli, 1992), all of the infiltration basins investigated clogged within 2 years. It is believed that these failures were for the most part due to allowing infiltration at sites with rates of less than 0.5 in/hr, basing siting on soil type rather than field infiltration tests, and poor construction practices that resulted in soil compaction of the basin invert.

A study of 23 infiltration basins in the Pacific Northwest showed better long-term performance in an area with highly permeable soils (Hilding, 1996). In this study, few of the infiltration basins had failed after 10 years. Consequently, the following guidelines for identifying appropriate soil and subsurface conditions should be rigorously adhered to.

- Determine soil type (consider RCS soil type 'A, B or C' only) from mapping and consult USDA soil survey tables to review other parameters such as the amount of silt and clay, presence of a restrictive layer or seasonal high water table, and estimated permeability. The soil should not have more than 30% clay or more than 40% of clay and silt combined. Eliminate sites that are clearly unsuitable for infiltration.

- Groundwater separation should be at least 3 m from the basin invert to the measured ground water elevation. There is concern at the state and regional levels of the impact on groundwater quality from infiltrated runoff, especially when the separation between groundwater and the surface is small.

- Location away from buildings, slopes and highway pavement (greater than 6 m) and wells and bridge structures (greater than 30 m). Sites constructed of fill, having a base flow or with a slope greater than 15% should not be considered.

- Ensure that adequate head is available to operate flow splitter structures (to allow the basin to be offline) without ponding in the splitter structure or creating backwater upstream of the splitter.

- Base flow should not be present in the tributary watershed.

Secondary Screening Based on Site Geotechnical Investigation

- At least three in-hole conductivity tests shall be performed using USBR 7300-89 or Bouwer-Rice procedures (the latter if groundwater is encountered within the boring), two tests at different locations within the proposed basin and the third down gradient by no more than approximately 10 m. The tests shall measure permeability in the side slopes and the bed within a depth of 3 m of the invert.

- The minimum acceptable hydraulic conductivity as measured in any of the three required test holes is 13 mm/hr. If any test hole shows less than the minimum value, the site should be disqualified from further consideration.

- Exclude from consideration sites constructed in fill or partially in fill unless no silts or clays are present in the soil boring. Fill tends to be compacted, with clays in a dispersed rather than flocculated state, greatly reducing permeability.

- The geotechnical investigation should be such that a good understanding is gained as to how the stormwater runoff will move in the soil (horizontally or vertically) and if there are any geological conditions that could inhibit the movement of water.

Additional Design Guidelines

(1) Basin Sizing - The required water quality volume is determined by local regulations or sufficient to capture 85% of the annual runoff.

(2) Provide pretreatment if sediment loading is a maintenance concern for the basin.

(3) Include energy dissipation in the inlet design for the basins. Avoid designs that include a permanent pool to reduce opportunity for standing water and associated vector problems.

(4) Basin invert area should be determined by the equation:

$$A = \frac{WQV}{kt}$$

where A = Basin invert area (m^2)

WQV = water quality volume (m^3)

k = 0.5 times the lowest field-measured hydraulic conductivity (m/hr)

t = drawdown time (48 hr)

(5) The use of vertical piping, either for distribution or infiltration enhancement shall not be allowed to avoid device classification as a Class V injection well per 40 CFR146.5(e)(4).

Maintenance

Regular maintenance is critical to the successful operation of infiltration basins. Recommended operation and maintenance guidelines include:

- Inspections and maintenance to ensure that water infiltrates into the subsurface completely (recommended infiltration rate of 72 hours or less) and that vegetation is carefully managed to prevent creating mosquito and other vector habitats.
- Observe drain time for the design storm after completion or modification of the facility to confirm that the desired drain time has been obtained.
- Schedule semiannual inspections for beginning and end of the wet season to identify potential problems such as erosion of the basin side slopes and invert, standing water, trash and debris, and sediment accumulation.
- Remove accumulated trash and debris in the basin at the start and end of the wet season.
- Inspect for standing water at the end of the wet season.
- Trim vegetation at the beginning and end of the wet season to prevent establishment of woody vegetation and for aesthetic and vector reasons.
- Remove accumulated sediment and regrade when the accumulated sediment volume exceeds 10% of the basin.
- If erosion is occurring within the basin, revegetate immediately and stabilize with an erosion control mulch or mat until vegetation cover is established.
- To avoid reversing soil development, scarification or other disturbance should only be performed when there are actual signs of clogging, rather than on a routine basis. Always remove deposited sediments before scarification, and use a hand-guided rotary tiller, if possible, or a disc harrow pulled by a very light tractor.

Cost

Infiltration basins are relatively cost-effective practices because little infrastructure is needed when constructing them. One study estimated the total construction cost at about $2 per ft (adjusted for inflation) of storage for a 0.25-acre basin (SWRPC, 1991). As with other BMPs, these published cost estimates may deviate greatly from what might be incurred at a specific site. For instance, Caltrans spent about $18/ft^3 for the two infiltration basins constructed in southern California, each of which had a water quality volume of about 0.34 ac.-ft. Much of the higher cost can be attributed to changes in the storm drain system necessary to route the runoff to the basin locations.

Infiltration basins typically consume about 2 to 3% of the site draining to them, which is relatively small. Additional space may be required for buffer, landscaping, access road, and fencing. Maintenance costs are estimated at 5 to 10% of construction costs.

One cost concern associated with infiltration practices is the maintenance burden and longevity. If improperly maintained, infiltration basins have a high failure rate. Thus, it may be necessary to replace the basin with a different technology after a relatively short period of time.

I. INTRODUCTION AND SETTING

A. Purpose and Objectives

The purpose of this noise impact analysis is to provide an assessment of the noise impacts resulting from development of the proposed Banning Distribution Facility project and to identify mitigation measures that may be necessary to reduce those impacts. The noise issues related to the proposed land use and development have been evaluated in the context of the California Environmental Quality Act.

Although this is a technical report, every effort has been made to write the report clearly and concisely. To assist the reader with those terms unique to noise analysis, a glossary of terms is provided in Appendix A of this report.

B. Project Location

The project is located at the easterly terminus of John Street and south of the I-10 Freeway in the City of Banning. A vicinity map showing the project location is provided on Figure 1.

C. Project Description

The approximately 63.75 acre project site is proposed to be developed with a 1,000,000 square foot gross floor area high-cube warehouse distribution center. The site is proposed to provide 231 parking spaces and 392 trailer parking spaces. The project site plan is illustrated on Figure 2. The proposed project is anticipated to generate approximately 1,040 average daily passenger car trips, 109 two-axle truck trips, 145 three-axle truck trips, and 386 four-axle (and greater) truck trips.

As shown on Figure 3, off-site improvements to the project include paving and improving of John Street, fire access road, sewer and water lines. The proposed project off-site roadways include a 5,688 linear foot extension of John Street from the project's west property line to the existing easterly terminus of John Street and a 3,871 linear foot emergency fire access roadway at the southwestern corner of the property, which will need to cross a tributary to Smith Creek, west across the Banning Municipal Airport property and south on the Juarez Street alignment to Lincoln Street.

The off-site utility improvements include extensions of water and sewer lines in order to connect to existing facilities and detention basins. There is an existing drainage swale between the project site and the train tracks north of the project site. A drainage swale is proposed west of the project site. The proposed project includes construction of 5,968 linear feet of sewer line and the construction of an approximately 0.146 acre lift station. The lift station is located approximately 0.4 miles from the southern edge of the project site. The proposed project requires construction of an off-site water line for 9,350 linear feet to connect to existing lines at the intersection of South Hathaway Street and East Barbour Street. Approximately 4,714 linear feet of the water line extension will extend north on South Hathaway Street and then east on the extension of John Street. The remaining 4,636 linear feet will be east and south of the project site, terminating at the intersection of Scott Street and East Westward Avenue.

II. NOISE AND VIBRATION FUNDAMENTALS

A. Noise Fundamentals

Sound is a pressure wave created by a moving or vibrating source that travels through an elastic medium such as air. Noise is defined as unwanted or objectionable sound. The effects of noise on people can include general annoyance, interference with speech communication, sleep disturbance, and in extreme circumstances, hearing impairment.

Commonly used noise terms are presented in Appendix B. The unit of measurement used to describe a noise level is the decibel (dB). The human ear is not equally sensitive to all frequencies within the sound spectrum. Therefore, the "A-weighted" noise scale, which weights the frequencies to which humans are sensitive, is used for measurements. Noise levels using A-weighted measurements are written dB(A) or dBA.

From the noise source to the receiver, noise changes both in level and frequency spectrum. The most obvious is the decrease in noise as the distance from the source increases. The manner in which noise reduces with distance depends on whether the source is a point or line source as well as ground absorption, atmospheric effects and refraction, and shielding by natural and manmade features. Sound from point sources, such as air conditioning condensers, radiates uniformly outward as it travels away from the source in a spherical pattern. The noise drop-off rate associated with this geometric spreading is 6 dBA per each doubling of the distance (dBA/DD). Transportation noise sources such as roadways are typically analyzed as line sources, since at any given moment the receiver may be impacted by noise from multiple vehicles at various locations along the roadway. Because of the geometry of a line source, the noise drop-off rate associated with the geometric spreading of a line source is 3 dBA/DD.

Decibels are measured on a logarithmic scale, which quantifies sound intensity in a manner similar to the Richter scale used for earthquake magnitudes. Thus, a doubling of the energy of a noise source, such as a doubled traffic volume, would increase the noise levels by 3 dBA; halving of the energy would result in a 3 dBA decrease.

Figure 4 shows the relationship of various noise levels to commonly experienced noise events.

Average noise levels over a period of minutes or hours are usually expressed as dBA L_{eq}, or the equivalent noise level for that period of time. For example, $L_{eq(3)}$ would represent a 3-hour average. When no period is specified, a one-hour average is assumed.

Noise standards for land use compatibility are stated in terms of the Community Noise Equivalent Level (CNEL) and the Day-Night Average Noise Level (L_{dn}). CNEL is a 24-hour weighted average measure of community noise. CNEL is obtained by adding five decibels to sound levels in the evening (7:00 PM to 10:00 PM), and by adding ten decibels to sound levels at night (10:00 PM to 7:00 AM). This weighting accounts for the increased human sensitivity to noise during the evening and nighttime hours. L_{dn} is a very similar 24-hour average measure that weights only the nighttime hours.

It is widely accepted that the average healthy ear can barely perceive changes of 3 dBA; that a change of 5 dBA is readily perceptible, and that an increase (decrease) of 10 dBA sounds twice (half) as loud. This definition is recommended by the California Department of Transportation's Traffic Noise Analysis Protocol for New Highway and Reconstruction Projects (2013).

B. Vibration Fundamentals

The way in which vibration is transmitted through the earth is called propagation. Propagation of earthborn vibrations is complicated and difficult to predict because of the endless variations in the soil through which waves travel. There are three main types of vibration propagation: surface, compression and shear waves. Surface waves, or Raleigh waves, travel along the ground's surface. These waves carry most of their energy along an expanding circular wave front, similar to ripples produced by throwing a rock into a pool of water. Compression waves, or P-waves, are body waves that carry their energy along an expanding spherical wave front. The particle motion in these waves is longitudinal (i.e., in a "push-pull" fashion). P-waves are analogous to airborne sound waves. Shear waves, or S-waves, are also body waves that carry energy along an expanding spherical wave front. However, unlike P-waves, the particle motion is transverse or "side-to-side and perpendicular to the direction of propagation".

As vibration waves propagate from a source, the energy is spread over an ever-increasing area such that the energy level striking a given point is reduced with the distance from the energy source. This geometric spreading loss is inversely proportional to the square of the distance. Wave energy is also reduced with distance as a result of material damping in the form of internal friction, soil layering, and void spaces. The amount of attenuation provided by material damping varies with soil type and condition as well as the frequency of the wave.

Construction operations generally include a wide range of activities that can generate groundborne vibration. Vibratory compactors or rollers, pile drivers, and pavement breakers can generate perceptible amounts of vibration at up to 200 feet. Heavy trucks can also generate groundborne vibrations, which can vary depending on vehicle type, weight, and pavement conditions. Potholes, pavement joints, discontinuities, or the differential settlement of pavement all increase the vibration levels from vehicles passing over a road surface. Construction vibration is normally of greater concern than vibration from normal traffic flows on streets and freeways with smooth pavement conditions.

Typically, particle velocity or acceleration (measured in gravities) is used to describe vibration. Table 1 shows the peak particle velocities (PPV) of some common construction equipment and Table 2 shows typical human reactions to various levels of PPV as well as the effect of PPV on buildings.

Figure 4
Common Noise Sources and Noise Levels

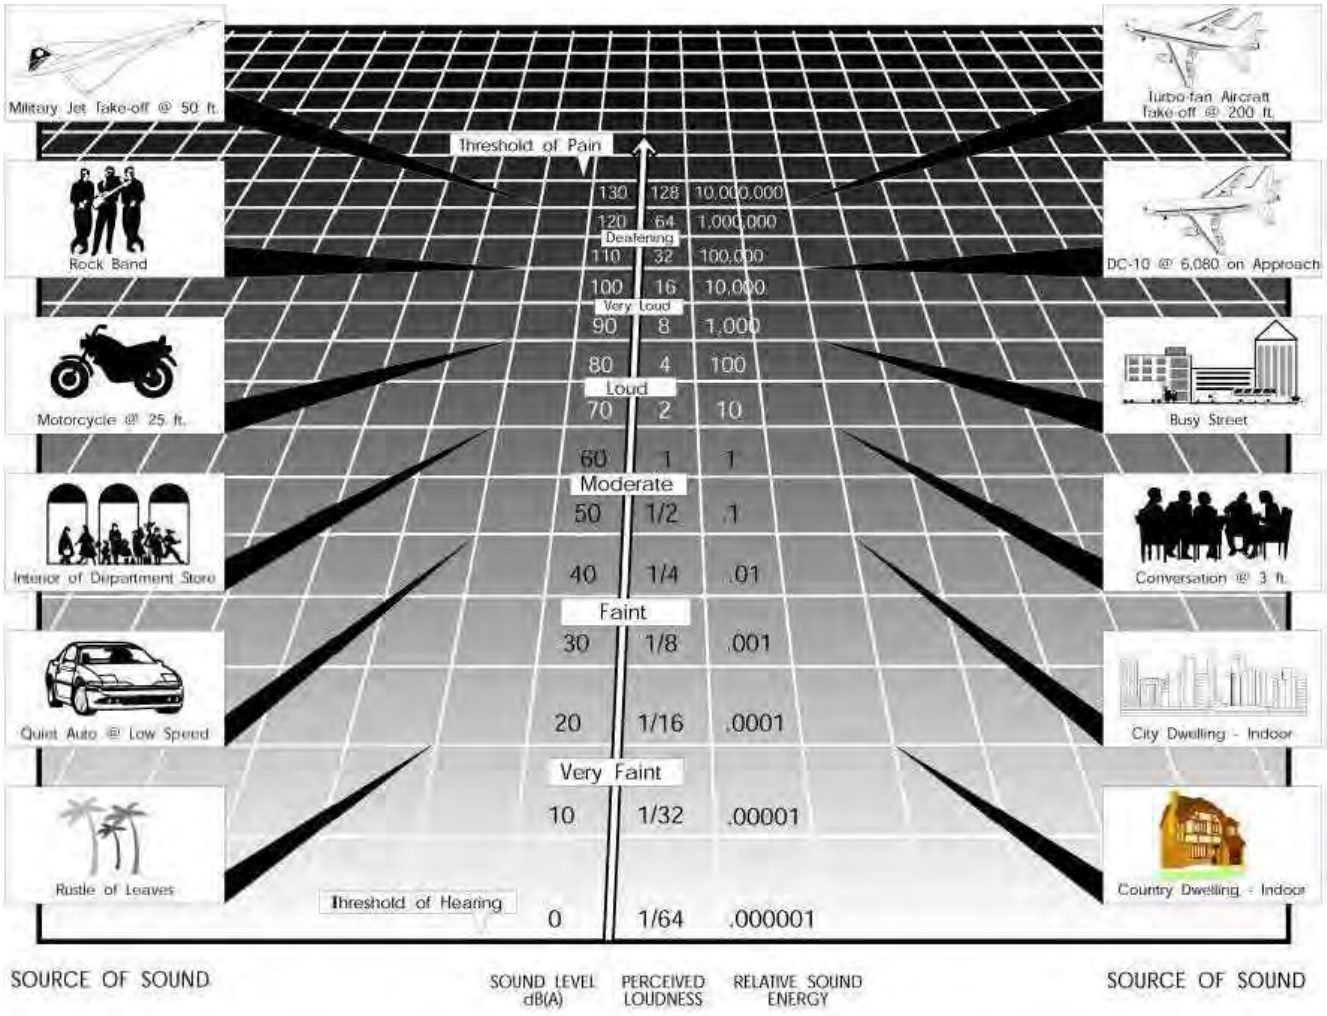

Table 1

Vibration Source Levels for Construction Equipment[1]

Equipment	Peak Particle Velocity (inches/second) at 25 feet	Approximate Vibration Level LV (dVB) at 25 feet
Pile driver (impact)	1.518 (upper range)	112
	0.644 (typical)	104
Pile driver (sonic)	0.734 upper range	105
	0.170 typical	93
Clam shovel drop (slurry wall)	0.202	94
Hydromill	0.008 in soil	66
(slurry wall)	0.017 in rock	75
Vibratory Roller	0.21	94
Hoe Ram	0.089	87
Large bulldozer	0.089	87
Caisson drill	0.089	87
Loaded trucks	0.076	86
Jackhammer	0.035	79
Small bulldozer	0.003	58

Table 2

Typical Human Reaction and Effect on Buildings Due to Groundborne Vibration[1]

Vibration Level Peak Particle Velocity (PPV)	Human Reaction	Effect on Buildings
0.006–0.019 in/sec	Threshold of perception, possibility of intrusion	Vibrations unlikely to cause damage of any type
0.08 in/sec	Vibrations readily perceptible	Recommended upper level of vibration to which ruins and ancient monuments should be subjected
0.10 in/sec	Level at which continuous vibration begins to annoy people	Virtually no risk of "architectural" (i.e., not structural) damage to normal buildings
0.20 in/sec	Vibrations annoying to people in buildings	Threshold at which there is a risk to "architectural" damage to normal dwelling – houses with plastered walls and ceilings
0.4–0.6 in/sec	Vibrations considered unpleasant by people subjected to continuous vibrations and unacceptable to some people walking on bridges	Vibrations at a greater level than normally expected from traffic, but would cause "architectural" damage and possibly minor structural damage

III. EXISTING NOISE ENVIRONMENT

A. Existing Land Uses and Sensitive Receptors

The project site is bordered by John Street and the I-10 Freeway to the north, Banning Municipal Airport to the south, vacant land to the east, and Banning Municipal Airport and vacant land to the west. There are no noise sensitive land uses adjacent to the project site.

The State of California defines sensitive receptors as those land uses that require serenity or are otherwise adversely affected by noise events or conditions. Schools, libraries, churches, hospitals, single and multiple-family residential, including transient lodging, motels and hotel uses make up the majority of these areas. Sensitive receptors that may be affected by project generated noise include single-family detached residential dwelling units and a church. Figure 5 shows sensitive receptors in proximity to the proposed project.

B. Ambient Noise Measurements

Short-Term Daytime Noise Measurements (10-minute)
Three (3) 10-minute daytime representative noise measurements were taken between 3:30 PM and 4:28 PM on April 19, 2017 with an American National Standards Institute (ANSI Section SI4 1979, Type 1) Larson Davis model LxT sound level meter in order to document existing ambient noise levels in the project area. Field worksheets and noise measurement output data are included in Appendix C.

As shown on Figure 6, two short-term noise measurements were taken near existing single-family detached residential dwelling units along roadway segments that will be affected by project generated vehicle trips and one short-term noise measurement was taken at the east end of East Westward Avenue in order to get representative noise levels at the project site. Table 3 provides a summary of the short-term ambient noise data. Ambient noise levels measured between 49.7 and 65.7 dBA L_{eq}. The dominant noise source was from vehicles traveling on local surface streets. Secondary noise sources included vehicle noise associated with traffic volumes on the I-10 Freeway, overhead aircraft, machinery at a distance, and birdsong.

Long Term Noise Measurements (24-Hour)
Kunzman Associates, Inc. conducted two 24-hour noise measurements at two locations that are representative of sensitive receptors that may be affected by project generated vehicle trips. The noise measurement data were collected in one-minute intervals over a 24-hour period.

The first 24-hour noise measurement was taken near the single-family detached residential dwelling units located at 982 East Lincoln Street (Figure 6, LTNM 1). One-hour L_{eq} noise levels are expected to range between 52.6-62.8 dBA Leq. The quietest daytime hour (7:00 AM-10:00 PM) was 56.8 and the quietest nighttime hour (between 7:00 AM and 10:00 PM was 52.6 dBA Leq. Maximum noise events during daytime hours ranged between 75.7 and 87.9 dBA and maximum noise events during nighttime hours ranged between 67.0 and 88.2 dBA. The CNEL of long term noise measurement 1 is 67.0 dBA.

Figure 5
Sensitive Receptors in Proximity to the Proposed Project

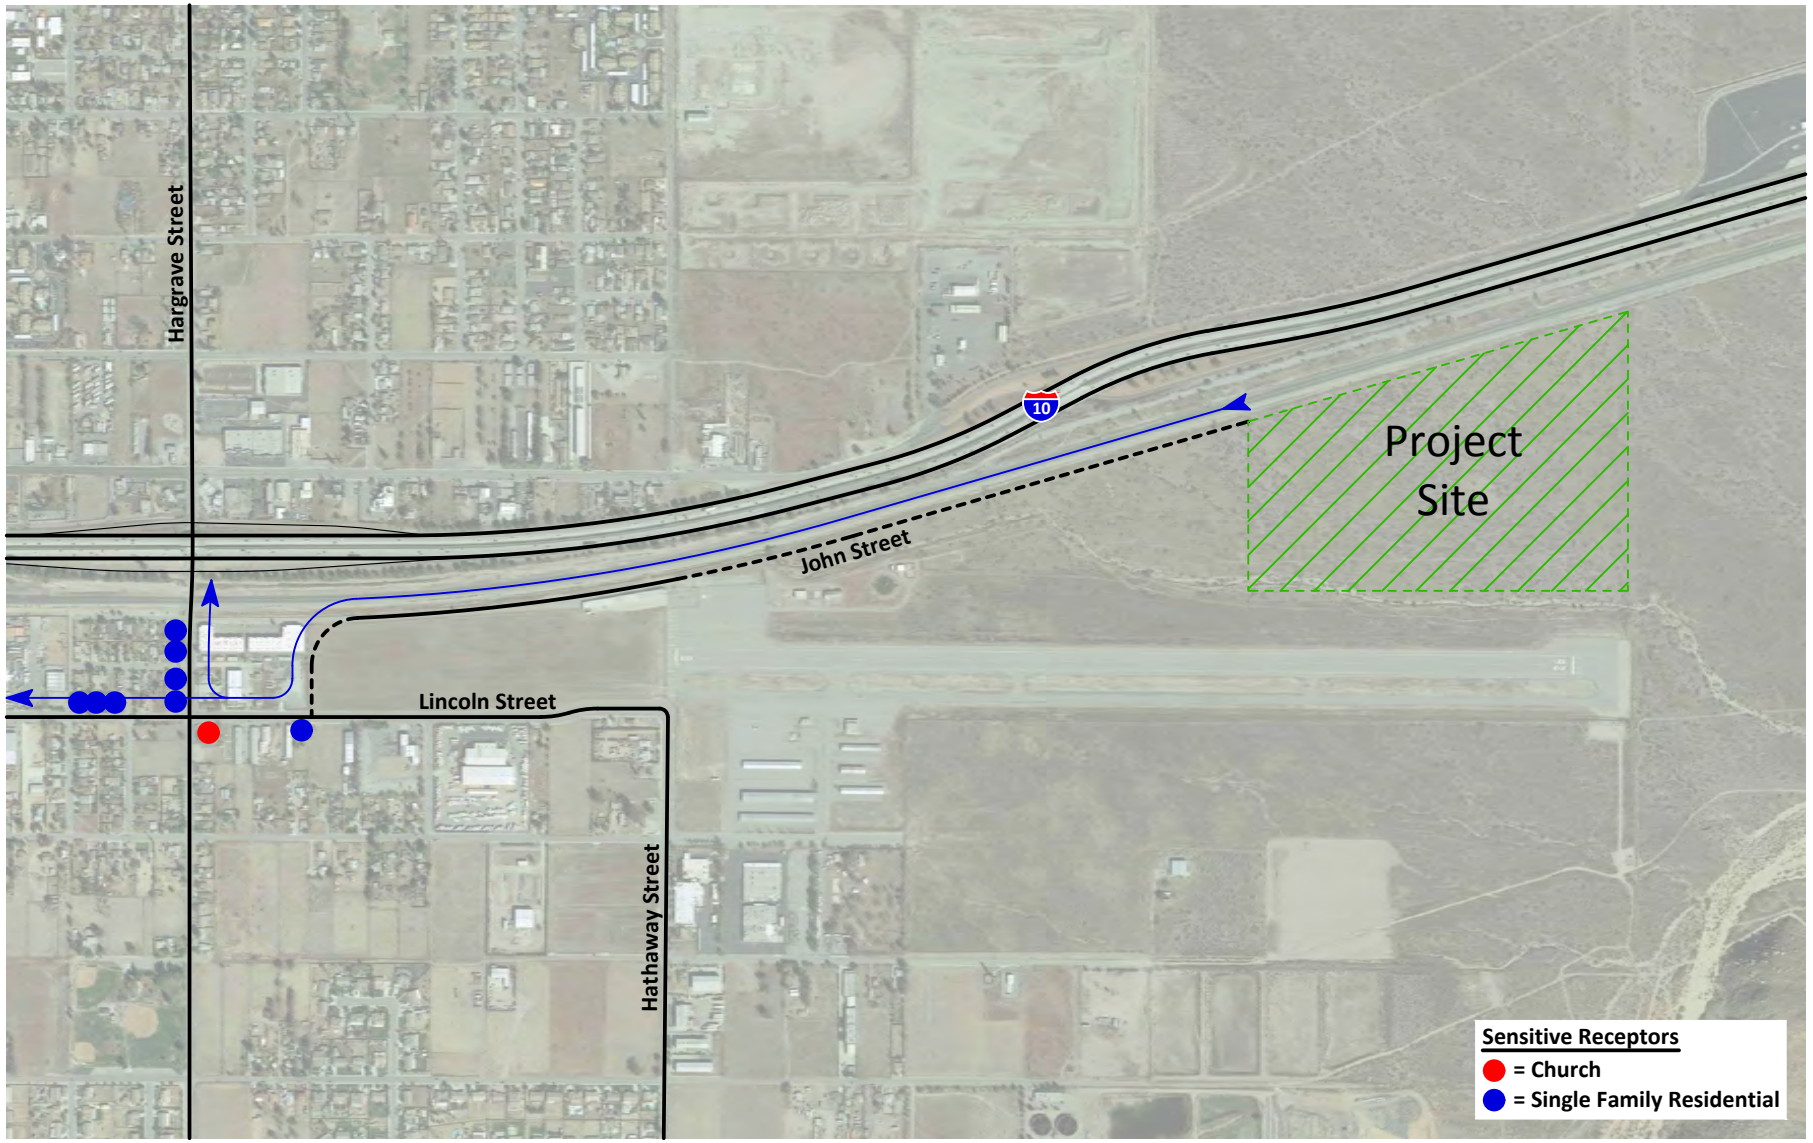

Figure 6
Noise Measurement Location Map

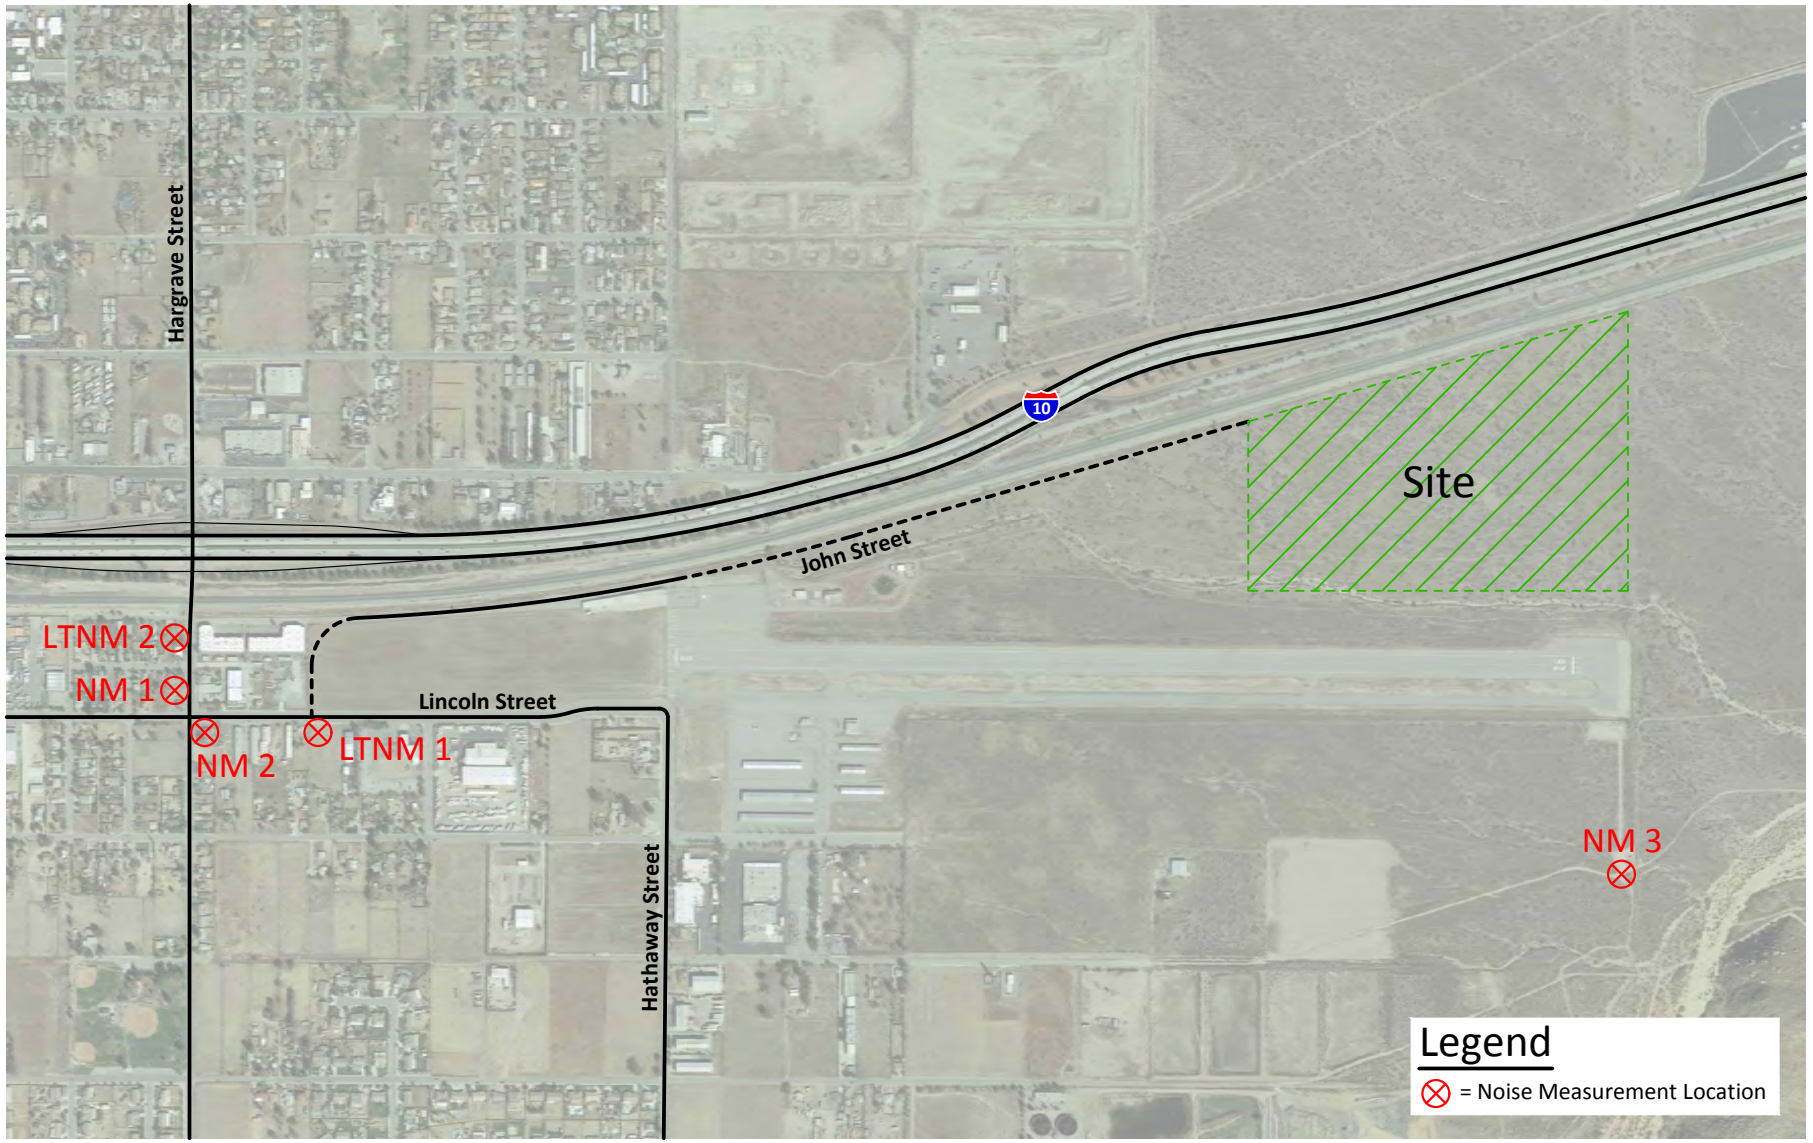

Table 3

Short-Term Noise Measurement Summary (dBA)[1, 2]

Daytime							
Site Location	Time Started	Leq	Lmax	L(2)	L(8)	L(25)	L(50)
NM1	3:30 PM	65.0	77.3	74.1	68.3	64.6	61.7
NM2	3:45 PM	65.7	83.3	73.4	67.7	63.2	59.8
NM3	4:48 PM	49.7	55.6	53.3	51.8	50.5	49.2

[1] See Figure 4 for noise measurement locations. Each noise measurement was performed over a 10-minute duration.

[2] Noise measurements performed on January 11, 2017.

Noise measurement data for long term noise measurement 1 (see Table 4) shows that there is little variation between daytime and nighttime noise levels. In fact, the quietest hours at this location are between 4:00 PM and 5:00 PM, 2:00 AM and 3:00 AM, and 3:00 PM and 4:00 PM in that order. It is clear that noise associated with the I-10 Freeway is the dominant noise source. Noise events exceeding 75 dBA occurred several times between the hours of 10:00 PM and 7:00 AM. The highest measured maximum noise level (88.2 dB) occurred at 11:21 PM.

The second 24-hour noise measurement was taken near the single-family detached residential dwelling unit located at 781 Plaza Street and adjacent to Hargrave Street (see Figure 6, LTNM 2). Measured one-hour L_{eq} noise levels are expected to range between 61.6-76.3 dBA Leq. The quietest daytime hour (7:00 AM-10:00 PM) was 63.5 and the quietest nighttime hour (between 7:00 AM and 10:00 PM was 61.6 dBA L_{eq}. Maximum noise events during daytime hours ranged between 78.2 and 103.4 dBA and maximum noise events during nighttime hours ranged between 73.5 and 103.4 dBA. The CNEL of long term noise measurement 2 is 77.9 dBA.

Noise measurement data for long term noise measurement 2 (see Table 5) shows that there is little variation between daytime and nighttime noise levels. In fact, the quietest hours at this location are between 11:00 PM to 12:00 AM, 1:00 AM and 2:00 AM, 2:00 AM and 3:00 AM, in that order. It is clear that noise associated with the I-10 Freeway and the Union Pacific Railroad Company rail line are the dominant noise sources. Noise events exceeding 75 dBA occurred several times between the hours of 10:00 PM and 7:00 AM. The highest measured maximum noise level (103.4 dB) occurred at 8:27 PM.

C. Existing Noise Sources

The project area is located in an environment heavily dominated by existing transportation related noise sources. The dominant noise sources in the project area are discussed below.

I-10 Freeway

The I-10 Freeway lies to the north of the proposed project site and is in close proximity to those existing sensitive receptors affected by the proposed project. The lanes of the I-10 Freeway are located as close as approximately 330 feet north of the single-family detached residential dwelling units located along Hargrave Street, with the on/off-ramps being as close as 250 feet north of these single-family detached residential dwelling units. Further, the lanes of the I-10 Freeway are located as close as approximately 900 feet north, with the on/off-ramps being located approximately 830 feet north of the single-family detached residential dwelling unit and church located along Lincoln Street.

The I-10 Freeway in the vicinity of the proposed project has a vehicle mix of approximately 84% autos, 4.7% medium trucks and 11.3% heavy trucks with an annual average daily traffic volume of 121,000 vehicles, found in data provided by the California Department of Transportation (http://traffic-counts.dot.ca.gov/).

Table 4

24-Hour Noise Measurement Data at Representative Sensitive Receptors just east of 982 East Lincoln Street (Single-Family Detached Residential Dwelling Unit)[1,2]

Measurement Period	Average One-Minute Leq (dBA)	Maximum Noise Event (dBA)	Leq (1Hour)
12:00 PM-1:00 PM	56.5	79.3	59.4
1:00 PM-2:00 PM	56.6	80.0	59.6

10:00 AM - 11:00 AM	65.9	101.2	72.8
11:00 AM -12:00 PM	64.3	100.2	63.5

[1] See Figure 4 for noise measurement locations. The noise measurement was performed over a 24-hour duration.

[2] Noise measurement performed from February 8, 2018 to February 9, 2018.

Train Noise

There is an existing Union Pacific Railroad Company rail line in the project vicinity running in an east/west direction just south of the I-10 Freeway. This rail line is as close as 100 feet north of the single-family detached residential dwelling units along Hargrave Street and approximately 660 feet north of the single-family detached residential dwelling unit and church located along Lincoln Street. According to the most recent Federal Railroad Administration Inventory Data Sheets (see Appendix H), approximately 17 thru trains occur during the nighttime hours (6:00 PM to 6:00 AM) and 17 during the daytime hours (6:00 AM to 6:00 PM), with two switching trains throughout the day. Typical train speed range between 20 and 60 miles per hour.

Banning Municipal Airport

Banning Municipal Airport is located approximately 2,660 feet east of the single-family detached residential dwelling units along Hargrave Street and between approximately 1,980 feet and 2,455 feet east of the single-family detached residential dwelling unit and church along Lincoln Street. The airport runway lies in an east/west direction.

According to both the Banning Municipal Airport Master Plan Update and the City of Banning General Plan existing noise contour maps as well as the City of Banning General Plan buildout airport noise contour map, the single-family detached residential dwelling units along Hargrave Street are within the 60 and 65 dB CNEL noise contours, while the church along Lincoln Street is within the 60 dB CNEL noise contour for the airport.

IV. REGULATORY SETTING

A. Federal Regulations

1. Federal Noise Control Act of 1972

The U.S. Environmental Protection Agency (EPA) Office of Noise Abatement and Control was originally established to coordinate federal noise control activities. After its inception, EPA's Office of Noise Abatement and Control issued the Federal Noise Control Act of 1972, establishing programs and guidelines to identify and address the effects of noise on public health, welfare, and the environment. In response, the EPA published Information on Levels of Environmental Noise Requisite to Protect Public Health and Welfare with an Adequate Margin of Safety (Levels of Environmental Noise). The Levels of Environmental Noise recommended that the Ldn should not exceed 55 dBA outdoors or 45 dBA indoors to prevent significant activity interference and annoyance in noise-sensitive areas.

In addition, the Levels of Environmental Noise identified five (5) dBA as an "adequate margin of safety" for a noise level increase relative to a baseline noise exposure level of 55 dBA Ldn (i.e., there would not be a noticeable increase in adverse community reaction with an increase of five dBA or less from this baseline level). The EPA did not promote these findings as universal standards or regulatory goals with mandatory applicability to all communities, but rather as advisory exposure levels below which there would be no risk to a community from any health or welfare effect of noise.

In 1981, EPA administrators determined that subjective issues such as noise would be better addressed at lower levels of government. Consequently, in 1982 responsibilities for regulating noise control policies were transferred to State and local governments. However, noise control guidelines and regulations contained in EPA rulings in prior years remain in place by designated Federal agencies, allowing more individualized control for specific issues by designated Federal, State, and local government agencies.

B. State Regulations

1. State of California General Plan Guidelines 2003

Though not adopted by law, the State of California General Plan Guidelines 2003, published by the California Governor's Office of Planning and Research (OPR) (OPR Guidelines), provide guidance for the compatibility of projects within areas of specific noise exposure. The OPR Guidelines identify the suitability of various types of construction relative to a range of outdoor noise levels and provide each local community some flexibility in setting local noise standards that allow for the variability in community preferences. Findings presented in the Levels of Environmental Noise Document (EPA 1974) influenced the recommendations of the OPR Guidelines, most importantly in the choice of noise exposure metrics (i.e., Ldn or CNEL) and in the upper limits for the Normally Acceptable outdoor exposure of noise-sensitive uses. The OPR Guidelines include a Noise and Land Use Compatibility Matrix identifies acceptable and

unacceptable community noise exposure limits for various land use categories. The City utilizes a version of this table (discussed below).

3. California Environmental Quality Act

The California Environmental Quality Act Guidelines (Appendix G) establishes thresholds for noise impact analysis. Two of these standards apply to what is referred to as a "substantial increase" in ambient noise levels. Neither the California Environmental Quality Act nor the City of Banning General Plan Noise Element recognizes an official numerical increase as a "substantial increase." Industry-accepted standards for what is considered to be a "substantial increase" range from 3 dB to 12 dB. It should be noted that a change of 3 dB is considered to be "barely audible" to a trained ear and that a change of 5 dB is considered to be a readily audible change.

For purposes of this analysis, the following threshold was used to evaluate the project's potential to result in substantial increases in ambient noise levels.

Roadway noise impacts would be considered significant if the project increases noise levels at a noise sensitive land use by 3 CNEL and if: (1) the existing noise levels already exceed the residential land use compatibility standard for "clearly compatible" (60 CNEL), or (2) the project increases noise levels from below the 60 CNEL standard to above 60 CNEL.

4. California Department of Transportation

The California Department of Transportation *and Vibration Guidance Manual* recommends a maximum vibration level standard of 0.2 in/sec PPV for the prevention of structural damage to typical residential buildings.

C. Local Regulations

1. City of Banning General Plan

Land use compatibility in light of community noise equivalent levels (CNEL) standards are presented in Table V-4 of the City of Banning General Plan Environmental Hazards Element. These standards (see Table 6) are presented as allowable exterior noise levels for various land uses.

Other Applicable policies and standards governing environmental noise in the City are set forth in the General Plan Noise Element. Those that are applicable to this analysis are presented below:

Goals, Policies, and Policy Action

The City utilizes the following General Plan Noise Element goal, policies and programs to assess and evaluate the project's suitability in light of noise impacts.

Table 6

Land Use Compatibility for Community Noise Environments[1]

Land Use Category	Community Noise Equivalent Level (CNEL)					
	55	60	65	70	75	80
Residential- Single Family Dwellings, Duples, Mobile Homes						
Residential Multi-Family						
Transient Lodging: Hotels/Motels						
School Classrooms, Libraries, Churches, Hospitals, Nursing Homes and Convelescent Hospitals						
Auditoriums, Concert Halls, Amphitheatres						
Sports Arena, Outdoor Spectator Sports						
Playgrounds, Neighborhood Parks						
Golf Courses, Riding Stables, Water Recreation, Cemeteries						
Office Buildings, Business Commercial and Professional						
Industrial, Manufacturing, Utilities, Agriculture						

Normally Acceptable: With no special noise reduction requirements assuming standard construction.

Conditionally Acceptable: New construction or development should be undertaken only after a detailed analysis of the noise reduction requirements is made and needed insulation features included in the design.

Normally Unacceptable: New construction is discouraged. If new construction or development does proceed, a detailed analysis of the noise reduction requirements must be made and needed noise insulation features included in the design.

Clearly Unacceptable: New construction or development should generally not be undertaken.

[1]Source: City of Banning General Plan Noise Element

Goal A noise environment that complements the community's residential character and its land uses.

Policy 1 The City shall protect noise sensitive land uses, including residential neighborhoods, schools, hospitals, libraries, churches, resorts and community open space, from potentially significant sources of noise.

Program 1.A The City shall require building setbacks, the installation of wall and window insulation, sound walls, earthen berms, and/or other mitigation measures in areas exceeding the City's noise limit standards for private development projects as they occur.

Program 1.B The City shall maintain and enforce its Noise Control Ordinances that establish community-wide noise standards and identify measures designed to resolve noise complaints.

Program 1.C The City shall use the development review process to assure the use of buffers between sensitive receptors and incompatible land uses.

Program 1.C The City shall require that commercial compactors, loading zones, and large trash bins be located at a sufficient distance from residential properties to reduce noise impacts to its acceptable standard.

Policy 3 Private sector project proposals shall include measures that assure that noise exposures levels comply with State of California noise insulation standards as defined in Title 25 (California Noise Insulation Standards) and/or Banning Ordinances 1138 and 1234, whichever is more restrictive.

Policy 4 The City shall maintain a General Plan Circulation Map and assure low levels of traffic within neighborhoods by assigning truck routes to major roadways only.

Program 4.A The City shall review designated primary truck routes and ensure they are clearly marked throughout the community. Except for traffic providing location-specific services and deliveries, construction trucks and delivery trucks shall be limited to designated truck routes, including: Ramsey Street, and those portions of Lincoln Street, Highland Springs Avenue, Hathaway Street, Sunset Avenue, Eighth Street, San Gorgonio Avenue, and Hargrave Street so designated.

Program 4.B The City shall discourage development projects that result in through-traffic in residential neighborhoods.

Policy 6 All development proposals within the noise impact area of the I-10 Freeway and the railroad shall mitigate both noise levels and vibration to acceptable levels through the preparation of focused studies and analysis in the development review and environmental review process.

Policy 8 The City shall impose and integrate special design features into proposed development that minimize impacts associated with the operation of air conditioning and heating equipment, on-site traffic, and use of parking, loading and trash storage facilities.

2. City of Banning Municipal Ordinance

Title 8, Chapter 44 of the City's Municipal Code establishes citywide exterior noise level standards. The noise ordinance has been reviewed and the sections that are applicable to this analysis are outlined below.

Section 8.44.040 – Noise level measurement criteria.

B. The Factors which shall be considered in determining whether a violation of the provisions of this section exists shall include, but not be limited to, the sound level of the objectionable noise; the sound level of the ambient noise; the proximity of the noise to residential sleeping facilities; the nature and zoning of the area within which the noise emanates; the number of persons affected by the noise source; the time of day or night the noise occurs; the duration of the noise and its tonal, informational or musical content; whether the noise is produced by a commercial or noncommercial activity.

C. The above factors shall be considered in addition to the noise levels set forth in this section in determining a violation. However, noises do not necessarily need to exceed those noise level limits to be considered unnecessary or unusual so as to cause discomfort or annoyance to persons in the area.

Section 8.44.050 – Base ambient noise level. All ambient noise measurements shall commence at the base ambient noise levels in decibels within the respective times and zones as shown below. As shown below, the base noise level for impacts to residential properties is 55 dBA between the hours of 7:00 AM and 10:00 PM and 45 dBA between the hours of 10:00 PM and 7:00 AM.

Base Ambient Noise Levels[1,2]		
Decibels	Time Period	Zone Use
45 dB(A)	10:00 PM – 7:00 AM	Residential
55 dB(A)	7:00 AM – 10:00 PM	Residential
75 dB(A)	Anytime	Industrial and Commercial

[1] Base ambient noise refers to the lowest ambient noise level for any particular zone.

[2] Source: City of Banning Code of Ordinances, 8.44.050.

Actual decibel measurements exceeding the levels set forth herein above at the times and within the zones corresponding thereto shall be employed as the "base ambient noise level" referred to in this chapter. Otherwise, no ambient noise shall be deemed to be less than the above specified levels.

As shown in Section III(B), the measured existing ambient noise exceeds the City's residential base ambient noise level standards for both day and night. Although the existing conditions have been identified as being above the City's base ambient noise level standards for residential uses, this report uses the base ambient noise levels as identified in Section 8.44.050 of the City's Municipal Code.

Section 8.44.060 – Exterior noise level measurement. Except as otherwise specifically provided within the Municipal Ordinance, all references to "exterior noise" or "exterior noise levels" as used in the Municipal Ordinance shall be as measured at any point relative to the closest point of the source of the noise at the property line of the complaining party. Measurements will not be made during extraordinary times, such as during the movement of a train or nearby airplane.

Section 8.44.070 – Maximum residential noise levels. No noise level shall exceed the standards presented below for the durations specified.

Maximum Allowable Residential Noise Levels[1]	
Decibels	Maximum Duration Period
5 dB(A) above Base Ambient Noise Level	5 minutes any hour
10 dB(A) above Base Ambient Noise Level	16 minutes any hour
15 dB(A) above Base Ambient Noise Level	1 minutes any hour
20 dB(A) above Base Ambient Noise Level	Not permitted
[1] Source: City of Banning Code of Ordinances, 8.44.070.	

Section 8.44.090 – Noises prohibited-unnecessary noise standard. Any other provision of this chapter notwithstanding, the following acts are expressly prohibited as a violation of this chapter. Such acts are hereby expressly declared to be loud, unusual and unnecessary noises in violation of this chapter, namely:

E. Construction, landscape maintenance or repair:

1. It is unlawful for any person to engage in or permit the generation of noise related to landscape maintenance, construction including erection, excavation, demolition, alteration or repair of any structure or improvement, at such sound levels, as measured at the property line of the nearest adjacent occupied property, as to be in excess of the sound levels permitted under this chapter, at other times than between the hours of 7:00 AM and 6:00 PM. The person engaged in such activity is hereby permitted to exceed sound levels otherwise set forth in this chapter for the duration of the activity during the above described hours for purposes of construction. However, nothing contained herein shall permit any person to cause sound levels to at any time exceed fifty-five dB(A) for intervals of

more than fifteen minutes per hour as measured in the interior of the nearest occupied residence or school.

G. Motor driven vehicles. It shall be unlawful for any person to operate any motor driven vehicle within the city that, due to the nature of the operation of the vehicle, or due to the operating condition of the vehicle, or due to any modification made to the vehicle, in such manner as to exceed noise levels set forth in Section 8.44.050 hereof.

1. Exhaust. It shall be unlawful for any person to discharge into the open air the exhaust of any steam engine, stationary internal combustion engine, motorboat or motor driven vehicle except through a muffler or other device which will effectively prevent loud or explosive noises therefrom.

A "motor-driven vehicle" shall include, but not be limited to, any automobile, truck, van, bus, motorcycle, minibike, go-cart or other self-propelled vehicle, on or off road, and aircraft.

H. Notwithstanding any other provisions of this chapter and in addition thereto, it shall be unlawful for any person to willfully make or continue, or to cause to be made or continued, any loud, unnecessary and unusual noise which disturbs the peace or quiet of any neighborhood or which causes discomfort or annoyance to any reasonable person of normal hearing sensitivity residing in the area. The standard which may be considered in determining whether a violation of the provisions of this section exists may include, but not be limited to, the following:

1. The level of noise;
2. Whether the nature of the noise is usual or unusual;
3. Whether the origin of the noise is natural or unnatural;
4. The level and intensity of the background noise, if any;
5. The proximity of the noise to residential sleeping facilities;
6. The nature of the zoning of the area within which the noise emanates;
7. The density of the inhabitation of the area within which the noise emanates;
8. The time of day and night the noise occurs;
9. Whether the noise is recurrent, intermittent, or constant;
10. The duration of the noise; and
11. Whether the noise is produced by a commercial or noncommercial activity.

Section 8.44.100 – Application Between Zones. In applying the regulations set forth in this chapter, each source of noise shall be subject only to such regulation as shall apply to the zone, including any designated truck route, within which it is located. A use laying adjacent to a zone with a more restrictive noise requirement hereunder shall not be required to conform to that more restrictive requirement. For purposes of this subsection, "zone" shall be as utilized in Title 17 of the Banning Ordinance Code.

V. ANALYTICAL METHODOLOGY AND MODEL PARAMETERS

A. Noise Modeling and Input

1. Road Construction Model

A worst-case construction noise scenario was modeled using a version of the Federal Highway Administration's Roadway Construction Noise Model (RCNM). RCNM utilizes standard noise emission levels for many different types of equipment and includes utilization percentage, impact, and shielding parameters. Noise modeling input parameters and output are provided in Appendix D.

2. Federal Highway Administration (FHWA) Traffic Noise Prediction Model

Existing, Existing Plus Project, and Buildout noise levels along the I-10 Freeway were modeled utilizing the FHWA Traffic Noise Prediction Model FHWA-RD-77-108 in order to quantify the proposed project's contribution to increases in ambient noise levels and to calculate future noise levels at the project site due to vehicular traffic traveling on the I-10 Freeway.

The FHWA Traffic Noise Prediction Model arrives at a predicted noise level through a series of adjustments to the Reference Energy Mean Emission Level (REMEL). Adjustments are then made to the REMEL to account for: total average daily traffic volumes (ADT), roadway classification, width, speed and truck mix, roadway grade and site conditions (hard or soft ground surface). Surfaces adjacent to all modeled roadways were assumed to have a "hard site" to predict worst-case, conservative noise levels. A hard site, such as pavement, is highly reflective and does not attenuate noise as quickly as grass or other soft sites. Possible reductions in noise levels due to intervening topography and buildings were not accounted for in this analysis.

Existing and Existing Plus Project vehicle trips provided in the Traffic Impact Analysis prepared for the project were utilized to evaluate the impact of project generated trips on affected road segments with adjacent sensitive receptors. The proposed project is anticipated to generate approximately 1,040 average daily passenger car trips, 109 two-axle truck trips, 145 three-axle truck trips, and 386 four-axle (and greater) truck trips. As neither the City of Banning or the County of San Bernardino have published vehicle mixes, the Riverside County Department of Industrial Hygiene published vehicle mix for use in Noise Studies were utilized for existing road segments.

Data from the California Department of Transportation Operations website was utilized for modeling the I-10 Freeway. An estimated 118,000 vehicle trips are expected to travel on the segment of the I-10 Freeway in the vicinity of the project site. The vehicle mix of traffic volumes travelling on the I-10 Freeway in the vicinity of the proposed project is 84 % passenger vehicles, 1% medium trucks and 14% heavy trucks (California Department of Transportation 2017). FHWA worksheets are included in Appendix E.

3. SoundPLAN

The SoundPLAN software utilizes algorithms (based on the inverse square law) to calculate noise level projections. The software allows the user to input specific noise sources, spectral content, sound barriers, building placement, topography, and sensitive receptor locations.

The SoundPLAN model was utilized to calculate future operational noise levels of the proposed warehouse. The model was utilized to calculate future noise levels using reference sound level data for the various stationary on-site sources. Loading/unloading was modeled as an area source and includes activities such as trucks' diesel engines, exhaust systems, braking, and forklifts. Noise levels associated with loading/unloading can range between 65 to 80 dBA. The parking lot was modeled with 623 parking spaces and 181 peak hour traffic movements. Noise levels associated with parking lots can reach peak levels of 80 dBA. Parking lot noise sources may include but are not limited to idling cars, doors closing, and starting engine noise.

VI. IMPACT ANALYSIS

A. Noise Impacts

This impact discussion analyzes the potential for project construction noise and operational noise to cause an exposure of person to or generation of noise levels in excess of established City of Banning noise standards related to construction noise, transportation, and stationary related noise impacts caused by the proposed project.

1. Construction Noise

Construction noise is considered a short-term impact and would be considered significant if construction activities are undertaken outside the allowable times as described by the City's Municipal Code Section 8.44.090 and as listed in Section IV – C2 of this report.

Existing single-family detached residential dwelling units may be temporarily affected by short-term noise impacts associated the transport of workers, the movement of construction materials to and from the project site, ground clearing, excavation, grading, and building activities.

On-Site Construction Noise

Project generated construction noise will vary depending on the construction process, type of equipment involved, location of the construction site with respect to sensitive receptors, the schedule proposed to carry out each task (e.g., hours and days of the week) and the duration of the construction work. Site grading is expected to produce the highest sustained construction noise levels. Typical noise sources and noise levels associated with the site grading phase of construction are shown in Table 7. Typical operating cycles for these types of construction equipment may involve one or two minutes of full power operation followed by three to four minutes at lower power settings. A likely worst-case construction noise scenario during grading assumes the use of a two graders, a dozer, and a water truck (modeled as a dump truck) operating between 10 and 150 feet from the property line.

Assuming a usage factor of 40 percent for each piece of equipment, per the FWA Roadway Construction Noise Model User's Guide, unmitigated noise levels have the potential to reach 95 dBA L_{eq} and 99 dBA L_{max} at the property line during grading[1]. The nearest sensitive receptor is a single-family detached residential dwelling unit located at 1899 Westward Avenue, over 2,800 feet from the project site. Under these assumptions, unmitigated on-site construction noise levels have the potential to reach up to 50 dBA L_{eq} and 50 dBA L_{max} at the nearest sensitive receptor. The measured noise

[1] The FHWA Roadway Construction Noise Model (RCNM) User's Guide (2006) explains that a usage factor is the percentage of time during a construction noise operation that a piece of construction equipment is operating at full power. The usage factor of 40 percent used in this analysis was taken from the usage factor database provided in Table 1 of the RCNM User's Guide.

Table 7

Typical Construction Equipment Noise Levels[1]

Type of Equipment	Range of Maximum Sound Levels Measured (dBA at 50 feet)	Suggested Maximum Sound Levels for Analysis (dBA at 50 feet)
Rock Drills	83-99	96
Jack Hammers	75-85	82
Pneumatic Tools	78-88	85
Pumps	74-84	80
Dozers	77-90	85
Scrappers	83-91	87
Haul Trucks	83-94	88
Cranes	79-86	82
Portable Generators	71-87	80
Rollers	75-82	80
Tractors	77-82	80
Front-End Loaders	77-90	86
Hydraulic Excavators	81-90	86
Graders	79-89	86
Air Compressors	76-89	86
Trucks	81-87	86

[1] Source: Bolt, Beranek & Newman; Noise Control for Buildings and Manufacturing Plants, 1987.

level documented at short-term ambient noise level measurement N3, shown on Figure 6, (49.7 dBA Leq) is representative of noise levels at 1899 Westward Avenue.

Project construction is expected to 0.3 dB louder than ambient conditions at this location and will not be audible over ambient noise associated with the I-10 Freeway, surface road traffic, the Banning Municipal Airport and other industrial land uses and will not result in noise levels that exceed 75 dBA at any sensitive receptors. Construction noise was modeled using RCNM. Input and output data is available in Appendix D. Although the impact is considered less than significant, measures to further reduce construction noise impacts are include in Section VII of this report.

Off-Site Construction Noise

As described previously, the proposed project includes several off-site elements. Figures 3 and 5 show the proposed off-site improvements and the location of sensitive receptors that may be affected by construction of the west end of John Street. Construction equipment that is expected to be utilized to for these off-site improvements includes a dozer, a tractor, and a backhoe. Simultaneous operation of three pieces of this equipment within 25-50 feet of a sensitive receptor may result in noise levels of up to 86.7 dBA L_{eq} and 87.7 dBA L_{max}. Modeled data is available in Appendix D.

Construction noise is lawful between the hours of 7:00 AM and 6:00 PM as long as it does not cause interior noise levels to exceed 55 dBA for intervals of more than 15 minutes at a sensitive receptor. Otherwise, it is unlawful for any person to engage in or permit the generation of noise related to landscape maintenance, construction including erection, excavation, demolition, alteration or repair of any structure or improvement, at such sound levels, as measured at the property line of the nearest adjacent occupied residential property, as to be in excess of standards set forth in Section IV – C2 of this report. Construction activities associated with off-site improvements may result in interior noise levels that exceed 55 dBA for a period of 15 minutes or more. These exceedances however are expected to last for no longer than a week at any particular sensitive receptor as construction moves to a location further along the off-site improvement alignment. Measures to reduce construction noise impacts are include in Section VII of this report.

2. Noise Impacts to Off-Site Receptors Due to Project Generated Traffic

A worst-case project generated traffic noise level was modeled utilizing the FHWA Traffic Noise Prediction Model - FHWA-RD-77-108. Traffic noise levels were calculated 50 feet from the centerline of the analyzed roadway. The modeling is theoretical and does not take into account any existing barriers, structures, and/or topographical features that may further reduce noise levels. Therefore, the levels are shown for comparative purposes only to show the difference in with and without project conditions. Roadway input parameters including average daily traffic volumes (ADTs), speeds, and vehicle distribution data is shown in Table 8. The potential off-site noise impacts caused by an increase of traffic volumes from operation of the proposed project on the nearby roadways were calculated for the following scenarios:

Table 8

Project Average Daily Traffic Volumes and Roadway Parameters

Roadway	Segment	Average Daily Traffic Volume		Posted Travel Speeds (MPH)	Site Conditions
		Existing	Existing Plus Project		
East Lincoln Street	West of Hargrave Street	2,800	2,900	40	Hard
	Hargrave Street to John Street	1,400	3,600	40	Hard
John Street	North of East Lincoln Street	-	2,200	25	Hard
Hargrave Street	North of East Ramsey Street	6,800	6,900	30	Hard
	East Ramsey Street to I-10 Freeway WB Ramps	10,200	10,300	30	Hard
	I-10 Freeway WB Ramps to I-10 Freeway EB Ramps	8,100	9,200	30	Hard
	I-10 Freeway EB Ramps to East Lincoln Street	5,700	7,800	30	Hard

Vehicle Distribution (Heavy Mix)[2]				
Motor-Vehicle Type	Daytime % (7 AM - 7 PM)	Evening % (7 PM - 10 PM)	Night % (10 PM - 7 AM)	Overall %
Automobiles	69.5	12.9	9.6	92
Medium Trucks	1.44	0.06	1.5	3
Heavy Trucks	2.4	0.1	2.5	5

Vehicle Distribution (Light Mix)[2]				
Motor-Vehicle Type	Daytime % (7 AM - 7 PM)	Evening % (7 PM - 10 PM)	Night % (10 PM - 7 AM)	Overall %
Automobiles	73.6	13.6	10.22	97.4
Medium Trucks	0.9	0.04	0.9	1.84
Heavy Trucks	0.35	0.04	0.35	0.74

Vehicle Type Definitions[3]

Automobiles: all vehicles having two axles and four tires-designated primarily for transportation of nine or fewer passengers (i.e., automobiles, or for transportation of cargo, i.e., light trucks). Generally with gross vehicle weight less than 9,900 pounds.

Medium Trucks: all cargo vehicles with two axles and six tires - generally gross vehicle weight is greater than 9,900 pounds but less than 26,400 pounds.

Heavy Trucks: all cargo vehicles with three or more axles -generally with gross vehicle weight greater than 26,400 pounds.

[1] Average daily traffic volumes obtained from the Banning Distribution Center Traffic Impact Analysis prepared by Albert A. Webb Associates (April 2017).

[2] Existing vehicle daytime/evening/nighttime percentages are based on the Riverside County Industrial Hygiene Letter for Traffic Noise as neither the City of Banning nor the County of San Bernardino have published vehicle mixes. The Riverside County Industrial Hygiene Letter for Traffic Noise has been included at the end of Appendix E.

[3] Per California Department of Transportation Technical Noise Supplement (September 2013).

Existing Year (without Project): This scenario refers to existing year traffic noise conditions and is demonstrated in Table 8.

Existing Year (Plus Project): This scenario refers to existing year traffic noise conditions with incorporation of the proposed project and is demonstrated in Table 8.

As stated previously, noise impacts would be considered significant if the project increases noise levels at a noise sensitive land use by 3 CNEL and if the existing noise levels already exceed the residential land use compatibility standard of 60 CNEL or the project increases noise levels from below the 60 CNEL standard to above 60 CNEL. As stated in Section IV - C2 above, the measured existing conditions have been identified as being above both the City's base ambient noise level standards identified in Section 8.44.050 of the City's Municipal Code as well as the normally acceptable residential noise standards in Table 6.

As shown in Table 9, existing traffic noise levels without the project exceed the residential land use compatibility standard of 60 CNEL. Existing traffic noise modeling and noise measurements resulted in noise levels ranging between 63.13 and 66.64 CNEL at 50 feet from the centerline of the affected road segments; and the Existing Plus Project traffic noise model resulted in noise levels ranging between 63.95 and 66.70 CNEL at 50 feet from the affected roadway segments (see Table 9). In no case however would project generated vehicle trips cause an increase in the ambient noise levels that exceeds 3.0 CNEL. Project generated trips thus would not result in significant increases in ambient noise levels according to the City of Banning Municipal Code. No mitigation is required. Traffic noise calculation outputs are included as Appendix E.

Table 9

Change in Existing Noise Levels Along Roadways as a Result of Project (CNEL)[1]

Roadway	Segment	Modeled Noise Levels (dBA CNEL) @ 50 feet from centerline				
		Existing Without Project	Existing Plus Project	Change in Noise Level	Exceeds Residential Land Use Compatibility Standards[2] (See Table 6)	Greater than 3 CNEL Increase
East Lincoln Street	West of Hargrave Street	66.64	66.70	0.06	YES	NO
	Hargrave Street to John Street	63.63	65.73	2.10	YES	NO
Hargrave Street	North of East Ramsey Street	63.89	63.95	0.06	YES	NO
	East Ramsey Street to I-10 Freeway WB Ramps	65.65	65.69	0.04	YES	NO
	I-10 Freeway WB Ramps to I-10 Freeway EB Ramps	64.65	65.20	0.55	YES	NO
	I-10 Freeway EB Ramps to East Lincoln Street	63.13	64.49	1.36	YES	NO

[1] Exterior noise levels calculated 5-feet above pad elevation, perpendicular to subject roadway.

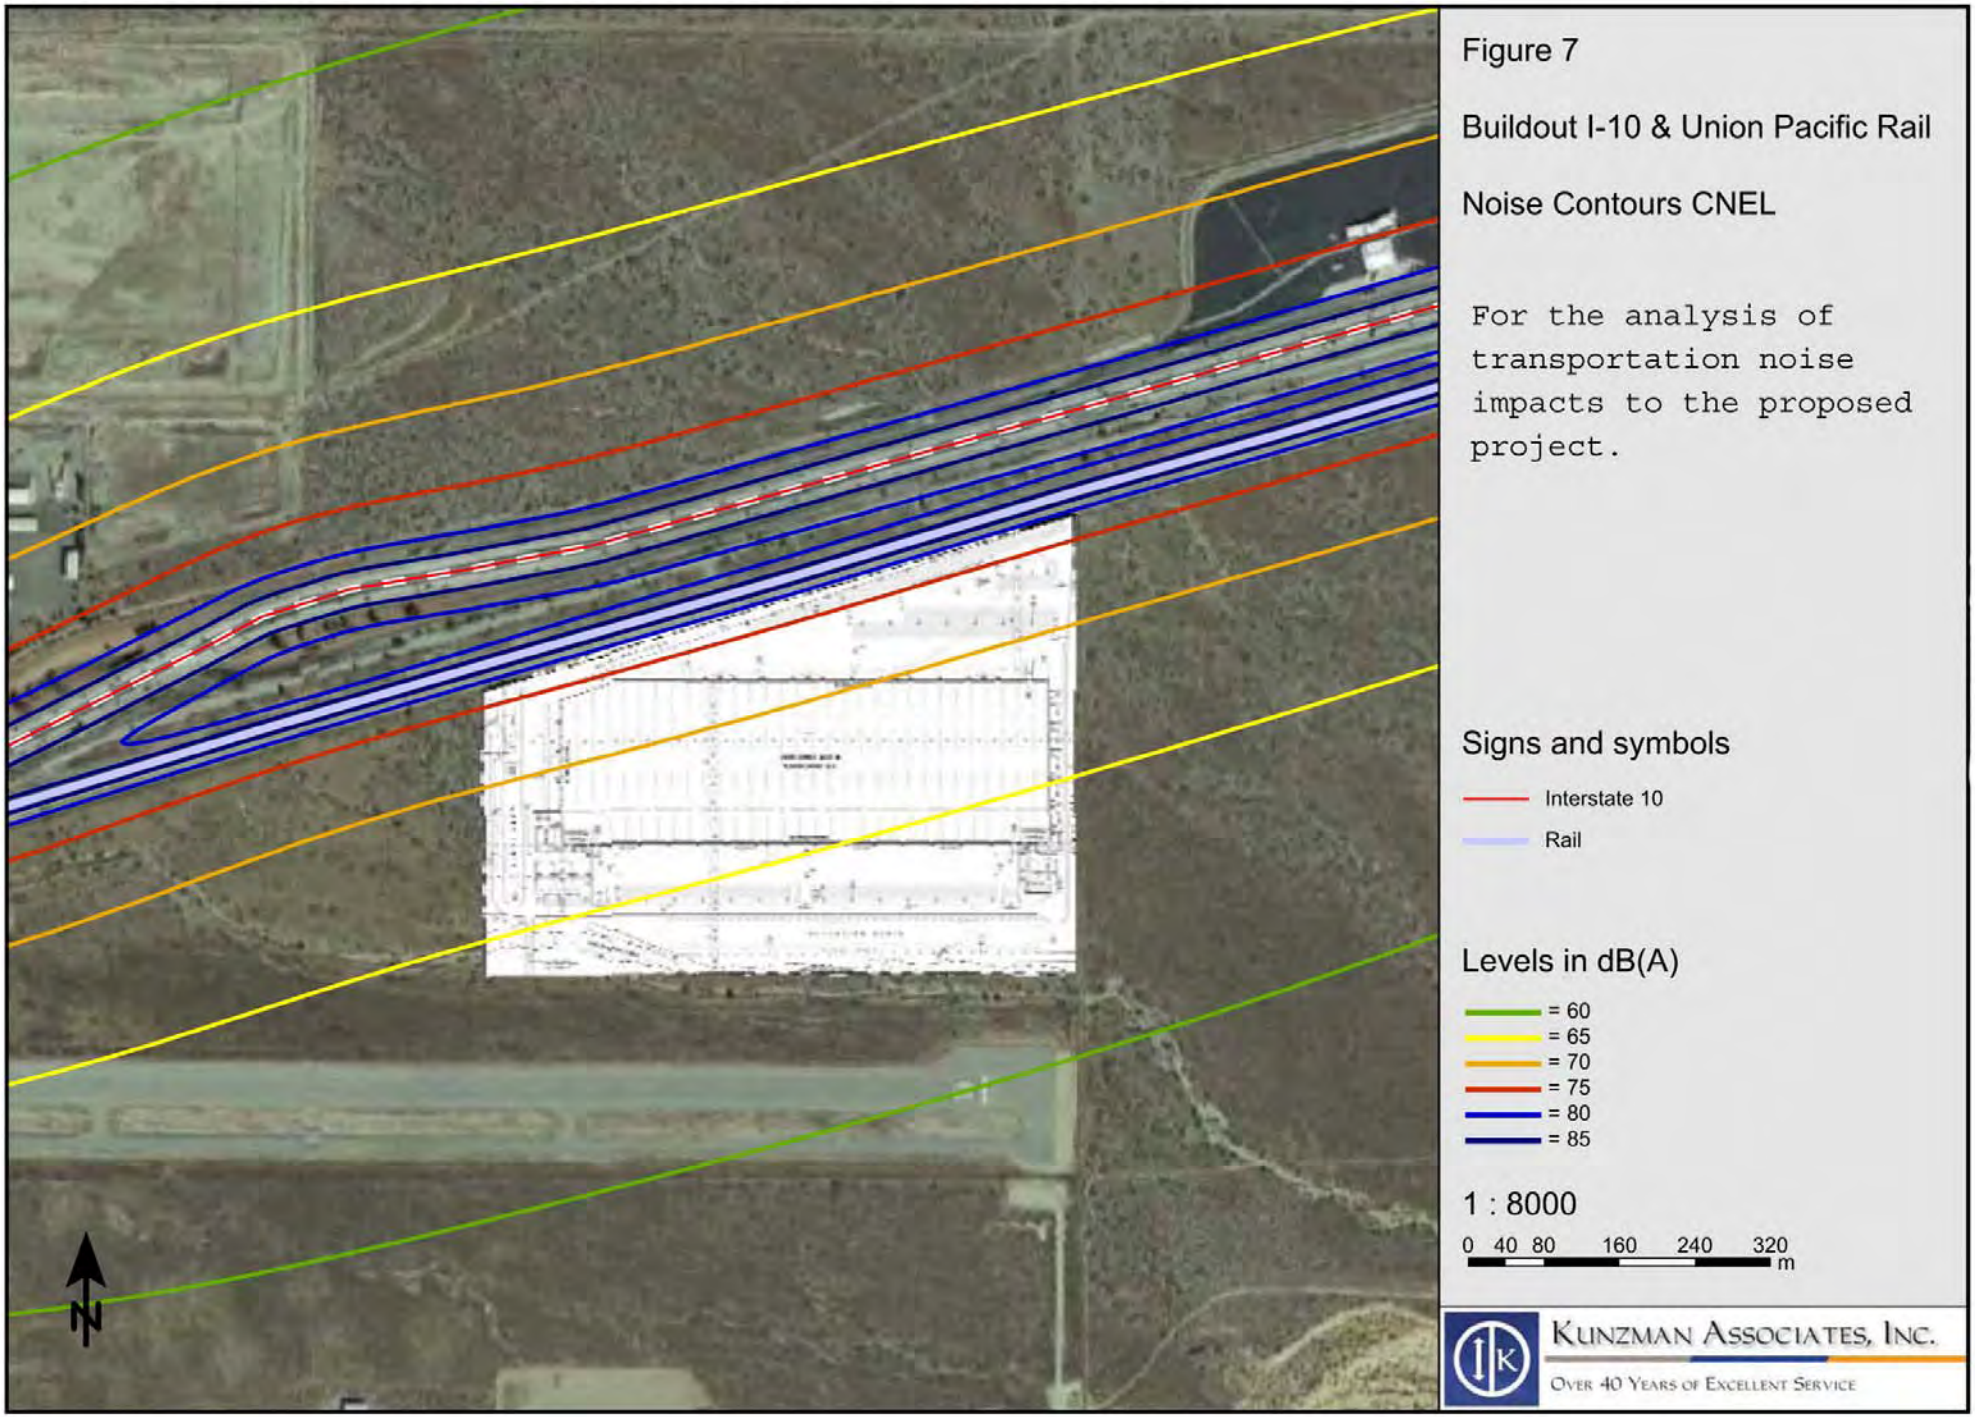
[2] In order for the proposed project to result in a "long-term substantial increase in ambient noise levels" per CEQA Guidelines Checklist questions, it was established that the project generated increase would need to result in an increase greater than 3 dB AND exceed land use compatibility criteria shown in Table 6. This is discussed on page 19 under the California Environmental Quality Act subtitle.

3. Traffic Noise Impacts to the Proposed Project

The City of Banning land use compatibility guidelines set forth noise/land use compatibility criteria for various land use types. The guidelines state that the proposed warehouse use is "normally acceptable" in areas with noise levels of up to 75 CNEL and "conditionally acceptable" in areas with noise levels of up to 80 CNEL (see Table 6).

The City's General Plan identifies principal roadways and their classifications at General Plan Buildout. Roadways in the vicinity of the proposed project that have the ability to impact noise levels include the I-10 Freeway. Volume and truck mix data for the I-10 Freeway were taken from the California Department of Transportation Operations website (California Department of Transportation 2016).

General Plan Buildout vehicle noise associated with the I-10 Freeway and rail noise associated with the rail line located directly north of the project site were modeled using the CREATE Rail model and the SoundPLAN model. CREATE was used to calculate an equivalent noise level for the recorded rail traffic at 50 feet and then included in the SoundPLAN model as a line source. CREATE data is included in this report as Appendix F. SoundPLAN input and output data is included as Appendix G.



As shown on Figure 7, the combined vehicle traffic noise levels associated with the I-10 Freeway and noise associated with the adjacent rail lines is expected to reach up to 80 CNEL at the northern property line of the proposed project and decreasing to below 65 CNEL in the southern portion of the site. The proposed building falls entirely outside of the 75 CNEL noise contour. Therefore, noise levels at the project site are within the City's "normally acceptable" noise/land use compatibility criteria of 75 CNEL for warehouse uses. No mitigation is required.

4. Noise Impacts to Off-Site Receptors Due to On-Site Operational Noise

Land uses immediately surrounding the project site consist of the Banning Municipal Airport to the south and west and vacant land to the east and west. The nearest sensitive receptors are the single-family detached residential dwelling units located approximately 0.61 miles northwest and 0.64 miles southwest of the project site.

The City of Banning land use compatibility guidelines set forth noise/land use compatibility criteria for various land use types. The guidelines state that single-family detached residential land uses would be "normally acceptable" in areas with noise levels of up to 60 CNEL and "conditionally acceptable" in areas with noise levels of up to 70 CNEL (see Table 6). As previously stated, the measured existing conditions have been identified as already being above both the City's base ambient noise level standards identified in Section 8.44.050 of the City's Municipal Code as well as the normally acceptable residential noise standards in Table 6.

A noisiest hour scenario was modeled utilizing the SoundPLAN model. The location of HVAC equipment was estimated based on other similar facilities. Each unit was given a sound power level of 80 dBA. Loading areas were assigned an area noise source of

70 dBA per meter and the parking lots were modeled based on the number of spaces, type (car or truck) and peak hour trip generation.

As shown on Figure 8, project peak hour operational noise levels will not result in noise levels that exceed 50 dBA L_{eq} at any sensitive receptors. No mitigation is required.

B. <u>Vibration Impacts</u>

This impact discussion analyzes the potential for the proposed project to cause an exposure of persons to or generation of excessive groundborne vibration or groundborne noise levels. Vibration levels in the project area may be influenced by construction. A vibration impact would generally be considered significant if it involves any construction-related or operations-related impacts in excess of 0.2 inches per second (in/sec) PPV.

There are several types of construction equipment that can cause vibration levels high enough to annoy persons in the vicinity and/or result in architectural or structural damage to nearby structures and improvements. However, there are no sensitive receptors adjacent to the proposed project's boundaries. Therefore, there will be no impacts.

VII. MEASURES TO REDUCE IMPACTS

A. Construction Mitigation Measures

In addition to adherence to the City of Banning policies found in the Noise Element and Municipal Code limiting the construction hours of operation, the following measures are recommended to reduce construction noise, emanating from the proposed project:

1. During all project site excavation and grading on-site, construction contractors shall equip all construction equipment, fixed or mobile, with properly operating and maintained mufflers, consistent with manufacturer standards.

2. The contractor shall place all stationary construction equipment so that emitted noise is directed away from the noise sensitive receptors nearest the project site.

3. Equipment shall be shut off and not left to idle when not in use.

4. The contractor shall locate equipment staging in areas that will create the greatest distance between construction-related noise sources and sensitive receptors nearest the project site during all project construction.

5. Jackhammers, pneumatic equipment and all other portable stationary noise sources shall be shielded and noise shall be directed away from sensitive receptors.

APPENDIX A

List of Acronyms

Term	Definition
ADT	Average Daily Traffic
ANSI	American National Standard Institute
CEQA	California Environmental Quality Act
CNEL	Community Noise Equivalent Level
D/E/N	Day / Evening / Night
dB	Decibel
dBA or dB(A)	Decibel "A-Weighted"
dBA/DD	Decibel per Double Distance
dBA L_{eq}	Average Noise Level over a Period of Time
EPA	Environmental Protection Agency
FHWA	Federal Highway Administration
L_{02},L_{08},L_{50},L_{90}	A-weighted Noise Levels at 2 percent, 8 percent, 50 percent, and 90 percent, respectively, of the time period
L_{dn}	Day-Night Average Noise Level
$L_{eq(x)}$	Equivalent Noise Level for '"x" period of time
L_{eq}	Equivalent Noise Level
L_{max}	Maximum Level of Noise (measured using a sound level meter)
L_{min}	Minimum Level of Noise (measured using a sound level meter)
LOS C	Level of Service C
OPR	California Governor's Office of Planning and Research
PPV	Peak Particle Velocities
RCNM	Road Construction Noise Model
REMEL	Reference Energy Mean Emission Level
RMS	Root Mean Square

APPENDIX B

Definitions of Acoustical Terms

Term	Definition
Decibel, dB	A logarithmic unit of noise level measurement that relates the energy of a noise source to that of a constant reference level; the number of decibels is 10 times the logarithm (to the base 10) of this ratio.
Frequency, Hertz	In a function periodic in time, the number of times that the quantity repeats itself in one second (i.e., the number of cycles per second).
A-Weighted Sound Level, dBA	The sound level obtained by use of A-weighting. The A-weighting filter de-emphasizes the very low and very high frequency components of the sound in a manner similar to the frequency response of the human ear.
Root Mean Square (RMS)	A measure of the magnitude of a varying noise source quantity. The name derives from the calculation of the square root of the mean of the squares of the values. It can be calculated from either a series of lone values or a continuous varying function.
Fast/Slow Meter Response	The fast and slow meter responses are different settings on a sound level meter. The fast response setting takes a measurement every 100 milliseconds, while a slow setting takes one every second.
L_{02}, L_{08}, L_{50}, L_{90}	The A-weighted noise levels that are equaled or exceeded by a fluctuating sound level, 2 percent, 8 percent, 50 percent, and 90 percent of a stated time period, respectively.
Equivalent Continuous Noise Level, L_{eq}	A level of steady state sound that in a stated time period, and a stated location, has the same A-weighted sound energy as the time-varying sound.
L_{max}, L_{min}	L_{max} is the RMS (root mean squared) maximum level of a noise source or environment measured on a sound level meter, during a designated time interval, using fast meter response. L_{min} is the minimum level.
Ambient Noise Level	The all-encompassing noise environment associated with a given environment, at a specified time, usually a composite of sound from many sources, at many directions, near and far, in which usually no particular sound is dominant.
Offensive/ Offending/ Intrusive Noise	The noise that intrudes over and above the existing ambient noise at a given location. The relative intrusiveness of sound depends on its amplitude, duration, frequency, and time of occurrence, and tonal information content as well as the prevailing ambient noise level.

Noise Measurement
Field Data

Project Name:	**Banning Distribution Facility, City of Banning.**	Date:	**8th to 9th Feb 2018**
Project #:	**6750a**		
Noise Measurement #:	**NM2** **3099 LxT_Data108.xlsx**	Technician:	**Ian Edward Gallagher**
Nearest Address or Cross Street:	**Hargrave Street & Lincolm Street**		
Site Description (Type of Existing Land Use and any other notable features)	**Banning Distribution Facility, Buildings, open storage areas, parking lot. Train tracks 200' North of NM2. 10 FWY 500' North of NM2**		
Weather:	**Blue sunny skies. Slight distant haze near horizon, some high cloud. Clear skies at night.**	**Settings:**	**SLOW** **FAST** (Circle one)
Temperature: 73 - 47 deg F	**Wind: 5 - 11mph** **Humidity: 13 - 22%**		**Flat**
Start Time:	**1:00 PM 8th Feb 2018** **End Time:** **1:00 PM 9th Feb 2018**	**Run Time:**	**24 Hours , 1440 x 1minute**

Leq:	72.2 **dB**	**Primary Noise Source:**	**Vehicles passing by along South Hargrave Street.**
Lmax	103.4 **dB**		**Train horn.**
L2	75.1 **dB**	**Secondary Noise Sources:**	**Active train tracks ~ 200 feet North of NM2 running East - West**
L8	69.0 **dB**		**10 Freeway ~ 500 feet North of NM2 running East - West**
L25	66.1 **dB**		**Bird song by day, noise from wild life. Wind blowing causing leaf rustle .**
L50	63.9 **dB**		**Aircraft flying overhead and occasional plane landing at Banning airport.**

NOISE METER:	SoundTrack LxT Class 1 ;	**CALIBRATOR:**	Larson Davis CAL250 Acoustic Calibrator
MAKE:	Larson Davis	**MAKE:**	Larson Davis
MODEL:	LxT1	**MODEL:**	Cal250
SERIAL NUMBER:	3099	**SERIAL NUMBER:**	2723
FACTORY CALIBRATION DATE:	6/23/2017	**FACTORY CALIBRATION DATE:**	6/9/2017
FIELD CALIBRATION DATE:	2/8/2018		

Additional Notes/Sketch

NM2 location inside large fallen tree

Looking North fom NM2 towards train tracks and beyond towards 10 Freeway

Summary	
File Name	LxT_Data.108
Serial Number	0003099
Model	SoundTrack LxT®
Firmware Version	2.301
User	Ian Edward Gallagher
Location	JN6750a NM2 S. Hargrave St Banning
Job Description	24 Hour noise sample
Measurement Description	1440 x 1 minute
Start	2018-02-08 13:00:00
Stop	2018-02-09 13:00:00
Duration	0:00:00.0
Run Time	0:00:00.0
Pause	0:00:00.0
Pre Calibration	2018-02-08 11:30:31
Post Calibration	None
Calibration Deviation	---

for Determining and Mitigating
Traffic Noise Impacts to Residential Structures

Riverside County
Department of Public Health

TO: Whom it may concern

DATE: November 23, 2009

FROM: Steven Hinde, REHS, CIH, Senior Industrial Hygienist

RE: Requirements for determining and mitigating traffic noise impacts to residential structures

---

NOISE STANDARDS:

1. The "Noise Element" section of the Riverside County General Plan states "to avoid future noise hazard, the maximum capacity design standard for highways and major roads shall be used for determining the maximum future noise level" or, in the case of freeways and airports, the estimated conditions 20 years in the future may be used.
2. The interior noise levels in residential dwellings shall not exceed 45 Ldn/CNEL.
3. The exterior noise level shall not exceed 65 Ldn/CNEL.
4. Required Noise Prediction Model - Traffic Noise: FHWA RD 77-108 Highway Traffic Prediction Model, Sound 32 or the equivalent.

REQUIRED TRAFFIC NOISE MODELING PARAMETERS:

1. **Roadway Classification:** All roadways must be classified into one of the following categories as defined in the County's General Plan: "Secondary", "Major", "Arterial", "Urban Arterial", "Expressway", "Freeway", and "Specific Plan Road". For future reference the Riverside County Integrated Project (RCIP)/ General Plan can be accessed using http://www.rctlma.org/genplan/default.aspx. The areas will be listed under AREA PLANS VOLUME 1 or 2. Click on area to be looked at. Under the section title “List of Figures” found near the bottom of the page, click on "Circulation" for the most current roadway classifications.
2. **Roadway Traffic Volume:** All roadways must be modeled using Average Daily Trip (ADT) level "C" design capacities (also known as future build-out daily traffic volumes) as quoted County of Riverside General Plan, Chapter 4, Figure C-3 "Link Volume Capacities/ Level of Service for Riverside County Roadways" revised March 2001. Or the page can be found on the Internet at http://www.rctlma.org/genplan/general_plan_2008/general_plan/Chapter_4_Circulation_Element_2008.pdf, or in the case of freeways, contact CALTRANS for future ADT.
3. **Required vehicle mix (MANDATORY)**
   i) Freeways: Vehicle mix information must be obtained from CALTRANS.

ii) Roadways designated as "major", "arterial" highways or "expressways":

VEHICLE	OVERALL %	DAY % (7AM-7PM)	EVENING % (7PM-10PM)	NIGHT % (10PM-7AM)
Auto	92	69.5	12.9	9.6
Medium Truck	3	1.44	0.06	1.5
Heavy Truck	5	2.4	0.1	2.5

iii) Roadways designated as "secondary", "collectors" or smaller.

VEHICLE	OVERALL %	DAY % (7AM-7PM)	EVENING % (7PM-10PM)	NIGHT % (10PM-7AM)
Auto	97.4	73.6	13.6	10.22
Medium Truck	1.84	0.9	0.04	0.9
Heavy Truck	0.74	0.35	0.04	0.35

4. **Traffic Speed**: For County roads assume an average traffic speed of 40 MPH. For freeways, contact CALTRANS and use what speed they recommend.
5. **Terrain conditions for modeling noise propagation**: Assume "hard site" conditions in determining noise propagation (no more than 3 dB of attenuation per doubling of distance between source and receiver).
6. **Noise attenuation attributed to standard residential architecture**: It is assumed that standard residential design (with windows closed) will provide no more than 20 dB (A) of attenuation. Additional mitigation must be demonstrated via modeling.
7. **Receiver placement for modeling exterior noise levels (unmitigated)**: Noise levels must be estimated at the exterior face of the nearest residence at an elevation of five feet above the finished pad.
8. **Receiver placement for noise barrier design**:
   i) *Set back*: Barrier calculations shall be based on a hypothetical outdoor receiver located ten (10) feet behind the intervening noise barrier.
   ii) *Receiver height*: Initial calculations shall be based on a receiver height of five (5) feet above the ground. If these calculations result in a barrier less than or equal to six (6) feet in height, no further barrier calculations are necessary and this shall be selected as the required wall height. However, if the resulting barrier height is calculated to be greater than six feet, it shall be re-calculated using a receiver height of three (3) feet. The resulting re-calculated wall height shall be then selected as the required wall height.
9. **Receiver placement for architectural-based (indoor) noise mitigation - first floor**: First floor interior noise level predictions are to be calculated assuming a hypothetical receiver is located in the center of the room nearest the noise source and elevated 5 feet above the pad (finished floor).
10. **Receiver placement for architectural-based noise mitigation-second floor**: Second floor interior noise level predictions are to be calculated assuming a hypothetical receiver is located in the center of the room nearest the noise source and elevated 14 feet above the pad (or 5 feet above the second story finished floor).

NOISE REPORT FORMAT AND REQUIRED SUBMITTALS: The noise Consultants findings and recommendations must be submitted for review, and receive approval from, the Office of Industrial Hygiene. The resulting report must incorporate the requirements above and, at a minimum, contain the following information: a) a clear description of the proposed project; b) the identity and characterization of all acoustically significant roadways; c) a discussion of analytical methodology and parameters used for noise modeling; d) information obtained from applying requirements 6-10 (above); e) a discussion of mitigation (if necessary) including a clear diagram illustrating noise barrier placement; f) a printed copy of computer input/output (if available).

In addition to the report, Industrial Hygiene must be provided with the following depending on the design stage of the project. The first item that must be provided is a scaled map (blue-line) of the project. This map must clearly illustrate lot boundaries and the relative location of all acoustically significant roadways. Topographical elevations for lots and roadway centerlines must be included. Second, if architectural-based mitigation is necessary, and if the project has progressed to the point where plans for the homes have been drawn, copies must be provided (floor plans and exterior elevation drawings). Additionally, an updated blue-line showing exact pad location and finished floor elevation must be included.

Office of Industrial Hygiene - (951) 358-5096

APPENDIX H

Federal Rail Administration Inventory Worksheets

U. S. DOT CROSSING INVENTORY FORM

DEPARTMENT OF TRANSPORTATION

FEDERAL RAILROAD ADMINISTRATION

OMB No. 2130-0017

Instructions for the initial reporting of the following types of new or previously unreported crossings: For public highway-rail grade crossings, complete the entire inventory Form. For private highway-rail grade crossings, complete the Header, Parts I and II, and the Submission Information section. For public pathway grade crossings (including pedestrian station grade crossings), complete the Header, Parts I and II, and the Submission Information section. For Private pathway grade crossings, complete the Header, Parts I and II, and the Submission Information section. For grade-separated highway-rail or pathway crossings (including pedestrian station crossings), complete the Header, Part I, and the Submission Information section. For changes to existing data, complete the Header, Part I Items 1-3, and the Submission Information section, in addition to the updated data fields. Note: For private crossings only, Part I Item 20 and Part III Item 2.K. are required unless otherwise noted. An asterisk * denotes an optional field.

RE: Revised Traffic Impact Analysis Report, Banning Distribution Center (Design Reivew No. 16-7002), City of Banning, CA.

Dear Mr. Patton,

We are pleased to submit herewith our Revised Traffic Impact Analysis Report for the proposed Banning Distribution Center (Design Review No. 16-7002) which we have prepared at your request.

If you have any questions regarding this report, please call the undersigned for clarification.

Sincerely yours,

EXECUTIVE SUMMARY

Purpose of Report and Study Objectives

The purpose of this study is to evaluate the effects on traffic circulation produced from the proposed development of Design Review No. 16-7002 (Banning Distribution Center) in the City of Banning.

The objectives of this study include the following:

- Document existing (2017) traffic conditions in the vicinity of the proposed development;
- Determine the traffic generated from the proposed development;
- Evaluate existing plus project (2017) traffic conditions;
- Evaluate existing plus ambient growth plus project (2019) traffic conditions;
- Evaluate existing plus ambient growth plus other cumulative projects plus project (2019) traffic conditions;
- Evaluate year 2040 plus project traffic conditions;
- Determine if the level of service (LOS) required by the City of Banning and/or California Department of Transportation (Caltrans) will be maintained within the study area, and if not, determine the mitigation measures that will be necessary in order to maintain the required LOS;
- Determine if peak hour traffic signal warrants are met for any of the unsignalized study area intersections;
- Evaluate the adequacy of on-site circulation for the proposed development;
- Determine if safety and/or operational improvements are necessary due to the proposed development.

Site Location and Study Area

The proposed project is located in the City of Banning. Banning Distribution Center is located at the east end of John Street.

Development Description

Project Size

Banning Distribution Center site encompasses approximately 63.75 acres. Banning Distribution Center is currently proposed for development of 1,000 thousand square feet (TSF) gross floor area high-cube warehouse.

Project Trip Generation

The proposed project is anticipated to generate approximately 2,652 daily trip-ends, including 156 trip-ends during the AM peak hour and 181 trip-ends during the PM peak hour in passenger car equivalent (PCE).

Project Site Circulation

Banning Distribution Center will have access to Lincoln Street south of the project via John Street.

Project Zoning and Land Use

The existing and proposed zoning and land use designations are as follows:

- Existing Zoning: Airport Industrial

- Proposed Zoning: Airport Industrial
- Existing Land Use: Vacant
- Proposed Land Use: Distribution Center

Principal Findings

Prior to the preparation of this report, the City of Banning and the California Department of Transportation (Caltrans) was solicited for input and approval of key assumptions used in the analysis of this traffic impact analysis. The approved scoping agreement or correspondence with these entities is included in Appendix A.

Acceptable Level of Service

The acceptable Level of Service (LOS) for the City of Banning is based on the City of Banning General Plan, Policy 6:

> *The City shall maintain peak hour Level of Service D or better on all local roadways and intersections.*

The acceptable LOS for Caltrans facilities is based on the Caltrans' *Guide for the Preparation of Traffic Impact Studies* Section II:

> *Caltrans endeavors to maintain a target LOS at the transition between LOS "C" and LOS "D" on State highway facilities, however, Caltrans acknowledges that this may not always be feasible and recommends that the lead agency consult with Caltrans to determine the appropriate target LOS. If an existing State highway facility is operating at less than the appropriate target LOS, the existing measures of effectiveness (MOE) should be maintained.*

Per discussion with Mark Roberts, Caltrans District 8 Office Chief, Intergovernmental Review, Community and Regional Planning, the region-wide goal for acceptable LOS on all freeways, roadway segments, and intersections is LOS D.

Levels of Service – Existing (2017) Conditions

The existing (2017) levels of service for the study area intersections vary from LOS A to F. The following study area intersections operate at an unacceptable LOS:

2. Hargrave Street (NS) / I-10 Westbound Ramps (EW)
3. Hargrave Street (NS) / I-10 Eastbound Ramps (EW)

The existing levels of service for the study area freeway ramps vary from LOS B to C.

Levels of Service – Existing Plus Project (2017) Conditions

For existing plus project (2017) traffic conditions without off-site improvements, the study area intersections are expected to operate at levels of service that vary from LOS B to F. The following study area intersections would operate at an unacceptable LOS:

2. Hargrave Street (NS) / I-10 Westbound Ramps (EW)
3. Hargrave Street (NS) / I-10 Eastbound Ramps (EW)

With the recommended improvements presented in Table 6-1 and Figure 6-A, levels of service at the impacted study area intersections could be improved to meet the required level of service.

The existing levels of service for the study area freeway ramps vary from LOS B to C.

Levels of Service – Existing Plus Ambient Growth Plus Project (2019) Conditions

For existing plus ambient growth plus project (2019) traffic conditions without off-site improvements, the study area intersections are expected to operate at levels of service that vary from LOS B to F. The following study area intersections would operate at an unacceptable LOS:

2. Hargrave Street (NS) / I-10 Westbound Ramps (EW)
3. Hargrave Street (NS) / I-10 Eastbound Ramps (EW)

With the recommended improvements presented in Table 6-3 and Figure 6-B, levels of service at the impacted study area intersections could be improved to meet the required level of service.

The existing levels of service for the study area freeway ramps vary from LOS B to C.

Levels of Service – Existing Plus Ambient Growth Plus Cumulative Plus Project (2019) Conditions

For existing plus ambient growth plus other cumulative projects plus project (2019) traffic conditions without off-site improvements, the study area intersections are expected to operate at levels of service that vary from LOS B to F. The following study area intersections would operate at an unacceptable LOS:

2. Hargrave Street (NS) / I-10 Westbound Ramps (EW)
3. Hargrave Street (NS) / I-10 Eastbound Ramps (EW)

With the recommended improvements presented in Table 6-5 and Figure 6-C, levels of service at the impacted study area intersections could be improved to meet the required level of service.

The existing levels of service for the study area freeway ramps vary from LOS B to C.

Levels of Service – Year 2040 Plus Project Conditions

Year 2040 plus project traffic conditions without off-site improvements, the study area intersections are expected to operate at levels of service that vary from LOS B to F. The following study area intersections would operate at an unacceptable LOS:

2. Hargrave Street (NS) / I-10 Westbound Ramps (EW)
3. Hargrave Street (NS) / I-10 Eastbound Ramps (EW)

With the recommended improvements presented in Table 6-7 and Figure 6-D, levels of service at the impacted study area intersections could be improved to meet the required level of service.

The existing levels of service for the study area freeway ramps vary from LOS B to C.

▪ Queuing Analysis

Per Caltrans request, a queuing analysis was performed at the intersections Hargrave Street /I-10 westbound ramps and Hargrave Street/I-10 eastbound ramps under existing plus project conditions, existing plus ambient growth plus project conditions, existing plus ambient growth plus cumulative projects plus project conditions, year 2040 plus project conditions.

As presented in Table 6-9 under existing plus project conditions, the internal back-to-back left-turn lane configuration consisting of one 135 foot northbound left-turn lane at Hargrave Street /I -10 westbound ramps and one 65 foot southbound left-turn lane at Hargrave Street/I-10 eastbound ramps provides adequate storage length for both intersections (95th percentile queuing results are provided in Appendix E).

Hargrave Street /I -10 westbound ramps would be an all-way stop controlled intersection with the following geometrics:

Northbound: One left turn lane. One through lane.
Southbound: One shared left-through lane.
Eastbound: Not applicable.
Westbound: One shared left-through-and-right turn lane.

Hargrave Street /I -10 eastbound ramps would be an all-way stop controlled intersection with the following geometrics:

Northbound: One shared left- through lane.
Southbound: One left turn lane. One through lane.
Eastbound: One shared left-through-and-right turn lane.
Westbound: Not applicable.

As presented in Table 6-10, under existing plus ambient growth plus project, no additional storage length improvements would be required to provide adequate storage length to accommodate queuing at the intersections of Hargrave Street and I-10 westbound ramps and Hargrave Street and I-10 eastbound ramps (95th percentile queuing results are provided in Appendix E).

As presented in Table 6-11, under existing plus ambient growth plus cumulative conditions plus project, no additional storage length improvements would be required to provide adequate storage length to accommodate queuing at the intersections of Hargrave Street and I-10 westbound ramps and Hargrave Street and I-10 eastbound ramps (95^{th} percentile queuing results are provided in Appendix E).

As presented in Table 6-12, under year 2040 plus project, no additional storage length improvements would be required to provide adequate storage length, however a signal at the intersection of Hargrave Street /I-10 westbound ramps and a signal at Hargrave Street /I-10 eastbound ramps would be required to accommodate queuing (95^{th} percentile queuing results are provided in Appendix E).

Hargrave Street /I -10 westbound ramps would be improved from an all-way stop controlled intersection to a signalized intersection with the following geometrics:

Northbound: One left turn lane. One through lane.
Southbound: One shared left-through lane.
Eastbound: Not applicable.
Westbound: One shared left-through-and-right turn lane.

Hargrave Street /I -10 eastbound ramps would be improved from an all-way stop controlled intersection to a signalized intersection with the following geometrics:

Northbound: One shared left- through lane.
Southbound: One left turn lane. One through lane.

Eastbound: One shared left-through-and-right turn lane.
Westbound: Not applicable.

A summary of the queuing analysis results for year 2040 plus project conditions is provided in Table 6-12 (see Appendix E for 95th percentile queuing results).

▪ Traffic Signal Warrants

The California MUTCD states that the satisfaction of a traffic signal warrant or warrants shall not in itself require the installation of a traffic control signal. Peak hour traffic signal warrant analysis should only be considered as an "indicator" of the likelihood of an unsignalized intersection warranting a traffic signal. Intersections that exceed the peak hour warrant are more likely to meet one or more of the other volume based signal warrants. The Manual on Uniform Traffic Control Devices (MUTCD) also advises that a traffic control signal should not be installed unless:

- One or more of the traffic signal warrants is satisfied;
- An engineering study indicates that installing a traffic control signal will improve the overall safety and/or operation of the intersection; and
- It will not seriously disrupt progressive traffic flow.

For existing (2017) traffic conditions, the peak hour traffic control signal warrant is satisfied for the following study area unsignalized intersection(s) (see Appendix D for technical calculations):

3. Hargrave Street (NS) / I-10 Eastbound Ramps (EW)

For existing plus project (2017) traffic conditions, no additional study area unsignalized intersections are expected to meet the peak hour traffic control signal warrant (see Appendix D for technical calculations).

For existing plus ambient growth plus project (2019) traffic conditions, no additional study area unsignalized intersections are expected to meet the peak hour traffic control signal warrant (see Appendix D for technical calculations).

For existing plus ambient growth plus other cumulative projects plus project (2019) traffic conditions, the peak hour traffic control signal warrant is expected to be satisfied for the following additional study area unsignalized intersection(s) (see Appendix D for technical calculations):

2. Hargrave Street (NS) / I-10 Westbound Ramps (EW)

Year 2040 plus project traffic conditions, no additional study area unsignalized intersections are expected to meet the peak hour traffic control signal warrant (see Appendix D for technical calculations).

The following study area unsignalized intersection(s) does not satisfy the peak hour traffic signal warrant in any study scenario (see Appendix D for technical calculations):

4. Hargrave Street (NS) / Lincoln Street (EW)
5. John Street (NS) / Lincoln Street (EW)

Circulation Recommendations

This traffic impact analysis demonstrates that the direct traffic impacts generated by Banning Distribution Center can be mitigated to meet the required level of service if the following recommended improvements are adopted.

Roadway Improvements

- Construct full width improvements on John Street at its ultimate cross-section as a collector from Lincoln Street to the east end at project boundary.

Intersection Improvements

- Construct the intersection of Lincoln Street and John Street with the following geometrics:
  Northbound: Not Applicable.
  Southbound: One left turn lane. One right turn lane. Stop controlled.
  Eastbound: One left turn lane. One through lane.
  Westbound: One shared through and right turn lane.

Safety and Operational Improvements

- Sight distance at Banning Distribution Center entrance roadway will be reviewed with respect to standard City of Banning sight distance standards at the time of preparation of final grading, landscape, site development, and street improvement plans.
- Participate in the phased construction of off-site traffic signals through payment of project's fair share of traffic signal mitigation fees.
- Signing/striping should be implemented in conjunction with detailed construction plans for Banning Distribution Center site.

Regional Funding Mechanisms

Banning Distribution Center will participate in the cost of off-site improvements through the payment of "fair share" mitigation fees, including the following:

- City of Banning Development Impact Fee (DIF), current at time of construction.

These fees will be collected and utilized as needed by City of Banning to construct the improvements necessary to assist in maintaining the required level of service.

Project Mitigation Summary

Table 1-1 summarizes the proposed mitigation measure and associated funding mechanism for Banning Distribution Center as a result of the traffic study.

Table 1-1 – Project Mitigation Summary

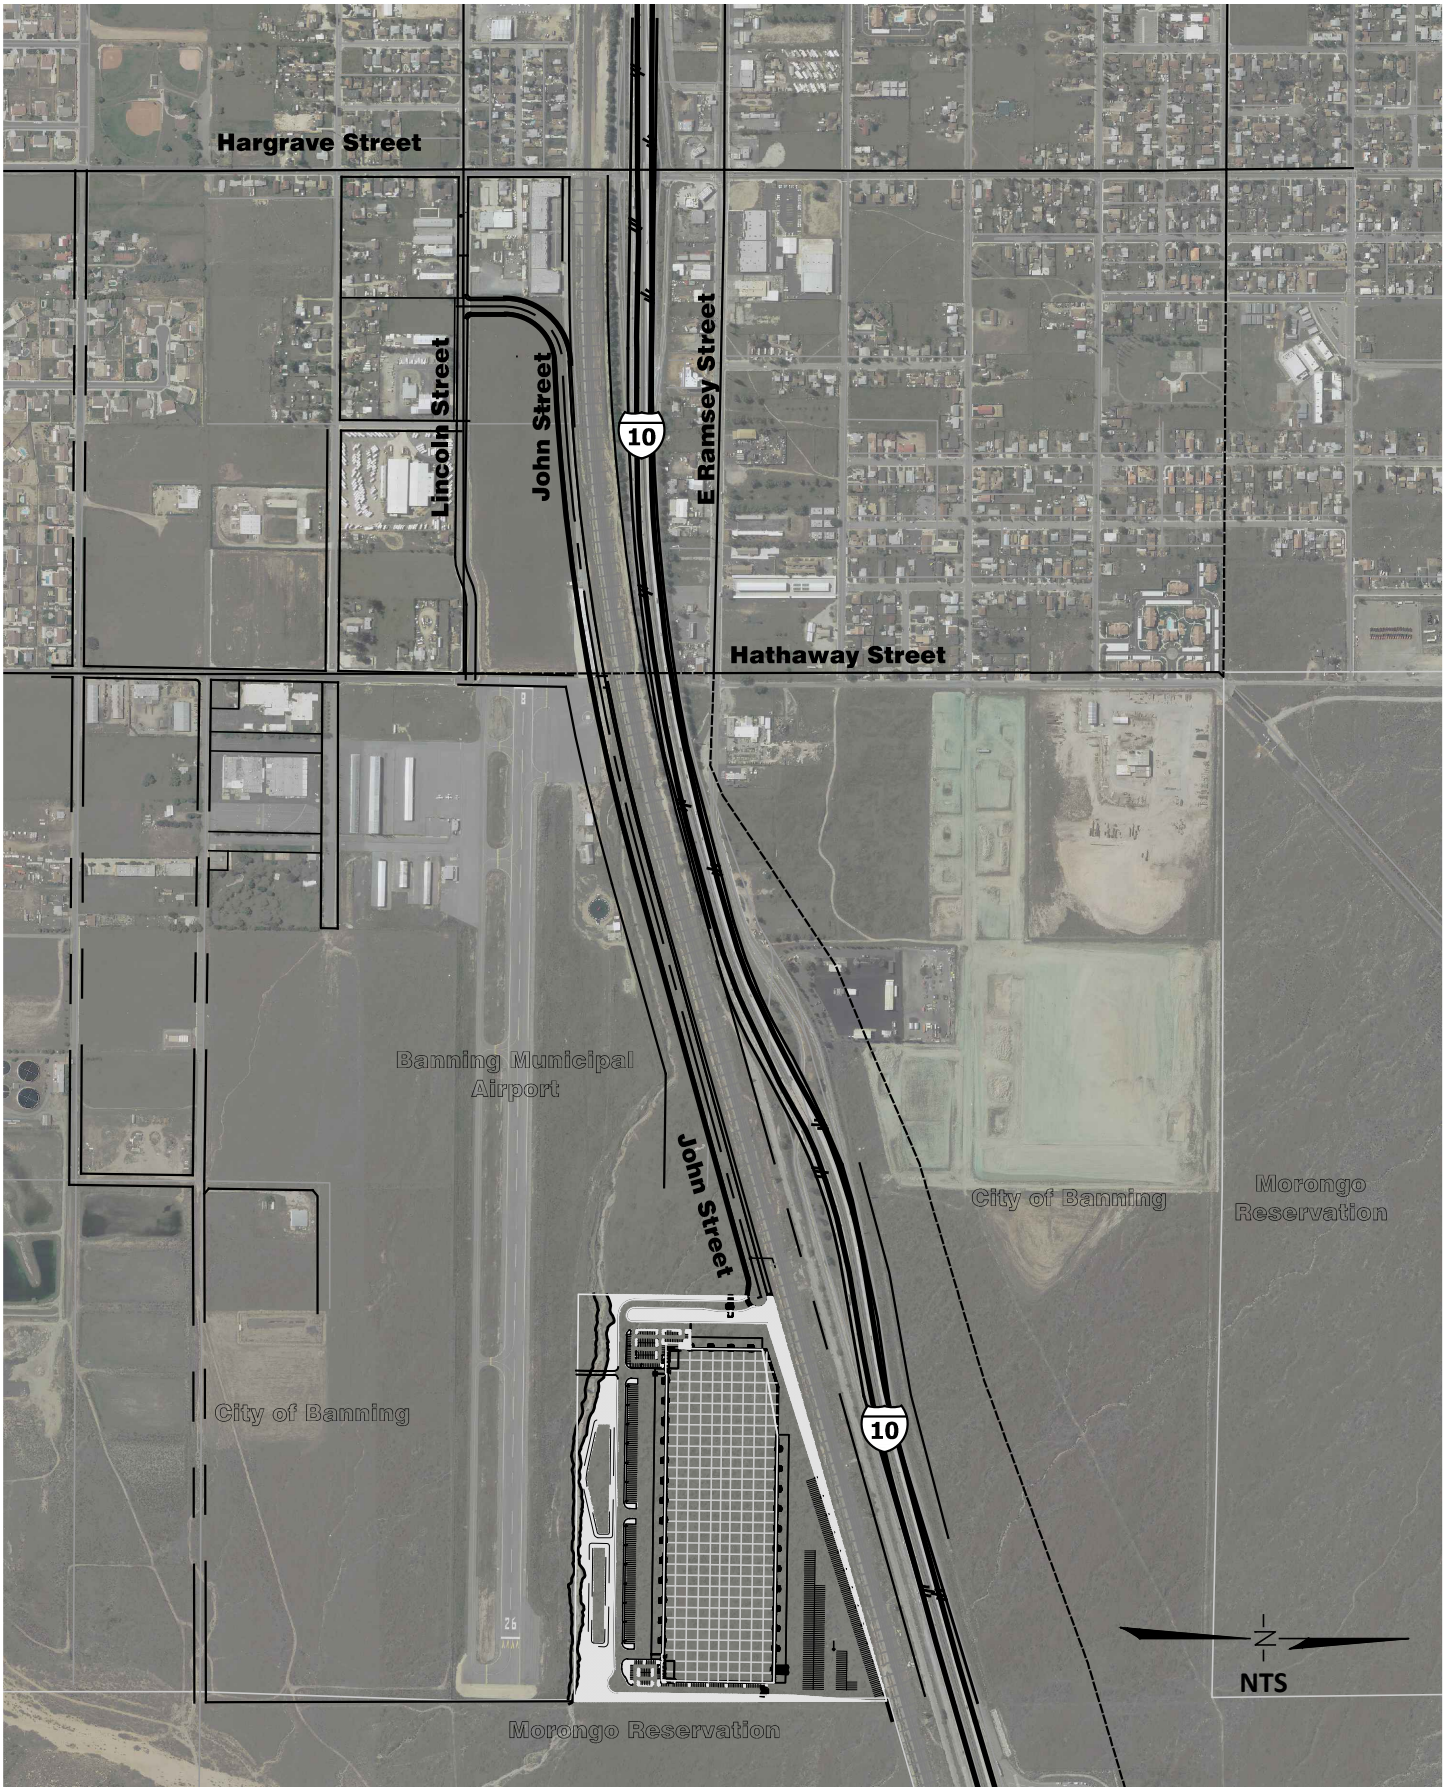
No.	Intersection	Jurisdiction	Target LOS	LOS w/o Mitigation		Mitigation Measure	LOS with Mitigation		Funding Mechanism
				AM	PM		AM	PM	
Existing Deficiency									
2	Hargrave Street (NS) I-10 Westbound Ramps (EW)	Caltrans	D	F	F	Install stop signs to change the intersection to be all-way stop controlled.	C	B	Developer
3	Hargrave Street (NS) I-10 Eastbound Ramps (EW)	Caltrans	D	F	F	Install stop signs to change the intersection to be all-way stop controlled.	C	B	Developer
Year 2040 Conditions									
3	Hargrave Street (NS) I-10 Eastbound Ramps (EW)	Caltrans	D	F	F	Install traffic signal. Re-stripe the to provide one 100 foot southbound left-turn lane.	C	C	Developer DIF Fees

INTRODUCTION

Purpose of Report and Study Objectives

The purpose of this study is to evaluate the effects on traffic circulation produced from the proposed development of Banning Distribution Center (Design Review No.16-7002).

The objectives of this study include the following:



- Document existing (2017) traffic conditions in the vicinity of the proposed development;
- Determine the traffic generated from the proposed development;
- Evaluate existing plus project (2017) traffic conditions;
- Evaluate existing plus ambient growth plus project (2019) traffic conditions;
- Evaluate existing plus ambient growth plus other cumulative projects plus project (2019) traffic conditions;
- Evaluate year 2040 plus project traffic conditions;
- Determine if the level of service (LOS) required by the City of Banning and/or California Department of Transportation (Caltrans) will be maintained within the study area, and if not, determine the mitigation measures that will be necessary in order to maintain the required LOS;
- Determine if peak hour traffic signal warrants are met for any of the unsignalized study area intersections;
- Evaluate the adequacy of on-site circulation for the proposed development;
- Determine if safety and/or operational improvements are necessary due to the proposed development;

Site Location and Study Area

The proposed project is located in the City of Banning. Banning Distribution Center is located at the east end of John Street.

The project site location is presented on Figure 2-A.

Figure 2-A Project Site Location Map

Development Project Description

Project Size and Description

Banning Distribution Center site encompasses approximately 63.75 acres. Banning Distribution Center is currently proposed for development of 1,000 thousand square feet (TSF) gross floor area high-cube warehouse.

Existing Land Use and Zoning

Existing land use and zoning designations are as follows:

- Existing Zoning: Airport Industrial
- Existing Land Use: Vacant

Proposed Land Use and Zoning

Proposed land use and zoning designations are as follows:

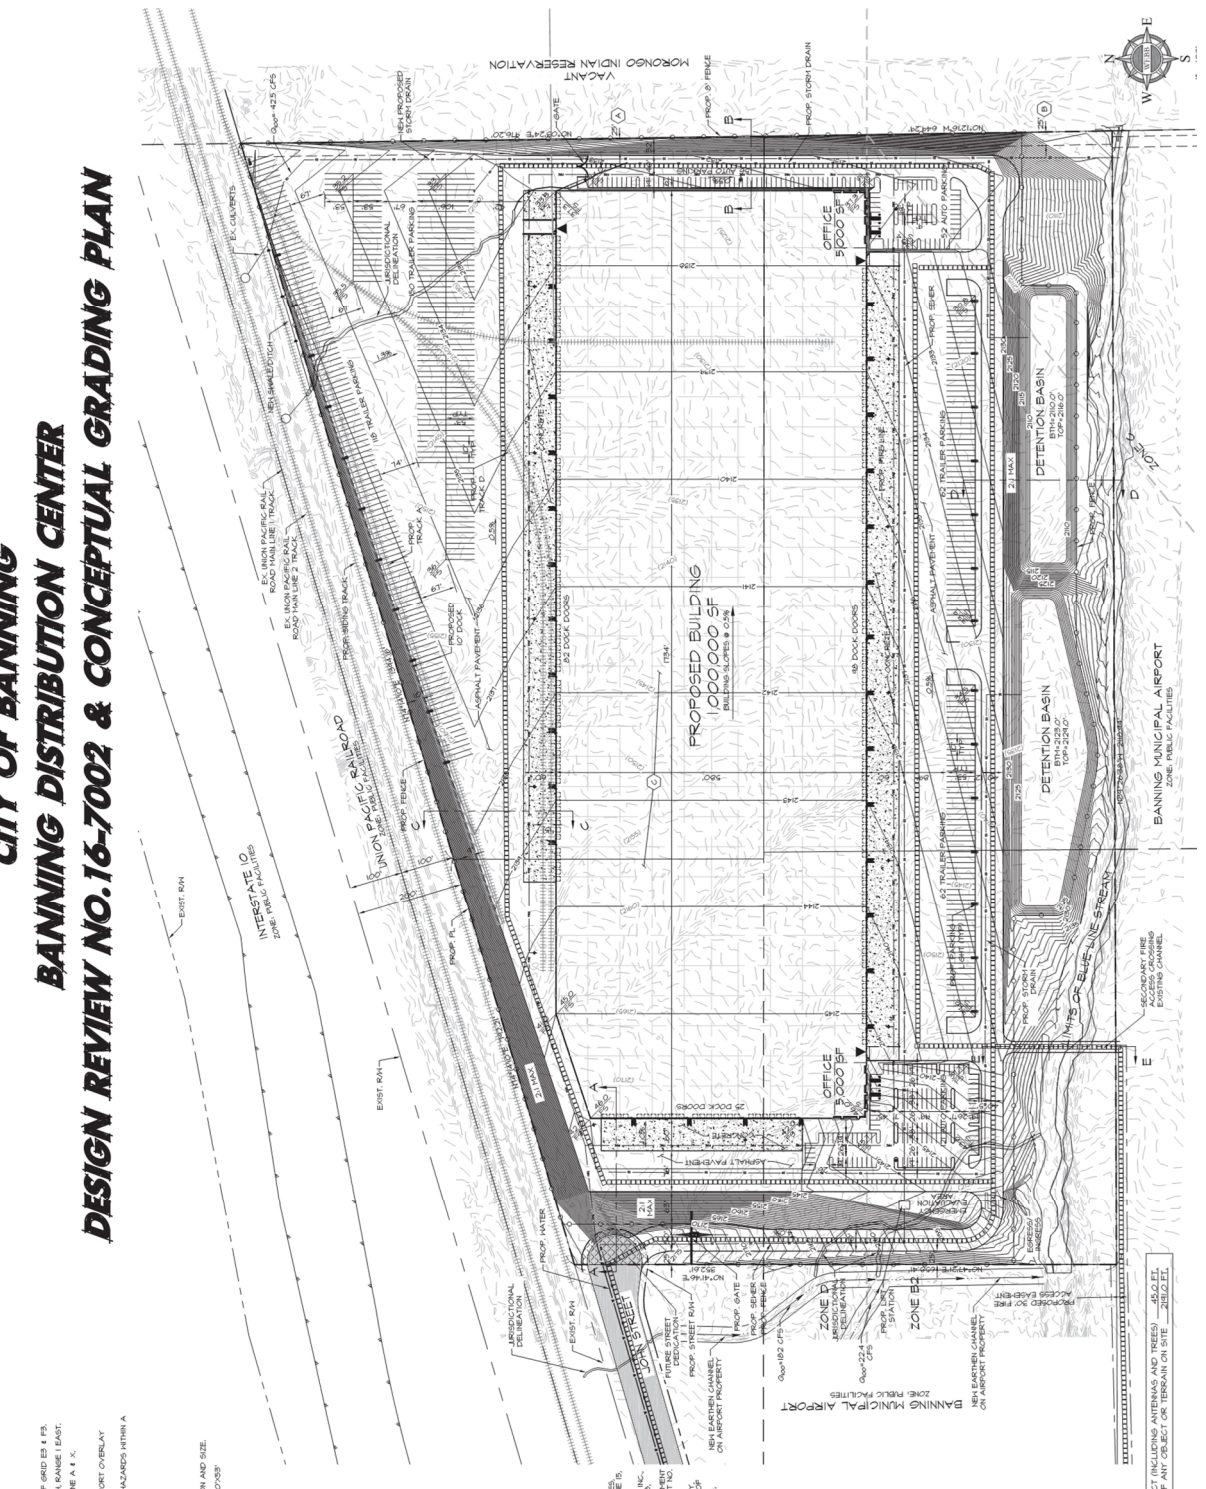
- Proposed Zoning: Airport Industrial
- Proposed Land Use: Distribution Center

Site Plan of Proposed Project

The current proposed project layout is shown on Figure 2-B.

Site Access

As indicated on Figure 2-B, Banning Distribution Center will have access to Lincoln Street south of the project via John Street.



Proposed Project Opening Year and Proposed Project Phasing

For analysis purposes, it is assumed that Banning Distribution Center will be developed in a single phase and full development is anticipated by 2019.

Sphere of Influence

Banning Distribution Center is within one mile of the border of the County of Riverside and the Morongo Reservation.

AREA CONDITIONS

Existing Roadway Descriptions

Hargrave Street is an undivided 2-lanes north-south arterial in the project area. It is classified as a secondary highway in the City of Banning General Plan Circulation Element and provides connectivity to the I-10 freeway. Street parking is not allowed for most of the study segment. There is some existing sidewalk on both sides of the street, but designated bike lanes do not exist within the study area.

Lincoln Street is an undivided 2-lanes east-west arterial in the project area. It is classified as a major highway in the City of Banning General Plan Circulation Element. It serves as a major thoroughfare across the City of Banning south of the I-10 freeway. Street parking is allowed on Lincoln Street within the study area. Sidewalk and designated bike lanes do not exist on Lincoln Street within the study area.

John Street is an undivided 2-lanes east-west road in the project area. It is classified as a collector highway in the City of Banning General Plan Circulation Element. It serves as the main access road for the Banning Distribution Center. The existing John Street east of Hargrave Street will be realigned to meet Lincoln Street east of Hargrave Street with this project.

Study Intersections

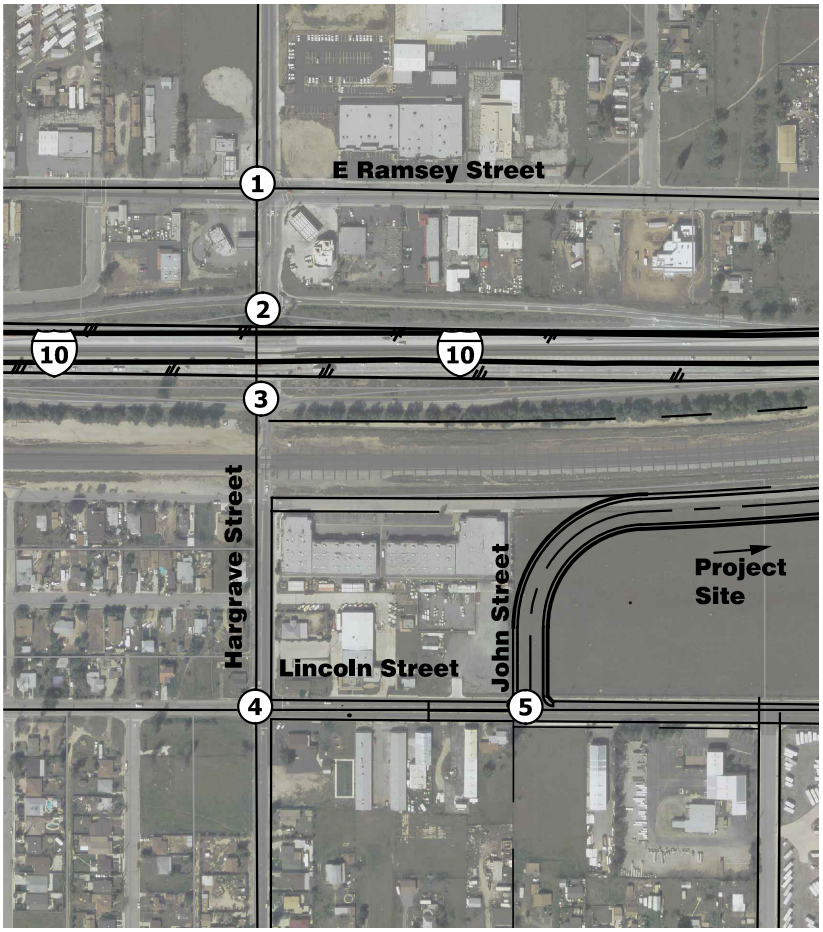
The study area includes the following intersections:

1. Hargrave Street (NS) / East Ramsey Street (EW)
2. Hargrave Street (NS) / I-10 Westbound Ramps (EW)
3. Hargrave Street (NS) / I-10 Eastbound Ramps (EW)
4. Hargrave Street (NS) / Lincoln Street (EW)
5. John Street (NS) / Lincoln Street (EW)

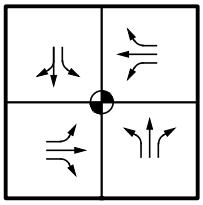
Study Freeway Ramps

The study area includes the following freeway ramps:

1. I-10 Eastbound: Hargrave Street Off-Ramp
2. I-10 Eastbound: Hargrave Street On-Ramp
3. I-10 Westbound: Hargrave Street Off-Ramp
4. I-10 Westbound: Hargrave Street On-Ramp

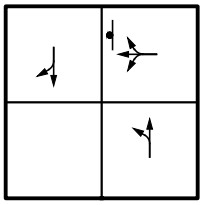


Existing Traffic Controls and Intersection Geometrics



The existing roadway system is shown on Figure 3-A. It identifies the existing intersection traffic controls (i.e. signals and signage) and intersection geometrics within the study area.

Existing Traffic Volumes



The existing AM peak period and PM peak period intersection turning movement counts were conducted by Counts Unlimited, Inc on January 31, 2017. The existing AM peak hour and PM peak hour freeway ramp volumes were taken from Caltrans PEMS website. The traffic count worksheets are provided in Appendix C. The AM and PM peak hour intersection turning movement volumes are presented on Figure 3-B and Figure 3-C, respectively.

Level of Service Methodology

The City of Banning Public Works requires that the Transportation Research Board Highway Capacity Manual 2000 (HCM2000) or the most recent release of the HCM be used to analyze Level of Service (LOS). This study has been prepared using HCM2010.

Quality of service describes how well a transportation facility or service operates from the traveler's perspective. Level of service (LOS) is a quantitative stratification of a performance measure or measures that represent quality of service. LOS is measured on a familiar A to F scale where LOS A represents the best conditions from a traveler's perspective and LOS F the worst. A simple LOS letter system is used to hide much of the complexity of transportation facility performance in order to simplify decision making on whether facility performance is generally acceptable and whether a future change in performance is likely to be perceived as significant by the general public. One reason for the widespread adoption of the LOS concept by agencies is the concept's ability to communicate roadway performance to nontechnical decision makers.

The HCM2010 evaluates the LOS of intersections based on the control delay per vehicle. Control delay is defined as the delay associated with vehicles slowing in advance of an intersection, the time spent stopped on an intersection approach, the time spent as vehicles move up in the queue, and the time needed for vehicles to accelerate to their desired speed. The methodology used to evaluate the intersection level of service differs on whether the intersection is signalized or unsignalized. Levels of service at signalized and unsignalized intersections have been evaluated using PTV Vistro 5.00, which is based on HCM2010 methodologies.

Signalized Intersections

Signalized intersections have been evaluated using the Operational Method as described in Chapter 18 of the HCM2010. According to this methodology, the level of service for signalized intersections is based on the weighted average control delay, in seconds per vehicle, of all vehicles passing through the intersection. Table 3-1 shows the criteria used to determine the level of service for signalized intersections.

Table 3-1 – Level of Service for Signalized Intersections

Level of Service	Control Delay (sec/vehicle)	Description
A	≤ 10	Minimal delay and primarily free-flow operation. Most vehicles do not stop because they arrive during the green indication or only stop for a brief amount of time as the signal changes.
B	> 10 – 20	Short delay and reasonably unimpeded operation. Many vehicles do not stop because they arrive during the green indication or only stop for a short amount of time as the signal changes. More vehicles stop than with LOS A.
C	> 20 – 35	Moderate delay and stable operation. Individual cycle failures (i.e. when queued vehicles do not clear the signal during the next green indication) may begin to appear. The number of vehicles stopping is significant, although many vehicles still pass through the intersection without stopping.
D	> 35 – 55	Less stable operation in which small increases in vehicles may cause substantial increases in delay. Many vehicles stop and individual cycle failures are noticeable.
E	> 55 – 80	Significant delay and unstable operation. Most vehicles stop and individual cycle failures are frequent.
F	> 80	Considerable delay and extensive queuing. Almost all vehicles stop and most cycles fail to clear the queue.

Unsignalized Intersections

Unsignalized intersections have been evaluated using Chapter 19-20 of the HCM2010. According to this methodology, the level of service for all-way stop intersections is based on the weighted average control delay, in seconds per vehicle, of all vehicles passing through the intersection. For two-way stop controlled intersections, the level of service is based on the highest control delay of all controlled movements for the intersection. Table 3-2 shows the criteria used to determine the level of service for unsignalized intersections.

Table 3-2 – Level of Service for Unsignalized Intersections

Level of Service	Control Delay (sec/vehicle)	Description
A	≤ 10	Minimal delay. Usually no conflicting traffic.
B	> 10 – 15	Short delay. Occasionally some conflicting traffic.
C	> 15 – 25	Noticeable delay, but not inconveniencing. Usually some conflicting traffic.
D	> 25 – 35	Noticeable delay and irritating. A significant amount of conflicting traffic. Increased likelihood of risk taking.
E	> 35 – 50	Significant delay approaching tolerance level. Lots of conflicting traffic, but with some gaps of suitable size. Risk taking behavior likely.
F	> 50	Considerable delay exceeding tolerance level. Lots of conflicting traffic, with not enough gaps of suitable size. High likelihood of risk taking.

Freeway Segments

The HCM2010 evaluates the LOS of freeway segments based on the density of vehicles within the segment. Density is defined as the number of vehicles occupying a given length of a lane or roadway at a particular instant and measured in passenger cars per mile per lane (pc/mi/ln). The methodology used to evaluate freeway segments differs based on the type of segment: merge and diverge segments (on-ramps and off-ramps), weaving segments (a merge segment closely followed by a diverge segment and the two are connected by a continuous auxiliary lane), and basic segments (all segments that are not merge, diverge, or weaving segments).

Basic freeway segments have been evaluated using Chapter 11 of the HCM2010. Freeway weaving segments have been evaluated using Chapter 12 of the HCM2010. Freeway merge and diverge segments have been evaluated using Chapter 13 of the HCM2010. Caltrans has only requested the analysis of the study area freeway ramps. Table 3-3 shows the criteria used to determine the LOS for freeway weaving segments and freeway merge and diverge segments.

Table 3-3 – Level of Service for Freeway Weaving, Merge, and Diverge Segments

Level of Service	Density (pc/mi/ln)	Description
A	≤ 10	Unrestricted operations exist and the number of vehicles is low enough to permit smooth merging or diverging with very little turbulence in the traffic stream.
B	> 10 – 20	Merging and diverging maneuvers become noticeable to through drivers, and minimal turbulence occurs.
C	> 20 – 28	Speed begins to decline as turbulence levels become much more noticeable. Both ramp and freeway vehicles begin to adjust their speeds to accomplish smooth transitions.
D	> 28 – 35	Turbulence levels become intrusive, and virtually all vehicles slow to accommodate merging or diverging maneuvers. Some ramp queues may form at heavily used on-ramps, but freeway operation remains stable.
E	> 35	Operating conditions approaching or at capacity. Small changes in demand or disruptions within the traffic stream can cause both ramp and freeway queues to form.
F	Demand exceeds capacity	Operating conditions within queues that form on both the ramp and the freeway mainline when capacity is exceeded by demand.

▪ Acceptable Level of Service

The acceptable Level of Service (LOS) for the City of Banning is based on the City of Banning General Plan, Policy 6:

> *The City shall maintain peak hour Level of Service D or better on all local roadways and intersections.*

The acceptable LOS for Caltrans facilities is based on the Caltrans' *Guide for the Preparation of Traffic Impact Studies* Section II:

> *Caltrans endeavors to maintain a target LOS at the transition between LOS "C" and LOS "D" on State highway facilities, however, Caltrans acknowledges that this may not always be feasible and recommends that the lead agency consult with Caltrans to determine the appropriate target LOS. If an existing State highway facility is operating at less than the appropriate target LOS, the existing measures of effectiveness (MOE) should be maintained.*

Per discussion with Mark Roberts, Caltrans District 8 Office Chief, Intergovernmental Review, Community and Regional Planning, the region-wide goal for acceptable LOS on all freeways, roadway segments, and intersections is LOS D.

▪ Levels of Service – Existing (2017) Conditions

The intersection levels of service for existing (2017) conditions shown on Table 3-4 and freeway ramps levels of service shown on Table 3-5 are based on the existing roadway system shown on Figure 3-A and the existing AM and PM peak hour intersection volumes shown on Figure 3-B and Figure 3-C, respectively. The level of service calculation worksheets are provided in Appendix E.

Table 3-4 – Intersection Levels of Service – Existing (2017) Conditions

Intersection	Jurisdiction	LOS Standard	Peak Hour	Traffic Control	Delay (sec)	LOS
1. Hargrave Street (NS) E Ramsey Street (EW)	City of Banning	D	AM PM	Signal	23.2 28.5	C C

▪ General Plan Circulation

The current City of Banning General Plan circulation element is shown on Figure 3-D.

▪ Transit Service

The project area is served by the City of Beaumont Transit System route 2 (Beaumont, Casino Morongo and Outlet Malls). The nearest bus stop is located at the intersection of East Ramsey Street and Hargrave Street.

Figure 3-D – City of Banning General Plan Circulation Element

Method of Projection

The method of traffic projection is based on the following criteria:

- Existing traffic conditions (2017);
- Ambient growth projections;
- Project generated traffic; and
- Cumulative project generated traffic.

This report uses a project buildout year of 2019 for analysis purposes.

Ambient Growth

In order to evaluate traffic conditions for the study year, area wide growth on existing roadways must be projected. The majority of the anticipated growth within the study area is accounted for with other cumulative project traffic. Per discussion with the City of Banning and Caltrans staff, this study will utilize a 1 percent per year growth rate based on the projections of the SCAG model.

Project Generated Traffic

Project Trip Generation

Trip Generation Rates

Trip generation represents the amount of traffic traveling to and from the proposed project. The traffic generation figures used in this study are based on the development of 1000 TSF gross floor area high-cube warehouse. Table 4-1 shows the peak hour and daily trip generation rates for the proposed project.

The trip generation rates for high-cube warehousing are based on the weighted average trip generation rates provided in the *Trip Generation Manual (9th Edition)* by the Institute of Transportation Engineers (ITE), 2012. The inbound and outbound peak hour trip generation rates are calculated by multiplying the total peak hour generation rate by the directional distribution provided in the *Trip Generation Manual*. The truck split is based on the *Truck Trip Generation Study* performed by the City of Fontana.

Table 4-1 – Trip Generation Rates

Land Use	Unit	AM Peak Hour			PM Peak Hour			Daily
		Total	In	Out	Total	In	Out	
High-Cube Warehouse Land Use Category: 152	TSF							
Passenger Cars		*0.080*	*0.055*	*0.025*	*0.080*	*0.025*	*0.055*	*1.040*
Trucks (2 Axle)		*0.005*	*0.004*	*0.004*	*0.007*	*0.002*	*0.002*	*0.108*
Trucks (3 Axle)		*0.007*	*0.005*	*0.005*	*0.009*	*0.003*	*0.003*	*0.145*
Trucks (4+ Axle)		*0.018*	*0.013*	*0.013*	*0.024*	*0.007*	*0.007*	*0.386*
LAND USE TOTAL		0.110	0.076	0.034	0.120	0.037	0.083	1.680

TSF = 1,000 Square Feet Gross Floor Area.
Average trip generation rates from *Trip Generation Manual, ITE, 9th Edition* (2012).
2 axle / 3 axle / 4+axle truck split from *Truck Trip Generation Study* by the City of Fontana, 2003.

Project Trip Generation

Table 4-2 presents the daily and peak hour trip generation for the proposed project. Table 4-3 presents the trip generation for the proposed project in Passenger Car Equivalent for trucks (PCE). As shown, the proposed project is anticipated to generate approximately 2,652 daily trip-ends in PCE, including 156 trip-ends during the AM peak hour and 181 trip-ends during the PM peak hour, in PCE.

Table 4-2 – Project Trip Generation

Land Use	Qty	Unit	AM Peak Hour			PM Peak Hour			Daily
			Total	In	Out	Total	In	Out	
High-Cube Warehouse	1000	TSF							
Passenger Cars			*80*	*55*	*25*	*80*	*25*	*55*	*1,040*
Trucks (2 Axle)			*5*	*3*	*2*	*7*	*2*	*5*	*109*
Trucks (3 Axle)			*7*	*5*	*2*	*9*	*3*	*6*	*145*
Trucks (4+ Axle)			*18*	*13*	*5*	*24*	*7*	*17*	*386*
LAND USE TOTAL			110	76	34	120	37	83	1,680

TSF = 1,000 Square Feet Gross Floor Area.

Table 4-3 – Project Trip Generation (in PCE)

Land Use	Qty	Unit	AM Peak Hour			PM Peak Hour			Daily
			Total	In	Out	Total	In	Out	
High-Cube Warehouse	1000	TSF							
Passenger Cars (PCE = 1.0)			*80*	*55*	*25*	*80*	*25*	*55*	*1,040*
Trucks (2 Axle, PCE = 1.5)			*8*	*5*	*3*	*11*	*3*	*8*	*164*
Trucks (3 Axle, PCE = 2.0)			*14*	*10*	*4*	*18*	*6*	*12*	*290*
Trucks (4+ Axle, PCE = 3.0)			*54*	*39*	*15*	*72*	*21*	*51*	*1,158*
LAND USE TOTAL (IN PCE)			156	109	47	181	55	126	2,652

TSF = 1,000 Square Feet Gross Floor Area.
PCE = Passenger Car Equivalent for Trucks

Project Trip Distribution

Trip distribution represents the directional orientation of traffic to and from the project site. Trip distribution is influenced by the geographical location of the site, type of land use in the study area, such as shopping centers and recreational sites, and proximity to the regional freeway system.

The trip directional orientation of traffic for the proposed project was determined based on the existing roadway system, existing traffic patterns, and existing and future land uses. The directional distribution for the proposed project traffic for trucks and passenger cars assumed in this study is shown on Figure 4-A and Figure 4-B, respectively.

Project Modal Split

The traffic reducing potential of public transit has not been considered in this study. Therefore, the traffic projections provided in this report are considered conservative since public transit could reduce traffic volumes in the project area.

Project Trip Assignment

Trip assignment is the result of assigning the previously discussed trip generation numbers to the circulation system using the previously discussed trip distribution.

The project related AM peak hour and PM peak hour intersection turning movement volumes are shown on Figure 4-C and Figure 4-D, respectively.

▪ Cumulative Project Generated Traffic

Cumulative project traffic from within the study area is expected to have an impact on levels of service. The cumulative projects within the study area are listed in Table 4-4 for 2019 and Table 4-5 for year 2040. These projects were included as per discussion with the City of Banning staff. The Morongo Reservation and Riverside County Transportation Department was consulted but did not provide any relevant cumulative projects. The location of these projects are shown on Figure 4-E. The AM and PM peak hour intersection turning movement volumes for cumulative projects are shown on Figure 4-F and Figure 4-G, respectively.

Table 4-4 – Cumulative Projects within the Study Area in 2019

TOTAL[4]				2,601	3,646	47,966

TSF = 1,000 Square Feet Gross Floor Area, DU = Dwelling Units, Stu = Students.

[1] Single-family detached housing assumption was reduced based on discussions with the City of Banning. The City does not anticipate all 1,077 residential project units that were assumed in the original scoping agreement dated February 1st, 2017 to be constructed by 2019. The 998 residential units assumed in this revised scoping agreement remains highly conservative.

[2] Revised development trip assumption for Rancho San Gorgonio Specific Plan has been revised to match the Rancho San Gorgonio Specific Plan Traffic Study, prepared by Kunzman Associates, Inc. on April 2016.

[3] The Airport Industrial Work Lofts project was not included in the approved scoping agreement dated February 1st, 2017. The Lofts project has now been included in this revised scoping agreement as part of the cumulative project list. The Lofts project is projected to generate very low traffic volume which would be compensated with the adjustments made to the internal trip capture explained in the next page regarding methodology. It is also considered accounted for in the analysis per the high number of residential units originally assumed in the Pardee Butterfield Specific Plan and the Rancho San Gorgonio Specific Plan.

[4] The cumulative project list assumes over 1,900 residential dwelling units completed in 2 years, which is very conservative. The City does not anticipate rapid growth in the next two years; therefore, all revision to the internal capture and residential dwelling units were made in agreement with the City.

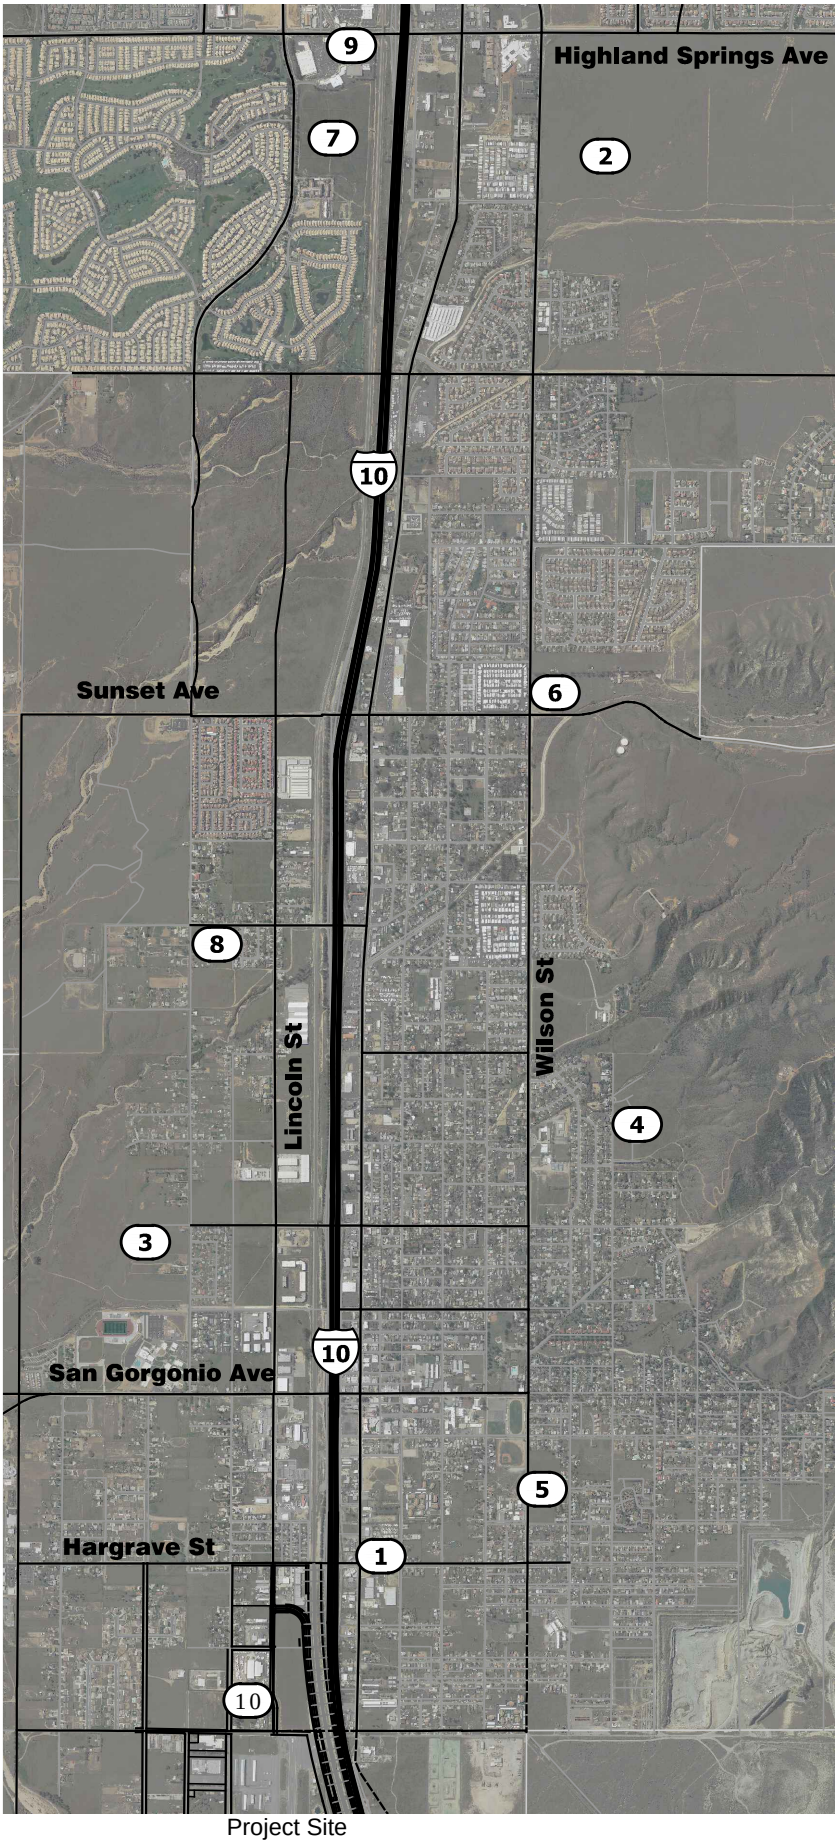

Table 4-5 – Cumulative Projects within the Study Area in Year 2040

TSF = 1,000 Square Feet Gross Floor Area.

Note that the I-10 Freeway Bypass project was not included in the assumptions for this analysis for neither opening year 2019 nor build out year 2040. Although this is a major project to be located in close proximity to the project and will alter the traffic patterns for the study area, it was not assumed for the following reasons: 1) the project is currently not fully funded; 2) the project would improve the freeway ramps, which are the critical intersections for the Banning Distribution Center traffic impact analysis.

Capacity and Level of Service and Improvement Analysis

Levels of Service – Existing Plus Project (2017) Conditions

The existing plus project (2017) scenario includes existing traffic and project traffic. Table 5-1 provides the projected delay and levels of service at the study intersections under existing plus project conditions without off-site improvements. These levels of service vary from LOS A to F. The existing plus project AM and PM peak hour intersection turning movement volumes are shown on Figure 5-A and Figure 5-B, respectively. The levels of service are based on the existing geometrics for the study intersections. The level of service calculation worksheets are provided in Appendix E. The following study intersections are expected to operate at an unacceptable level of service:

2. Hargrave Street (NS) / I-10 Westbound Ramps Street (EW)
3. Hargrave Street (NS) / I-10 Eastbound Ramps Street (EW)

Table 5-1 – Intersection Levels of Service – Existing Plus Project (2017) Conditions

2. Hargrave Street On-Ramp	Merge	4	1	16.7	B	14.6	B	3970	316	16.9	B	3421	322	15.1	B
I-10 Westbound															
3. Hargrave Street Off-Ramp	Diverge	4	1	16.1	B	25.8	C	3291	200	16.6	B	5533	285	26.0	C
4. Hargrave Street On-Ramp	Merge	4	1	11.2	C	19.0	C	3091	412	13.5	C	5248	699	23.0	C

Note that the I-10 Freeway Bypass project was not included in the assumptions for this analysis for neither opening year 2019 nor year 2040. Although this is a major project to be located in close proximity to the project and will alter the traffic patterns for the study area, it was not assumed for the following reasons: 1)

the project is currently not fully funded; 2) the project would improve the freeway ramps, which are the critical intersections for the Banning Distribution Center traffic impact analysis.

Levels of Service – Year 2040 Plus Project Conditions with Improvements

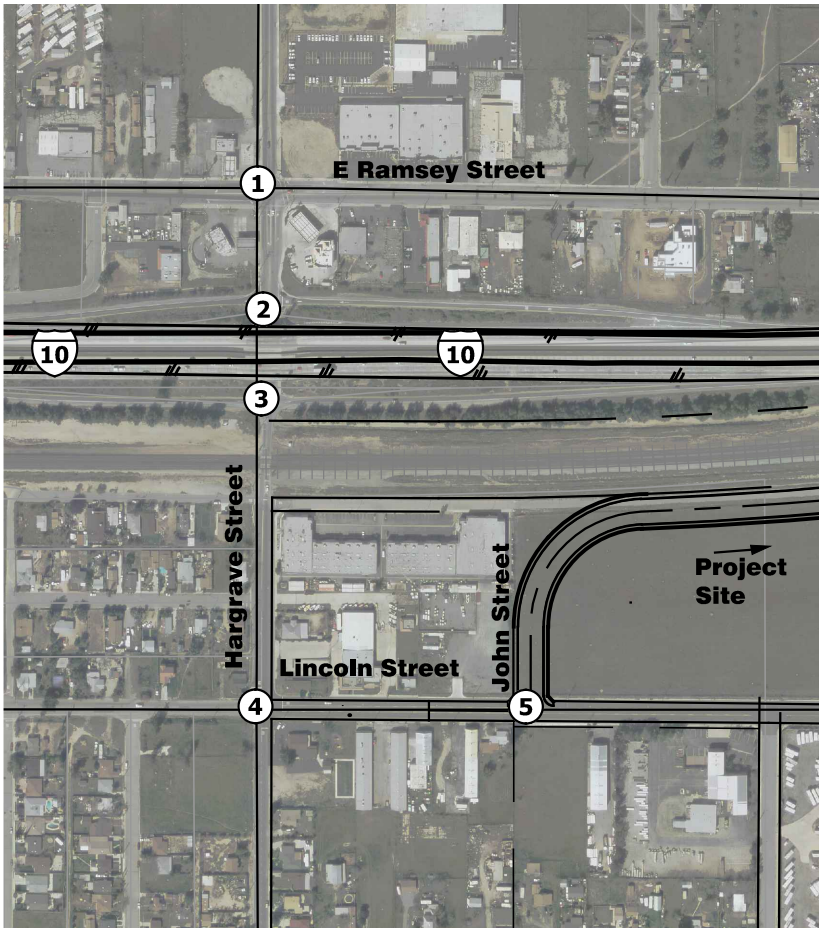

Table 5-9 provides the projected delay and levels of service at the study intersections under year 2040 plus project conditions with off-site improvements. With the recommended off-site improvements, the study area intersections would operate at an acceptable LOS D or better. The level of service calculation worksheets are provided in Appendix E.

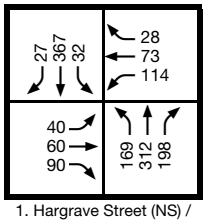

Table 5-12 – Intersection Levels of Service – Year 2040 Plus Project Conditions with Improvements

Traffic Signal Warrants

The California MUTCD states that the satisfaction of a traffic signal warrant or warrants shall not in itself require the installation of a traffic control signal. Peak hour traffic signal warrant analysis should only be considered as an "indicator" of the likelihood of an unsignalized intersection warranting a traffic signal. Intersections that exceed the peak hour warrant are more likely to meet one or more of the other volume based signal warrants. The Manual on Uniform Traffic Control Devices (MUTCD) also advises that a traffic control signal should not be installed unless:

- One or more of the traffic signal warrants is satisfied;
- An engineering study indicates that installing a traffic control signal will improve the overall safety and/or operation of the intersection; and
- It will not seriously disrupt progressive traffic flow.

For existing (2017) traffic conditions, the peak hour traffic control signal warrant is satisfied for the following study area unsignalized intersection(s) (see Appendix D for technical calculations):

3. Hargrave Street (NS) / I-10 Eastbound Ramps (EW)

For existing plus project (2017) traffic conditions, no additional study area unsignalized intersections are expected to meet the peak hour traffic control signal warrant (see Appendix D for technical calculations).

For existing plus ambient growth plus project (2019) traffic conditions, no additional study area unsignalized intersections are expected to meet the peak hour traffic control signal warrant (see Appendix D for technical calculations).

For existing plus ambient growth plus other cumulative projects plus project (2019) traffic conditions, the peak hour traffic control signal warrant is expected to be satisfied for the following additional study area unsignalized intersection(s) (see Appendix D for technical calculations):

2. Hargrave Street (NS) / I-10 Westbound Ramps (EW)

For year 2040 plus project traffic conditions, no additional study area unsignalized intersections are expected to meet the peak hour traffic control signal warrant (see Appendix D for technical calculations).

The following study area unsignalized intersection(s) does not satisfy the peak hour traffic signal warrant in any study scenario (see Appendix D for technical calculations):

4. Hargrave Street (NS) / Lincoln Street (EW)
5. John Street (NS) / Lincoln Street (EW)

Queuing Analysis

Per Caltrans request, a queuing analysis was performed at the intersections Hargrave Street /I-10 westbound ramps and Hargrave Street/I-10 eastbound ramps under existing plus project conditions, existing plus ambient growth plus project conditions, existing plus ambient growth plus cumulative projects plus project conditions, year 2040 plus project conditions.

Existing Plus Project Conditions

The current two-way stop controlled intersection would be improved to provide an all-way stop control and the following geometrics:

2. Improve the intersection to install an all-way stop control at the intersection of Hargrave Street (NS) and Interstate -10 WB Ramps with the following geometrics:
   Northbound: One shared left-turn and through lane.
   Southbound: One shared through and right-turn lane.
   Eastbound: Not applicable.
   Westbound: One shared left-turn, through and right-turn lane.

A signal is not warranted at this intersection as shown in the provided signal warrant worksheets in Appendix D. An all-way stop control has been recommended at the intersections of Hargrave Street and I-10 westbound ramps in accordance with Section 2B.07 Multi-Way Stop Applications of the California Manual on Uniform Traffic Control Devices 2014 (CA MUTCD 2014). The recommendation is based on option: A. The need to control left-turn conflicts". Over 200 northbound left turns occur at the intersection which conflict with the west-bound left turn movements. With the recommended improvement the westbound traffic approaching the intersection as vehicles exit the freeway ramp would be able to proceed safely through the intersection.

Current two-way stop controlled intersection would be improved to provide an all-way stop control and the following geometrics:

3. Improve the intersection to install an all-way stop control at the intersection of Hargrave Street (NS) and Interstate -10 EB Ramps with the following geometrics:
   Northbound: One shared through and right-turn lane.
   Southbound: One shared left-turn and through lane.
   Eastbound: One shared left, through and right-turn lane.
   Westbound: Not applicable.

A signal is warranted at this intersection as shown in the provided signal warrant worksheets in Appendix D. An all-way stop control has been recommended in accordance with Section 2B.07 Multi-Way Stop Applications of the California Manual on Uniform Traffic Control Devices 2014 (CA MUTCD 2014). The recommendation is based on "guidance: A. Where traffic control signals are justified, the multi-way stop is an interim measure that can be installed quickly to control traffic while arrangements are being made for the installation of the traffic control signal.

A summary of the queuing analysis results for existing plus project conditions and the recommended improvements is provided in Table 6-9 (95th percentile queuing results are provided in Appendix E).

Table 6-9 – Queuing Summary - Existing Plus Project (2017) Conditions

EACP+Imp.: Existing plus Ambient Growth Plus Cumulative Projects Plus Project Conditions With Improvements.

Year 2040 Plus Project Conditions

For Year 2040 plus project conditions the no additional improvements would be required from the proposed all-way stop controlled intersection with the following geometrics:

Northbound: One shared left-turn and through lane.
Southbound: One shared through and right-turn lane.
Eastbound: Not applicable.
Westbound: One shared left-turn, through and right-turn lane.

For Year 2040 plus project conditions the all-way stop controlled intersection would be improved to a signalized intersection at Hargrave Street and I-10 eastbound ramps. A signal is warranted at this intersection as shown in the provided signal warrant worksheets in Appendix D. The Intersection will include the following geometrics:

Northbound: One shared through and right-turn lane.
Southbound: One left-turn lane with 100 feet of storage length. One through lane.
Eastbound: One shared left, through and right-turn lane.
Westbound: Not applicable.

A summary of the queuing analysis results for year 2040 plus project conditions is provided in Table 6-12 (95th percentile queuing results are provided in Appendix E).

Yr.2040P +Imp : Year 2040 Plus Project Conditions With Proposed Improvements.

Circulation Recommendations

This traffic impact analysis demonstrates that the direct traffic impacts generated by Banning Distribution Center can be mitigated to meet the required level of service if the following recommended improvements are adopted.

Roadway Improvements

- Construct full width improvements on John Street at its ultimate cross-section as a collector from Lincoln Street to the east end at project boundary.

Intersection Improvements

- Construct the intersection of Lincoln Street and John Street with the following geometrics:
  Northbound: Not Applicable.
  Southbound: One left turn lane. One right turn lane. Stop controlled.
  Eastbound: One left turn lane. One through lane.
  Westbound: One shared through and right turn lane.

Safety and Operational Improvements

- Sight distance at Banning Distribution Center entrance roadway will be reviewed with respect to standard City of Banning sight distance standards at the time of preparation of final grading, landscape, site development, and street improvement plans.
- Participate in the phased construction of off-site traffic signals through payment of project's fair share of traffic signal mitigation fees.
- Signing/striping should be implemented in conjunction with detailed construction plans for Banning Distribution Center site.

Regional Funding Mechanisms

Banning Distribution Center will participate in the cost of off-site improvements through the payment of "fair share" mitigation fees, including the following:

- City of Banning Development Impact Fee (DIF), current at time of construction.

These fees will be collected and utilized as needed by City of Banning to construct the improvements necessary to assist in maintaining the required level of service.

Table 6-13 summarizes the proposed mitigation measure and associated funding mechanism for Banning Distribution Center as a result of the traffic study.

Table 6-13 – Project Mitigation Summary

No.	Intersection	Jurisdiction	Target LOS	LOS w/o Mitigation		Mitigation Measure	LOS with Mitigation		Funding Mechanism
				AM	PM		AM	PM	
Existing Deficiency									
2	Hargrave Street (NS) I-10 Westbound Ramps (EW)	Caltrans	D	F	F	Install stop signs to change the intersection to be all-way stop controlled.	C	B	Developer

RE: Revised Scoping Agreement for the proposed Banning Distribution Center, in the City of Banning.

Background

WEBB Associates is the Traffic Consultant for Pacific Newport Properties (PNP) on their Banning Distribution warehouse project (Design Review 16-7002) located in the City of Banning. The City of Banning approved a Scoping Agreement for a traffic study on this project back on February 1, 2017 which included nine cumulative projects identified by the City to be included in the traffic study analysis. The City approved the traffic study in October 2017, and in December 2017 WEBB submitted to the City the final traffic study which documented all of the reviews and approval from Caltrans.

On March 26, 2018 PNP became aware of pending project in the City of Banning in close proximity to the Banning Distribution warehouse project which was not one of the nine projects listed by the City and included in the February 2017 Scoping Agreement from the City. The Airport Industrial Work Lofts (aka The Banning Lofts) is located south of the Banning Municipal Airport, between Lincoln and Barbour Streets, just west of South Hathaway Street and is within one mile of the Banning Distribution project. Subsequently, the City determined that the Banning Lofts project should have been previously listed and now must be included as a cumulative project to be analyzed in the Banning Distribution traffic study.

Methodology

With the inclusion of the Banning Lofts project, the internal trip count assumptions for the other nine cumulative projects was revisited. It was determined in conversations with the City Engineer that the original scoping agreement (approved February 1st, 2017) made overly conservative assumptions for some of the cumulative projects. (i.e. 1,900 residential dwelling units to be built in a two year period is highly conservative). Therefore adjustments were made to change the internal trips. As a result, this revised TIA scoping agreement dated April 24, 2018 and the original TIA scoping agreement dated February 1, 2017 retain the same total number of daily trips for the cumulative projects.

The revised internal trip assumptions were made based on: ITE manual percentages, professional judgment, and discussions with the City of Banning. The previous TIA scope used a conservative analysis to account for internal trips and projected number of residential dwelling units. Internal trips for cumulative project sites use a range of percentages based on the type of use; these can range

between 3 – 35% of all the traffic. This means that between 3 – 35% of the total trips assigned to that project could occur internally on the project site. The original TIA scope used a conservative number of internal trips. The revised TIA scope uses a conservative number of internal trips within the agreed upon range of 3-35%. The remaining number of trips were then assigned to the Banning Lofts project. The trips for the Banning Lofts project was taken from the traffic impact study prepared for that project by Kunzman Associates in August 2013.

All other assumptions in this revised TIA remain the same.

Definition:
Internal Capture Trips - *internal trips are made within mixed-use developments and are on internal roadways only and do not use adjacent main roadways.*

SCOPING AGREEMENT FOR TRAFFIC IMPACT STUDY

TSF = 1,000 Square Feet Gross Floor Area, DU = Dwelling Units, Stu = Students.

[1] Single-family detached housing assumption was reduced based on discussions with the City of Banning. The City does not anticipate all 1,077 residential project units that were assumed in the original scoping agreement dated February 1st, 2017 to be constructed by 2019. The 998 residential units assumed in this revised scoping agreement remains highly conservative.

[2] Revised development trip assumption for Rancho San Gorgonio Specific Plan has been revised to match the Rancho San Gorgonio Specific Plan Traffic Study, prepared by Kunzman Associates, Inc. on April 2016.

[3] The Airport Industrial Work Lofts project was not included in the approved scoping agreement dated February 1st, 2017. The Lofts project has now been included in this revised scoping agreement as part of the cumulative project list. The Lofts project is projected to generate very low traffic volume which would be compensated with the adjustments made to the internal trip capture explained in the next page regarding methodology. It is also considered accounted for in the analysis per the high number of residential units originally assumed in the Pardee Butterfield Specific Plan and the Rancho San Gorgonio Specific Plan.

[4] The cumulative project list assumes over 1,900 residential dwelling units completed in 2 years, which is very conservative. The City does not anticipate rapid growth in the next two years; therefore, all revision to the internal capture and residential dwelling units were made in agreement with the City.

Scoping Agreement

Subject: RE: Banning Industrial Scoping Agreement

Hello

Use the SCAG Model for a growth rate, rather than 2%.
Provide a merge/diverge analysis for the ramps.
Provide a break down year, if any.
Provide a 2040 future year analysis.

Hi Mark,
Do you have any comments or issues with the scope of work as defined in the scoping agreement approved by the City of Banning? Thanks.

Subject: Banning Industrial Scoping Agreement

Hi Mark,
Attached you will find the scoping agreement with the City of Banning for an industrial project just south of the I-10 freeway. The only freeway ramps it will be accessing is the Hargrave ramps to the I-10. Please let me know if you have any comments or issues with the proposed scope of the traffic study as it is written.
Thanks!

Subject: RE: Banning Industrial - Data Request Information

Hi Art,
For the past couple of weeks I've been in conversation with Caltrans and they have come up with the conclusion that based on the SCAG model, a 1% ambient growth is appropriate for consideration any future scenarios, which includes 2040. So instead of requesting the model from SCAG, they have just given us an ambient growth to use. Let me know if you have any thoughts or if you're ok with us moving forward with a 1% ambient growth for both near term and long term.
Thanks.

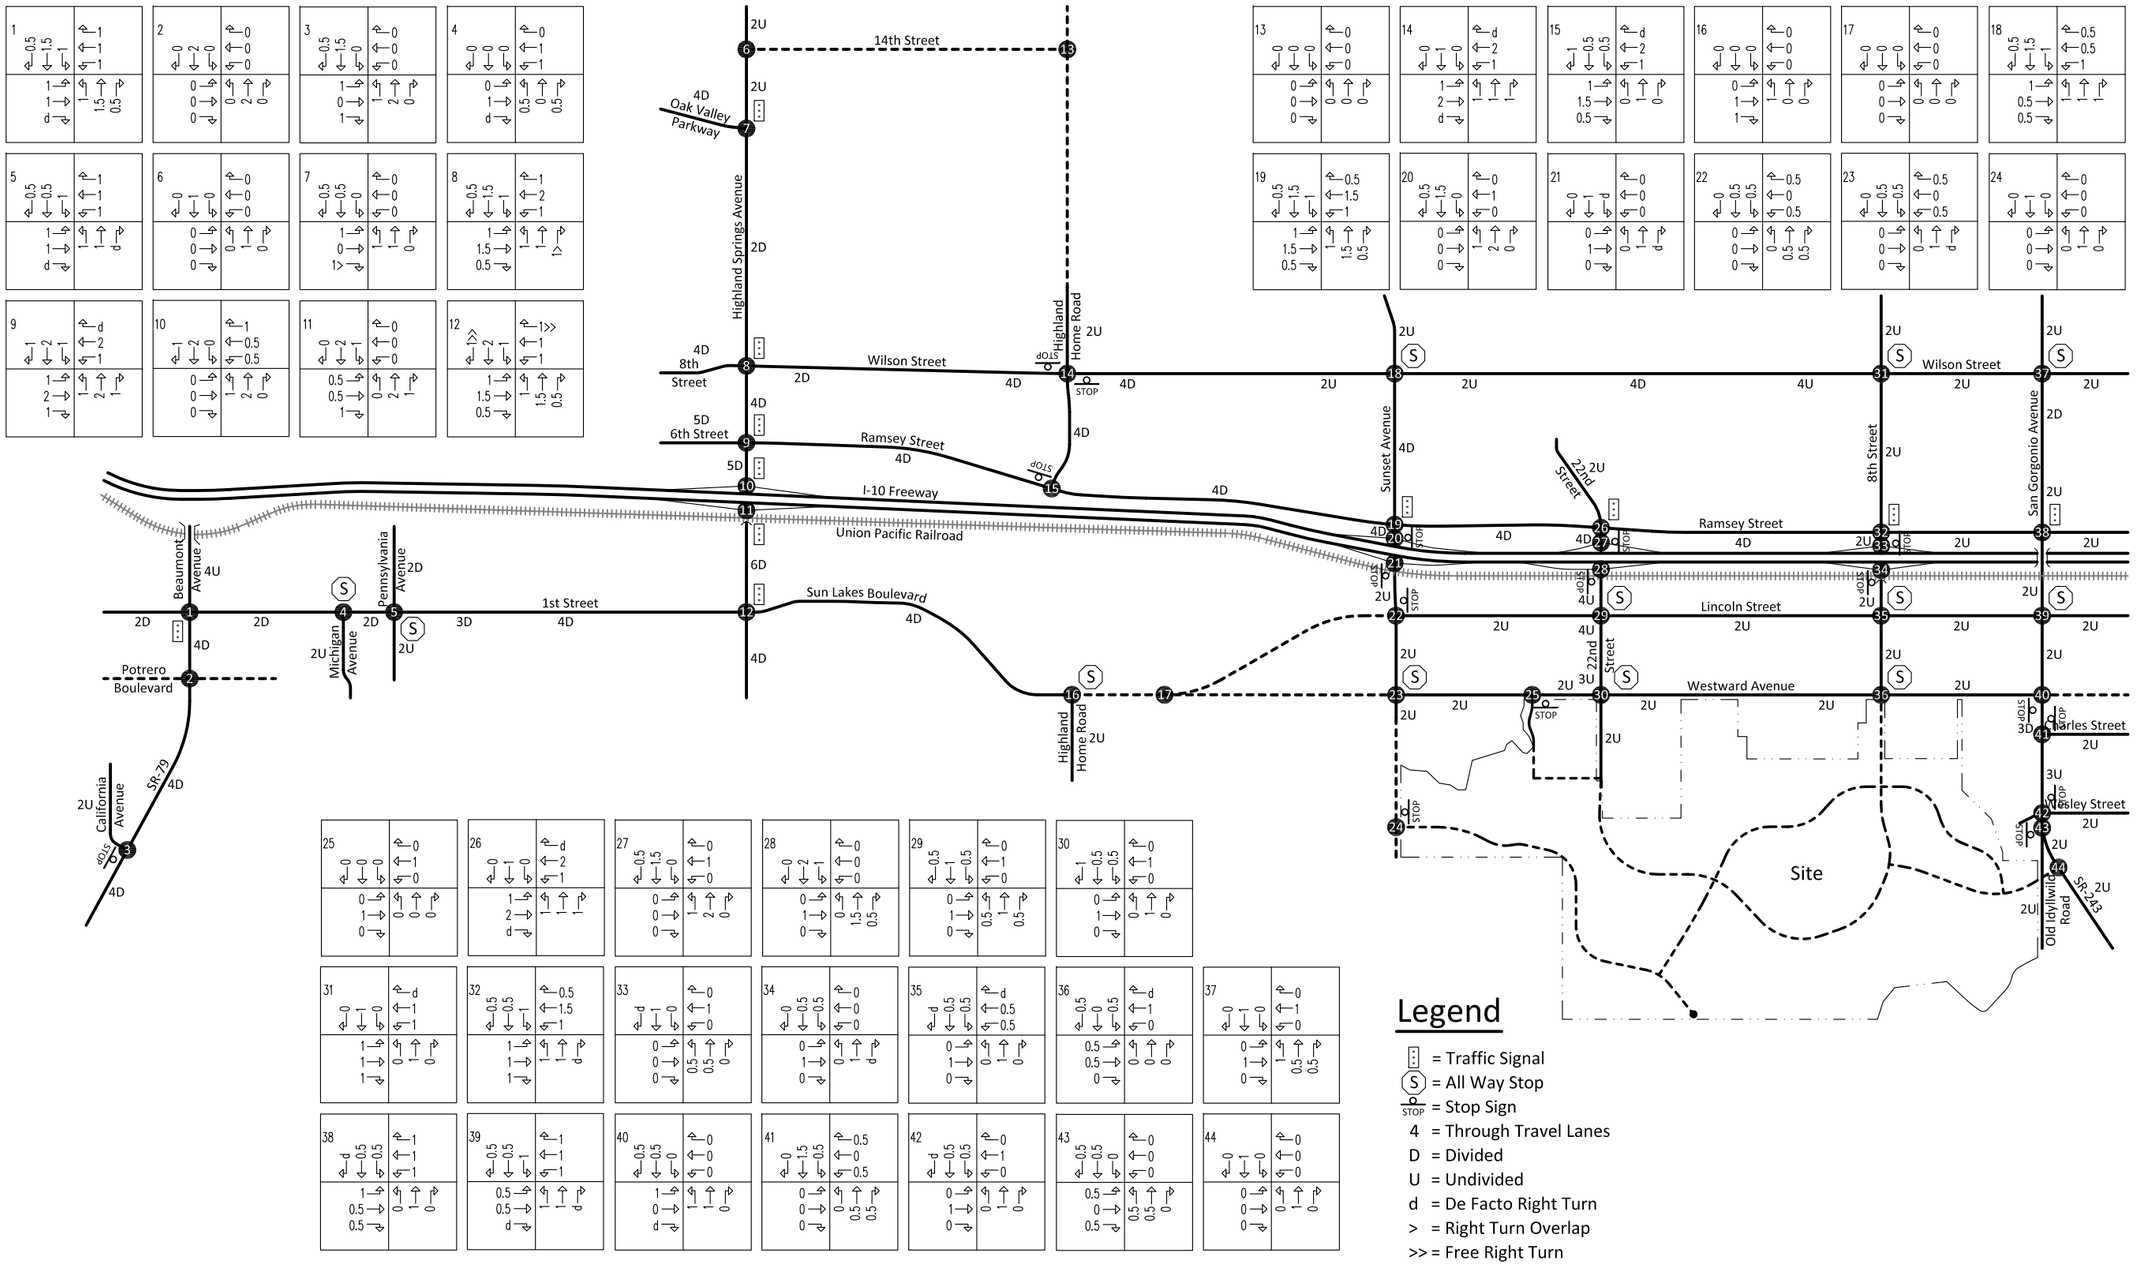
[1] When a right turn is designated, the lane can either be striped or unstriped. To function as a right turn lane there must be sufficient width for right turning vehicles to travel outside the through lanes.



L = Left; T = Through; R = Right; d = De Facto Turn Lane; > = Right Turn Overlap; >> = Free Right Turn

[2] Delay and level of service calculated using the following analysis software: Traffix, Version 7.9.0215 (2008). Per the Highway Capacity Manual, overall average intersection delay and level of service are shown for intersections with traffic signal or all way stop control. For intersections with cross street stop control, the delay and level of service for the worst individual movement (or movements sharing a single lane) are shown.

[3] TS = Traffic Signal; CSS = Cross Street Stop; AWS = All Way Stop

[4] 99.9-F = Delay High, Intersection Unstable, Level of Service F

Figure 3
Existing Through Travel Lanes and Intersection Controls

Intersection reference numbers are in upper left corner of turning movement boxes.

Institute of Transportation Engineers, Trip Generation Handbook, 2nd Edition, 2004.

[2] DU = Dwelling Units; TSF = Thousand Square Feet; AC = Acres

[3] NOM = Nominal

[4] Trips generated would be nominal on weekdays and anticipated to remain internal to the Specific Plan.

[5] Consists of a proposed electrical switching station, or similar use, which would not generate trips on a regular daily basis.

Source: *Traffic Impact Analysis* (September 2016) (Appendix C)

1 Trip Generation for Approved Project obtained from BSPTIA.

2 Rates based on Land Use 210 - Single Family Detached Housing from Institute of 'Transportation Engineers (ITE) Trip Generation, 8th Edition.

3 Trip Generation rates based on Land Use 820 - Shopping Center from ITE *Trip Generation*, 8th Edition and Pass-By Rates based on Land Use 820 - Shopping Center from ITE *Trip Generation Handbook* , 2nd Edition.

4 Rates based on Land Use 230 - Residential Condominium/Townhomes from ITE *Trip Generation*, 8th Edition.

5 Rates based on Land Use 520 - Elementary School from ITE *Trip Generation*, 8th Edition.

6 Rates based on Land Use 430 - Golf Course from ITE *Trip Generation*, 8th Edition.

7 Internal Trip Capture Rates based on Project Select Zone from the Pass Area Model

As a result of the analysis conducted in the TIA for the Proposed Project, the following six intersections were determined to exceed LOS thresholds following project implementation:

- Highland Springs Avenue/16th Street-Cougar Way [City of Beaumont/City of Banning];
- Highland Springs Avenue/F Street [City of Beaumont/City of Banning];
- Highland Springs Avenue/Starlight Avenue-A Street [City of Beaumont/City of Banning];
- Highland Springs Avenue/Wilson Street [City of Beaumont/City of Banning];
- C Street-Apex Avenue/Wilson Street [City of Banning];
- Highland Home Road/Wilson Street [City of Banning].

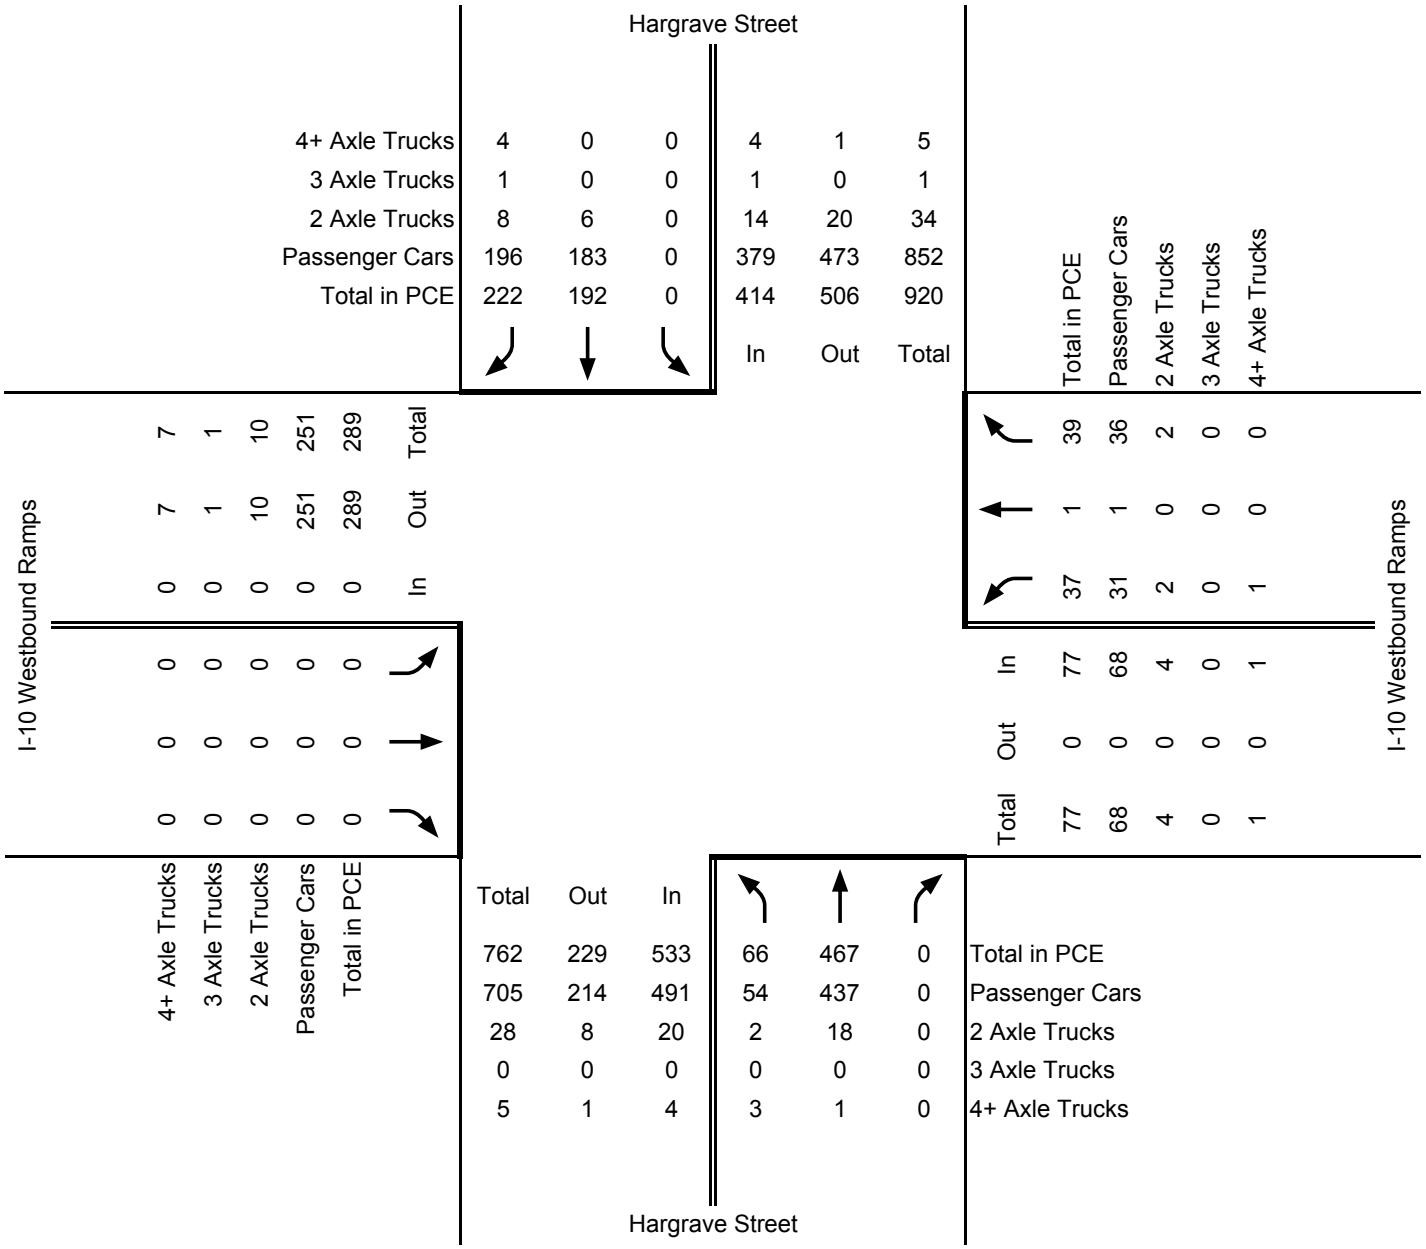
PHF: 0.869

PCE Factors

Passenger Cars = 1 PCE



2 Axle Trucks = 1.5 PCE

3 Axle Trucks = 2 PCE

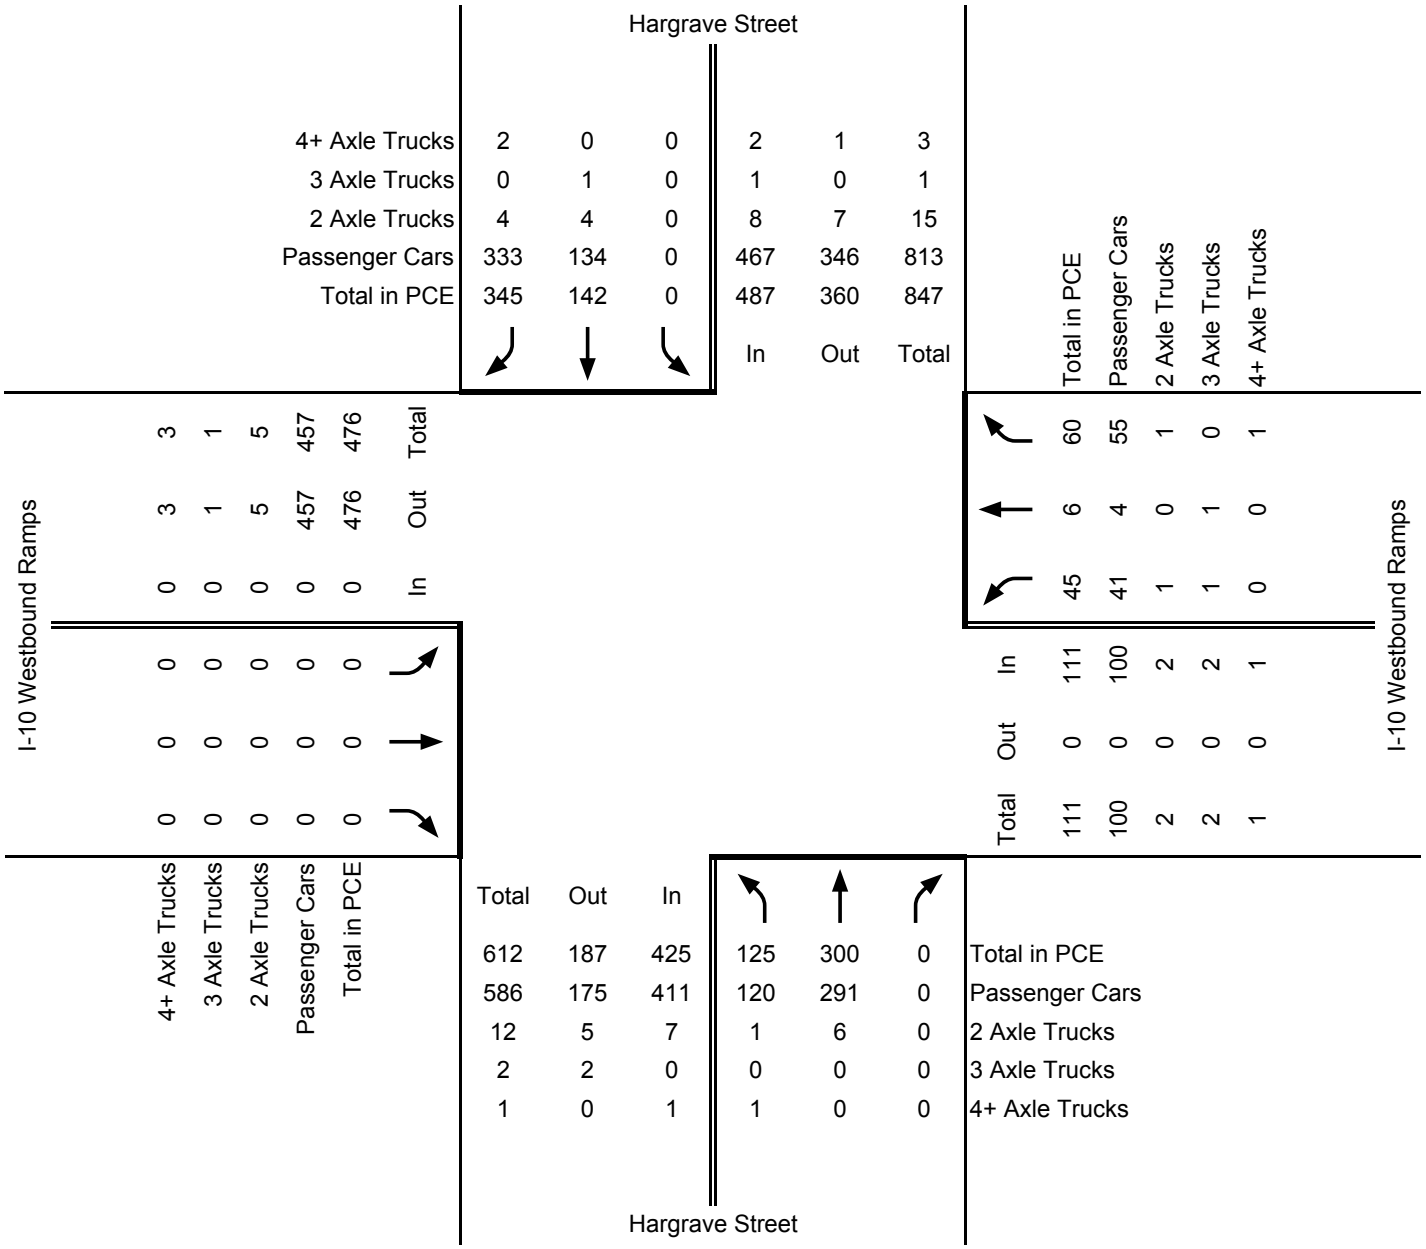
4+ Axle Trucks = 3 PCE

2. Hargrave Street / I-10 Westbound Ramps

Count Date: 1/31/2017
Peak Hour: 7:15-8:15 AM
PHF: 0.844

PCE Factors

Passenger Cars = 1 PCE



2 Axle Trucks = 1.5 PCE

3 Axle Trucks = 2 PCE

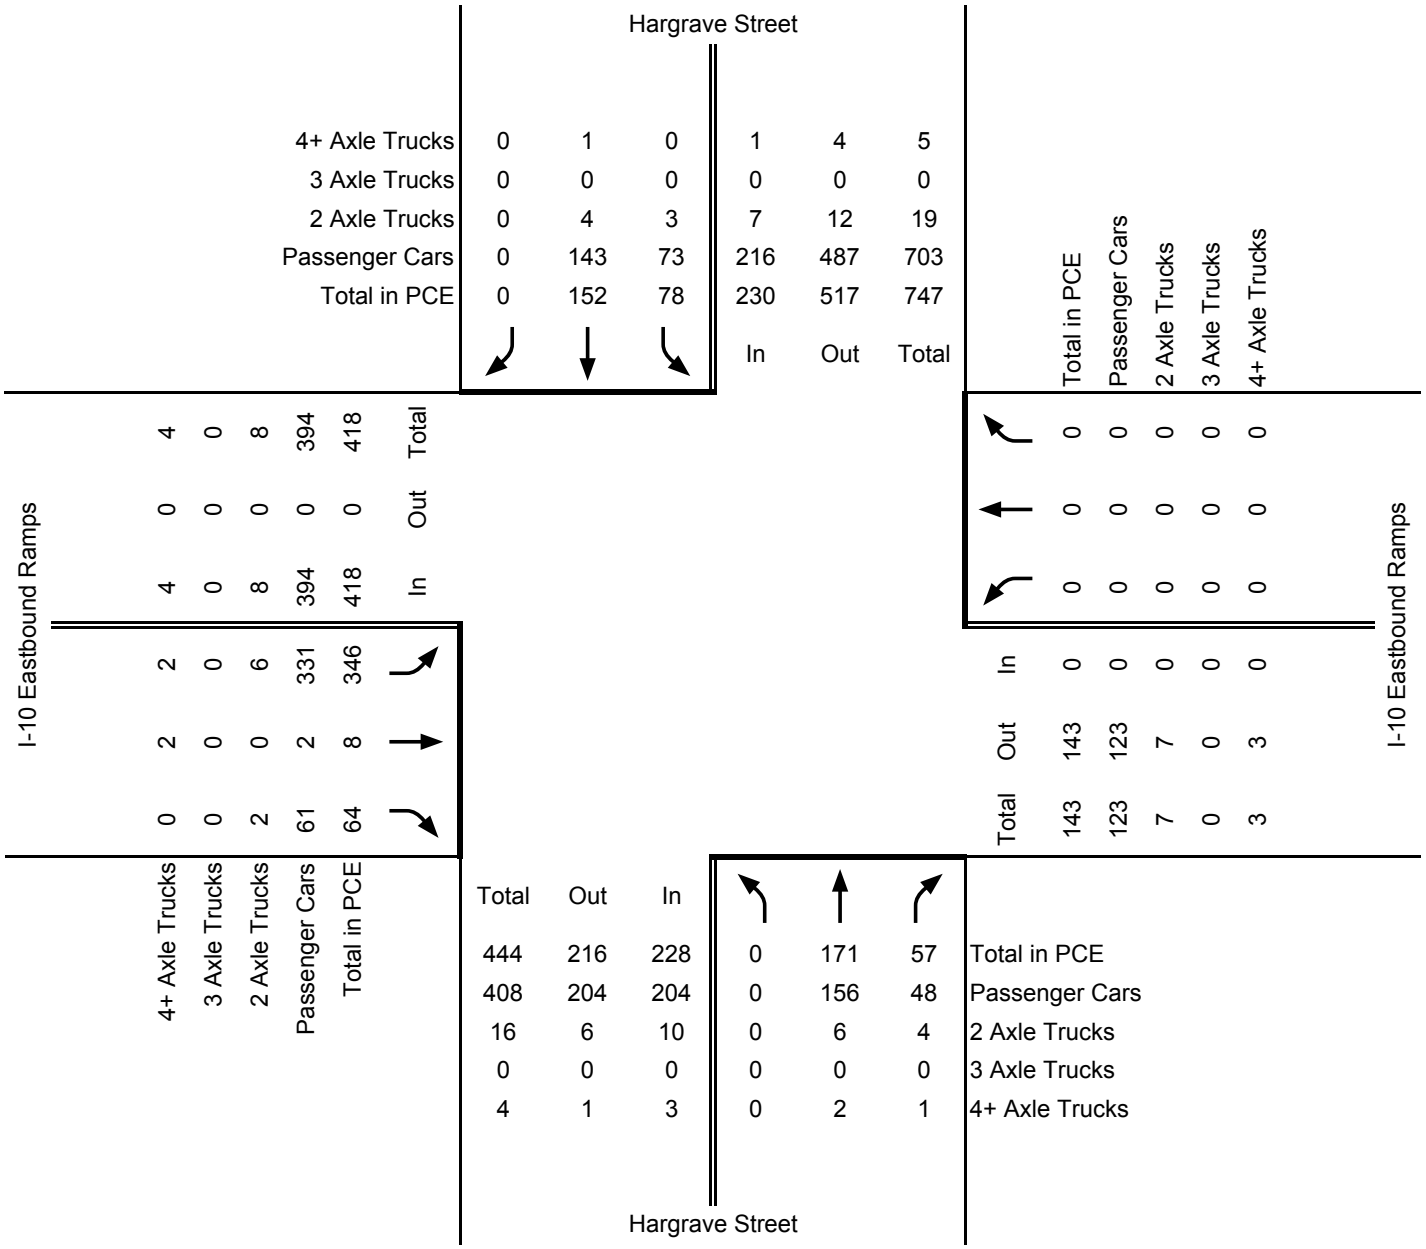
4+ Axle Trucks = 3 PCE

2. Hargrave Street / I-10 Westbound Ramps

Count Date: 1/31/2017
Peak Hour: 4:30-5:30 PM
PHF: 0.876

PCE Factors

Passenger Cars = 1 PCE



2 Axle Trucks = 1.5 PCE

3 Axle Trucks = 2 PCE

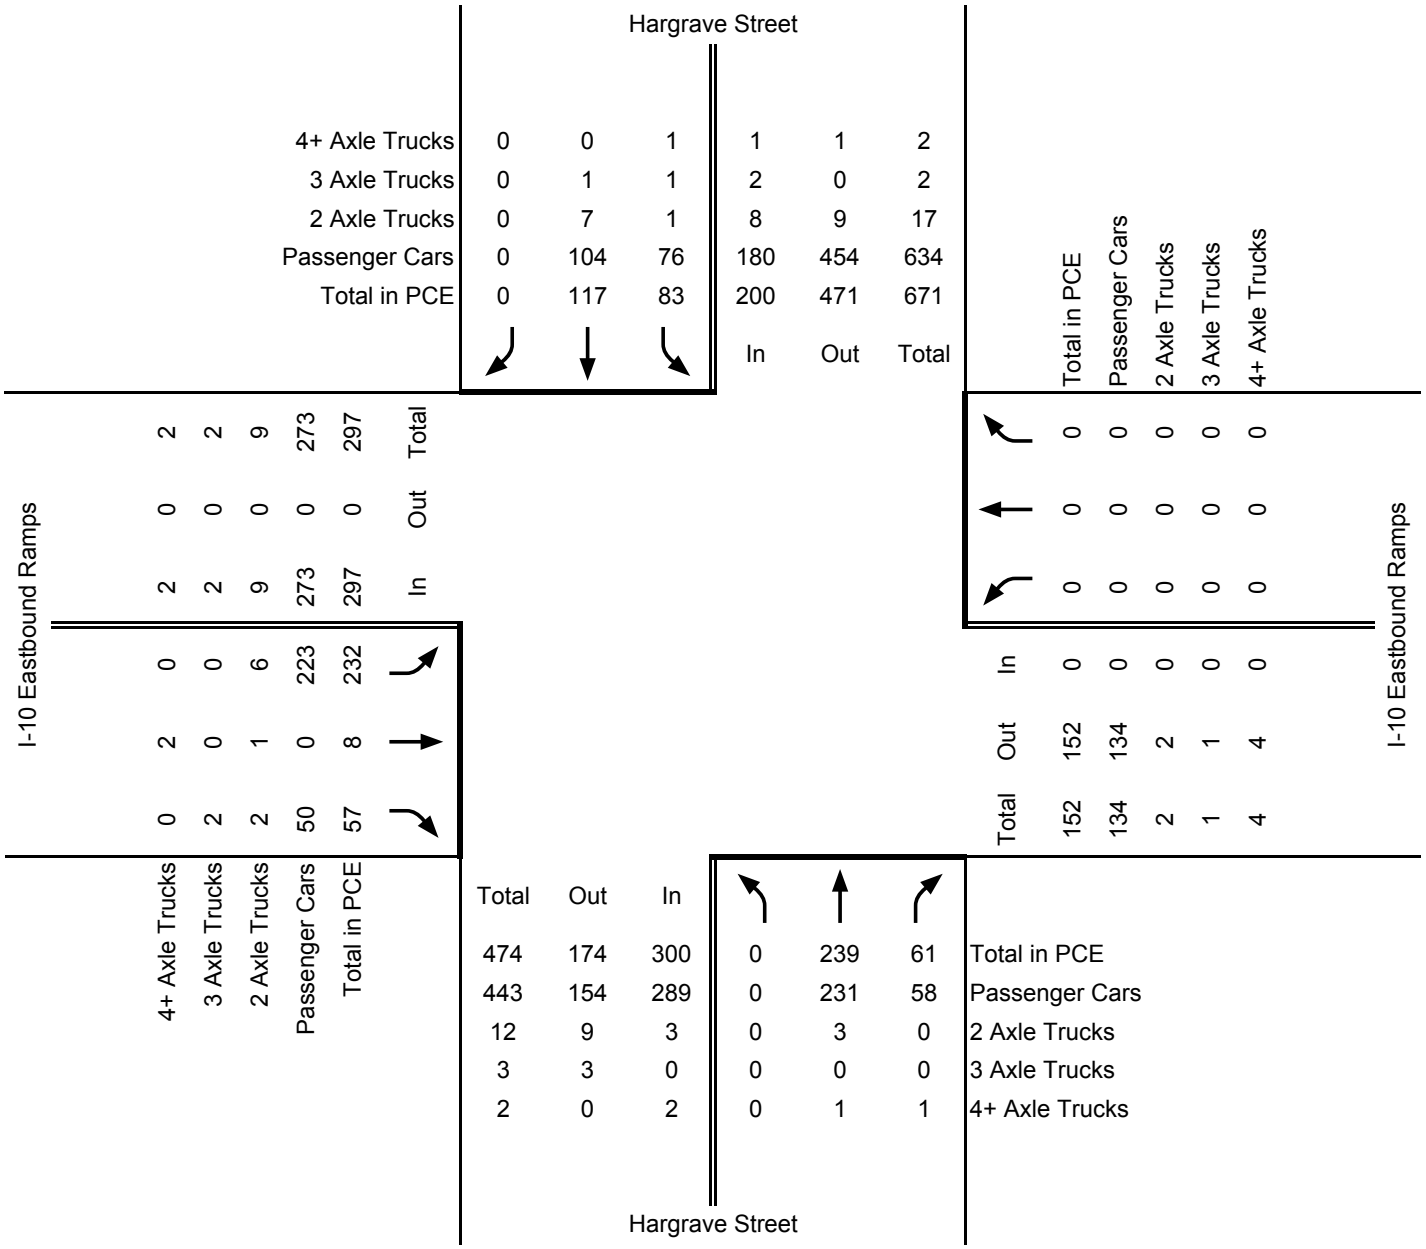
4+ Axle Trucks = 3 PCE

3. Hargrave Street / I-10 Eastbound Ramps

Count Date: 1/31/2017
Peak Hour: 7:15-8:15 AM
PHF: 0.776

PCE Factors

Passenger Cars = 1 PCE



2 Axle Trucks = 1.5 PCE

3 Axle Trucks = 2 PCE

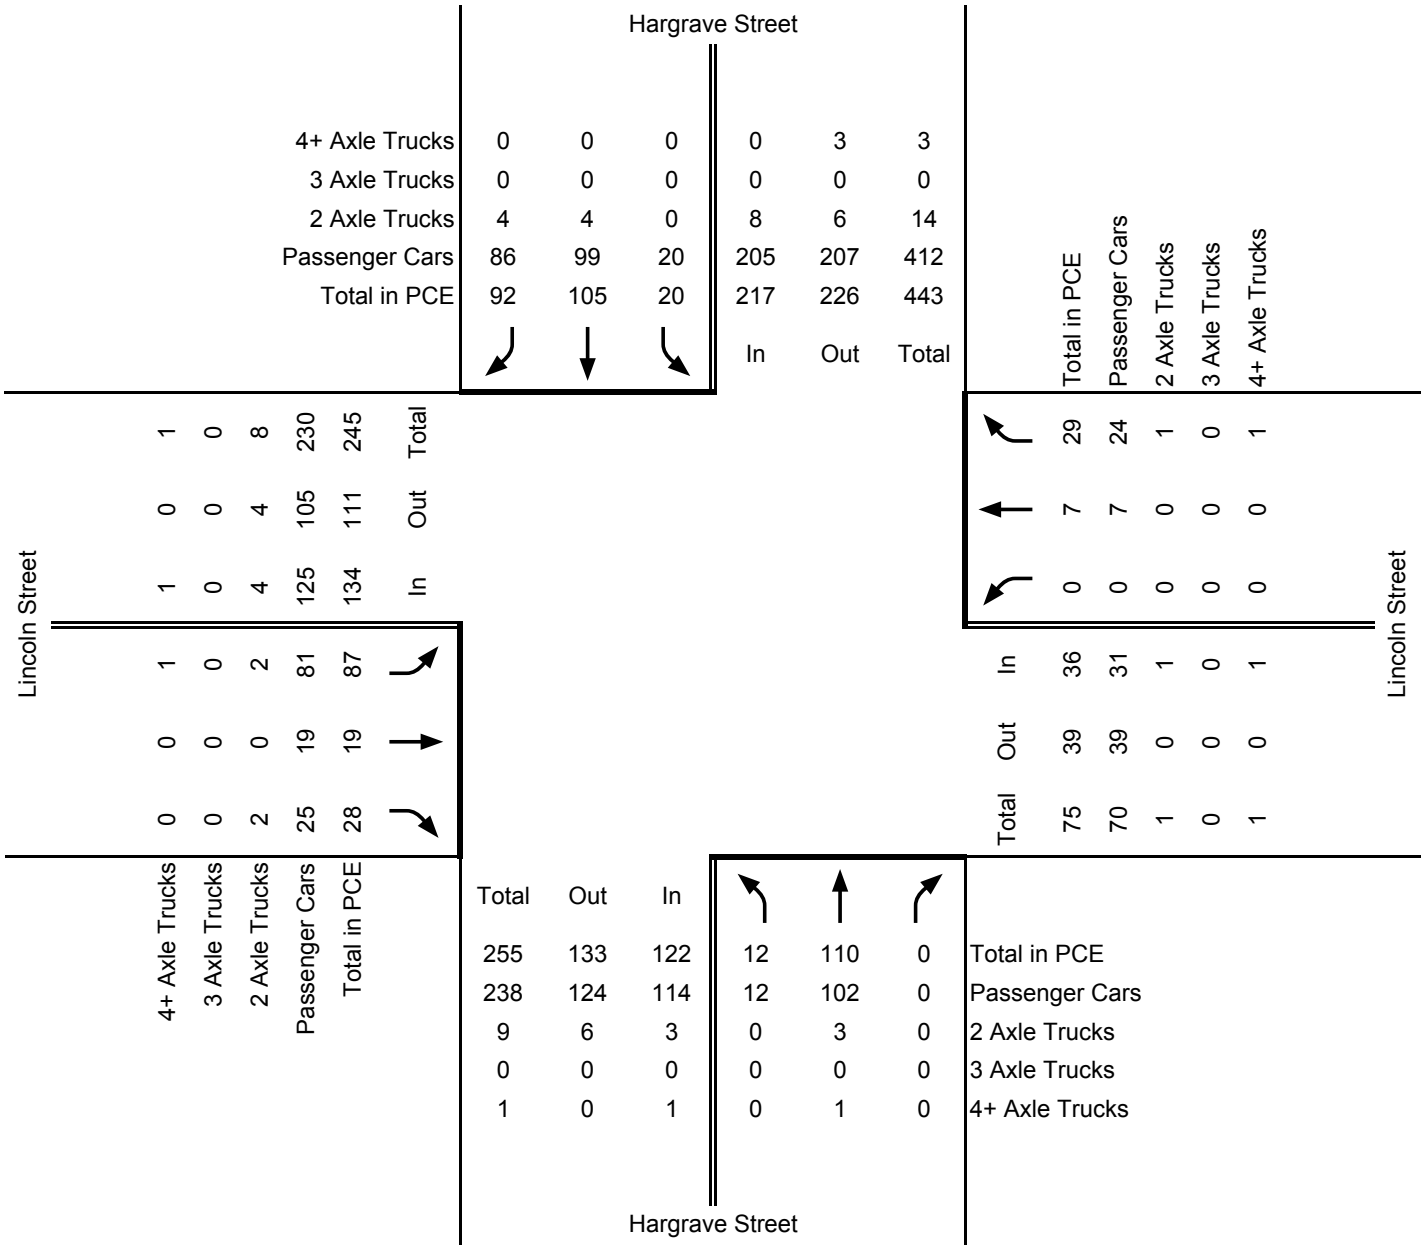
4+ Axle Trucks = 3 PCE

3. Hargrave Street / I-10 Eastbound Ramps

Count Date: 1/31/2017
Peak Hour: 4:00-5:00 PM
PHF: 0.876

PCE Factors

Passenger Cars = 1 PCE



2 Axle Trucks = 1.5 PCE

3 Axle Trucks = 2 PCE

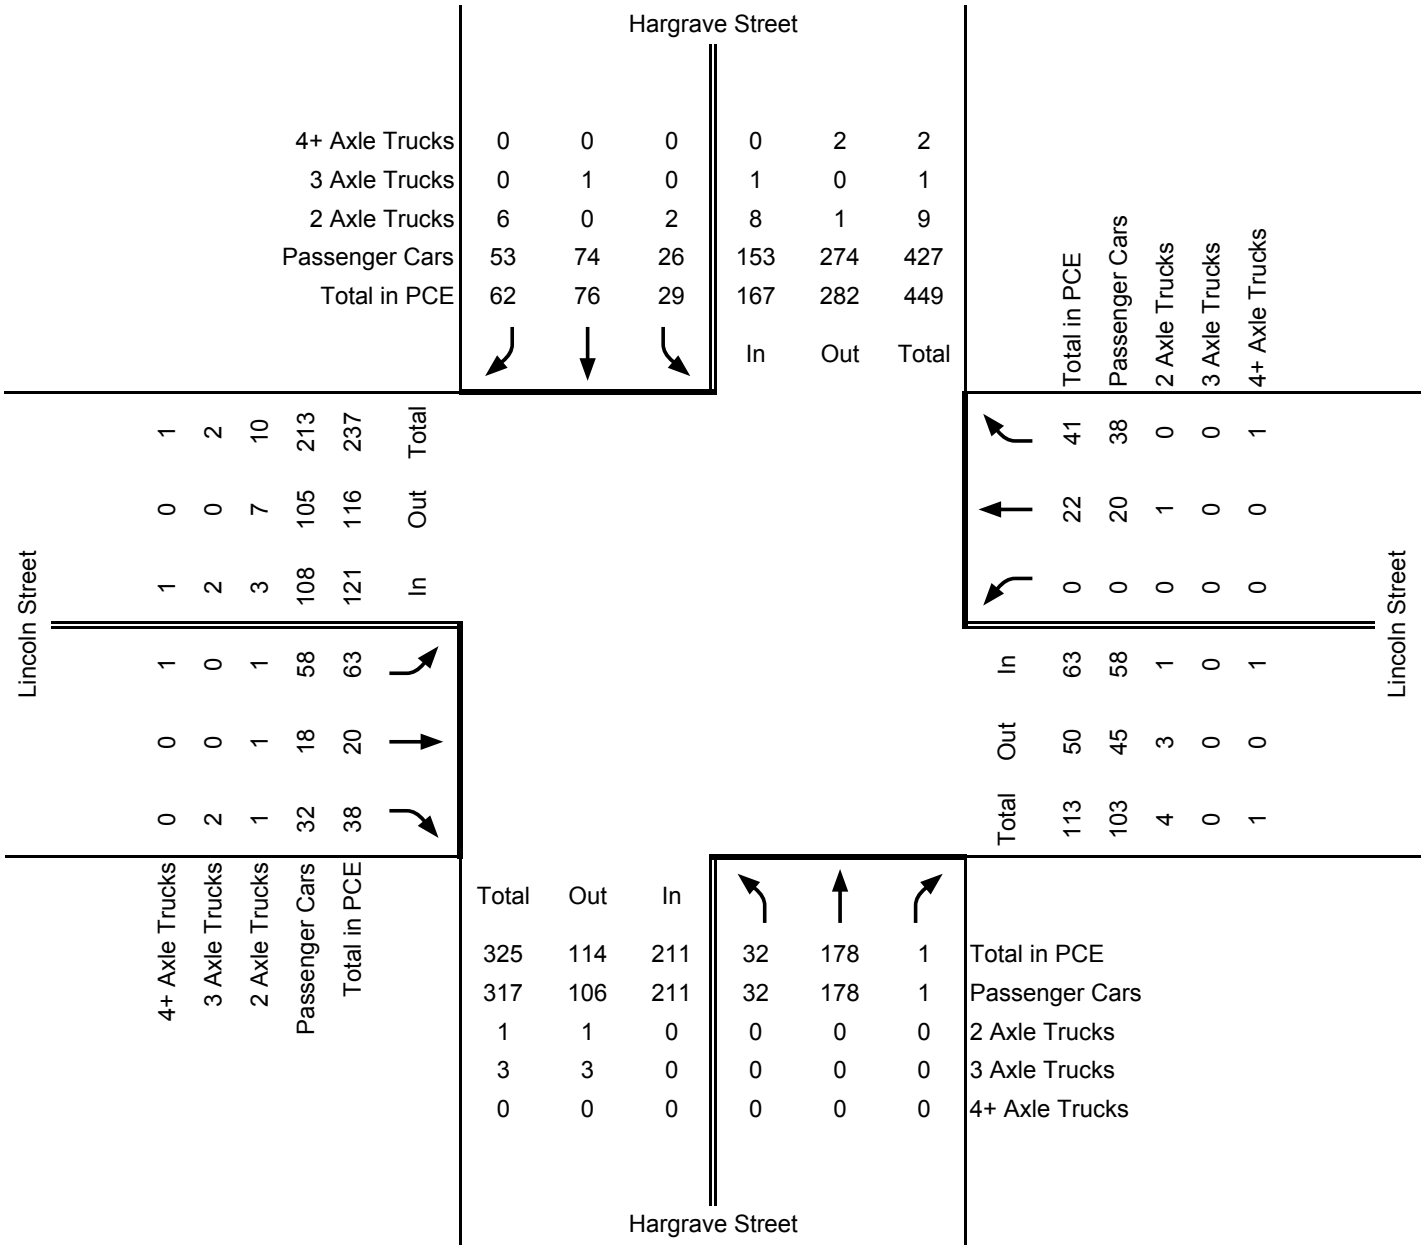
4+ Axle Trucks = 3 PCE

4. Hargrave Street / Lincoln Street

Count Date: 1/31/2017
Peak Hour: 7:00-8:00 AM
PHF: 0.710

PCE Factors

Passenger Cars = 1 PCE



2 Axle Trucks = 1.5 PCE

3 Axle Trucks = 2 PCE

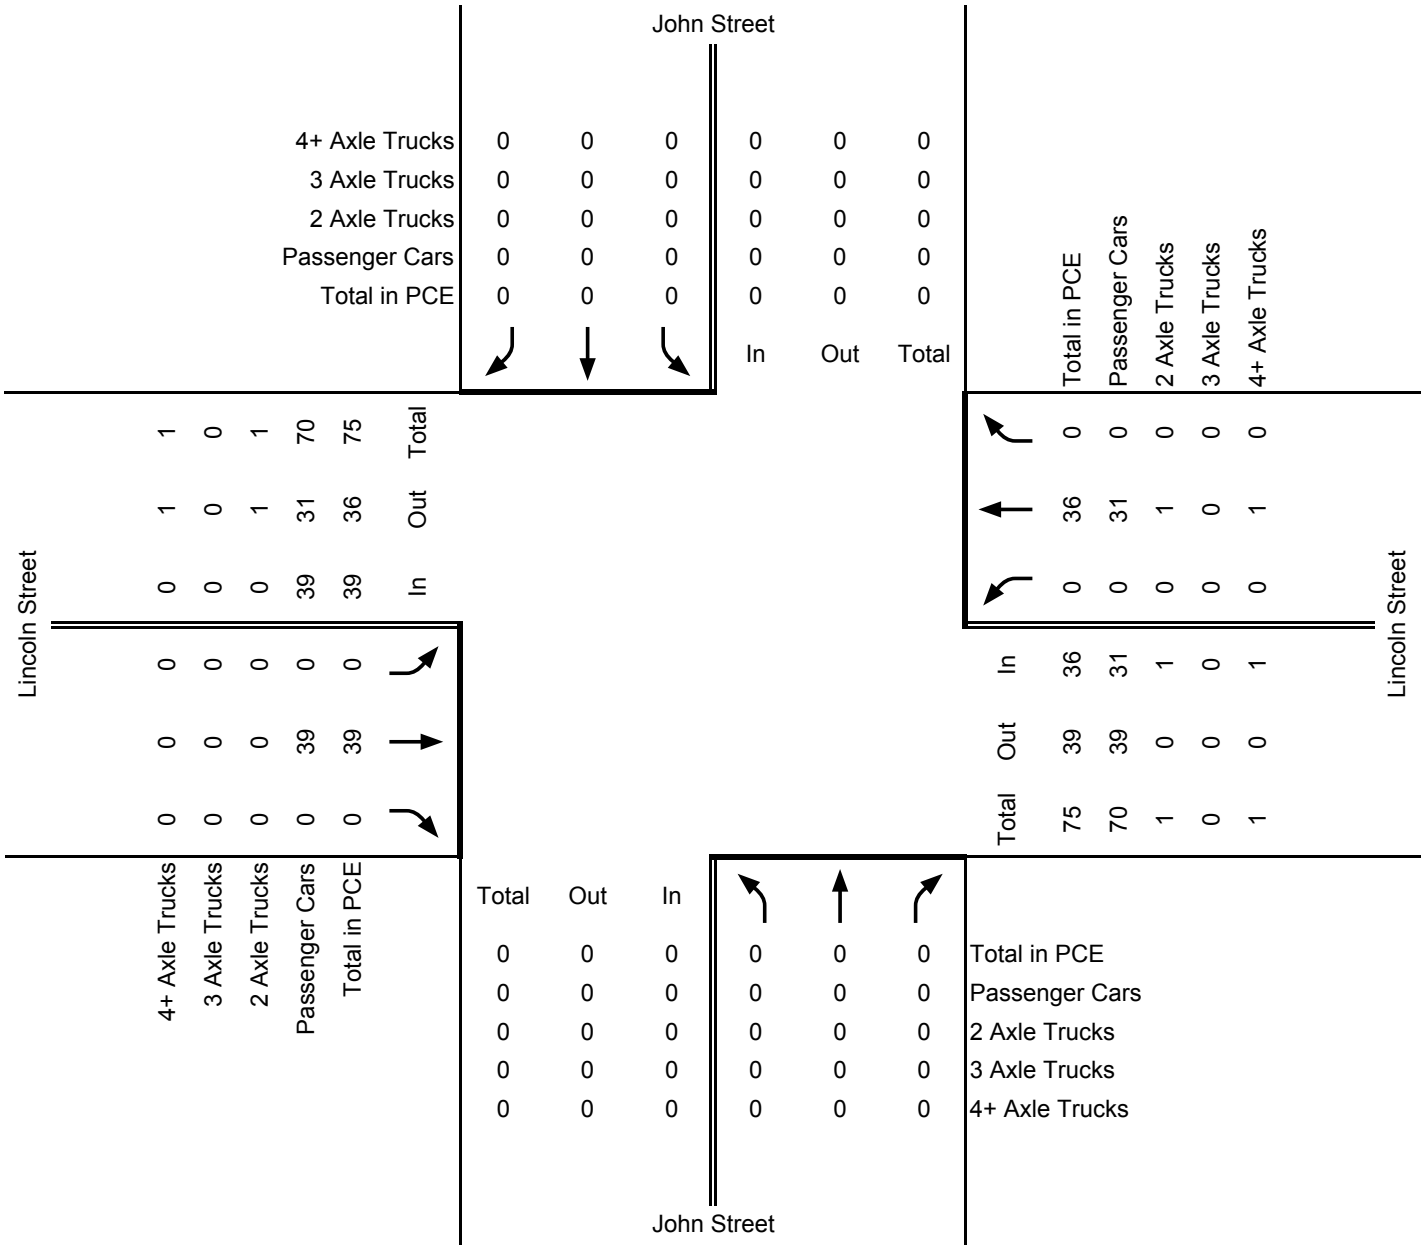
4+ Axle Trucks = 3 PCE

4. Hargrave Street / Lincoln Street

Count Date: 1/31/2017
Peak Hour: 4:00-5:00 PM
PHF: 0.894

PCE Factors

Passenger Cars = 1 PCE



2 Axle Trucks = 1.5 PCE

3 Axle Trucks = 2 PCE

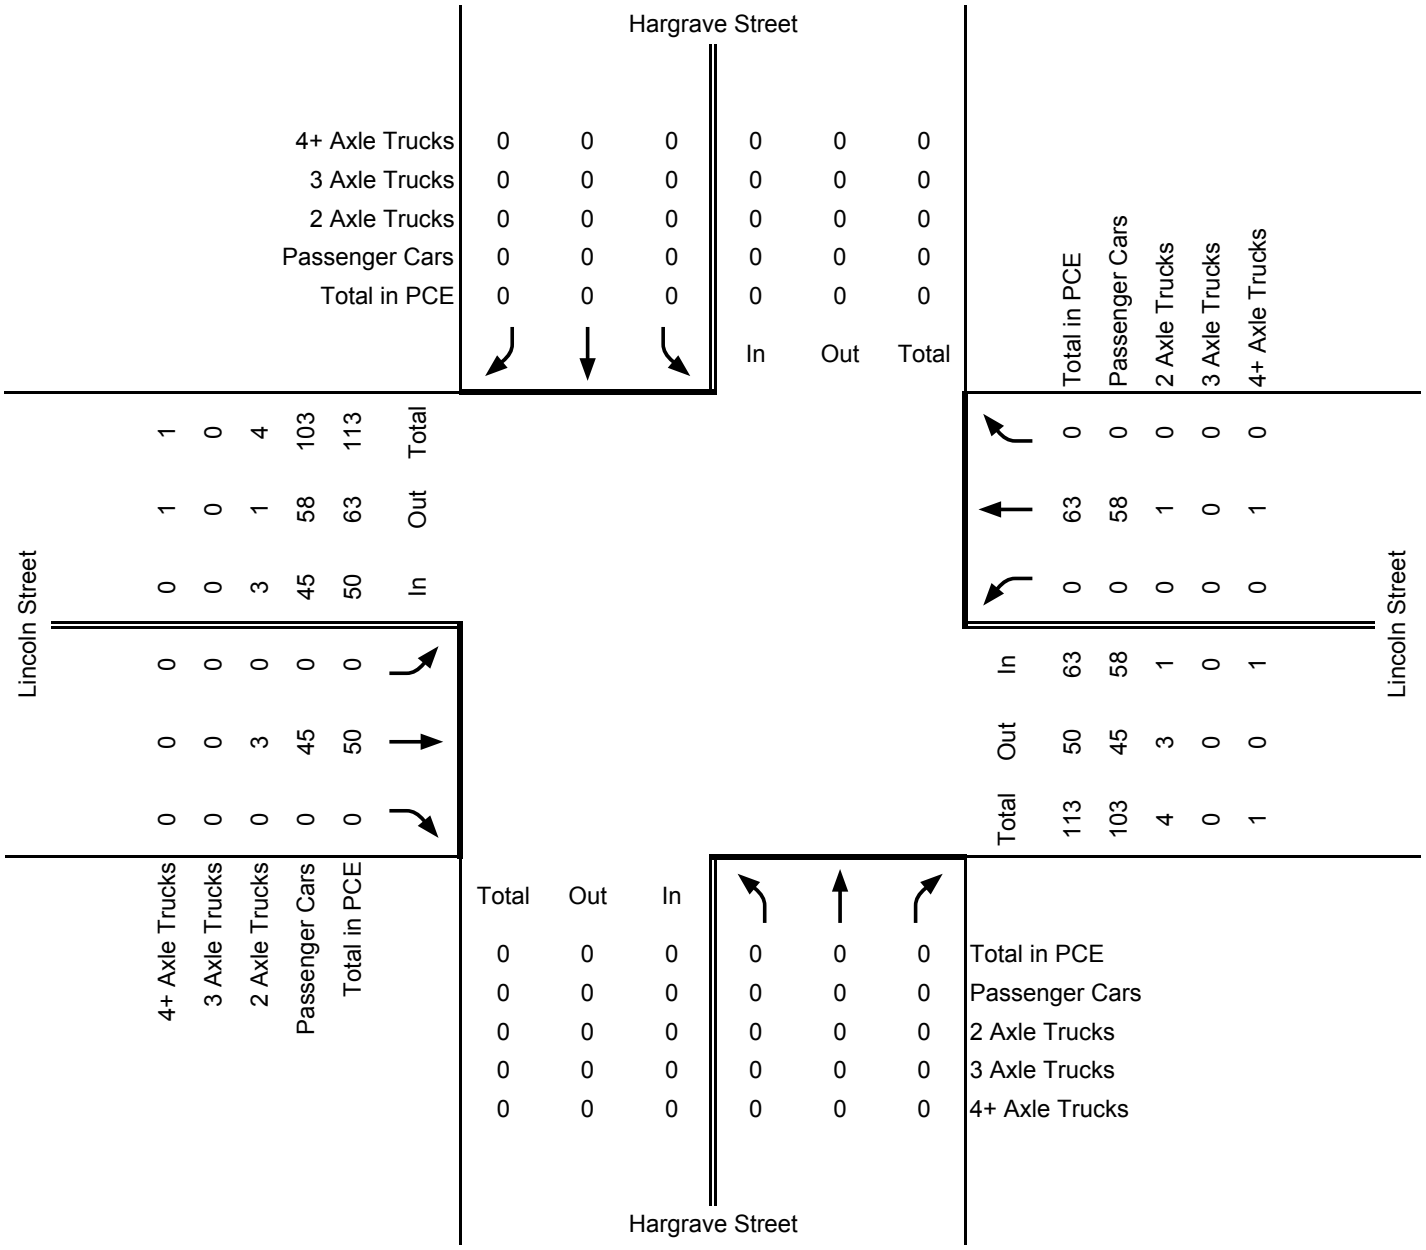
4+ Axle Trucks = 3 PCE

5. John Street / Lincoln Street

Count Date: 1/31/2017
Peak Hour: 7:00-8:00 AM
PHF: 0.920

PCE Factors

Passenger Cars = 1 PCE



2 Axle Trucks = 1.5 PCE

3 Axle Trucks = 2 PCE

4+ Axle Trucks = 3 PCE

5. Hargrave Street / Lincoln Street

Count Date: 1/31/2017
Peak Hour: 4:00-5:00 PM
PHF: 0.894

PCE Factors

Passenger Cars = 1 PCE

2 Axle Trucks = 1.5 PCE

3 Axle Trucks = 2 PCE

4+ Axle Trucks = 3 PCE

Table 1 – Total Construction-Related Fuel Consumption

Banning Distribution Center

Fuel	Consumption	
Diesel		
On-Road Construction Trips[1]	119,356	Gallons
Off-Road Construction Equipment[2]	67,476	Gallons
Diesel Total	**186,832**	**Gallons**
Gasoline		
On-Road Construction Trips[1]	198,436	Gallons
Off-Road Construction Equipment[3]	-	Gallons
Gasoline Total	**198,436**	**Gallons**

Notes:

1. On-road mobile source fuel use based on vehicle miles traveled (VMT) from CalEEMod for construction in 2019 and fleet-average fuel consumption in gallons per mile from EMFAC2014 web based data for SCAQMD's jurisdiction. See Table 2 for calculation details.
2. Off-road mobile source fuel usage based on a fuel usage rate of 0.05 gallons of diesel per horsepower (HP)-hour, based on SCAQMD CEQA Air Quality Handbook, Table A9-3E.
3. All emissions from off-road construction equipment were assumed to be diesel.

Table 2 – On-Road Construction Trip Estimates

Banning Distribution Center

Trip Type	Trips	Trip length	Vehicle Miles Traveled (VMT)	Fuel Efficiency	Annual Fuel Usage[1]	
	(trips)	(miles)	(miles)	(mpg)	(Fuel)	(gallon)
Worker[2,3]	321,016	14.7	4,718,935	23.2	Gasoline	198,436
Vendor[4]	119,704	6.9	825,958	7.3	Diesel	118,707
Hauling - Offsite [5,6]	188	20	3,760	5.8	Diesel	649
Hauling - Site Prep[5,7]	1,288	11.5	14,812	5.8	Diesel	2,557

Notes:

1. On-road mobile source fuel use based on vehicle miles traveled (VMT) from CalEEMod output (DEIR Appendix B) for all years of construction and fleet-average fuel consumption in gallons per mile from EMFAC2014 web based data for 2019 in the South Coast Air Quality Management District (SCAQMD) to ensure a conservative analysis.
2. Worker trips were assumed to be 100% gasoline powered vehicles.
3. Per CalEEMod, worker Trips were assumed to be 50% LDA, 25% LDT1, and 25% LDT2.
4. Vendor trips were assumed to be 50% MHDT and 50% HHDT, split evenly between the MHDT and HHDT construction categories.
5. Per CalEEMod, hauling trips were assumed to be 100% HHDT.
6. Trips from off-site infastructure hauling trips.
6. Trips from site preperation debris hauling. Hauling Distance was assumed per Landfill at 11.5 miles from Project site.

Table 3 – Annual Energy Consumption from Operation

Banning Distribution Center

Fuel Type	Energy Consumption	Units	Natural Gas	Units
Electricity				
Building[1]	1,482,500	kWh/year	**2,030,000**	kBTU/yr
Water[2]	151,333	kWh/year		
Total Electricity	**1,633,833**	kWh/year		
Mobile[3]				
Gasoline	**714,550**	gallons/year		
Diesel	**1,554,697**	gallons/year		

Notes:

1. Building electricity use from CalEEMod output (DEIR Appendix B) based on 2016 Title 24 and includes mitigation for high efficiency lighting.
2. Calculated based on the CalEEMod SCAQMD energy intensity of 0.0111 kWhr per gallon for supply, distribution, and treatment of water and the Project's annual water consumption. Indoor water use will be reduced by 20% per CalGreen building code.
3. Mobile source fuel use based on annual vehicle miles traveled (VMT) from CalEEMod output for operational year 2020 and fleet-average fuel consumption in gallons per mile from EMFAC2014 web based data for the South Coast Air Quality Management District.
