3. Entitlement of The Banning Water Company (City of Banning) to "…divert from the natural flow of San Gorgonio River, or from its underground storage in San Gorgonia [sic] Canyon as provided for in [the two previously mentioned entitlements], or in part from both of said sources, through the Main Stone Lined Conduit of said Banning Water Company's system, and through various ditches and pipe lines leading thereto hereinafter mentioned, a total of 14,000 acre-feet per annum - priority March 17, 1875…and said total quantity of water to be diverted at such times and at such rates throughout the year as may be necessary in order that said Banning Water Company may adequately supply the requirements of water for domestic, stock watering and irrigation purposes within the territory which it serves as hereinabove described…and the requirements of water for domestic and municipal purposes within the city of Banning" (pp. 9-10 of Appendix F).

In the same 1928 proceedings, the State determines that, "Banning Water Company, Banning Heights Mutual Water Company and San Gorgonio Power Company are the owners of the paramount right to divert water from the South Fork of Whitewater River through the Consolidated Reservoir and Power Company Canal…" (p. 17). The three entitlements listed above are reiterated in a December 1938 proceeding that determined the relative rights of various claimants to the waters of the Whitewater River and its tributaries (Riverside County Superior Court, case no. 18035), a copy of which is provided in **Appendix G** (refer to pp. 28-36).

- **Imported water from SGPWA:** Annual water order request form.

An expanded discussion that is required for groundwater supplies by SB 610 is located in Section 4 – Groundwater Analysis.

Water Supply Capacities

The capacity of a supply system differs from the available supplies or safe yield in that "capacity" presents the maximum output possible. For example, the capacity of the City's groundwater wells refers to a pumping rate based on running the pumps at full utilization, 24-hours a day, 7 days a week. Although this maximum rate of pumping is assumed in terms of comparing capacities, groundwater pumps are rarely used at more than two-thirds capacity. Knowing the system capacity is important to ensure the City can meet all demands imposed upon the system, specifically meeting "average day demand" and "maximum day demand." Demand can be met with multiple supply sources, storage, or a combination of both. The City's reservoirs are not considered part of the City's supply in this Assessment, however, they are used to regulate hourly fluctuations in demand, provide fire flow, and supplement supply during an extended outage of a source (Appendix A, section 7.1.2).

As the City land uses and population change, so will the average and maximum day demands. The City is required to meet the following water supply criterion from the California Code of Regulations: "a source of supply equal to one maximum day demand, with one average day demand from local sources." Based on 2015 data, the maximum day demand for the City is currently estimated at 30 AF per day (6,788.6 gpm, Appendix A p. 7-3).

The estimated pumping capacities of the City's (active) well field are provided below in **Table 3-5**. The adjudicated/estimated safe yields for each Storage Unit are included to compare with the pumping capacities. Per the criterion described previously, the City's source of supply as of 2015 meets and exceeds the maximum day demand, all from local sources (i.e., existing wells).

Table 3-5: Existing Pumping Capacity for City

Source	Number of Active Wells	Nominal Capacity (gpm) [a]	Safe Yield (AFY) [d]
Beaumont Basin	5	4,650	2,097 (City's portion in 2015) [c]
	3 equally shared with BCVWD	3,000 [b]	
Banning	4	3,500	1,130 (estimated)
Cabazon	1	900	2,515 (estimated)
Banning Bench	3	3,650	1,960 (estimated)
Banning Canyon	8	8,600	4,070 (estimated)
Total	**21 (plus 3 equally shared)**	**24,300**	**11,773**

Notes: Data from Appendix A, Sec. 5.1.1-5.1.5.
(a) "gpm" is gallons per minute. Capacities are design capacities based on historical water use records.
(b) Combined nominal capacity of the three wells is 6,000 gpm, half of which is allotted to the City.
(c) From Appendix H, Table 3-7. Banning's portion in 2015 is 31.43% of the Appropriative Water (unused overlying water) estimated in 2010.
(d) Estimated safe yields for Banning, Banning Bench, and Banning Canyon storage units come from Appendix I (p. 45), calculated as the average of two methods of calculating maximum perennial yield: Zero Net Draft Method (the average annual groundwater production over a selected period of time when the average groundwater elevation is the same), and the Hill Method (production for an average water level change of zero). Due to limited data, Cabazon was calculated differently using the equation of hydrologic equilibrium.

Notably, the pumping capacity for the Beaumont Basin in **Table 3-5** does not include any of the production rights the City has to water that is banked in their Beaumont Basin storage account, which was most recently measured at the end of 2016 at 49,990.8 AF according to the 2016 (draft) Watermaster Annual Report (Appendix H, p. 3-10).

In the event of an emergency, the City can nearly meet the current maximum day demand of 30 AF (6,788.6 gpm) with its suite of emergency backup systems. Seven of the City's active wells are equipped with emergency generators or other backup

systems in the event of a power outage, as shown below in **Table 3-6**. If additional supply is needed in an emergency, portable generators can be obtained to operate other wells and booster stations (Appendix A, p. 7-3). The City also maintains 13 reservoirs currently containing 19.7 million gallons (ibid, p. 7-4).

Table 3-6: City Wells with Emergency Backup Systems

Well No.	Storage Unit	Capacity (gpm)	System Type
1	Banning Bench	1,250	Pelton wheel
3		500	
4	Banning Canyon	600	
5		550	
10		600	Diesel engine drive
C2	Beaumont Basin	1,000	Generator
M12	Banning	950	
	Total	**5,450**	-

Notes: From Appendix A, p. 7-4

The City shares a 12-inch diameter emergency potable water interconnection with BCVWD located at the western boundary of the City's service area, which can be another source of water in the event of an emergency. The interconnection was built in the 1990's so that water can be supplied in either direction between agencies and, according to BCVWD's 2015 UWMP: "The City of Banning's water system pressure zones closely match BCVWD's and mutual exchanges are possible" (Appendix C, p. 6-58). In addition, BCVWD has provided several large pipeline "stub outs" (future points of connection) from their potable water system across Highland Springs Avenue to the City of Banning. BCVWD expects these "stub outs" will be extended through the future Butterfield Specific Plan project (see Section 2, Table 2-1) to connect with the City's potable water system. According to BCVWD, "These interconnections allow Banning to recharge imported [State Water Project water] at BCVWD's groundwater recharge facility and, using the joint wells and the interconnections, extract that water when needed, and convey it to Banning's water system for use" (Appendix C, p. 6-58).

3.3. Descriptions of All Water Supply Projects

City Well Production:

The City of Banning currently owns 21 groundwater wells outright, and shares equal ownership of three additional wells with BCVWD. A study of the maximum perennial yield estimates of the Banning, Banning Bench, Banning Canyon, and Cabazon storage units was commissioned by the City and prepared by Geoscience Support Services, Inc. in 2011. The report estimates the amount of groundwater in storage within the City of Banning water resource area to be approximately 1.1 to 1.2 million AF, although existing wells may not be able to access all of it (Appendix I, p. 23). The report also estimates long-term supply available from the adjudicated Beaumont Basin based on the information available and previous safe yield.

The Beaumont Basin Watermaster has estimated that at the end of 2016, approximately 101,425.0 AF of water is held in storage for each party with a storage account. The City's storage account currently holds 49,990.8 AF (Appendix H, p. 3-10). Pursuant to the Judgment, the City is allowed to pump sufficient water from the Beaumont Basin in order to meet its water demand. Should this amount exceed the City's rights, the Watermaster has an obligation to replenish the overproduction (Appendix I, p.43).

The City has indicated that additional groundwater can be developed from the Cabazon Storage Unit, particularly after the City's WWTP is expanded and upgraded (Appendix A, p. 5-5). The City is currently seeking funding to construct additional groundwater wells and water storage reservoirs (ibid, p. 6-11).

In addition to planning for new wells, the City repairs or replaces facilities as necessary in order to maintain the integrity and reliability of the City's water system. One project that will repair a major component of the City's supply network is currently in the final planning stages. The "Banning Water Canyon Main Replacement Project" will replace portions of the existing Banning Water Canyon main (a riveted steel pipeline that was constructed circa 1927), which conveys potable water from a series of City wells along

the San Gorgonio River (Banning Canyon Storage Unit) to the City's service area (ibid). The City has completed its environmental impact document for the project pursuant to the California Environmental Quality Act (CEQA) and is in the process of obtaining the appropriate permits and approvals from various agencies, including but not limited to: the U.S. Forest Service, U.S. Army Corps of Engineers, California Department of Fish and Wildlife, and the Regional Water Quality Control Board-Colorado River Basin.

The City's water supply for the last five years (groundwater pumped by City wells and imported water from SGPWA) is shown in **Table 3-7.** The City pumped 6,659 AF in 2015 from all five storage units. Notably, the City reduced pumping by approximately 24% between the high of 8,742 AF in 2013 and 2015.

Table 3-7: City Water Production and Purchases, 2011-2015 (AFY)

Storage Unit	2011	2012	2013	2014	2015
Beaumont	1,483	1,170	2,136	2,729	1,675
Banning	1,345	1,260	1,747	1,393	527
Banning Bench	1,319	1,644	1,701	1,001	1,208
Cabazon	499	455	11	787	787
Banning Canyon	3,808	4,046	3,147	2,558	2,462
Sub-Total	**8,454**	**8,575**	**8,742**	**8,468**	**6,659**
Purchased Water from SGPWA	800	1,200	1,200	608	694
TOTAL	**9,254**	**9,775**	**9,942**	**9,076**	**7,353**

Notes: Actual amounts produced. From Appendix A, Tables 5-1 and 5-2.

As of 2015, approximately 91% of the City's water supply came from groundwater, with a majority pumped from the Banning Canyon Storage Unit. The City strives to maximize local water supplies, and minimize the need for imported water. The City does not consider imported water its current or future primary source of water (Appendix A, p. 6-4).

In terms of reliability, the City has not experienced any actual supply deficiencies in its groundwater supply despite the recent five-year drought (Appendix A, p. 6-1). Further, as part of the Beaumont Basin adjudication, the City can store up to 80,000 AF of water in the basin. At the end of 2015, the City's storage account held approximately 47,888 AF (Appendix H, p. 3-10).

The City's water supply projections from 2020 to 2040 are shown in **Table 3-8**, with the City's assumed available supply from SGPWA at 2,718 AFY. Recycled water supply is not included. Compared to the actual supplies historically required by the City in **Table 3-7**, total groundwater supply projections show a 59% increase from 2015 to 2040.

Table 3-8: Projected City Water Supplies, 2020-2040 (AFY)

Source	2020	2025	2030	2035	2040
Beaumont Basin Appropriative Water (Actual quantity to be pumped)[a]	1,266 (840)	1,145 (1,645)	1,029 (2,372)	925 (3,162)	925 (3,643)
Banning Storage Unit	1,130	1,130	1,130	1,130	1,130
Banning Bench Storage Unit	1,960	1,960	1,960	1,960	1,960
Cabazon Storage Unit	2,515	2,515	2,515	2,515	2,515
Banning Canyon Storage Unit	4,070	4,070	4,070	4,070	4,070
Sub-Total	**10,941**	**10,820**	**10,704**	**10,600**	**10,600**
Purchased SWP water from SGPWA [a]	2,718	2,718	2,718	2,718	2,718
Total	**13,659**	**13,538**	**13,422**	**13,318**	**13,318**

Notes: From Appendix A, Table 5-4.
(a) From Appendix A, Table 5-3. Shown for comparison only, not part of totals.

Projected supplies from the Beaumont Basin (i.e., Appropriative Water available after overlying producers take their share) are subject to the provisions of the Judgment (see discussion in Section 4) and are expected to vary annually and decrease over time.

However, as shown in **Table 3-8**, the City's projection of the quantities of groundwater pumped from the Beaumont Basin increase with time to meet projected demands by accessing the City's water storage account. The volume projected to be pumped from the Beaumont Basin increases on average by approximately 140 AFY from 2020 to 2040 while the available supply decreases by roughly 17 AFY over the 20-year period.

The City's water supply projections in **Table 3-8** for the other sources (Banning, Banning Bench, Cabazon, Banning Canyon, and imported water) show a consistent supply from 2020 to 2040. These constant supply volumes from the storage units correlate to the estimated safe yield of each storage unit, and the City's assumption on annual imported water availability from SGPWA at 2,718 AFY.

A thorough description of the City's groundwater rights pursuant to SB 610 guidance is provided in Section 4 – Groundwater Analysis.

City Wastewater Effluent Production:

The effluent discharged from the City's wastewater treatment plant (WWTP) is currently treated to secondary standards and is then discharged to percolation ponds that recharge the Cabazon Storage Unit. The City currently does not produce effluent that meets the threshold for recycled water that can be distributed for irrigation and other beneficial uses. Therefore, the City is planning an upgrade of the WWTP with the addition of tertiary treatment facilities, as well as an expansion by 2025 from a treatment capacity of 3.6 million gallons per day (MGD) to 5.1 MGD.[5]

After completion of the WWTP upgrades, the City would have recycled water to distribute for beneficial uses, which is estimated at 1,680 AFY. This would be in addition to continuing the use of percolation basins. The City's 2006 Recycled Water Master Plan estimated the demand for recycled water at that time to be 2,700 AFY

[5] Parsons Corp. for City of Banning, *Water Reclamation Facility Preliminary Draft Pre-Design Report* (July 2007) and *90% Design Plans for 1.5 MGD Water Reclamation Facility Expansion Project* (April, 2008) (Available from City of Banning Public Works Dept.).

(Appendix A, p. 5-12). Although the demand for recycled water may exceed the supply, distribution is limited by the network of recycled water pipelines.

The actual 2015 volume of wastewater collected, treated and then percolated, as well as the projected volumes of recycled water are shown in **Table 3-9**.

Table 3-9: Current and Projected Recycled Water (AFY)

Level of Effluent Treatment and Use	2015	2020	2025	2030	2035	2040
	Actual	Projected				
Secondary (percolation)	2,207	2,869	1,409	1,607	1,823	2,039
Tertiary (irrigation)	0	0	1,680	1,680	1,680	1,680
Total	**2,207**	**2,869**	**3,089**	**3,287**	**3,503**	**3,719**

Notes: From Appendix A, Tables 5-5 and 5-6.

According to DWR, recycled water is wastewater that has been treated to a specific quality to enable it to be used again (2015 UWMP Guidebook Appendices, Appendix M). For the purposes of the 2015 UWMPs, DWR considered the term "recycled water" to include the various levels of secondary, tertiary, and advanced treatment that are described in Title 22 of the California Code of Regulations. Therefore we have included recycled water in the supply projections as shown in **Table 3-10**.

Table 3-10: City Water Supply Projections with Recycled Water 2020-2040 (AFY)

Supply Source	2020	2025	2030	2035	2040
Beaumont Basin Appropriative Water Allocation	1,266	1,145	1,029	925	925
(Actual quantity to be pumped)	(840)	(1,645)	(2,372)	(3,162)	(3,643)
Banning Storage Unit	1,130	1,130	1,130	1,130	1,130
Banning Bench Storage Unit	1,960	1,960	1,960	1,960	1,960
Cabazon Storage Unit	2,515	2,515	2,515	2,515	2,515
Banning Canyon Storage Unit	4,070	4,070	4,070	4,070	4,070
Purchased SWP water from SGPWA	2,718	2,718	2,718	2,718	2,718
Sub-Total [a]	**13,659**	**13,538**	**13,422**	**13,318**	**13,318**
Recycled Water -Tertiary (irrigation)	0	1,680	1,680	1,680	1,680
Total [B]	**13,659**	**15,218**	**15,102**	**14,998**	**14,998**

Notes:
(a) Does not include the estimated actual production from the City's storage account in the Beaumont Basin shown in parenthesis in Table 3-8.
(b) Does not include secondary effluent in percolation basins because supply from Cabazon basin is already accounted for in table.

Recycled water is a widely recognized reliable source of water for a growing list of beneficial uses. The City expects future use of recycled water to increase and offset potable water demand. Currently, an integrated master plan for water, wastewater and recycled water is being prepared by the City and a professional consulting firm.

Imported Water Supplies from SGPWA

Current infrastructure limits SGPWA to importing a maximum of approximately 11,000 AFY. The Agency is in the process of completing the "Phase 2 of the East Branch Extension" project (or "EBX 2") that will provide the infrastructure necessary to import

the entire Table A allocation of 17,300 AFY when it is available, plus additional supplies (Report, 2015). With additional imported water, the Agency has started construction on the "Beaumont Avenue Recharge Facility" that includes a new connection to the East Branch Extension (EBX) and a new pipeline that conveys the water to a new recharge facility. This new facility will enable storage of imports received during wet years to use during dry years ("conjunctive use").

In addition, SGPWA and Valley District have recently constructed improvements to the existing EBX, an expansion of the Crafton Hills Reservoir from 90 AF to 135 AF, and a bypass line to continue delivering water in the event the Crafton Hills Reservoir is out of service. Lastly, the Agency is considering purchasing capacity in the Valley District's proposed Bunker Hill Conjunctive Use Project, which would enable the Agency to store imports in the Bunker Hill Basin during wet years and deliver to retail agencies in dry years.

SGPWA has put a financial plan in place to purchase additional supplemental water supplies from various sources. One of the sources of revenue for this financial plan is a recently adopted capacity fee on new growth in the Agency's service area. (Appendix D, p. 3-12). In order to collect the capacity fee, the Agency has to sign cooperative agreements with retail water agencies or land use planning agencies within its service area. In areas where SGPWA can collect the fee, the Agency has stated that it can assure its retail customers that it will have the financial resources to procure needed additional water supplies.

Although SGPWA has other financial resources to procure additional water for these areas as needed, a cooperative agreement with Banning may be needed as the City grows. However, the size of the proposed Project is such that a cooperative agreement would not be necessary to meet its water demands, in addition to existing City demands.

3.4 Documenting Normal Year Supply and Demand for City of Banning

According to DWR, a "normal" or "average" year can be a single year or averaged range of years that most closely represents the average water supply available to the agency (2015 UWMP Guidance, p. 7-4). The City interpreted this to mean, "one year in the historical sequence that most closely represents median runoff levels and patterns" (Appendix A, p. 6-5). Based on that assumption, the representative normal year for the City was 2001 (ibid, p. 6-7). The City has assumed in the 2015 UWMP that supply reliability will remain constant during normal, single dry, and multiple dry precipitation years, due to reliance on groundwater (ibid, p. 6-6). This assumption will be reassessed by the City in the next UWMP.

The normal year supply available to the City and the normal year demand projections from Section 2 are compared in **Table 3-11**.

Table 3-11: Projected Normal, Single Dry and Multiple Dry Year Supply and Demand (AFY)

	2020	2025	2030	2035	2040
Supply[a]	13,659	13,538	13,422	13,318	13,318
Demand[b]	10,515	11,320	12,047	12,837	13,629
Difference	**3,144**	**2,218**	**1,375**	**481**	**-311**

Notes: Does not include supply or demand for recycled water. Same as Tables 6-4, 6-5, and 6-6 in Appendix A.
(a) See Table 3-8 herein.
(b) See Table 2-3 herein.

Based on the methodology in the City's 2015 UWMP, surplus supply will be available during a normal (or "average") year between 2020 and 2039. A deficit in supply appears beginning in 2040 under normal year conditions. The 2015 UWMP also projected a deficit beginning in 2040 and provided this discussion in response (p. 6-8):

Although projected supply totals are less than projected demand totals for 2040, the City has 46,774 AF [2014 Watermaster Annual Report, which has been updated to 49,990.8 in 2016 draft Watermaster Annual Report] *of stored water in its Beaumont Basin storage account, which is not accounted for in the projected supply totals. Therefore, the City has ample water supplies to meet projected demands through 2040.*

3.5 Documenting Single Dry Year Supply and Demand for City of Banning

A "single dry year" is defined by DWR as, "the year that represents the lowest water supply available to the agency" (2015 UWMP Guidance, p. 7-4). The City interpreted this to mean "the lowest annual runoff for a watershed" (Appendix A., p. 6-5). Based on that assumption, the representative single dry year for the City was 2007 (ibid, p. 6-7). Again, the City assumes that supply will not change during normal, single dry, and multiple dry precipitation years, due to reliance on groundwater. Therefore, the projected water supplies and customer demands for a single dry year would be the same as shown in **Table 3-11** (Appendix A, p. 6-8).

The City has determined in its 2015 UWMP that surplus supply will be available during a single dry year that could occur anytime from 2020 to 2039, with a deficit in supply beginning in 2040. However, because of the groundwater storage account maintained in the Beaumont Basin, the City expects to have sufficient supplies to meet demand through 2040.

3.6 Documenting Multiple Dry Year Supply and Demand for City of Banning

A "multiple dry year" sequence is defined by DWR as, "the period that represents the lowest average water supply availability to the agency for a consecutive multiple year period (three years or more)" (2015 UWMP Guidance, p. 7-5). The City interpreted this to be defined as, "the lowest average runoff for a consecutive multiple year period (three years or more)" (Appendix A, p. 6-5). Based on that assumption, the representative multiple dry year period for the City was 2012 to 2014 (ibid, p. 6-7). Again, the City assumes that supply will not change during normal, single dry, and

multiple dry precipitation years, due to reliance on groundwater. Therefore, the projected water supplies and customer demands for a multiple dry year period would be the same as shown in **Table 3-11** (Appendix A, p. 6-8).

The City has determined in its 2015 UWMP that surplus supply will be available during a multiple dry year that could occur anytime from 2020 to 2039, with a deficit in supply beginning in 2040. However, because of the groundwater storage account maintained in the Beaumont Basin, the City expects to have sufficient supplies to meet demand through 2040 despite a three-year drought.

3.7 Comparison of Banning's Projected Supply and Demand

As explained previously in Section 2, the annual water demand for the Banning Distribution Center is estimated at 47 AFY. This would increase the current industrial water demand 50% from 92 AFY to 139 AFY, and require the City to revise industrial water demand projections accordingly in the 2020 UWMP update.

To reiterate, California Water Code Section 10910(c)(2) states:

> *If the project water demand associated with the proposed project was accounted for in the most recently adopted urban water management plan, the public water system may incorporate the requested information from the urban water management plan in preparing the elements of the assessment required to comply with subdivisions (d), (e), (f), and (g).*

The City has provided guidance for this Assessment to combine the commercial and industrial demand projections together for comparison with the Project's estimated water demand. Therefore, the Project's water demand has been included in the City's demand projections for commercial/industrial properties.

Because the supply and demand comparisons shown in **Table 3-11** do not include the actual quantity estimated by the City in their 2015 UWMP to be pumped from the Beaumont Basin, pursuant to their storage account production rights, the resulting estimated supply is less than realistically available. This results in a calculated deficit in

supply shown in 2040. Supply availability in the future will have to take into account the recalculation of the Beaumont Basin safe yield in 2024, any new estimates of safe yield from the other storage units that may be done in the future, or any change in the supplies of imported water and recycled water.

In conclusion, the City of Banning projected water supply (potable, recycled and groundwater held in storage) that is available during normal, single dry, and multiple dry water years during a 20-year projection will meet the projected water demand associated with the Banning Distribution Center Project, in addition to the City's existing and planned future uses including agricultural and manufacturing uses.

This Page Intentionally Blank

SECTION 4 - GROUNDWATER ANALYSIS

As discussed in Section 3, groundwater is the primary source of supply for the City of Banning, which will provide the water supply for the proposed Banning Distribution Center. SB 610 requires specific groundwater information to be included in the Assessment if groundwater will be a source of water for the proposed project.

Law

Water Code Section 10910 (f): *If a water supply for a proposed project includes groundwater, the following additional information shall be included in the water supply assessment:*

(1) A review of any information contained in the urban water management plan relevant to the identified water supply for the proposed project.

(2) A description of any groundwater basin or basins from which the proposed project will be supplied. For those basins for which a court or the board has adjudicated the rights to pump groundwater, a copy of the order or decree adopted by the court or the board and a description of the amount of groundwater the public water system, or the city or county if either is required to comply with this part pursuant to subdivision (b), has the legal right to pump under the order or decree. For basins that have not been adjudicated, information as to whether the department has identified the basin or basins as over drafted or has projected that the basin will become over drafted if present management conditions continue, in the most current bulletin of the department that characterizes the condition of the groundwater basin, and a detailed description by the public water system or the city or county if either is required to comply with this part pursuant to subdivision (b), of the efforts being undertaken in the basin or basins to eliminate the long-term overdraft condition.

(3) A detailed description and analysis of the amount and location of groundwater pumped by the public water system, or the city or county if either is required to comply with this part pursuant to subdivision (b), for the past five years from any groundwater basin from which the proposed project will be supplied. The description and analysis shall be based on information that is reasonably available, including, but not limited to, historic use records.

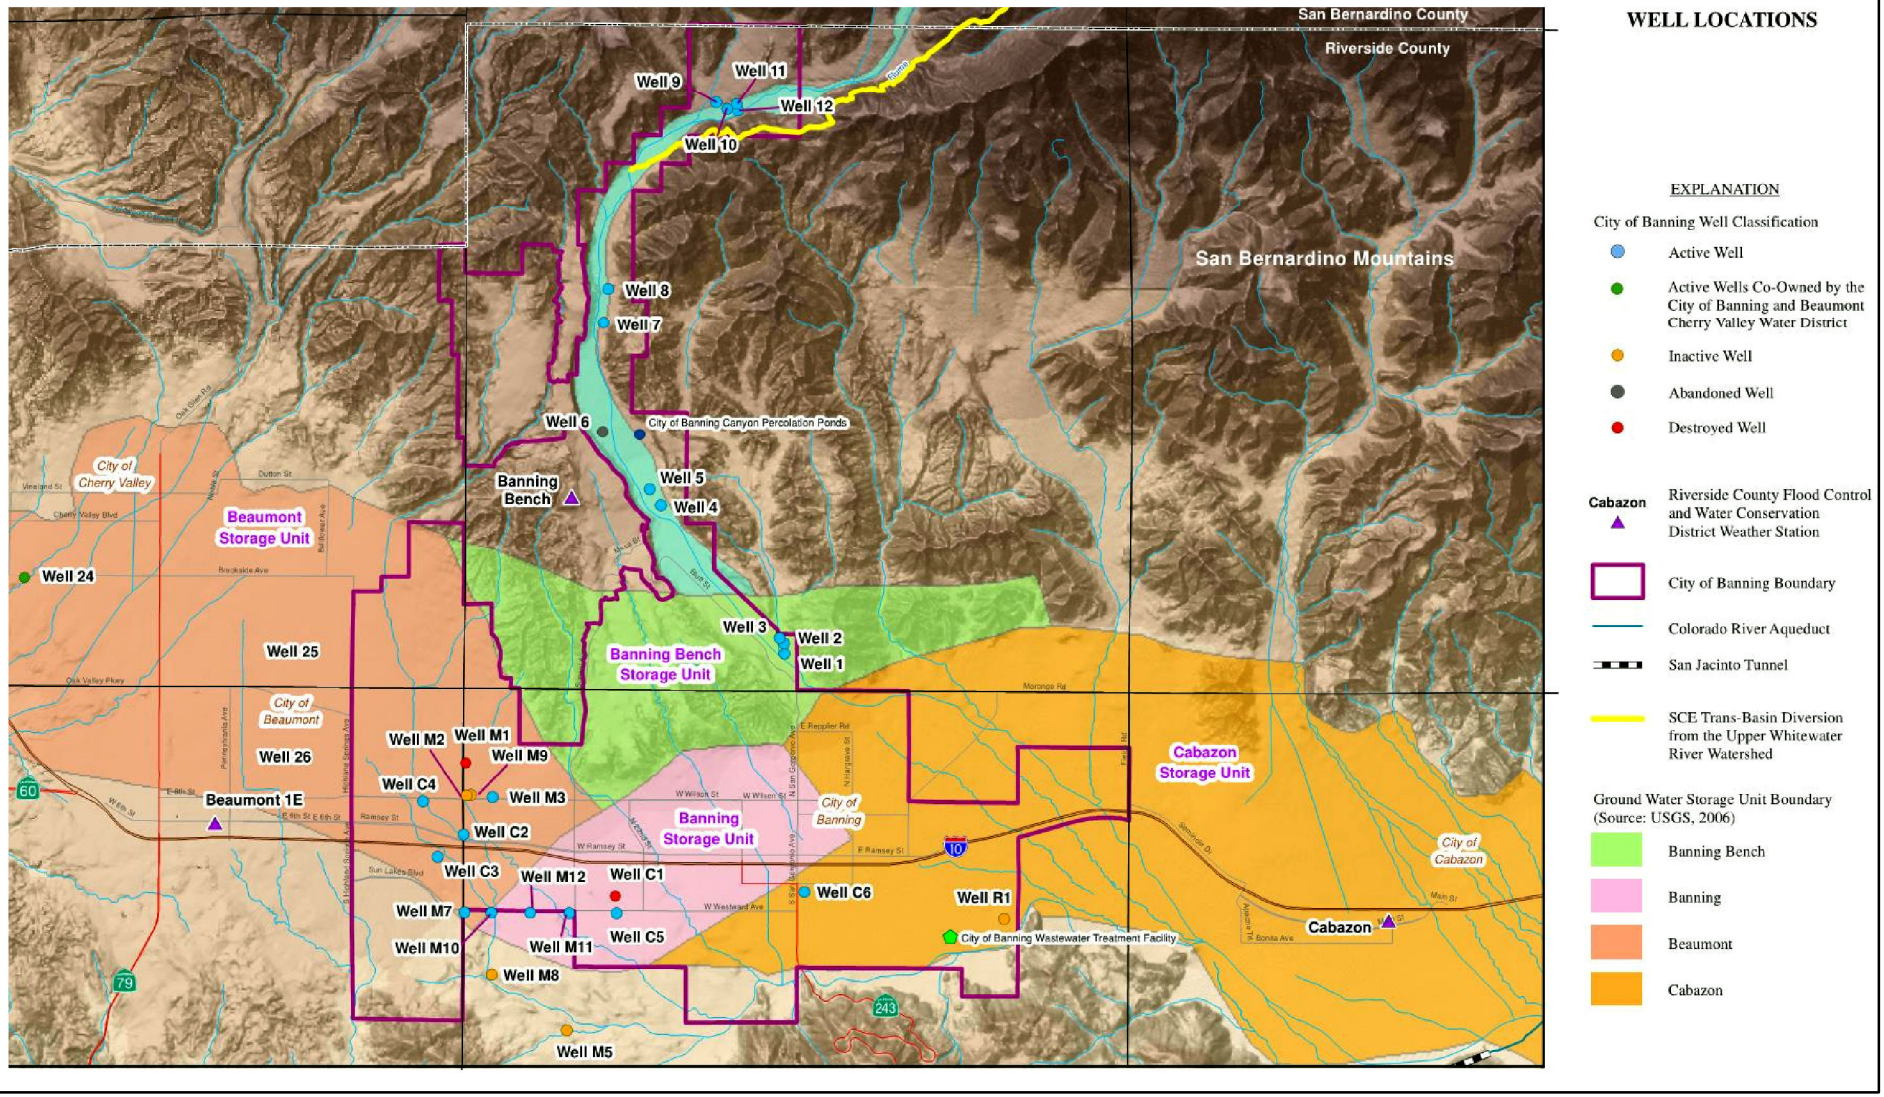
(4) A detailed description and analysis of the amount and location of groundwater that is projected to be pumped by the public water system, or the city or county if either is required to comply with this part pursuant to subdivision (b), from any basin from which the proposed project will be supplied. The description and analysis shall be based on information that is reasonably available, including, but not limited to, historic use records.

(5) An analysis of the sufficiency of the groundwater from the basin or basins from which the proposed project will be supplied to meet the projected water demand associated with the proposed project. A water supply assessment shall not be required to include the information required by this paragraph if the public water system determines, as part of the review required by paragraph (1), that the sufficiency of groundwater necessary to meet the initial and projected water demand associated with the project was addressed in the description and analysis required by paragraph (4) of subdivision (b) of Section 10631.

4.1 Review of Urban Water Management Plan (CWC Section 10910 (f)(1))

The *2015 Urban Water Management Plan* (UWMP), prepared by Krieger & Stewart Engineering Consultants on behalf of the City of Banning was adopted by the City Council by Resolution 2016-10 UA on June 14, 2016. The UWMP includes information relevant to the identified water supply for the proposed project and is incorporated herein (Appendix A). This information includes: current and projected water demands (*System Water Use*) through year 2040; a description of the various groundwater basins (*System Water Supplies*); the reliability of the water supply, projected supply

and demand comparisons, and water shortage plans (*Water Supply Reliability* and *Water Shortage Contingency Planning*); and water demand management efforts (*Demand Management Measures*).[1]



4.2 Groundwater Basin Descriptions (CWC Section 10910 (f)(2))

The City of Banning is underlain by a portion of the San Gorgonio Pass Subbasin of the greater Coachella Valley Groundwater Basin (Basin 7-021.04). The whole of the Subbasin is approximately 38,650 acres (60 square miles) in size and bounded on the north of the San Bernardino Mountains and on the south by the San Jacinto Mountains. The western boundary is defined by a surface drainage that divides the Colorado River and South Coast Hydrologic Study Areas,[2] and the eastern boundary is formed by bedrock constriction that creates a groundwater cascade into the adjacent Indio Subbasin. In 1987, the California Department of Water Resources (DWR) estimated the total storage capacity of the Subbasin at 2.2 million acre-feet (MAF) and the volume held in storage at 1.4 MAF (Bulletin 118, updated 2/27/14).[3]

The westerly half of the San Gorgonio Pass Subbasin includes five hydraulically-connected groundwater storage units (or "basins"), which constitute the City of Banning water resource area.[4] The City extracts water from wells located in the following storage units as shown on **Figure 4-1**:

- Banning Storage Unit;
- Banning Bench Storage Unit;
- Banning Canyon Storage Unit;
- Beaumont Storage Unit; and
- Cabazon Storage Unit.

[1] Words and phrases italicized parenthetically reference chapters so titled in the City's 2015 UWMP.
[2] Also defines the boundary between the Santa Ana River RWQCB and the Colorado River Basin RWQCB.

Figure 4-1 - City of Banning Well Locations

Banning Distribution Center

Not to Scale

ALBERT A. WEBB ASSOCIATES

The Beaumont, Banning Canyon and Cabazon Storage Units have active recharge activities through the use of recharge basins. Other sources of recharge include precipitation and subsurface inflow from storage unit to storage unit.

Banning Storage Unit Description

The Banning Storage Unit is approximately 2,489 acres (4 square miles) in size and underlain by alluvial sediments, with bedrock occurring to the north at the base of the San Bernardino Mountains (Appendix A, p. 5-5). According to a 2011 study by Geoscience Support Services, Inc. (provided in Appendix I), the average saturated thickness in the basin was 600 feet, with an effective porosity of 15-17%, and an estimated storage volume between 211,000 to 240,000 AF (p. 24).

The Banning Storage Unit is not adjudicated and the City is the only remaining large water user in the unit, after acquiring the Mountain Water Company. The City currently operates four groundwater production wells within the Banning Storage Unit, which have a combined nominal pumping capacity of 3,500 gallons per minute (gpm, *ibid*). One of the wells in this storage unit has an emergency generator with pumping capacity of 950 gpm (Appendix A, Table 7-1).

The safe yield of the Banning Storage Unit has been estimated by Geoscience (2011) at 1,130 acre-feet per year (AFY), using historical production data from 1992 to 2010 and groundwater elevations from 2003 to 2009 (Appendix I, Figs. 12, 13).[5] According to the 2015 UWMP, the City has assumed this safe yield rate as the projected annually available water supply from the Banning Storage Unit from 2020 to 2040 (Appendix A, Table 5-4), which are expected to be consistent regardless of any future drought conditions (Appendix A, Table 6-2). In 2015, the City pumped 527 AFY from this unit, or roughly 8% of its total groundwater production (Appendix A, Table 5-2).

[5] Production analysis of three groundwater storage units were provided in the geohydrologic study: *Maximum Perennial Yield Estimates for the Banning and Cabazon Storage Units, and Available Water Supply from the Beaumont Basin* prepared by Geoscience, dated March 29, 2011. Included herein as Appendix I.

Banning Bench Storage Unit Description

The Banning Bench Storage Unit is approximately 3,573 acres (6 square miles) in size with a considerably smaller estimated volume of groundwater in storage compared to the other storage units, of 1,200 AF to 1,500 AF. The average saturated thickness was estimated in 2011 to be about 30 feet with an effective porosity of 15-17%. (Appendix I, p. 24).

The City currently operates three groundwater production wells within the unit, which have a combined pumping capacity of 3,650 gpm (Appendix A, p. 5-7). Like the Banning Storage Unit, the Banning Bench Storage Unit is not adjudicated. The City and Banning Heights Mutual Water Company rely on this storage unit to serve a portion of their respective water demands. During an emergency, two of the City's wells in this storage unit have the ability to produce a combined maximum rate of 1,750 gpm without electricity using Pelton wheels (Appendix A, Table 7-1).[6]

The safe yield of the Banning Bench Storage Unit was estimated by Geoscience (2011) to be 1,960 AFY using historical production and groundwater elevation data from 1979 to 2009 (pp. 35-36). According to the 2015 UWMP, the City has assumed this safe yield rate as the projected available water supply from the Banning Storage Unit from 2020 to 2040 (Appendix A, Table 5-4), which are expected to be consistent regardless of any future drought conditions (Appendix A, Table 6-2). In 2015, the City pumped 1,208 AFY from this unit, or roughly 18% of total production (Appendix A, Table 5-2).

Banning Canyon Storage Unit Description

The Banning Canyon Storage Unit is approximately 1,058 acres (2 square miles) in size and is mostly comprised of Banning Canyon where the San Gorgonio River flows intermittently out of the San Gorgonio Mountains (Appendix A, p. 5-7). From 12,000 to 13,500 AF of groundwater is estimated in storage, with an average saturated thickness of 161 feet and effective porosity of 15-17% (Appendix I, p. 24).

[6] A Pelton wheel allows pumping to occur without electricity but instead with the pressure in the system as long as upstream wells are pumping.

Recharge also occurs within the canyon through the diversion of the Whitewater River, which began in 1913. Spreading ponds/infiltration basins have been created adjacent to the river bed to facilitate infiltration when surface flow is present. The basins are un-gauged and as such, there has been no recordation of the volume of water infiltrated (Appendix I, p. 23). After Banning Heights Mutual Water Company (BHMWC)[7] extracts their allotment of water from the Whitewater River diversion, the City can access the remainder in the groundwater.

The City currently operates eight groundwater production wells within the Banning Canyon Storage Unit, which have a combined pumping capacity of 8,600 gpm (*ibid).* Three of the wells in this storage unit have the ability to produce water in an emergency; two with Pelton wheels and one diesel engine drive (Appendix A, Table 7-1). Using the backup systems, these wells would have a pumping capacity of 1,750 gpm (*ibid)*.

The safe yield of the Banning Canyon Storage Unit has been estimated by Geoscience (2011) at 4,070 AFY using groundwater elevation and well production data from 1984 to 2000 (Appendix I, Figs. 16,17). According to the 2015 UWMP, the City has assumed this safe yield rate as the projected available water supply from the Banning Storage Unit from 2020 to 2040 (Appendix A, Table 5-4), which are expected to be consistent regardless of drought conditions (Appendix A, Table 6-2). In 2015, the City pumped 2,462 AFY from this unit, or roughly 37% of total production (Appendix A, Table 5-2).

Beaumont Storage Unit Description

The Beaumont Storage Unit (aka Beaumont Basin) is the second largest of the five storage units at approximately 12,480 acres (20 square miles). The Beaumont Basin was adjudicated by the Riverside County Superior Court in 2004 as a result of a friendly lawsuit to establish water rights and develop a storage program for the basin.

[7] Banning Heights Mutual Water Company serves 200 domestic water connections with storage and treatment facilities (www.bhmwco.com).

A copy of the Judgment is provided in Appendix E.[8] A court-appointed Watermaster Committee was established consisting of representatives from each of the five appropriators (Cities of Banning and Beaumont, BCVWD, South Mesa Water Company, and Yucaipa Valley Water District). Other stipulated users include 17 overlying users, consisting of individuals, golf courses/resorts, poultry farmers, private companies, and a church. The Watermaster carries out the provisions of the Judgment including monitoring of the basin and files an annual report on pumping and replenishment.[9]

The following is a summary description of the Beaumont Basin Judgment from Langridge et al., 2016): [10]

> *Parties to the judgment entered into agreements with the Watermaster to store 260,000 AF in the basin. The safe yield of the basin, estimated at 8,650 AFY, was distributed to overlying users who only incurred water replacement charges if they pumped more than five times their share of the safe yield over a five-year period. Allocation to the five appropriative users included any portion of the safe yield available after overlying users satisfied their needs. If they pumped more than their allotment they also had to pay to replace that water. Appropriators were allocated an additional "temporary surplus" totaling 160,000 AF from 2004-2013 to satisfy their needs, with some to be stored in the basin for future use. The temporary surplus is no longer available…*

The safe yield of the Beaumont Basin was reevaluated as required by the Judgment ten years after issuance.[11] As of April 3, 2015, the safe yield available to all parties was

[8] Beaumont Basin Judgment: *San Timoteo Watershed Management Authority v. City of Banning et al., Stipulation for Entry of Judgment Adjudicating Groundwater Rights in the Beaumont Basin, Case No. RIC 389197, Superior Court of California in and for the County of Riverside.*
[9] All Watermaster documents can be accessed on the Web site: http://www.beaumontbasinwatermaster.org/
[10] Ruth Langridge, Abigail Brown, Kirsten Rudestam and Esther Conrad, 2016, *An Evaluation of California's Adjudicated Groundwater Basins, Report for the State Water Resources Control Board.* Available at http://groundwater.ca.gov/docs/UCSC_Adjudicated_Groundwater_Basins_Report_FINAL.pdf.

determined to be 6,700 AFY, which is a 23% decrease from the original estimate of 8,650 AFY.[12] The "temporary surplus" is no longer allowed and appropriators are permitted to extract only the amount each has in storage and their proportionate share of Appropriative Water (Appendix A, p. 5-4).

The Watermaster determines on an annual basis the amount of groundwater to which each producer is entitled without incurring a replenishment obligation. The City of Banning's share of the safe yield is currently 31.43% of the Appropriative Water, which is the amount left after the Overlying Users have taken their share. For example, in 2016 the City's proportion of Appropriative Water was equivalent to 2,099.1 AF and according to Watermaster records the City pumped 1,472.7 AF in 2016 or about 70% of their allocation. For comparison, in 2015 the City pumped 80% of their allocation in the Beaumont Basin (2,097.5 AF, Appendix H, Table 3-8). Overtime, as Overlying Users increase the amount of water used, the City of Banning's share is expected to decline.

The City of Banning purchases imported water from the local wholesaler, San Gorgonio Pass Water Agency (SGPWA), for recharge of the Beaumont Basin at BCVWD's recharge facility (Appendix H, p. 3-6). In 2015, the City recharged 694 AFY of imported water at this location (Appendix A, Table 5-1). Again, the City can credit this recharge volume to its storage account for future withdrawal. Future recharge rates (and available supply from SGPWA) are estimated by the City to be 2,718 AFY based on an unsigned draft agreement with the SGPWA (*ibid*, p. 5-4).[13]

As of December 31, 2015, the total storage allowed in the Beaumont Basin stands at 280,000 AF; the City of Banning can store up to 80,000 AF (Appendix H, p. 2-7). At the end of calendar year 2016, the City had approximately 49,990.8 AF in its storage account or 62% of capacity, based on the draft 2016 Watermaster Report provided in

[11] The Beaumont Basin Watermaster Committee adopted a report entitled, "Final 2013 Reevaluation of the Beaumont Basin Safe Yield" prepared by Thomas Harder & Co. in association with Alda, Inc. on April 1, 2015 as part of Resolution No. 2015-01.
[12] Judgment (2004) defines Safe Yield as, "The maximum quantity of water which can be produced annually from a Groundwater Basin under a given set of conditions without causing a gradual lowering of the groundwater level leading eventually to depletion of the supply in storage."
[13] A copy of the draft agreement could not be obtained for this Assessment.

Appendix H (p. 3-10). The volume held in the Beaumont Basin storage account is notable because of its size and that it is not accounted for in the City's projected supplies. The City only includes in its supply projections their estimated proportion of Appropriative Water, not the actual volume that could be pumped since the City will only pump that volume which is required to meet demands. The Beaumont Basin storage account is of such size that hypothetically, it could provide enough water to meet 2015 demand (approximately 6,700 AFY) for roughly seven years.

The City currently operates five groundwater production wells in the Beaumont Basin that have a combined capacity of 4,650 gpm (Appendix A, p. 5-3). One of the wells has an emergency generator with pumping capacity of 1,000 gpm (Appendix A, Table 7-1).

The City shares equal ownership in three additional water production wells in the Beaumont Basin with Beaumont Cherry Valley Water District (BCVWD) in accordance with an agreement dated December 23, 2003 (Appendix B). The wells have a combined capacity of 6,000 gpm, of which the City is allotted half. Therefore, the City's total pumping capacity in the Beaumont Basin is 7,650 gpm (Appendix A, p. 5-3).

Cabazon Storage Unit Description

The Cabazon Storage Unit is the largest of the five storage units at approximately 17,215 acres (27 square miles). As such, the estimated volume in storage ranges from 880,000 to 1,000,000 AF, with an average saturated thickness of 350 feet and effective porosity of 15-17% (Appendix I, p. 24).[14]

The Cabazon Storage Unit is not adjudicated. The City currently operates one groundwater production well in this unit, which has a pumping capacity of 900 gpm (Appendix A, p. 5-5). This well is not yet equipped with emergency back-up features to allow production during a power outage (*ibid*, p. 7-1).

[14] Notably, the volume of storage is approximate as the depth to basin bottom was not observed in wells ranging from 500 to 1,200 feet below ground surface during the preparation of the Geoscience, 2011 report (Appendix I, p. 24).

The safe yield of the Cabazon Storage Unit has been estimated by Geoscience (2011) at 2,515 AFY using an alternate method than the other non-adjudicated storage units discussed previously. Because of limited long-term pumping and groundwater elevation data, Geoscience used a water budget approach that estimates the average annual change in storage based on all the inflow and outflow to the storage unit (1,805 AFY), which was then added to the average production from the City's well (710 AFY) (Appendix I, pp. 29, 45).

Natural recharge of the Cabazon Storage Unit is supplemented by the City of Banning with percolation ponds containing the treated effluent of the City's wastewater treatment plant (WWTP). The City plans to achieve tertiary treatment with an upgrade and expansion of the plant facilities by 2025 (p. 5-12). The City estimates that 1,680 AFY of tertiary-treated recycled water will then be made available for irrigation purposes (and offset an equal amount of potable water demand) and no longer applied to recharge the Cabazon Storage Unit (*ibid*, p. 5-6). The remaining secondary effluent, which is projected to increase with increased development, will be used for recharge purposes.

Based on the findings of the hydrogeologic study by Geoscience (2011), the City plans to more than double groundwater production in the Cabazon Storage Unit from 787 AFY pumped in 2015 to the estimated safe yield of 2,515 AFY by 2020 (Appendix A, p. 5-8). The City assumes consistent reliability at this rate of extraction through 2040 regardless of drought conditions (*ibid*, Table 6-2).

Storage Unit Summary

A summary of the groundwater produced in 2015 from each storage unit, the estimated future production levels, the forms of water right and pertinent notes for each are provided in **Table 4-1.**

Table 4-1: City Groundwater Production and Rights Summary

Storage Unit	2015 Production (AFY)	Future (AFY)	Form of Right	Notes
Banning	527	1,130	Non-adjudicated basins	Safe yield 1,130 AFY (estimated)
Banning Bench	1,208	1,960		Safe yield 1,960 AFY (estimated)
Cabazon	787	2,515		Safe yield 2,515 AFY (estimated)
Banning Canyon	2,462	4,070	Appropriative	Safe yield 4,070 AFY (estimated)
Beaumont	1,675	31.43% of unused overlying production	Appropriative	Total safe yield 6,700 AFY
Beaumont Basin Storage Account	694 (SWP water)	2,718 (SWP water)	Water order request	Actual is variable.
	47,888 AF in storage	Up to 80,000 AF can be stored	Groundwater Storage Agreement	Tracked by Watermaster, allowed per Judgment.

4.3. Historic Use of Groundwater (CWC Section 10910 (f)(3))

Banning's groundwater supply comes from their 21 (and 3 shared) active groundwater wells located throughout their service area. The annual groundwater production rate since 2000 from all groundwater storage units available to the City is listed below in **Table 4-2**.

Table 4-2: City of Banning Historic Groundwater Production

Calendar Year	Groundwater Produced (AFY)
2000	9,373
2001	9,932
2002	9,691
2003	9,992
2004	9,779
2005	9,212
2006	10,115
2007	10,226
2008	10,225
2009	9,237
2010	8,319
2011	8,454
2012	8,575
2013	8,742
2014	8,468
2015	6,659
Average	**9,187**

Notes: Data from 2000-2010 obtained from City of Banning's 2010 UWMP, Table 4-3. Data from 2011-2015 from Banning 2015 UWMP, Table 5-2 (Appendix A).

4.4. Projected Use of Groundwater by the City (CWC Section 10910 (f)(4))

The proposed Project will receive water from a combination of the City of Banning's groundwater wells. The City's projected groundwater use is dependent upon the cost of extracting, treating and transporting the water to its customers. According to the nominal capacities provided in the 2015 UWMP, the City's current well capacity is estimated at 24,300 gpm. The City of Banning's projected use of groundwater from all five storage units in the San Gorgonio Pass Subbasin is reproduced in **Table 4-3**.

Table 4-3: City of Banning Projected Groundwater Production (AFY)

Storage Unit	2020	2025	2030	2035	2040
Beaumont	840	1,645	2,372	3,162	3,643
(Estimated Proportion of Appropriative Water)	(1,266)	(1,145)	(1,029)	(925)	(925)
Banning	1,130	1,130	1,130	1,130	1,130
Banning Bench	1,960	1,960	1,960	1,960	1,960
Cabazon	2,515	2,515	2,515	2,515	2,515
Banning Canyon	4,070	4,070	4,070	4,070	4,070
Total	**10,515**	**11,320**	**12,047**	**12,837**	**13,318**

Notes: From Table 5-3, Banning 2015 UWMP located in Appendix A. Footnote to this table in UWMP states, "The City plans to pump only those quantities of water needed to meet demands" (p. 5-8).

As shown in the projections of **Table 4-3**, the City plans to increase production within the Cabazon Storage Unit, but the details are not yet known. In addition, the production rate is expected to increase in the Beaumont Basin as the City uses water from its storage account, even though the Appropriative Water is projected to decrease over time.

In addition to production from new future wells, the City of Banning will purchase additional imported water supplies when possible from SGPWA for the purpose of recharging the Beaumont Storage Unit as previously discussed. Similarly, the City plans to upgrade its wastewater treatment plant to produce higher quality effluent that can offset potable irrigation water demand. Currently, the City is preparing to start phased repairs of the Banning "water" Canyon pipeline to eliminate aging infrastructure that is prone to leaks. The pipeline will be relocated onto higher ground to make it less likely to incur damage from the San Gorgonio River and easier to maintain. To help with planning future water supply investments, the City is currently preparing an "integrated master plan" for recycled water, sewer, and potable water projects.

4.5. Sufficiency of Groundwater Basin (CWC Section 10910 (f)(5))

Non-Adjudicated Basins

The amount of water that the City of Banning expects to be available from each of the four non-adjudicated storage units (Banning, Banning Bench, Banning Canyon and Cabazon) is based on a 2011 geohydrologic study that has been accepted by the City and used for planning projections in the most recent UWMP (refer to Geoscience report in Appendix I). The study updated a prior 2009 geohydrologic study by the same firm in the same area but with additional and updated data sources including driller's logs, geophysical borehole logs, historical production data, groundwater elevation data, weather data, pumping tests, wastewater percolation data, water quality data, public and private files and personal communications with local and state agencies (Appendix I, p. 7). The City has therefore determined that the resulting estimated safe yields are the most accurate measurements of available of supplies. The City has also determined that those supplies are currently and will continue to be sufficient to meet demands up to 2040, as shown in the assumptions used in the 2015 UWMP.

Adjudicated Basin

The City of Banning's legal right to pump water in an amount not to exceed its Appropriator Production Rights, except as additional annual Production may be authorized by the provisions of the Physical Solution, is protected by the Judgment as discussed above, and buttressed by a number of programs and projects directed at ensuring the sufficiency of groundwater supplies from the Beaumont Basin. An adjudicated water right has perhaps the most substantial indicia of reliability of any water right that currently exists in California. An adjudicated right is based upon long-term studies whose purpose it is to protect the long-term functionality of the water source. These rights are coordinated in an established and binding manner with all the other users of the Basin and are overseen by the Watermaster Committee which has the authority to mandate and proscribe activities whose purpose is to protect the water source and maximize its long-term beneficial use.

The Watermaster Committee consists of representation from the five appropriators: City of Banning, City of Beaumont, SMWC, YVWD, and BCVWD. The Judgment granted the Watermaster discretionary powers to develop and implement a groundwater management plan for the basin, including water quality and quantity considerations and reflecting the provisions of the Judgment. The Watermaster responsibilities according to the Judgment include the following (summarized from Watermaster 2016 Annual Report in Appendix H, pp. 1-3 to 1-4):

- **Administration** of activities under the Rules and Regulations of the Judgment, originally adopted June 8, 2004, and subsequently amended in 2006 and 2008. The Rules and Regulations establish how the Watermaster accounts for the water resources of the Basin. Watermaster collects replenishment assessments from parties pumping in excess of their pumping right to fund its operations. Each year, Watermaster publishes an Annual Report, which documents production and recharge activities in the Beaumont Basin.
- **Approve Producer Activities** such as recharging water, transferring or exchanging water, storing local water, and storing or recovering supplemental water.
- **Maintain and Improve Water Supply** by determining on an annual basis the amount of groundwater that each producer is entitled to pump without incurring a replenishment assessment. Watermaster is responsible for facilitating and coordinating the acquisition, recharge, and storage of imported water or other local supplemental water to replenish and/or conjunctively manage the Basin to increase local supplies.
    - Supplemental replenishment water can be in the form of recycled water, imported State Water Project water, or other imported water. Replenishment can be accomplished by spreading and percolation, injection, or in-lieu use of surface water or imported water.
- **Monitor and Understand the Basin** by collecting information from producers and other cooperating agencies in order to enhance the knowledge of Basin

function to manage it more effectively. Information collected by the Watermaster includes:

- Water production, water level, and water quality information from the Appropriator Parties;
- Water production and water level information from the Overlying Parties;
- Water level and water quality data collected by local agencies as part of their Maximum Benefit and Monitoring Program[15] for the Beaumont Management Zone; and
- Ground surface elevations from surveys to determine whether ground subsidence may be occurring as a result of over-pumping from the basin.

- **Maintain and Improve Water Quality** by participating in efforts to preserve or enhance the quality of groundwater. Assists regulatory agencies to enforce water quality regulations, including the Maximum Benefit Monitoring Program of the Beaumont Management Zone.
- **Develop and Administer a Well Policy** on the proper construction and abandonment methods of wells in the Basin. The Watermaster adopted Resolution 2004-04 to set minimum standards for the construction, repair, abandonment and destruction of groundwater extraction wells in the Basin. The Resolution adopted Riverside County Ordinance No. 682.3[16] and expanded it to require the installation of a sounding tube to measure water levels on all future wells.
- **Develop and Enter into Contracts for Beneficial Programs and Services** that are beneficial to the Basin on behalf of the Parties to the Judgment. Includes

[15] As a result of the 2004 amendments to the Santa Ana Regional Water Quality Control Board's Basin Plan to incorporate updated total dissolved solids (TDS) and nitrogen management plan, the groundwater subbasin boundaries (called management zones), TDS and nitrate-nitrogen groundwater quality objectives, TDS and nitrogen wasteload allocations, reach designations, and TDS and nitrogen objectives and beneficial uses for specific surface waters were all revised. As a result, the use of recycled water in the Beaumont Management Zone would exceed the new antidegradation objectives. Therefore, maximum-benefit objectives and commitments from affected agencies were agreed upon. One of the commitments is to monitor groundwater and surface water quality for changes in the salt (TDS and nitrogen) concentrations, which is reported annually in the Maximum Benefit Monitoring Program.

[16] An ordinance of the County of Riverside regulating the construction, reconstruction, abandonment and destruction of wells, available at the Clerk of the Board Web site: http://www.rivcocob.org/ords/600/682.3.pdf.

programs for conjunctively utilizing the Basin for the storage of supplemental water, and programs for the direct and indirect use of recycled water.

- **Provide Cooperative Leadership** with other local, state, and/or federal agencies to develop and implement regional scale programs for the management of the Basin and its surrounding resources.

All Watermaster processes are governed by Rules and Regulations and receive active oversight from the Court which retains continuing jurisdiction over the administration of the Judgment. Consequently, the sufficiency of the groundwater is not only directed by rigorous Watermaster management processes, but validated and ensured by continuing Court oversight.

The efforts listed above collectively comprise a comprehensive regimen directed to ensuring and maximizing the long-term beneficial use of water in the Beaumont Basin. In particular, and specific to the location of current and future groundwater production facilities upon which Banning relies or will rely to provide water to meet all demands within its service area, efforts related to "Maintain and Improve Water Supply" and efforts related to developing "Contracts for Beneficial Programs and Services," address the sufficiency of groundwater from the Basin. Fundamentally, the goal of the Watermaster's responsibilities is to develop a regional, long range, and equitable water supply plan for producers in the Beaumont Basin that incorporates sound basin management.

The sufficiency of the City of Banning's groundwater supply is assured due to the abundance of groundwater which it overlies, Watermaster responsibilities that prioritize and assure production from the Beaumont Basin, coupled with the pursuit of expanded recycled water that enable the continued use of this abundant supply for municipal purposes.

Sufficiency of groundwater from the five storage units on which the City of Banning relies is further assured for the following reasons:

- SGPWA is a State Water Project contractor that provides imported water from the State Water Project for direct and indirect use by parties to the Judgment in the Beaumont Basin for basin recharge purposes (when supplies are available). SGPWA monitors groundwater levels twice a year over a large network of monitoring wells (currently 110 wells), as well as regular water quality monitoring of imported water supplies.

- Local compliance with the Sustainable Groundwater Management Act of 2014 (SGMA) is in progress with creation of the "San Gorgonio Pass Groundwater Sustainability Agency," that will develop a Groundwater Sustainability Plan (GSP) for all non-adjudicated parts of the San Gorgonio Pass Sub-basin that is within the SGPWA service area. Members of the new agency include SGPWA, Cabazon Water District, City of Banning and Banning Heights Mutual Water Company. The GSP must be prepared by 2022 to demonstrate, with a relatively robust level of analysis, what actions will be taken to ensure the basin will operate within its sustainable yield. The GSP will include the Banning, Banning Bench, and Banning Canyon Storage Units, and most of the Cabazon Storage Unit.

- The SGPWA 2015 UWMP analyzes the sufficiency of imported water supplies for average rain years as well as single and multiple year drought scenarios from 2015 to 2040 and concludes the Agency is expected to have adequate supplies to meet projected future needs in average and multiple-dry year scenarios. However, the Agency will need to procure additional water supplies, which are described in the UWMP and reiterated herein, to meet projected single dry year conditions.

California Water Code Section 10631(j) provides that urban water suppliers, such as the City of Banning, that rely upon a wholesale agency for a source of water may rely upon water supply information provided by the wholesale agency in fulfilling UWMP informational requirements.

SGPWA's independent analysis of regional water conditions in conjunction with DWR's most recent Delivery Capability Report, provide additional and reliable assurances concerning the sufficiency of imported water supplies that comprise a portion of overall Beaumont Basin supply sufficiency.

The City's pursuit of improved and expanded recycled water supplies described in Section 3, along with future storage and recovery projects will help drought-proof the City's groundwater resources during imported water shortages. These efforts are consistent with the goals of the Beaumont Basin Watermaster, as well as the intent of SGMA.

In conclusion, the sufficiency of groundwater supplies available to the City in the Beaumont Basin is assured because of the City's additions to their storage account and the programs overseen by the Beaumont Basin Watermaster, which are conducted under the auspices of continuing Court jurisdiction, that specifically direct and assure the long-term production of water pursuant to the City's legal rights to produce such water necessary to meet future demands.

Similarly, the sufficiency of groundwater supplies available to the City from the Cabazon, Banning, Banning Bench, and Banning Canyon Storage Units is assured because of the 2011 geohydrologic study of said storage units that was commissioned by the City. The study calculated the safe yields of each based on the most current information available at the time (see Appendix I). These results in combination with the City's efforts and that of other participating parties to maintain the diversion of Whitewater River into Banning Canyon, the City's pursuit of expanded recycled water supplies and increased groundwater production in the Cabazon basin, as well as the City's focus on capturing stormwater runoff as part of new development proposals will help to meet the City's anticipated water demands.

SECTION 5 - PRIMARY ISSUE FOR ASSESSMENT

As cited below, the lead agency, "…shall determine, based on the entire record, whether projected water supplies will be sufficient to satisfy demands of the project, in addition to existing and planned future uses." The lead agency is expected to approve or disapprove the project based on a number of factors, including but not limited to the Water Supply Assessment.

Law

> Water Code Section 10910(g)(1): *Subject to paragraph (2), the governing body of each public water system shall submit the assessment to the city or county not later than 90 days from the date on which the request was received. The governing body of each public water system, or the city or county if either is required to comply with this act pursuant to subdivision (b), shall approve the assessment prepared pursuant to this section at a regular or special meeting.*
>
> Water Code Section 10911(b): *The city or county shall include the water assessment provided pursuant to Section 10910, and any information provided pursuant to subdivision 9a), in any environmental document prepared for the project pursuant to Division 13 (commencing with Section 21000) of the Public Resources Code.*
>
> *(c) The city or county may include in any environmental document an evaluation of any information included in that environmental document provided pursuant to subdivision (b). The city or county shall determine, based on the entire record, whether projected water supplies will be sufficient to satisfy the demands of the project, in addition to existing and planned future uses. If the city or county determines that water supplies will not be sufficient, the city or county shall include that determination in its findings for the project.*

The lead agency is expected to review the Assessment and decide whether additional water supply information is needed for its consideration of the proposed project.

5.1 Findings

Whereas:

1. The City of Banning has been identified as the water supplier for the Banning Distribution Center ("Project").
2. The projected total water demand for the Project is 47 acre-feet per year (AFY).
3. The water demand for the Project was included in the "2015 Urban Water Management Plan" dated May 2016, which was adopted by the City of Banning Utility Authority by Resolution 2016-10 UA on June 14, 2016.
4. The City of Banning's water supply capacity from City wells, as of 2015, was 24,300 gallons per minute (gpm). Supplies are obtained from five hydraulically-connected storage units of the San Gorgonio Pass Groundwater Sub-basin: Banning, Banning Bench, Banning Canyon, Cabazon, and Beaumont Storage Units.
5. The City has estimated build-out of the General Plan to occur beyond the 20-year planning horizon required for this Assessment.
6. As of 2015, the City of Banning's combined potable and non-potable water demand was 6,709 AFY. The City estimates an increase of potable and non-potable water demand to 13,628 AFY by 2040. In addition, the City anticipates the development of tertiary-level recycled water by 2025 in the amount of 1,680 AFY to offset potable water currently used for landscape irrigation.
7. The City of Banning has Appropriative Water Rights in the Beaumont Storage Unit, and documented entitlement to water within the Banning Canyon Storage Unit. The Cabazon, Banning, and Banning Bench Storage Units are not adjudicated. The City purchases imported State Water Project water from San Gorgonio Pass Water Agency for recharge of the Beaumont Storage Unit pursuant to the stipulations of the Groundwater Storage Agreement with the Watermaster.

8. The City of Banning maintains a storage account in the Beaumont Storage Unit, currently estimated by the Beaumont Basin Watermaster at 49,990.8 AF, pursuant to the stipulations of the adjudication. The City has not included this storage account in their supply projections provided in the 2015 UWMP.

Considering the aforementioned facts, the total projected water supplies available to the City of Banning during normal, single dry, and multiple dry water years during a 20-year projection are therefore sufficient to meet the projected water demand associated with the proposed Project, in addition to the City's existing and planned future uses, including agricultural and manufacturing uses, as described in Chapter 6 of the City's 2015 Urban Water Management Plan (Appendix A).

CHAPTER 1

INTRODUCTION AND OVERVIEW

CHAPTER 1
INTRODUCTION AND OVERVIEW

1.1 BASIS FOR PREPARING AN URBAN WATER MANAGEMENT PLAN

> *Water Code*
>
> **10617.** "Urban water supplier" means a supplier, either publicly or privately owned, providing water for municipal purposes either directly or indirectly to more than 3,000 customers or supplying more than 3,000 acre-feet of water annually…
>
> **10621.** (a) Each urban water supplier shall update its plan at least once every five years on or before December 31, in years ending in five and zero, except as provided in subdivision (d).
>
> (d) Each urban water supplier shall update and submit its 2015 plan to the department by July 1, 2016.

The City of Banning (City) has prepared this 2015 Urban Water Management Plan in accordance with the Urban Water Management Planning Act (UWMP Act), as set forth in Part 2.6 of Division 6 of the California Water Code, and the Water Conservation Act of 2009, as set forth in Part 2.55 of Division 6 of the California Water Code. The City serves greater than 3,000 active water service connections and supplies more than 3,000 acre-feet (AF) of water per year, and therefore meets the definition of an urban water supplier pursuant to California Water Code (CWC) Section 10617, cited above. As an urban water supplier, the City is required to prepare and adopt an Urban Water Management Plan (UWMP or Plan) every five years and to submit same to the California Department of Water Resources (DWR). Copies of the applicable sections of the CWC are included in **Appendix A** herein.

The City operates a public water system (PWS), as defined in California Health and Safety Code Section 116275(h), which defines a PWS as "a system for the provision of water for human consumption through pipes or other constructed conveyances that has 15 or more service connections or regularly serves at least 25 individuals daily at least 60 days out of the year." PWSs are regulated by the State Water Resources Control Board, Division of Drinking Water. An urban water supplier may operate one or more PWS. The City operates a single PWS, which currently serves a population of approximately 30,500 people through about 10,650 water service connections.

1.2 URBAN WATER MANAGEMENT PLAN DEVELOPMENT

Water Code

10620. (d)(2) Each urban water supplier shall coordinate the preparation of its plan with other appropriate agencies in the area, including other water suppliers that share a common source, water management agencies, and relevant public agencies, to the extent practicable.

10621. (b) Every urban water supplier required to prepare a plan pursuant to this part shall, at least 60 days before the public hearing on the plan required by Section 10642, notify any city or county within which the supplier provides water supplies that the urban water supplier will be reviewing the plan and considering amendments or changes to the plan. The urban water supplier may consult with, and obtain comments from, any city or county that receives notice pursuant to this subdivision.

10635. (b) The urban water supplier shall provide that portion of its urban water management plan prepared pursuant to this article to any city or county within which it provides water supplies no later than 60 days after the submission of its urban water management plan.

10641. An urban water supplier required to prepare a plan may consult with, and obtain comments from, any public agency or state agency or any person who has special expertise with respect to water demand management methods and techniques.

10642. Each urban water supplier shall encourage the active involvement of diverse social, cultural, and economic elements of the population within the service area prior to and during the preparation of the plan. Prior to adopting a plan, the urban water supplier shall make the plan available for public inspection and shall hold a public hearing thereon…

10645. Not later than 30 days after filing a copy of its plan with the department, the urban water supplier and the department shall make the plan available for public review during normal business hours.

1.2.1 Plan Organization and Development

This Urban Water Management Plan (UWMP) has been developed in compliance with the California Water Code (CWC), as cited in **Section 1.1** herein, and in accordance with guidance documents issued by the California Department of Water Resources (DWR).

This UWMP generally follows the format recommended by DWR's *2015 Urban Water Management Plans Guidebook for Urban Water Suppliers*, dated March 2016. The standardized tables required for 2015 UWMPs have been completed and are included in **Appendix B** herein. In order to assist DWR in its review of this UWMP, a checklist citing the document location of required information is included in **Appendix C** herein.

1.2.2 Public Participation

The City is a retail water supplier and, since its first UWMP was developed in 1985, has actively encouraged community participation in its urban water management planning efforts by holding public hearings and making draft UWMPs available for public review and comment prior to adoption.

On May 24, 2016, the City held a public hearing to discuss and receive comments on its Draft 2015 Urban Water Management Plan. Copies of the Draft were made available at the City Clerk's office during regular business hours and online at www.ci.banning.ca.us/draft2015uwmp for public review approximately 30 days prior to the public hearing. All comments received prior to and during the public hearing were taken into consideration during preparation of the Final 2015 UWMP. Copies of the comments received on the Draft 2015 UWMP, and the City's responses thereto, are included in **Appendix D** herein.

Prior to the public hearing on the Draft 2015 UWMP, and in accordance with CWC Section 10642 and California Government Code Section 6066, the City published notice of the date, time, and location of the public hearing in The Press-Enterprise on April 18, 2016 and April 25, 2016. Copies of these published notices are included in **Appendix D** herein. A copy of the Final 2015 UWMP is available for public review at the City Clerk's office during regular business hours and is also available online at www.ci.banning.ca.us/2015uwmp.

1.2.3 Agency Coordination

City staff coordinated the development of this Plan with local water agencies and other interested parties. On February 23, 2016, the City provided a written 60-day notice to cities, counties, and other entities, as specified in **Table 1-1** below. The 60-day notice satisfies the requirements set forth in CWC Section 10621(b), which requires that an urban water supplier, at least 60 days prior to the public hearing on its 2015 UWMP, notify any city or county within which the water supplier provides water, that the water

supplier is reviewing and considering changes or amendments to its UWMP. Copies of the 60-day notices are included in **Appendix D**.

Copies of comments received on the Draft 2015 UWMP are also included in **Appendix D** herein and were considered during preparation of the final 2015 UWMP.

TABLE 1-1

[1] Documents were made available to the public through notices published in the newspaper and copies of documents made available online and at the City Clerk's office for public review.

1.3 UWMP ADOPTION, SUBMITTAL, AND IMPLEMENTATION

1.3.1 Plan Adoption and Submittal

The City prepared this UWMP in 2015 and 2016. The Plan was adopted by the City Council on June 14, 2016, and was submitted to the California Department of Water Resources (DWR) and the California State Library on June 21, 2016. A copy of the City's Resolution Adopting the 2015 UWMP is included in **Appendix E** herein.

Final copies of this UWMP, as well as any adopted amendments, are available for public review at the City Clerk's office during normal business hours and online at www.ci.banning.ca.us/2015uwmp.

This Plan includes all information necessary to meet the requirements of the UWMP Act (UWMP Act), as set forth in Part 2.6 of Division 6 of the California Water Code, and the Water Conservation Act of 2009, as set forth in Part 2.55 of Division 6 of the California Water Code. The Water Conservation Act of 2009 is also referred to as 20X2020 or SB X7-7.

In addition to the UWMP Act and the Water Conservation Act of 2009, the City, in preparing this Plan, referenced guidance available from DWR, including that set forth in the document titled *2015 Urban Water Management Plans Guidebook for Urban Water Suppliers*, prepared by DWR, dated March 2016, and referred to herein as the DWR Guidebook.

1.3.2 Plan Implementation

To facilitate effective and efficient management of water supplies, and in compliance with the UWMP Act and the Water Conservation Act of 2009, the City has prepared this 2015 UWMP. This UWMP includes background information regarding groundwater supply and historic water use within the City's service area, as well as water management tools and options that will enable the City and its residents to maximize efficient use of available water resources, reduce per capita water use, and decrease the potential future need to import water from other regions. This 2015 UWMP will be implemented as set

forth herein. Since UWMPs are due for revision every five years, this UWMP is projected to be in effect until the year end 2020, at which time the City's 2020 UWMP will be developed and adopted.

CHAPTER 2

SYSTEM DESCRIPTION

CHAPTER 2
SYSTEM DESCRIPTION

Water Code

10631. A plan shall be adopted in accordance with this chapter that shall do all of the following:
(a) Describe the service area of the supplier, including current and projected population, climate, and other demographic factors affecting the supplier's water management planning. The projected population estimates shall be based upon data from the state, regional, or local service agency population projections within the service area of the urban water supplier and shall be in five-year increments to 20 years or as far as data is available.

2.1 CITY OF BANNING

The City of Banning was incorporated on February 6, 1913. The City currently comprises a total land area of approximately 23.2 square miles (14,848 acres) in northern Riverside County, approximately 25 miles east of downtown Riverside and approximately 30 miles west of the City of Palm Springs. The City of Banning is bounded by the City of Beaumont on the west and the Morongo Band of Mission Indians on the east. The unincorporated community of Cabazon lies approximately 1-1/2 miles to the east.

The Banning Water Company was incorporated in 1884 to provide delivery of domestic and irrigation water to various local customers. In 1913, the Banning Water Company began operating as a public utility, and, in 1967, the City of Banning acquired the Banning Water Company. Later, in 1997, the City purchased the Mountain Water Company, which had supplied water to its customers from groundwater wells located within the City of Banning in an unincorporated portion of the County of Riverside. The City's water system is currently part of the City of Banning Public Works Department and Water Division.

2.2 WATER SERVICE AREA

The City, through its Public Works Department and Water Division, provides municipal water to its service area, which includes the area within the City's boundary as well as some unincorporated areas of Riverside County. The City of Banning's Water Service Area comprises approximately 16,908 acres and is depicted on **Figure 1** herein.

2.3 COOPERATIVE AGREEMENTS WITH LOCAL AGENCIES

The City participates in the following cooperative agreements pertaining to water:

- The City of Banning and Beaumont-Cherry Valley Water District jointly own and operate three groundwater wells in accordance with an agreement between the two parties, dated December 23, 2003.

- The City of Banning is party to an agreement with Banning Heights Mutual Water Company and Southern California Edison for restoration of the Flume.

- The City of Banning purchases State Water Project water from the San Gorgonio Pass Water Agency. The City uses said water for groundwater recharge in the Beaumont Basin.

- The City of Banning participates in the Beaumont Management Zone (BMZ) Maximum Benefits Program, which is under the oversight of the Santa Ana Regional Water Quality Control Board (RWQCB) and is intended to ensure the long-term sustainability of water quality in the BMZ. Yucaipa Valley Water District, Beaumont-Cherry Valley Water District, and City of Beaumont are also participants in the program.

- City of Banning is a member of the San Gorgonio Pass Regional Water Alliance (Alliance), which was created on November 6, 2012 by action of the Riverside County Board of Supervisors. The Alliance was created to identify challenges in water supply and water quality in the region and to improve coordination, collaboration, and communication among local, state, and federal governments and water purveyors and other water resource stakeholders in the San Gorgonio Pass region.

- The City is currently working with other water agencies that overly the San Gorgonio Pass Subbasin to develop a cooperative agreement to manage the subbasin in accordance with the Sustainable Groundwater Management Act (SGMA). The other agencies involved include Desert Water Agency, Mission Springs Water District, High Valleys

Water District, Morongo Band of Mission Indians, San Gorgonio Pass Water Agency, and Banning Heights Mutual Water Company.

2.4 SERVICE AREA CLIMATE

The City is located within the San Gorgonio Pass, which experiences climate characterized by hot, dry summers and short, mild winters. The area receives an average annual precipitation of approximately 19.7 inches, most of which takes place between December and March. Evapotranspiration (ETo) in the area ranges from 7.88 inches in July to 1.94 inches in December.

Monthly average maximum and minimum temperatures, monthly average precipitation, and monthly average evaporation for the area are set forth in **Table 2-1** below. Copies of the printed data sources are included in **Appendix F** herein.

TABLE 2-1
CLIMATE

Month	Average Precipitation (inches) [1]	Average Maximum Temperature (°F) [1]	Average Minimum Temperature (°F) [1]	Standard Monthly Average ETo (inches) [2]

[1] Average rainfall data and average temperature data were obtained from the Western Regional Climate Center website at http://www.wrcc.dri.edu/ for the Beaumont #2 Station (040609) for the period of record 08/01/1939 to 1/20/2015.

[2] ETo data was obtained from the California Irrigation Management Information System (CIMIS) website at http://www.cimis.water.ca.gov/ for the Hemet Station (Station 239).

2.5 SERVICE AREA POPULATION

The City currently serves a population of approximately 30,500 people through approximately 10,650 water service connections. Population within the City's service area increased to its current level from approximately 28,250 in 2005. Based on development currently proposed within the City's water service area (as summarized in Section 2.6 herein), approximately 8,285 new dwelling units are anticipated to be added to the City's service area by 2040.

Data obtained from the Southern California Association of Governments (SCAG), estimates that the City's population is anticipated to reach approximately 37,700 people by 2040. This number does not appear to account for the proposed development within the City's service area; therefore, population estimates are based on the proposed additional dwelling units and an estimate of 3.12 persons per dwelling unit. Estimated current and projected population for the City's water service area is set forth in **Table 2-2**.

TABLE 2-2
POPULATION - CURRENT AND PROJECTED

	2015[1]	2020[2]	2025[2]	2030[2]	2035[2]	2040
Population within the City's Water Service Area (without proposed specific plan developments)	30,491	31,913	33,335	34,757	36,179	37,700 [3]
Population within the City's Water Service Area (with proposed specific plan developments)	30,491	35,730	40,969	46,207	51,446	56,685 [4]

(1) Data obtained from the California Department of Finance document *E-1 Population Estimates for Cities, Counties, and the State with Annual Percentage Change—January 1, 2014 and 2015*. Sacramento CA, May 2015

(2) Population numbers based on a linear projection from 2015 through 2040

(3) Data obtained from the Southern California Association of Governments (SCAG) document *Draft Program Environmental Impact Report for the 2016 Regional Transportation Plan / Sustainable Communities Strategy*, Sapphos Environmental, Inc., November 24, 2015

(4) Based on SCAG data with the addition of approximately 8,285 connections between 2015 and 2040 and a factor of 3.12 persons per connection to account for the anticipated population increase resulting from two proposed specific plan developments in the City's service area, which are described in **Section 2.6** herein.

2.6 ANTICIPATED FUTURE DEVELOPMENT

Currently, there are two significant developments planned within the City's water service area, as described below. Final subdivision maps prepared for the two projects will comply with the provisions of California Government Code Section 66473.7.

2.6.1 Butterfield Ranch

The Butterfield Ranch Specific Plan (Butterfield Ranch) is a master planned community project that encompasses 1,543 acres and includes approximately 4,900 residential dwelling units, two elementary schools, two commercial sites, a golf course with clubhouse, and community parks and trails. The project would be constructed in five phases over an estimated period of 30 years.

A project-specific water supply assessment (WSA), titled *Water Supply Assessment for Butterfield Specific Plan, Issued June 2011 with the Draft EIR, Modified December 2011 by Section 4.1 of the Final EIR*, was prepared to determine the adequacy of existing and future water supplies available to serve the project. Projected water demand associated with Butterfield Ranch is included in the "Proposed Specific Plan Developments" column in **Table 3-1** herein.

The Environmental Impact Report (EIR) for Butterfield Ranch, which includes an analysis of water supply supported by the project-specific WSA cited above, has been approved by the City Council of the City of Banning.

2.6.2 Rancho San Gorgonio

The Rancho San Gorgonio Specific Plan (Rancho San Gorgonio) is a master planned community project that encompasses approximately 831 acres and includes up to 3,385 residential dwelling units, almost 49 acres of neighborhood and community parks, over 160 acres of paseos and open space, and approximately 81 acres of right-of-way and utility easements. The project is anticipated to be constructed in six phases over a period of 18 years. This period is likely to be extended due to varying economic factors.

A project-specific WSA was prepared for Rancho San Gorgonio, titled *Water Supply Assessment Rancho San Gorgonio Specific Plan*, by Madole & Associates, Inc. and Encompass Associates, Inc., dated September 30, 2015. Projected water demand associated with Rancho San Gorgonio is included in the "Proposed Specific Plan Developments" column in **Table 3-1** herein.

The Draft EIR for Rancho San Gorgonio is currently being finalized, and said EIR analyzes water supply supported by the project-specific WSA cited above.

CHAPTER 3

SYSTEM WATER USE

CHAPTER 3
SYSTEM WATER USE

3.1 WATER USES BY SECTOR

Water Code

10631. A plan shall be adopted in accordance with this chapter that shall do all of the following:

(e)(1) Quantify, to the extent records are available, past and current water use, over the same five-year increments described in subdivision (a), and projected water use, identifying the uses among water use sectors, including, but not necessarily limited to, all of the following uses:

(A) Single-family residential.
(B) Multifamily.
(C) Commercial.
(D) Industrial.
(E) Intuitional and governmental.
(F) Landscape.
(G) Sales to other agencies.
(H) Saline water intrusion barriers, groundwater recharge, or conjunctive use, or any combination thereof.
(I) Agricultural.
(J) Distribution system water loss.

(2) The water use projections shall be in the same five year increments described in subdivision (a).

The City currently provides water service to a population of approximately 30,491 through approximately 10,648 service connections. The City of Banning categorizes its water users into the following five categories: Residential, Commercial, Industrial, Public, and Irrigation. The City also provides water to the Banning Heights Mutual Water Company and High Valleys Water District. Other water uses include fire protection, construction use, and groundwater recharge.

Table 3-1 is arranged by customer type and shows current and projected numbers of customer connections and quantities of water delivered. All of the City's water service connections are metered. **Table 3-2** lists system water losses and quantities of water provided to other agencies, and **Table 3-3** shows the City's total water use for 2015 through 2040 as the sum of **Table 3-1** and estimated system water losses.

TABLE 3-1 CURRENT AND PROJECTED WATER DELIVERIES (AF/YR)[1]								
Year	Water Use Sectors	Residential[3]	Commercial	Industrial	Public	Irrigation[4]	Proposed Specific Plan Developments[3,5]	Total
2015 [2]	# of Accounts	9,787	742	63	46	10	0	10,648
	Deliveries	3,395	1,705	92	53	726	0	5,971
2020	# of Accounts	10,257	778	66	48	10	1,423	12,582
	Deliveries	4,482	2,281	94	63	944	1,609	9,473
2025	# of Accounts	10,714	812	69	50	11	3,086	14,692
	Deliveries	4,683	2,382	99	66	986	1,983	10,198
2030	# of Accounts	11,171	847	72	52	11	5,995	18,101
	Deliveries	4,882	2,484	103	69	1,028	2,288	10,853
2035	# of Accounts	11,627	882	75	54	12	7,305	19,955
	Deliveries	5,082	2,586	107	71	1,070	2,649	11,565
2040	# of Accounts	12,116	919	78	57	12	8,285	21,467
	Deliveries	5,295	2,694	111	74	1,115	2,988	12,278

(1) Deliveries projected for 2020, 2025, 2030, 2035, and 2040 are based on projected population estimates based on SCAG data (refer to **Table 2-2** in **Chapter 2** herein) and a demand factor of 220 gpcd. Deliveries for proposed specific plan developments are based on projected water demands set forth in the documents, *Water Supply Assessment for Butterfield Specific Plan, Issued June 2011 with the Draft EIR and Modified December 2011 by Section 4.1 of the Final EIR* and *Water Supply Assessment Rancho San Gorgonio Specific Plan*, dated September 30, 2015.

(2) Numbers of accounts and deliveries for 2015 are based on City records for calendar year 2015.

(3) Includes accounts and deliveries for lower-income households (refer also to **Section 3.3** herein).

(4) Includes quantities of non-potable water from Well M7 provided for irrigation (approximately 200 AF/year).

(5) Projections of numbers of accounts and water deliveries are based on the water supply assessment documents cited in note (1) above.

TABLE 3-2 ADDITIONAL WATER USES AND LOSSES (AF/YR)						
Water Use	2015[1]	2020	2025	2030	2035	2040
Water Provided to Other Agencies[2]	95	104	109	113	119	124
System Water Losses[3]	738	1,042	1,122	1,194	1,272	1,351
Total	833	1,146	1,231	1,307	1,391	1,475

(1) Quantities for 2015 are based on the City's records.

(2) Quantities of water provided to other water suppliers (i.e. High Valleys Water District and Banning Heights Mutual Water Company), assuming a 1% growth rate per year. These quantities are included in the residential sector deliveries in **Table 3-1**.

(3) System water losses are based on the water audit report prepared for the City for the 2015 calendar year and are consistent with the City's estimated water losses for 2015. For the purposes of this UWMP, it is assumed that the percentage of water lost (11%) will remain consistent over the next 25 years.

TABLE 3-3 TOTAL WATER USE (AF/YR)						
Water Distributed	2015	2020	2025	2030	2035	2040
Table 3-1 + System Water Losses	6,709	10,515	11,320	12,047	12,837	13,629

3.1.1 Residential Sector

The City's residential sector includes single family residences, condominiums, apartments, and mobile homes. Water use in this sector typically includes indoor uses (such as bathing, laundry, drinking, cooking, and sanitation) and outdoor uses, such as landscape irrigation, car washing, swimming pools, and hardscape cleaning. Rural residences may also include livestock watering. Residential water use accounts for approximately 57% of the City's water use. The residential sector is expected to expand with new specific plan developments, as described in **Section 2.6** herein.

3.1.2 Commercial Sector

The City has a complex mix of commercial customers, ranging from family restaurants, insurance offices, and gas stations to shopping centers, high-volume restaurants, golf courses, and other facilities serving the local population and visitors. Commercial sector water use accounts for approximately 29% of the City's water use. The City's commercial sector is expected to grow to accommodate growth in the City's residential sector.

3.1.3 Industrial Sector

The City's industrial sector has historically been divided between airport-industrial related uses and traditional industrial uses, ranging from storage to heavy manufacturing. Industrial development has been an important source of employment in the City. Industrial sector water use accounts for approximately 1.5% of the City's water use.

3.1.4 Public Sector

The City's public sector includes governmental institutions, such as City Hall, fire and police facilities, hospitals, railroads, schools, the airport, the courthouse, and interstate highways. This sector also includes cemeteries, which are non-governmental institutions. The public sector is expected to expand as the City's population grows. Currently, public sector water use accounts for approximately 1% of the City's water use.

3.1.5 Irrigation

Currently, the City has ten landscape connections. Landscape demand is currently served by potable water, with the exception of the non-potable groundwater served to Sun Lakes Golf Course for irrigation use. Significant increases in landscape sector potable demand are not anticipated and future increases in landscape demand may be offset by future recycled water use. Currently, irrigation water use accounts for approximately 12% of the City's water use.

3.1.6 Agriculture

The only agriculture currently within the City of Banning is animal husbandry, and these uses are served under the residential sector. The City does not expect other agricultural activities to develop within its water service area, and land previously designated for agricultural purposes with a slope of 25% or greater is expected to be set aside for hillside preservation.

3.2 DISTRIBUTION SYSTEM WATER LOSSES

Water Code

10631. A plan shall be adopted in accordance with this chapter that shall do all of the following:

(e)(3)(A) For the 2015 urban water management plan update, the distribution system water loss shall be quantified for the most recent 12-month period available. For all subsequent updates, the distribution system water loss shall be quantified for each of the five years preceding the plan update.

(e)(3)(B) The distribution system water loss quantification shall be reported in accordance with a worksheet approved or developed by the department through a public process. The water loss quantification worksheet shall be based on the water system balance methodology developed by the American Water Works Association.

Beginning with the 2015 UWMP, water suppliers are required to report their distribution system water losses based on a methodology and quantification worksheet developed by the American Water Works Association (AWWA). In future UWMPs, this distribution system water loss will be included for each of the five years preceding the UWMP.

Based on the AWWA methodology and worksheet, the City's distribution system water loss was approximately 738.4 acre-feet for 2015. A copy of Banning's water audit report for the 2015 calendar year is included in **Appendix G** herein. The 2015 water loss determined based on the AWWA methodology and worksheet is consistent with the 2015 water loss measured by the City.

3.3 WATER USE FOR LOWER INCOME HOUSEHOLDS

> ***Water Code***
>
> **10631.1.** (a) The water use projections required by Section 10631 shall include projected water use for single-family and multifamily residential housing needed for lower income households, as defined in Section 50079.5 of the Health and Safety Code, as identified in the housing element of any city, county, or city and county in the service area of the supplier.

In accordance with CWC Section 10631.1, this UWMP includes projected water use for residential housing needed for lower income households. "Lower income household" is defined in California Health and Safety Code Section 50079.5 as persons and families whose income does not exceed the qualifying limits for lower income families as established and amended from time to time pursuant to Section 8 of the United States Housing Act of 1937.

Based on U.S. Census Bureau data from the 2009-2013 American Community Survey 5-Year Estimates and the state income limits for Riverside County published by the California Department of Housing and Community Development, approximately 62 percent of the City's population are defined as lower income. Therefore, approximately 62 percent of water needed for residential uses is needed for lower income households.

The City has a civic and legal responsibility to provide for the water-related health and safety of the community. One of the City's objectives is to provide its customers with an adequate and reliable supply of high-quality water to meet present and future needs in an environmentally and economically responsible manner. Water use priority does not differ based on income level, but is classified by the type of use.

Residential sector water use projections included in **Table 3-1** herein include all residential accounts, regardless of income level, and residential accounts are not subdivided into income-specific categories. The City does not offer decreased water rates for lower income households, as rates are based on the cost of providing water service. The City does not give priority to one residential area over another; therefore, all residential customers are served equally, including during water shortage emergencies, in terms of service and delivery. The City does not deny water service to non-delinquent accounts.

CHAPTER 4

BASELINES AND TARGETS

CHAPTER 4
BASELINES AND TARGETS

Water Code

10608.20. (e) An urban retail water supplier shall include in its urban water management plan…due in 2010 the baseline daily per capita water use, urban water use target, interim urban water use target, and compliance daily per capita water use, along with the bases for determining those estimates, including references to supporting data.

(h) (1) The department, through a public process and in consultation with the California Urban Water Conservation Council, shall develop technical methodologies and criteria for the consistent implementation of this part, including

(A) Methodologies for calculating base daily per capita water use, baseline commercial, industrial, and institutional water use, compliance daily per capita water use, gross water use, service area population, indoor residential water use, and landscaped area water use.

4.1 BASE DAILY PER CAPITA WATER USE (BASELINE)

***Water** Code*

10608.12. (b) "Base daily per capita water use" means any of the following:

(1) The urban retail water supplier's estimate of its average gross water use, reported in gallons per capita per day and calculated over a continuous 10-year period ending no earlier than December 31, 2004 and no later than December 31, 2010.

Base daily per capita water use (also referred to herein as baseline) is defined as set forth in Water Code Section 10608.12(b)(1). The City's baseline was determined in its 2010 UWMP, as modified by an addendum adopted by the City on December 11, 2012. The baseline is summarized herein and remains the same for this 2015 UWMP. The City's baseline was determined in accordance with methodologies developed by the California Department of Water Resources (DWR), pursuant to Water Code Section 10608.20(h)(1), that are set forth in the document, *Methodologies for Calculating Baseline and Compliance Urban Per Capita Water Use*, dated October 1, 2010, referred to herein as DWR's *Methodologies*.

A revised version of the *Methodologies* document, titled *Methodologies for Calculating Baseline and Compliance Urban Per Capita Water Use, Final Draft*, dated February 2016, has been made available by DWR; however, the requirements for determining the baseline and the urban water use targets have not changed since the time that the 2010 UWMP was prepared.

Pursuant to DWR's *Methodologies*, calculating baseline water use involves four steps:

1. Estimate service area population for each year in the base period.
2. Calculate gross water use for each year in the base period, and express gross water use in gallons per day.
3. Divide gross water use by service area population for each year in the base period to calculate daily per capita water use.
4. Calculate the average per capita water use by summing the values calculated in step 3 above and dividing by the number of years in the base period. The result is the baseline.

The City had selected the ten-year base period of January 1, 2001 through December 31, 2010. The City's water use in acre-feet per year (AF/yr) is based on the City's water production records. Using this data, the City's baseline was determined to be 315 gallons per capita per day (GPCD), calculated as shown in **Table 4-1**.

TABLE 4-1
CITY OF BANNING BASE DAILY PER CAPITA WATER USE

Year	Estimated Service Area Population [1]	Gross Water Use		
		AF/yr [2]	MGD [3]	GPCD [4]
2001	24,639	10,032	8.95	363
2002	25,662	9,808	8.75	341
2003	27,608	10,043	8.96	324
2004	28,055	10,424	9.30	332
2005	28,250	9,427	8.41	298
2006	28,234	10,245	9.14	324
2007	28,193	10,245	9.14	324
2008	28,551	9,606	8.57	300
2009	28,751	9,259	8.26	287
2010	29,603	8,485	7.57	256
Baseline *(Average of Gross Water Use for 2001-2010)*				***315***

[1] Population values were obtained from the California Department of Finance, Table E-5.
[2] Acre-feet per year, based on the City's water production records
[3] Million gallons per day
[4] Gallons per capita per day

4.2. URBAN WATER USE TARGET

In accordance with CWC Section 10608.20(g), an urban retail water supplier may update its 2020 water use target in its 2015 UWMP and may make this update using a different target method than was used in 2010. City of Banning has elected not to update its urban water use target; therefore, the urban water use target and interim urban water use target described herein are the same as those set forth in Banning's 2010 UWMP.

The urban water use target is determined based on one of the four available methods described in Water Code Section 10608.20(b). Banning's urban water use target was determined during preparation of its 2010 UWMP and the City selected DWR's Method 1 for determining its urban water use target. Method 1 is set forth in CWC Section 10605.20(b)(1) and provides for an urban water use target of "eighty percent of the urban retail water supplier's baseline per capita daily water use".

Using Method 1, the City's urban water use target is equal to 80% of its baseline; therefore, City of Banning's urban water use target is 252 GPCD.

4.3. MINIMUM WATER USE REDUCTION REQUIREMENT

Water Code

10608.12. (b) "Base daily per capita water use" means any of the following:
(3) For the purposes of Section 10608.22, the urban retail water supplier's estimate of its average gross water use, reported in gallons per capita per day and calculated over a continuous five-year period ending no earlier than December 31, 2007, and no later than December 31, 2010.

10608.22. Notwithstanding the method adopted by an urban retail water supplier pursuant to Section 10608.20, an urban retail water supplier's per capita daily water use reduction shall be no less than 5 percent of base daily per capita water use…

In accordance with DWR's *Methodologies*, a five-year baseline was calculated to determine whether the urban water use target meets the minimum water use reduction requirement pursuant to Water Code Section 10608.22. These calculations have not changed during preparation of this UWMP, and they are the same as those included in Banning's 2010 UWMP.

The following two steps were used to determine the minimum water use reduction requirement:

1. Calculate baseline water use using a continuous five-year period ending no earlier than December 31, 2007 and no later than December 31, 2010.

2. Multiply the result from the first Step by 0.95. The 2020 urban water use target cannot exceed this value. If the urban water use target is greater than this value, reduce the target to this value.

The City selected a five-year base period of January 1, 2006 through December 31, 2010. The City's five-year baseline water use was calculated as shown in **Table 4-2**.

TABLE 4-2
CITY OF BANNING FIVE-YEAR BASELINE WATER USE

Year	Estimated Service Area Population [1]	Gross Water Use		
		AF/yr [2]	MGD [3]	GPCD [4]
2006	28,234	10,245	9.14	324
2007	28,193	10,245	9.14	324
2008	28,551	9,606	8.57	300
2009	28,751	9,259	8.26	287
2010	29,603	8,485	7.57	256
Five-Year Baseline *(Average of Gross Water Use for 2005-2009)*				***298***

(1) Population values were obtained from the California Department of Finance, Table E-5
(2) Acre-feet per year, based on the City's water production records
(3) Million gallons per day
(4) Gallons per capita per day

The calculation in **Table 4-2** above yields a five-year baseline water use of 256 GPCD. In accordance with step 2 above, multiplying the five-year baseline by 0.95 yields a value of 283 GPCD.

Pursuant to Water Code Section 10608.22, "…an urban retail water supplier's per capita daily water use reduction shall be no less than 5 percent of base daily per capita water use as defined in paragraph (3) of subdivision (b) of Section 10608.12". The City's urban water use target is 252 GPCD, which is less than the 283 GPCD result described above, and therefore meets the minimum water use reduction requirement set forth in Water Code Section 10608.22.

4.4. INTERIM URBAN WATER USE TARGET

> *Water Code*
>
> **10608.12.** (j) "Interim urban water use target" means the midpoint between the urban retail water supplier's base daily per capita water use and the urban retail water supplier's urban water use target for 2020.

The interim urban water use target is defined in Water Code Section 10608.12(j) and is the midpoint between an urban retail water supplier's baseline and its urban water use target for 2020. Urban retail water suppliers who meet their interim urban water use target by December 31, 2015 are generally considered to be on track to meet their urban water use target by December 31, 2020.

Based on the City's baseline of 315 GPCD and its urban water use target of 252 GPCD, the City's interim urban water use target is 283 GPCD.

Based on completion of the SB X7-7 Verification Form, a copy of which is included in **Appendix H** herein, City of Banning's water use for compliance year 2015 was 196 GPCD; therefore, the City has met its interim urban water use target of 283 GPCD.

Further, the City's 2015 water use is below its urban water use target of 252 GPCD. Therefore, the City has achieved compliance with its interim water use target required by December 31, 2015, and it is on track to meet its urban water use target required by December 31, 2020.

CHAPTER 5

SYSTEM WATER SUPPLIES

CHAPTER 5
SYSTEM WATER SUPPLIES

Water Code

10631. A plan shall be adopted in accordance with this chapter and shall do all of the following:

(a) Describe the service area of the supplier, including current and projected population, climate, and other demographic factors affecting the supplier's water management planning. The projected population estimates shall be based upon data from the state, regional, or local service agency population projections within the service area of the urban water supplier and shall be in five-year increments to 20 years or as far as data is available.

(b) Identify and quantify, to the extent practicable, the existing and planned sources of water available to the supplier over the same five-year increments described in subdivision (a). If groundwater is identified as an existing or planned source of water available to the supplier, all of the following information shall be included in the plan:

(1) A copy of any groundwater management plan adopted by the urban water supplier, including plans adopted pursuant to Part 2.75 (commencing with Section 10750), or any other specific authorization for groundwater management.

(2) A description of any groundwater basin or basins from which the urban water supplier pumps groundwater. For those basins for which a court or the board has adjudicated the rights to pump groundwater, a copy of the order or decree adopted by the court or the board and a description of the amount of groundwater the urban water supplier has the legal right to pump under the order or decree. For basins that have not been adjudicated, information as to whether the department has identified the basin or basins as overdrafted or has projected that the basin will become overdrafted if present management conditions continue…

(3) A detailed description and analysis of the location, amount, and sufficiency of groundwater pumped by the urban water supplier for the past five years. The description and analysis shall be based on information that is reasonably available, including, but not limited to, historic use records.

(4) A detailed description and analysis of the amount and location of groundwater that is projected to be pumped by the urban water supplier. The description and analysis shall be based on information that is reasonably available, including, but not limited to, historic use records.

5.1 GROUNDWATER

The City is within the boundaries of the Coachella Valley Hydrologic Unit, which encompasses several groundwater basins, including the Coachella Valley Groundwater Basin (Basin), within which the City is located. The Basin is underlain by several large subbasins, the boundaries of

which are generally defined by fault lines that restrict the lateral flow of water. The Basin extends from Banning easterly to the Salton Sea.

The City is underlain by the San Gorgonio Pass Subbasin (SGP Subbasin) portion of the Basin. The SGP Subbasin is divided into water storage units (also colloquially termed "basins"), as depicted on **Figure 2** herein. The City extracts groundwater from the Banning Storage Unit, the Banning Bench Storage Unit, the Cabazon Storage Unit, the Beaumont Storage Unit, and the Banning Canyon Storage Unit, as described in **Table 5-2** below. The storage unit boundaries have most recently been defined in the document Geology, Ground-Water Hydrology, Geochemistry, and Ground-Water Simulation of the Beaumont and Banning Storage Units, San Gorgonio Pass Area, Riverside County, California, Scientific Investigations Report 2006-5026, prepared by the United States Geological Survey in cooperation with the San Gorgonio Pass Water Agency, dated 2006.

Groundwater recharge in the area results from precipitation infiltrating into the ground within the surface water catchments and particularly in the canyons north of the City. An additional source of recharge is subsurface inflow (also referred to as underflow) from storage unit to storage unit, infiltration of Whitewater River diversions in the Banning Canyon, and from percolation of treated wastewater into the Cabazon Storage Unit. The Banning Canyon area receives water from the percolation of canyon flows through the gravelly soils of the canyon bottom. The San Gorgonio River running southerly through the Banning Canyon provides intake areas for distributing water to spreading ditches that interconnect with spreading ponds located approximately one mile north of the Banning Bench to enhance percolation.

A geohydrologic study was conducted by Geoscience to determine the maximum perennial yield of the groundwater storage units in the vicinity and to determine the anticipated future available water supply from the Beaumont Storage Unit, Banning Storage Unit, Banning Bench Storage Unit, Cabazon Storage Unit, and Banning Canyon Storage Unit. The findings of the study are set forth in the report by Geoscience, titled *Maximum Perennial Yield Estimates for the Banning and Cabazon Storage Units, and Available Water Supply from the Beaumont Basin*, dated March 29, 2011 (herein referred to as the Geoscience Report).

5.1.1 Beaumont Storage Unit (Beaumont Basin)

The Beaumont Storage Unit (also referred to as the Beaumont Basin) is located primarily in the City of Beaumont, with some portions located within Banning, Calimesa, and Cherry Valley, as depicted on **Figure 2** herein. The Beaumont Storage Unit covers approximately 12,480 acres (19.5 square miles). The City operates five groundwater production wells, namely Wells C2, C3, C4, M3, and M7, within the Beaumont Basin. These five wells have a combined nominal capacity of 4,650 gallons per minute (gpm). The City also co-owns, with Beaumont-Cherry Valley Water District (BCVWD), three additional groundwater production wells (Wells 24, 25, and 26), with a combined nominal capacity of 6,000 gpm, of which half is allotted to the City. Therefore, the City's total nominal pumping capacity in the Beaumont Basin is 7,650 gpm.

The Beaumont Basin is an adjudicated basin pursuant to the *Stipulation for Entry of Judgment Adjudicating Groundwater Rights in the Beaumont Basin* (the Judgment), a copy of which is included in **Appendix I** herein. Pursuant to the Judgment, the Court appointed a five-member Watermaster Committee, consisting of representatives from each of the five appropriators, which include City of Banning, City of Beaumont, Beaumont-Cherry Valley Water District, South Mesa Water Company, and Yucaipa Valley Water District.

The safe yield of the Beaumont Basin was initially established at 8,650 AF/yr, to be distributed among the appropriators. The safe yield is to be reevaluated at least once every ten years. Based on the *2013 Reevaluation of the Beaumont Basin Safe Yield*, dated April 3, 2015, the safe yield was determined to be 6,700 AF/yr.

Based on a description of the Judgment included in the *Beaumont Basin Watermaster 2014 Annual Report Draft*, dated June 2015 (referred to herein as the 2014 Watermaster Report), a controlled overdraft (also referred to as temporary surplus) was created to allow the appropriators to extract from the Beaumont Basin, during the first ten years after adoption of the Judgment, a maximum of 16,000 AF/yr. The temporary surplus was divided among the appropriators, with City of Banning receiving 31.43 percent (or 5,029 AF/yr).

After the first 10 years of operation ended in 2014, appropriators no longer receive the temporary surplus and are permitted to extract only the amount each has in storage or credited to them. At the end of calendar year 2014, the City had approximately 46,774 AF in its storage account, based on the 2014 Watermaster Report. City of Banning is permitted to store up to 80,000 AF in the Beaumont Basin.

On an annual basis, the Watermaster determines the amount of groundwater to which each producer is entitled from the Beaumont Basin without incurring a replenishment obligation. City of Banning is entitled to 31.43% of the unused overlying production in the Beaumont Basin. Quantities to which the City is entitled but does not pump can be credited to the City's storage account.

The City purchases State Water Project (SWP) water from the San Gorgonio Pass Water Agency (SGPWA), who is one of 29 state water contractors. Quantities of SWP water purchased are recharged to the Beaumont Basin at BCVWD's Noble Creek spreading facility, which is located in the vicinity of Beaumont Avenue and Cherry Valley Boulevard. Quantities of water obtained from SGPWA and recharged to the Beaumont Basin are set forth in **Table 5-1** below. Quantities that will be recharged in the future are dependent upon SWP water availability and storage capacity available to the City.

The City has estimated future recharge quantities at 2,718 AF/yr, based on a draft Regional Water Allocation Agreement for Water Imported by the San Gorgonio Pass Water Agency based on a water retailer's sphere of influence within the SGPWA service area. The allocation agreement identifies that the City of Banning would receive 27.3% of the SGPWA Table A allocation which has been allocated by DWR in the amount of 17,300 AF/yr. SGPWA's Table A allocation is subject to the reliability of the SWP water deliveries, which the City's 2015 UWMP states that 58% was used (based on DWR's 2013 Final SWP Reliability Report). It should be noted that the draft allocation agreement has not been adopted by SGPWA, although it does provide a methodology for water supply planning related to imported water deliveries from SGPWA.

Based on the above, the estimated annual recharge quantity was determined as follows:

17,300 AF/yr X 57.5% X 27.3% = 2,718 AF/yr

.

[1] Based on data provided by San Gorgonio Pass Water Agency

5.1.2 Banning Storage Unit

The Banning Storage Unit lies south of the Banning Bench Storage Unit and east of the Beaumont Storage Unit, as depicted on **Figure 2** herein. The total surface area of the Banning Storage Unit is approximately 2,489 acres (3.9 square miles). The area is underlain by alluvial sediments, with bedrock occurring to the north in the San Bernardino Mountains. The City currently operates four groundwater production wells within the Banning Storage Unit, namely C-5, M10, M11, and M12, with a combined nominal pumping capacity of 3,500 gpm. The safe yield of the Banning Storage Unit was estimated by Geoscience in 2011 as 1,130 AF/yr.

5.1.3 Cabazon Storage Unit

The Cabazon Storage Unit is located near the eastern boundary of the City, southeast of the Banning Storage Unit and the Banning Bench Storage Unit, as depicted on **Figure 2** herein. The Cabazon Storage Unit encompasses a surface area of approximately 17,215 acres (26.9 square miles). The City currently operates one groundwater production well in the Cabazon Storage Unit, namely Well C6, with a nominal pumping capacity of 900 gpm.

Additional groundwater can be developed from the Cabazon Storage Unit. A water balance prepared for the Cabazon Storage Unit, as described in the Geoscience Report (cited in **Section 5.1** herein), determined that a positive change in storage has occurred as a result of inflow and outflow factors, including wastewater percolated into the Cabazon Storage Unit. Therefore, future projections of additional water from the Cabazon Storage Unit available to the City assume that all inflow and outflow values remain the same, with the exception of wastewater applied to the basin. For purposes of projecting

Cabazon water supplies into the future, inflow of recycled water increases in time to account for the increase of wastewater generated by an increase in population over time, and this recycled water will be percolated into the Cabazon Storage Unit. Once Phase I of the WWTP expansion (described in **Section 5.3** herein) is completed, approximately 1,680 AF/yr of recycled water will be used for irrigation purposes and will no longer be applied to the Cabazon Storage Unit for direct percolation.

Projected future wastewater volumes were estimated based on the population projections shown in **Table 2-2** herein. The average wastewater per capita for the period 2005-2010 was estimated by multiplying the population by 84.6 gallons per day. The average for 2010 alone was approximately 75 gallons per capita per day (gpcd), which had been reduced to approximately 65 gpcd, most likely due to water conservation efforts. With ongoing water conservation measures that have been previously implemented, and future conservation efforts to meet state mandated water reductions and the City's water use target, it is anticipated that wastewater volumes will remain at current levels or decrease even further.

To determine the volume of treated wastewater that will be percolated into the Cabazon Storage Unit, the volume of tertiary treated wastewater (1,680 AF/yr) generated after completion of Phase I of the WWTP expansion (described in **Section 5.3**) was deducted from the estimates of future wastewater generation. The remainder of treated wastewater will be percolated into the Cabazon Storage Unit and was incorporated into the hydrologic budget to estimate the anticipated future change in storage in the Cabazon Storage Unit as described in the Geoscience Report. The volume of groundwater, represented by the change in storage, is assumed to be additional water available to the City for development.

5.1.4 Banning Bench Storage Unit

The Banning Bench Storage Unit is located to the north of the Banning Storage Unit, as shown on **Figure 2** herein. The total surface area of the Banning Bench Storage Unit is approximately 3,573 acres (5.9 square miles). The City currently operates three groundwater production wells within the Banning Bench Storage Unit, namely Wells 1,

2, and 3, with a combined nominal pumping capacity of 3,650 gpm. The safe yield of the Banning Bench Storage Unit was estimated by Geoscience in 2011 as 1,960 AF/yr.

5.1.5 Banning Canyon Storage Unit

The Banning Canyon Storage Unit is located north of the Banning Bench Storage Unit, as depicted on **Figure 2** herein. The total surface area of the Banning Canyon Storage Unit is approximately 1,058 acres (1.7 square miles). The canyon bottom comprises alluvium, and the canyon sides are bedrock. The City currently operates eight groundwater production wells within the Banning Canyon Storage Unit, namely Wells 4, 5, 7, 8, 9, 10, 11, and 12, with a combined nominal pumping capacity of 8,600 gpm.

Additional recharge occurs in the Banning Canyon Storage Unit through the diversion of Whitewater River drainage into Banning Canyon, which began in 1913. The diverted water flows along steep mountain slopes for approximately 14 miles in a mostly concrete lined conveyance system known as the Flume.

Banning Heights Mutual Water Company (BHMWC) utilizes approximately 1,000 AF/yr of the Whitewater River diversions in the Flume, and the remainder of the diverted water flows into the San Gorgonio River below the BHMWC extraction point. A portion of the natural runoff and the Whitewater River diversions are diverted into spreading ponds located approximately one mile north of the Banning Bench in order to increase groundwater recharge. The safe yield of the Banning Canyon Storage Unit was estimated by Geoscience in 2011 as 4,070 AF/yr.

Quantities of groundwater pumped in 2010 through 2015 are set forth in **Table 5-2**. Past, current, and estimated future quantities of groundwater extracted from each storage unit (basin) by the City for use within its water service area are set forth in **Tables 5-2 and 5-3** herein.

TABLE 5-2 QUANTITIES OF GROUNDWATER PUMPED (AF/YR)						
Basin Name	**2010**	**2011**	**2012**	**2013**	**2014**	**2015**

(1) Quantities are based on the projected water use described in **Chapter 3**, specifically **Tables 3-1, 3-2, and 3-3**. The City plans to pump only those quantities of water needed to meet demands.

TABLE 5-4 QUANTITIES OF AVAILABLE WATER SUPPLIES (AF/YR)					
Basin Name	**2020**	**2025**	**2030**	**2035**	**2040**
Beaumont Storage Unit[(1)]	1,266	1,145	1,029	925	925
Beaumont Storage Unit Recharge (SWP Water)[(2)]	2,718	2,718	2,718	2,718	2,718
Banning Storage Unit	1,130	1,130	1,130	1,130	1,130
Banning Bench Storage Unit	1,960	1,960	1,960	1,960	1,960
Cabazon Storage Unit	2,515	2,515	2,515	2,515	2,515
Banning Canyon Storage Unit	4,070	4,070	4,070	4,070	4,070
San Gorgonio Pass Subbasin Total	**13,659**	**13,538**	**13,422**	**13,318**	**13,318**

(1) Quantities of water available from the Beaumont Storage Unit are based on the estimated quantities of water that would be available to the City based on its appropriative rights after extractions by overlying producers, as set forth in Table 4-4 of *City of Banning 2010 Urban Water Management Plan*, dated

July 22, 2011. Because the safe yield of the Beaumont Storage Unit was reduced from 8,650 AF/yr to 6,700 AF/yr in 2013 (a decrease of approximately 22.5%), estimated quantities of water available to the City of Banning from the Beaumont Storage Unit were reduced proportionately herein.

(2) These quantities represent estimated annual recharge of the Beaumont Storage Unit by the City and do not account for the 46,774 AF that the City of Banning currently has in storage in the Beaumont Storage Unit.

5.2 SURFACE WATER

Since 1913, surface water from the Whitewater River has been diverted into the Banning Canyon Storage Unit, with an average of 1,500 AF/yr diverted into Banning Canyon since 1961. The water flowed within the Flume, and then through two hydroelectric power plants. Due to damage along sections of the Flume, surface flow is being diverted into Burnt Canyon to the north, and then back to the Flume upstream of Powerhouse No. 1, where it continues downstream through Powerhouse No. 2 to the reservoir operated by Banning Heights Mutual Water Company (BHMWC), where BHMWC extracts approximately 1,000 AF/yr. The remaining water flows to the San Gorgonio River, where it recharges the Banning Canyon Storage Unit.

The City of Banning plans to conserve stormwater flows from tributary creeks within its service area by allowing water to percolate into the ground. A preliminary evaluation by the City indicated that a portion of stormwater flows from creeks in the area could be conserved as "new" water to meet future needs. The Butterfield Ranch Specific Plan (described in **Section 2.6.1** herein) includes design features that are estimated to capture and recharge approximately 1,370 AF/yr of stormwater flows from Smith Creek by 2020. The Rancho San Gorgonio Specific Plan (described in **Section 2.6.2** herein) includes design features that are estimated to capture and recharge approximately 199 AF/yr of stormwater at full buildout.

5.3 WASTEWATER AND RECYCLED WATER

Water Code

10633. The plan shall provide, to the extent available, information on recycled water and its potential for use as a water source in the service area of the urban water supplier. The preparation of the plan shall be coordinated with local water, wastewater, groundwater, and planning agencies that operate within the supplier's service area, and shall include all of the following:
(a) A description of the wastewater collection and treatment systems in the supplier's service area, including a quantification of the amount of wastewater collected and treated and the methods of wastewater disposal.
(b) A description of the quantity of treated wastewater that meets recycled water standards, is being discharged, and is otherwise available for use in a recycled water project.
(c) A description of the recycled water currently being used in the supplier's service area, including, but not limited to, the type, place, and quantity of use.
(d) A description and quantification of the potential uses of recycled water, including, but not limited to, agricultural irrigation, landscape irrigation, wildlife habitat enhancement, wetlands, industrial reuse, groundwater recharge, indirect potable reuse, and other appropriate uses, and a determination with regard to the technical and economic feasibility of serving those uses.
(e) The projected use of recycled water within the supplier's service area at the end of 5, 10, 15, and 20 years, and a description of the actual use of recycled water in comparison to uses previously projected pursuant to this subdivision.
(f) A description of actions, including financial incentives, which may be taken to encourage the use of recycled water, and the projected results of these actions in terms of acre-feet of recycled water used per year.
(g) A plan for optimizing the use of recycled water in the supplier's service area, including actions to facilitate the installation of dual distribution systems, to promote recirculating uses, to facilitate the increased use of treated wastewater that meets recycled water standards, and to overcome any obstacles to achieving that increased use.

5.3.1 Wastewater

City of Banning provides sewer service to the area within City limits and to unincorporated areas of Riverside County that surround the southeast portion of the City. The City of Banning is responsible for the collection, conveyance, treatment, and disposal of wastewater generated within its service area.

Collected wastewater is conveyed through sewer main lines, which are connected to the larger trunk lines. The trunk lines transport wastewater to the City's wastewater treatment plant (WWTP). The effluent is treated to secondary standards and is then

discharged to percolation ponds to recharge the Cabazon Storage Unit. Quantities of wastewater collected within the City's service area and treated at the WWTP during years 2010 through 2015 are set forth in **Table 5-5** below.

TABLE 5-5
WASTEWATER COLLECTED AND TREATED
(AF/YR)

Wastewater	2010	2011	2012	2013	2014	2015

Quantity Meeting Recycled Water Standards	0	0	0	0	0	0

[1] Wastewater is treated to secondary treatment standards.

TABLE 5-6
PROJECTED QUANTITIES OF WASTEWATER REQUIRING TREATMENT AND DISPOSAL[1]
(AF/YR)

Types of Use	Treatment Level	2020	2025	2030	2035	2040
Percolation	Secondary	2,869	1,409	1,607	1,823	2,039
Irrigation	Tertiary	0	1,680	1,680	1,680	1,680
	Total	2,869	3,089	3,287	3,503	3,719

[1] Assumes that Phase I of the WWTP expansion will be operational in 2025, and that all available quantities of recycled water will be used for landscape irrigation in the City

5.3.2 Recycled Water

The list of types of uses for which recycled water is approved within California is continuing to grow as the value of wastewater reclamation is now widely recognized as a reliable water resource. The State Water Resources Control Board (SWRCB) is responsible for Title 22 of the California Code of Regulations, which establishes water recycling criteria and allowable uses. The bulk of potential uses fall into landscape irrigation such as golf courses, schools, cemeteries, parks, medians, and freeway landscape.

The City of Banning currently does not produce recycled water. The City proposes to expand its 3.6 million gallons per day (MGD) wastewater treatment plant and construct facilities to support its planned recycled water storage and distribution capability in accordance with the *City of Banning Recycled Water Master Plan*, dated September 21, 2006 (Recycled Water Master Plan), a copy of which is included in **Appendix J** herein. Phase I of the WWTP expansion consists of increasing the capacity from 3.6 MGD to 5.1 MGD and adding tertiary treatment facilities for production of recycled water. Upon completion of Phase I, approximately 1,680 AF/yr of recycled water would be available to the City for irrigation use. Assuming that the WWTP expansion would be completed by year 2025, projected quantities of recycled water production and use are set forth in **Table 5-6** above. According to the Recycled Water Master Plan, the City has a current recycled water demand of approximately 2,700 AF/yr; however, future recycled water use is limited to irrigation use in near proximity to the City's recycled water pipeline, as well as quantities of recycled water available. Recycled water demand in excess of quantities available will be made up with potable water.

5.3.3 Proposed Actions to Encourage Use of Recycled Water

The City's Water Shortage Contingency Plan (**Chapter 7** herein) contains exceptions from water conservation measures for consumers, such as golf courses, commercial nurseries, and car wash facilities, who use recycled water. Historically, favorable rates for recycled water have been a primary incentive for customers with large landscaped areas to use recycled water in lieu of potable water for irrigation. The City can encourage recycled water use by restructuring its water rates and service charges for customers who use recycled water; however, recycled water use will be limited to those customers who are within close proximity to a recycled water pipeline.

CHAPTER 6

WATER SYSTEM RELIABILITY

CHAPTER 6
WATER SUPPLY RELIABILITY

Water Code

10631. (c) (1) Describe the reliability of the water supply and vulnerability to seasonal or climatic shortage, to the extent practicable, and provide data for each of the following:

(A) An average water year.

(B) A single dry water year.

(C) Multiple dry water years.

(2) For any water source that may not be available at a consistent level of use, given specific legal, environmental, water quality, or climatic factors, describe plans to supplement or replace that source with alternative sources or water demand management measures, to the extent practicable.

(g) Include a description of all water supply projects and water supply programs that may be undertaken by the urban water supplier to meet the total projected water use as established pursuant to subdivision (a) of Section 10635…

6.1 FREQUENCY AND MAGNITUDE OF SUPPLY DEFICIENCIES

Although Southern California has experienced severe drought conditions since 2011, the City has not experienced any actual supply deficiencies due to its reliance on local groundwater sources. The City does not have an immediate concern with water supply reliability. Because the City's water supply is primarily groundwater, the City is not subject to short-term water shortages resulting from temporary dry weather conditions.

Factors that can cause water supply shortages are earthquakes, chemical spills, and energy outages at treatment and pumping facilities. The City of Banning includes the probability of catastrophic outages when using the reliability planning approach.

6.1.1 Groundwater

The City extracts groundwater from the Beaumont Storage Unit (Beaumont Basin) Banning Storage Unit, the Banning Bench Storage Unit, the Cabazon Storage Unit, and the Banning Canyon Storage Unit of the San Gorgonio Pass Subbasin portion of the Coachella Valley Groundwater Basin, as described in **Chapter 5**.

As stated previously, because the City's water supply is primarily groundwater, the City is not subject to short-term water shortages resulting from temporary dry weather conditions. Further, as part of the Beaumont Basin adjudication, the City has the option of storing up to 80,000 acre feet of water in the Beaumont Basin. At the end of calendar year 2014, City of Banning had 46,774 AF of water available in Beaumont Basin storage.

6.1.2 SWP Water

The City purchases imported State Water Project water (SWP) supplies for replenishment of the groundwater from the San Gorgonio Pass Water Agency (SGPWA), a State Water Contractor. Continuous availability of SWP allocations will require complete development of the SWP, which currently is unable to meet maximum Table A amount obligations during droughts; available water supplies are being further threatened by new and increasing constraints on the development of new water supply facilities and on the operation of existing facilities.

In particular, the Wanger decisions regarding protection of the Delta smelt, concerns about reliability of the Delta levees, and other concerns led the DWR to issue a revision in June 2012 of The SWP Reliability Report 2009, dated August 2010, wherein the long-term reliability of SWP supplies was reduced to approximately 60 percent of maximum allocations (later reduced to 58 percent). Without the construction of additional Sacramento-San Joaquin Delta facilities and certain water storage reservoirs, the water supply capability of the SWP will remain limited and SWP Contractors will have to share reduced quantities of available supplies, especially during droughts.

With continued progress in the completion of California WaterFix (formerly known as the Bay Delta Conservation Plan (BDCP)), the balance between more reliable SWP water supplies and ecosystem restoration will be increased.

The BDCP was a long-term conservation strategy designed to set forth actions required for a healthy Delta that would have been implemented over the next 50 years, with an estimated cost of about $20 billion. California WaterFix is a refinement of the BDCP that involves a shorter term of implementation and incidental take authorization, and a

narrowing of scope: the principal habitat restoration effort of the BDCP has been isolated as a separate program called "California EcoRestore".

California WaterFix itself involves the construction and operation of new water diversion facilities near Courtland to convey water from the Sacramento River through two tunnels to the existing state and federal pumping facilities near Tracy. In addition to other federal, state, and local approvals, California WaterFix requires changes to the water rights permits for the SWP and the federal Central Valley Project to authorize the proposed new points of water diversion and rediversion.

Currently, the cost of California WaterFix is estimated at about $15 billion. Eventually, SWP water supply reliability, quality, and delivered quantities and the overall health of the Delta may improve; however, it is unlikely that the costs for Delta improvements will be allocated to the SWP Contractors before 2020.

In addition to the existing restrictions on water supplies from the SWP, California is in its fourth consecutive year of severe drought. Beginning in 2012, the State has experienced the driest three years on record. In response to another dry winter in 2014/2015, the Governor of California issued an executive order on April 1, 2015, mandating water restrictions on urban water use statewide, and demanding 25 percent reduction in water use. As of the date of this report, the effect this executive order will have on water deliveries from the SWP is uncertain.

The 2013 SWP Final Reliability Report, dated December 2014, estimated the long-term reliability of SWP supplies at 58 percent of maximum Table A amounts through 2033. Last year, DWR issued the 2015 SWP Deliverability Capability Report, dated July 2015. Said report estimated the median deliverability of SWP supplies at approximately 64 percent, and long-term deliverability (82-year average value) at 62 percent of maximum Table A amounts 50 percent of the time over the historic long-term. However, said report's estimates are qualified as being based on existing and historical conditions, and are not intended as future projections. Furthermore, the extremely dry sequence from the beginning of January 2013 through the end of 2014 was one of the driest two-year periods in historical record, and resulted in a low SWP supply allocation in 2013 (35 percent of SWP Table A amounts), and an extremely low SWP water supply

allocation in 2014 (5 percent of Table A amounts). The dry hydrologic conditions that led to the low 2014 SWP water supply allocation were extremely unusual, and to date have not been included in the SWP delivery estimates presented in DWR's 2015 Delivery Capability Report. It is anticipated that the hydrologic record used in the DWR model will be extended to include the period through 2014 during the next update of the model, which is expected to be completed prior to issuance of the next update to the biennial SWP Delivery Capability Report. Given these factors, the older, more conservative 58 percent reliability figure has been used for future projections in this report.

SGPWA, has established a water shortage plan, which is set forth in its Ordinance No. 10, Ordinance Establishing Water Shortage Plan. Ordinance No. 10 adds SGPWA's Water Shortage Plan to the Rules and Regulations for SGPWA Water Service. A copy of Ordinance No. 10, adopted by SGPWA on July 21, 2014, is included in **Appendix L** herein.

SGPWA has also established a policy that will work toward the goal of meeting future water demands within its service area, which includes City of Banning. Said policy is set forth in Resolution No. 2014-02, A Resolution of the San Gorgonio Pass Water Agency Establishing a Policy for Meeting Future Water Demands. A copy of Resolution No. 2014-02, adopted by SGPWA on February 18, 2014, is included in **Appendix L** herein.

Although the City may expect variable reliability in availability of SWP water, such water is not its primary source of water, and short-term declines in SWP water availability would be offset by the City's substantial reserves of stored groundwater and would not result in a substantial impact to the City's water supply.

6.2 NORMAL AND DRY WATER YEARS

As required by the Urban Water Management Planning Act, the tables below describe the City's supply reliability and vulnerability during an average (normal) water year, a single dry water year, and multiple dry water years. For purposes of this section, a normal water year, a single dry water year, and a multiple dry water year period are defined below:

- **Normal Water Year** is defined as a year in the historical sequence that most closely represents median runoff levels and patterns.
- **Single Dry Water Year** is defined as the lowest annual runoff for a watershed.
- **Multiple Dry Water Year Period** is defined as the lowest average runoff for a consecutive multiple year period (three years or more).

As stated previously in this chapter, due to its reliance on local groundwater sources, the City has not experienced any actual supply deficiencies, even during multiple drought years. With the local groundwater reserves available to the City, the City does not anticipate a decrease in available water supplies during a dry year or during multiple dry years.

Table 6-1 describes groundwater supply reliability based on a normal water year, a single dry water year, and multiple dry water years. The base years and historic sequence are listed in **Table 6-3** and are based on historical precipitation data. **Table 6-2** describes groundwater supply reliability under current conditions and sets forth the anticipated supply reliability for the next three years.

The water supply quantities shown in **Tables 6-4**, **6-5**, and **6-6** are based on the maximum perennial yield quantities for each basin, as described in the City's 2010 UWMP, except the Beaumont Basin, which is adjudicated. Quantities of water available for the Beaumont Basin are based on estimated quantities that would be available to the City as described in note 2 to **Table 6-2** herein. The quantities estimated to be recharged to the Beaumont Basin were determined as described in **Section 5.1.1** herein.

The water demands described in **Tables 6-4**, **6-5**, and **6-6** were calculated on the basis of an average per capita demand within the City's service area of 220 gpcd, with future actual demands

of the two proposed specific plan developments (Butterfield Ranch and Rancho San Gorgonio) at the demands set forth in their respective water supply assessments, which are cited in note (1) of **Table 3-1** herein. At these demands, the City will be able to meet future demands through 2035 with existing supplies, without using any of the City's 46,774 AF of groundwater in reserve storage in the Beaumont Storage Unit. If the stored groundwater is used to supplement demands, the City will be able to satisfy projected demands at 220 gpcd without acquiring additional quantities of replenishment water for many years beyond 2040.

TABLE 6-1
GROUNDWATER SUPPLY RELIABILITY - HISTORIC CONDITIONS[1]
(AF/YR)

Source	Normal Water Year (2001)	Single Dry Water Year (2007)	Multiple Dry Water Years		
			2012	2013	2014
Beaumont Storage Unit[2]	5,910	5,910	5,910	5,910	5,910
Beaumont Storage Unit Recharge (SWP Water)[3]	0	0	1,200	1,200	608
Banning Storage Unit	1,130	1,130	1,130	1,130	1,130
Cabazon Storage Unit	2,515	2,515	2,515	2,515	2,515
Banning Bench Storage Unit	1,960	1,960	1,960	1,960	1,960
Banning Canyon Storage Unit	4,070	4,070	4,070	4,070	4,070
Total	**15,585**	**15,585**	**16,785**	**16,785**	**16,193**
Percent of Normal	100%	100%	100%	100%	100%

(1) Due to reliance on groundwater, supply reliability is the same during normal, single-dry, and multiple-dry water years. Refer to **Table 6-3** for the basis of water year data.

(2) The Beaumont Storage Unit was adjudicated in 2004.

(3) The City began providing SWP water for recharge of the Beaumont Storage Unit in 2008.

TABLE 6-2 GROUNDWATER SUPPLY RELIABILITY - CURRENT CONDITIONS[1] (AF/YR)					
Source	Normal Water Year (2016)	Single Dry Water Year (2016)	Multiple Dry Water Years		
			2016	2017	2018
Beaumont Storage Unit[2]	1,398	1,398	1,398	1,398	1,398
Beaumont Storage Unit Recharge (SWP Water)[3]	2,718	2,718	2,718	2,718	2,718
Banning Storage Unit	1,130	1,130	1,130	1,130	1,130
Cabazon Storage Unit	2,515	2,515	2,515	2,515	2,515
Banning Bench Storage Unit	1,960	1,960	1,960	1,960	1,960
Banning Canyon Storage Unit	4,070	4,070	4,070	4,070	4,070
Total	**13,791**	**13,791**	**13,791**	**13,791**	**13,791**
Percent of Normal	100%	100%	100%	100%	100%

(1) Due to reliance on groundwater, supply reliability is the same during normal, single-dry, and multiple-dry water years.

(2) Quantities of water available from the Beaumont Storage Unit are based on the estimated quantities of water that would be available to the City based on its appropriative rights after extractions by overlying producers, as set forth in Table 4-4 of *City of Banning 2010 Urban Water Management Plan*, dated July 22, 2011. Because the safe yield of the Beaumont Storage Unit was reduced from 8,650 AF/yr to 6,700 AF/yr in 2013 (a decrease of approximately 22.5%), estimated quantities of water available to the City of Banning from the Beaumont Storage Unit were reduced proportionately herein.

(3) These quantities represent estimated annual recharge of the Beaumont Storage Unit by the City and do not account for the 46,774 AF that the City of Banning currently has in storage in the Beaumont Storage Unit.

TABLE 6-3 BASIS OF WATER YEAR DATA		
Water Year Type	Base Years [1]	Historic Sequence
Average Water Year	2001	1901-2015
Single-Dry Water Year	2007	1901-2015
Multiple-Dry Water Years	2012-2014	1901-2015

(1) Base years identified from historical precipitation data for the period 1901-2015, a copy of which is included in **Appendix F**.

TABLE 6-4 NORMAL YEAR SUPPLY AND DEMAND COMPARISON[1] (AF/YR)					
	2020	**2025**	**2030**	**2035**	**2040 [2]**
Supply Totals	13,659	13,538	13,422	13,318	13,318
Demand Totals	10,515	11,320	12,047	12,837	13,629
Difference	3,144	2,218	1,375	481	-311

(1) Due to reliance on groundwater, supply reliability is the same during normal, single-dry, and multiple-dry water years.

(2) Although projected supply totals are less than projected demand totals for 2040, the City has 46,774 AF of stored water in its Beaumont Basin storage account, which is not accounted for in the projected supply totals. Therefore, the City has ample water supplies to meet projected demands through 2040.

TABLE 6-5 SINGLE DRY YEAR SUPPLY AND DEMAND COMPARISON[1] (AF/YR)					
	2020	**2025**	**2030**	**2035**	**2040 [2]**
Supply Totals	13,659	13,538	13,422	13,318	13,318
Demand Totals	10,515	11,320	12,047	12,837	13,629
Difference	3,144	2,218	1,375	481	-311

(1) Due to reliance on groundwater, supply reliability is the same during normal, single-dry, and multiple-dry water years.

(2) Although projected supply totals are less than projected demand totals for 2040, the City has 46,774 AF of stored water in its Beaumont Basin storage account, which is not accounted for in the projected supply totals. Therefore, the City has ample water supplies to meet projected demands through 2040.

TABLE 6-6
MULTIPLE DRY YEARS SUPPLY AND DEMAND COMPARISON[1]
(AF/YR)

		2020	2025	2030	2035	2040 [2]
First Year	Supply Totals	13,659	13,538	13,422	13,318	13,318
	Demand Totals	10,515	11,320	12,047	12,837	13,629
	Difference	3,144	2,218	1,375	481	-311
Second Year	Supply Totals	13,659	13,538	13,422	13,318	13,318
	Demand Totals	10,515	11,320	12,047	12,837	13,629
	Difference	3,144	2,218	1,375	481	-311
Third Year	Supply Totals	13,659	13,538	13,422	13,318	13,318
	Demand Totals	10,515	11,320	12,047	12,837	13,629
	Difference	3,144	2,218	1,375	481	-311

(1) Due to reliance on groundwater, supply reliability is the same during normal, single-dry, and multiple-dry water years.

(2) Although projected supply totals are less than projected demand totals for 2040, the City has 46,774 AF of stored water in its Beaumont Basin storage account, which is not accounted for in the projected supply totals. Therefore, the City has ample water supplies to meet projected demands through 2040.

6.3 WATER QUALITY IMPACTS ON RELIABILITY

Water Code

10634. The plan shall include information, to the extent practicable, relating to the quality of existing sources of water available to the supplier over the same five-year increments as described in subdivision (a) of Section 10631, and the manner in which water quality affects water management strategies and supply reliability.

The City of Banning monitors its water quality as required by state and federal regulations. Groundwater underlying the City's water service area has historically been of high quality, with concentrations of total dissolved solids (TDS) under 300 milligrams per liter (mg/L). The average level of TDS detected in the City's drinking water during 2014 was 200 mg/L. The secondary maximum contaminant level (MCL) range for TDS concentrations in drinking water is 500-1,000 mg/L.

California has established a maximum contaminant level (MCL) of 10 parts per billion (ppb) for hexavalent chromium (Cr6), which took effect on July 1, 2014. Prior to this, Cr6 was regulated under California's total chromium MCL of 50 ppb. Based on monitoring results, the City has detected Cr6 at concentrations exceeding the MCL in water produced by seven of its groundwater production wells (Wells C2, C3, C4, C6, M3, M10, and M12).

The City has received a variance from the Cr6 MCL until year 2020 in order take actions necessary to address the high Cr6 concentrations. The City's *Chromium-6 Compliance Plan*, dated December 2015 (compliance plan) involves analysis to determine treatment options and the design and construction of treatment facilities. Completion of the compliance plan is anticipated to take place in early 2020. A copy of the compliance plan and associated Amendment No. 1 are included in **Appendix M** herein.

Besides the areas containing elevated levels of Cr6, City of Banning's drinking water is of excellent quality, and no significant impacts to Banning's water supply reliability are expected to result from water quality issues.

6.4 OTHER POTENTIAL WATER SOURCES

Water Code

10631. A plan shall be adopted in accordance with this chapter that shall do all of the following:
(d) Describe the opportunities for exchanges or transfers of water on a short-term or long-term basis.
(g) Include a description of all water supply projects and water supply programs that may be undertaken by the urban water supplier to meet the total projected water use, as established pursuant to subdivision (a) of Section 10635…
(h) Describe the opportunities for development of desalinated water, including, but not limited to, ocean water, brackish water, and groundwater, as a long-term supply.

6.4.1 Transfer or Exchange Opportunities

The City of Banning currently has no plans for water transfers or exchanges, with the exception of interbasin transfers in the adjudicated Beaumont Basin. The City can meet

its future water demand with existing groundwater sources, including SWP water used for recharge, as well as recycled water and conservation measures.

6.4.2 Water Supply Projects and Programs

The City currently repairs or replaces facilities as necessary in order to maintain the integrity and reliability of the City's water system. Additionally, the City is currently seeking funding to construct additional groundwater wells and water storage reservoirs.

The Banning Water Canyon Main Replacement Project will replace portions of the existing Banning Water Canyon Main (a riveted steel pipeline that was constructed circa 1927), which conveys potable water from a series of wells along the San Gorgonio River to the City's service area. The purpose of this project is to eliminate aging infrastructure.

6.4.3 Desalinated Water

The City of Banning is located approximately 55 miles from the Pacific Ocean and approximately 50 miles from the Salton Sea. Groundwater quality in the area does not have levels of total dissolved solids (TDS) that require desalting. Therefore, the City does not have access to a source of water that could be desalinated for potable use.

CHAPTER 7

WATER SHORTAGE CONTINGENCY PLANNING

CHAPTER 7
WATER SHORTAGE CONTINGENCY PLANNING

Water Code

10632. (a) The plan shall provide an urban water shortage contingency analysis which includes each of the following elements which are within the authority of the urban water supplier:
(1) Stages of action to be undertaken by the urban water supplier in response to water supply shortages, including up to a 50 percent reduction in water supply, and an outline of specific water supply conditions which are applicable to each stage.
(2) An estimate of the minimum water supply available during each of the next three water years based on the driest three-year historic sequence for the agency's water supply.
(3) Actions to be undertaken by the urban water supplier to prepare for, and implement during, a catastrophic interruption of water supplies including, but not limited to, a regional power outage, an earthquake, or other disaster.
(4) Additional, mandatory prohibitions against specific water use practices during water shortages, including, but not limited to, prohibiting the use of potable water for street cleaning.
(5) Consumption reduction methods in the most restrictive stages. Each urban water supplier may use any type of consumption reduction methods in its water shortage contingency analysis that would reduce water use, are appropriate for its area, and have the ability to achieve a water use reduction consistent with up to a 50 percent reduction in water supply.
(6) Penalties or charges for excessive use, where applicable.
(7) An analysis of the impacts of each of the actions and conditions described in subdivisions (1) to (7), inclusive, on the revenues and expenditures of the urban water supplier, and proposed measures to overcome those impacts, such as the development of reserves and rate adjustments.
(8) A draft water shortage contingency resolution or ordinance.
(9) A mechanism for determining actual reductions in water use pursuant to the urban water shortage contingency analysis.
(b) Commencing with the urban water management plan update due July 1, 2016, for purposes of developing the water shortage contingency analysis pursuant to subdivision (a), the urban water supplier shall analyze and define water features that are artificially supplied with water, including ponds, lakes, waterfalls, and fountains, separately from swimming pools and spas, as defined in subdivision (a) of Section 115921 of the Health and Safety Code.

7.1 WATER SHORTAGE CONTINGENCY PLAN

Water shortage contingency planning is a strategic planning process to prepare for and respond to water shortages. The City of Banning relies on groundwater as its primary source of water supply, and periodic drought has historically not substantially affected the groundwater levels.

Therefore, the water shortage contingency analysis herein focuses mainly on water supply interruption resulting from equipment failure and disaster.

The City adopted its Water Shortage Contingency Plan (WSCP) in 1991 with adoption of City Ordinance No. 1040. The WSCP outlines a plan of action in the event of a water shortage caused by a catastrophic event, such as electrical power failure, earthquake, pipeline failure, or other event that results in the City's potential inability to meet the water demands of its customers.

7.1.1 Three-Year Minimum Water Supply

The City's minimum water supply for the following three years (2016-2018) is listed in **Table 6-2** in **Chapter 6** herein. Although a decrease in availability of SWP water is expected during drought conditions, because the City's primary water supply is groundwater, drought conditions are not expected to result in a water shortage within the City's water service area. Should drought conditions persist over the next three years, the City does not expect to experience a decrease in water supply would be able to meet the water demands of its customers.

7.1.2 Catastrophic Water Supply Interruption

Several faults, including the Banning Fault and portions of the San Gorgonio Fault Zone, are present within the City's sphere of influence. The Banning Fault defines the north side of the Banning Bench Storage Unit, and it is characterized by a right-lateral strike-slip displacement on the northwest trending faults with a normal dip-slip displacement. The San Gorgonio Fault Zone describes a group of Quaternary reverse, thrust, and tear faults that extend from the Whitewater area westward to the Calimesa area and define the boundary of the Banning Storage Unit.

An earthquake could result in a power outage and damage to the water system facilities. The City has its own field crews, equipment, and materials to make immediate responses and repairs to its water system. Standby crews are on call at all times to respond promptly to emergencies.

The City's water production wells are located throughout its water service area, which provides the ability to supply water in different portions of the City. Also, the City has a 12-inch emergency interconnection with BCVWD at the western boundary of the City's service area, located at the intersection of Highland Springs Avenue and Sun Lakes Boulevard.

Wells 8, 9, 10, C-2, and M-12 have an emergency power source available to continue to operate when the power fails. Wells 1, 3, 4, and 5 do not have an emergency power supply, but they have the ability to provide water during an emergency. **Table 7-1** summarizes the City's wells with emergency power source and anticipated capacity during auxiliary backup. It should be noted that the backup systems for Wells 8, 9, and 10 require manual turn on. Additionally, Wells 1 and 3 are equipped with both electric pumps and Pelton wheels, and Wells 4 and 5 are equipped with only a Pelton wheel pump, which also allows these wells to provide water in the event of an emergency. Pelton wheel pumps allow these wells to be operated by a hydraulic-driven pump using existing water under pressure in the distribution system. If additional water supply capacity is needed, portable generators can be obtained to operate other remaining wells and booster stations.

The total water available from the use of these nine wells is 6,850 gpm (30.3 AF/day), based on City of Banning dry-year capacities, City of Banning Public Works (2011). These quantities would be sufficient to meet the maximum day demand of approximately 30 AF/day (based on 2015 high day). If needed, additional water is available in the aboveground storage, as listed in **Table 7-2** herein. The total emergency aboveground water supply available is 67.1 AF. Total combined emergency supply from production wells and aboveground storage reservoirs and tanks is approximately 97.4 AF. It should be noted that the High Valleys Reservoir is used exclusively by High Valleys Water District and the associated storage is not included in the emergency supplies listed for the City.

TABLE 7-1 WELLS WITH EMERGENCY GENERATORS AND BACKUP SYSTEMS				
Well	Location	Total Capacity		Remarks
		GPM	AF/Day	
1	Banning Bench Storage Unit	1,250	5.5	Pelton Wheel
3	Banning Bench Storage Unit	500	2.2	Pelton Wheel
4	Banning Canyon Storage Unit	600	2.7	Pelton Wheel
5	Banning Canyon Storage Unit	550	2.4	Pelton Wheel
8	Banning Canyon Storage Unit	550	2.4	Backup Portable Generator
9	Banning Canyon Storage Unit	400	1.8	Backup Portable Generator
10	Banning Canyon Storage Unit	600	2.7	Diesel Engine Drive
C2	Beaumont Storage Unit	1,000	4.4	Generator
M12	Banning Storage Unit	950	4.2	Generator
	Total	**6,400**	**28.3**	

TABLE 7-2 AVAILABLE EMERGENCY RESERVOIR STORAGE		
Available Reservoirs	Total Aboveground Storage (MG)	Total Aboveground Storage (AF)
Brinton Reservoir	8.0	24.6
C2 Tank	0.22	0.7
C3 Tank	0.06	0.2
C4 Tank	0.05	0.2
C5 Tank	0.05	0.2
Mountain Tank	0.025	0.1
Receiving	0.024	8.0
San Gorgonio Reservoir No. 1	2.60	6.1
San Gorgonio Reservoir No. 2	2.00	3.1
San Gorgonio Reservoir No. 3	1.00	4.6
Southwest Reservoir	1.50	6.4
Sunset Reservoir No. 1	2.1	6.4
Sunset Reservoir No. 2	2.1	6.4
Total	**19.7**	**67.0**

7.1.3 Stages of Action

The City's WSCP includes four stages of action to progressively reduce water consumption within its Water Service Area during an increasingly dramatic water supply shortage. **Table 7-3** shows a rationing plan that the City could adopt to achieve the reduction goal listed for each stage. The rationing plan includes voluntary and mandatory rationing, which will be required based on the causes, severity, and anticipated duration of the water supply shortage. In the event that a water shortage is caused by catastrophic outage or failure of City water system facilities, the water shortage percentage will be determined by the percentage of the City's service area served by the facilities that are out of service as a result of the outage or failure. Said percentage will be verified by the Superintendent of Water/Wastewater.

The Superintendent of Water/Wastewater routinely monitors the City's water supply and demand. If any water supply shortage conditions are observed, then the Superintendent of Water/Wastewater will recommend implementing a stage of action, as listed in **Table 7-3** below.

During all stages of a water shortage, the Water Operations Superintendent will monitor the supply and demand for water on a daily basis to determine the level of conservation required and notify the City Council of the necessity for the implementation or termination of each stage of action. Each declaration of the City Council's implementation or termination of a water conservation stage shall be published at least once in a newspaper of general circulation within the City's Water Service Area. A copy of the City's Draft Resolution to Declare a Water Shortage Emergency is included in **Appendix N** herein.

The City's mechanism for determining reductions in water use based on the rationing stages consists of comparing meter readings while a rationing stage is in effect to the meter readings from prior to implementation of the rationing stage.

TABLE 7-3 RATIONING STAGES AND REDUCTION GOALS			
Shortage	**Stage of Action[(1)]**	**Reduction Goal**	**Type of Program**
Up to 15%	1	15%	Voluntary
15% to 25%	2	25%	Mandatory
25% to 35%	3	35%	Mandatory
35% to 50%	4	50%	Mandatory

(1) Determined by the City's Superintendent of Water/Wastewater and implemented or terminated by City Council action.

Stage of Action 1. Stage 1 occurs when the City of Banning is able to meet all of the water demands of its customers within the immediate future. During this stage, the City recommends voluntary conservation measures. All water users will be advised to use water wisely, prevent the waste or unreasonable use of water, and reduce water consumption to levels necessary for ordinary domestic and commercial purposes.

Stage of Action 2. Stage 2 occurs when a sudden and unexpected water supply shortage occurs that prevents the City from meeting the water demands of its customers. If this should occur, the City Council would immediately hold a public hearing wherein water service customers will have the opportunity to protest and to present their respective needs to the City Council. No public hearing would be required in the event of a breakage or failure of a dam, pump, pipeline, or conduit. At the public hearing, the Council may declare a water shortage emergency condition, and the following mandatory rules and regulations will be in effect immediately following such declaration:

- Washing driveways, parking lots, other hard surfaced areas, or building exteriors at any time, except to alleviate immediate fire hazards, is prohibited;
- Parks, golf courses, and school grounds are to be irrigated during nighttime hours only, between sunset and sunrise;
- Lawn watering and landscape irrigation, including construction meter use, is prohibited between the hours of 10:00 AM to 5:00 PM;

- Running water shall not be used for washing privately owned vehicles. A bucket may be used for the washing of vehicles, and only hoses with shut-off nozzles may be used for rinsing;
- Restaurants are requested to not provide drinking water to patrons except by request;
- Commercial nurseries shall use water only during the hours from midnight to 6:00 AM. Irrigation of propagation beds and watering of livestock is permitted as necessary during any hours; and
- Golf courses using reclaimed water are exempted from these restrictions.

Stage of Action 3. If, after Stage 2 has been implemented, further reductions in water consumption are required, Stage 3 will be declared following a public hearing, as described for Stage 2. Water supply and demand will be continuously monitored by the Water Operations Superintendent. The City Council will declare an emergency water supply shortage, and the following mandatory water conservation measures will apply:

- Parks and schools shall be watered on alternate days during the hours between sunset to sunrise, the schedule of which shall be set following the public hearing;
- Golf courses that utilize domestic water from the City's water system may irrigate greens only during the hours between sunset to sunrise. Golf courses using reclaimed water are exempted from this restriction;
- Other lawn watering, landscape irrigating, and construction water use are restricted as follows: customers with even numbered street addresses may water only on even numbered days, and customers with odd numbered street addresses may water only on odd numbered days. No watering or irrigating shall be done between the hours of 10:00 AM and 5:00 PM on any day;
- Washing down driveways, parking lots, or other paved surfaces is prohibited;
- Washing vehicles is restricted to commercial car wash establishments which recycle their water;
- Filling or adding water to swimming pools, wading pools, spas, ornamental ponds, fountains, and artificial lakes is prohibited;

- Restaurants shall not serve drinking water to patrons except by request;
- No new construction water meter permits shall be issued by the City;
- Construction metered water shall not be used for earth work or road construction purposes;
- Watering livestock is permitted as necessary during any hours; and
- Commercial nurseries may use water only between the hours of midnight and 6:00 AM. Irrigation of propagation beds is permitted as necessary during any hours. Commercial nurseries using reclaimed water are exempted from this restriction.

Stage of Action 4. Stage 4 will be implemented if water shortage conditions continue or worsen and measures to reduce water use required by Stage 3 are not adequate. Following a declaration by the City Council that an emergency water supply shortage due to a major failure in a supply or distribution facility, the following mandatory water conservation measures will apply:

- Watering of parks, school grounds, and golf courses is prohibited, except by reclaimed water;
- Watering of lawn and irrigating of landscape is prohibited;
- Washing down driveways, parking lots, or other paved surfaces is prohibited;
- Washing vehicles is prohibited, except when done by commercial car washing establishments using recycled or reclaimed water;
- Filling or adding water to swimming pools, wading pools, spas, ornamental ponds, fountains, and artificial lakes is prohibited;
- Restaurants shall not serve drinking water to patrons except by request;
- No new construction water meter permits shall be issued by the City;
- All existing construction meters will be turned off and locked; and
- Commercial nurseries shall discontinue all watering and irrigating. Those utilizing reclaimed water are exempted from this restriction. Livestock watering is permitted as necessary.

7.1.4 Implementation

During all stages of a water shortage, the Water Operations Superintendent will monitor the supply and demand for water on a daily basis to determine the level of conservation required and will notify the City Council of the necessity for the implementation or termination of each stage. Each declaration of the City Council's implementation or termination of a water conservation stage shall be published at least once in a newspaper of general circulation.

7.1.5 Penalties

Violation of any mandatory restriction or requirement of City Ordinance No. 1040 constitutes a misdemeanor. Conviction of this misdemeanor could result in imprisonment in the county jail for not more than thirty days, a fine of not more than $1000, or both such fine and imprisonment.

In addition to criminal penalties, violators of the mandatory restrictions or of City Ordinance No. 1040 are subject to civil action initiated by the City, as summarized below:

First Violation: The City will issue a written notice of violation to the water user.

Second Violation: For a second violation within a 12-month period, a one-month surcharge of 25% of the previous month's water bill will be imposed.

Third Violation: For a third violation within a 12-month period, a one-month penalty surcharge of 50% of the previous month's water bill will be imposed. In addition to the surcharge, the City may install a flow-restricting device at the meter at the expense of the violator.

Subsequent Violations: For any subsequent violation within 24 calendar months after a fist violation, water service will be discontinued. Service will not be restored until the Water Operations Superintendent has determined that the water user has provided reasonable assurances that future violations will not occur.

7.1.6 Determining Water Shortage Reductions

All of the City's water connections are metered; therefore, the City relies upon water meters readings to record the production and consumption of water. Consumption reduction would be measured by tracking any decrease in water production.

7.1.7 Revenue and Expenditure Impacts

The City's water department's principal source of operating revenue is from collection of water rates. A 50% reduction in water consumption would have a large impact on the water department's revenue. Revenue loss could be partially offset by penalties collected for violations of mandatory restrictions. Provisions for an emergency reserve were accounted for in the City's current water rates and water service connection fee. At a minimum, this reserve should maintain a 60-day operating period.

CHAPTER 8

DEMAND MANAGEMENT MEASURES

CHAPTER 8
DEMAND MANAGEMENT MEASURES

Water Code

10631. A plan shall be adopted in accordance with this chapter and shall do all of the following:

(f) Provide a description of the supplier's water demand management measures. This description shall include all of the following:

(1)(A) …a narrative description that addresses the nature and extent of each water demand management measure implemented over the past five years. The narrative shall describe the water demand management measures that the supplier plans to implement to achieve its water use targets pursuant to Section 10608.20.

(B) The narrative pursuant to this paragraph shall include descriptions of the following water demand management measures:

(i) Water waste prevention ordinances
(ii) Metering
(iii) Conservation pricing
(iv) Public education and outreach
(v) Programs to assess and manage distribution system real loss
(vi) Water conservation program coordination and staffing support
(vii) Other demand management measures that have a significant impact on water use as measured in gallons per capita per day, including innovative measures, if implemented.

(g) Include a description of all water supply projects and water supply programs that may be undertaken by the urban water supplier to meet the total projected water use, as established pursuant to subdivision (a) of Section 10635. The urban water supplier shall include a detailed description of expected future projects and programs that the urban water supplier may implement to increase the amount of the water supply available to the urban water supplier in average, single-dry, and multiple-dry water years. The description shall identify specific projects and include a description of the increase in water supply that is expected to be available from each project. The description shall include an estimate with regard to the implementation timeline for each project or program.

(i) For purposes of this part, urban water suppliers that are members of the California Urban Water Conservation Council shall be deemed in compliance with the requirements of subdivision (f) by complying with all the provisions of the "Memorandum of Understanding Regarding Urban Water Conservation in California", dated December 10, 2008, as it may be amended, and by submitting the annual reports required by Section 6.2 of that memorandum.

8.1 REQUIREMENTS

The section of the California Water Code (CWC) addressing demand management measures (DMMs) was significantly modified in 2014 based on recommendations from the Independent Technical Panel (ITP) to the Legislature. The ITP was formed by DWR to provide information and recommendations to DWR and the state Legislature on new demand management measures,

technologies, and approaches to water use efficiency. In its report to the Legislature, the ITP recommended that the UWMP Act be amended to simplify, clarify, and update the demand management measures reporting requirements. The ITP recommended, and the legislature enacted, streamlining the retail water agency requirements from 14 specific measures to six more general requirements plus an "other" category. These categories are set forth in CWC Section 10631(f)(1)(B).

8.2 IMPLEMENTATION

The City of Banning is committed to implementing water conservation programs and encourages its customers to conserve water whenever possible. The following paragraphs describe the water demand management measures (DMMs) that the City has implemented over the past five years, as well as those that will be implemented in order to ensure that the City achieves its urban water use target in 2020.

8.2.1 Water Waste Prevention Ordinances

City Ordinance No. 1039 was adopted by the City Council in 1991, prohibiting the waste of water. Ordinance No. 1039 describes actions that are considered a waste of water and the subsequent penalties if a violation were to occur. In 1998, this Ordinance was incorporated into City Ordinance No. 1231.

In 2006, Assembly Bill No. 1881 was passed, requiring local agencies, beginning January 1, 2010, to adopt a model water efficiency landscape ordinance that is at least as effective as the State's model water efficiency landscape ordinance. The City Council adopted Resolution No. 2010-06 on January 26, 2010 to meet this requirement.

Most recently, the City adopted Ordinance No. 1489 pertaining to drought water conservation. This ordinance sets forth mandatory prohibitions and additional restrictions on water use during drought conditions to comply with the executive orders issued by Governor Brown pertaining to the declared drought emergency and with the emergency water conservation regulations promulgated by the State Water Resources Control Board.

Copies of Ordinance No. 1489 and Resolution No. 2010-06 are included in **Appendix K** herein.

8.2.2 Metering

All of the City's water service connections, for all customer sectors, are metered. The City has investigated the feasibility of separately metering each of the multifamily dwelling units in its Water Service Area; however, it determined that doing so is not feasible. Additionally, the City has installed dedicated landscape irrigation meters for Sun Lakes Country Club, Caltrans, the City park system, and City school district facilities. The City will continue to meter all new water service connections.

The City is considering a transition to either a fixed base or drive-by Automatic Meter Read (AMR) system that allows the City to monitor each individual customer account for water conservation.

The fixed system involves placing antennas throughout the City that would collect data from the water meters at set intervals. The data would then be downloaded to the City's system and transferred to a desktop computer. The data is computed for individual users for billing purposes or for alerting the City if a set water use threshold has been exceeded, signaling a possible leak on the property. If this condition arises, the owner of the property would be notified by either email or phone call.

The drive-by system is similar to the fixed base system, but instead of using a network of antennas, meter readings are picked up by driving by the meters and then downloading the readings after returning to the office. This delays the ability to collect the information immediately and be able to alert the customer of possible leaks within the shortest amount of time. The implementation of either AMR system would facilitate the review of water records and evaluation of effectiveness of conservation programs.

8.2.3 Conservation Pricing

The City has a three-tiered increasing rate structure that applies to all customers. The City is currently investigating the potential of a fixed or drive-by Automatic Meter Read (AMR) system that allows the City to monitor each individual customer account for water conservation. These potential systems are described in **Section 8.2.2** above.

8.2.4 Public Education and Outreach

The City has initiated several water conservation programs to educate its water service customers in regards to various approaches to conserve water. At City Hall, water conservation pamphlets are displayed year-round as well as at public city-wide events. Public Works Department staff plan to visit school classrooms and make presentations on water conservation and distribute brochures with additional conservation information. The Public Works Superintendent is in continuous contact with the staff of Sun Lakes Country Club golf course to manage water more efficiently. The City intends to continue to expand public education on water resources.

Additionally, the City has a program in which Public Works staff visits local schools to make presentations on water conditions in the San Gorgonio Pass area, emphasizing the value of water and water conservation. Educational brochures are also made available to the students.

8.2.5 Programs to Assess and Manage Distribution System Real Loss

The City has prepared a water audit for reporting year 2015 in accordance with CWC Section10631(e)(3), using methods and a worksheet developed by the American Water Works Association (AWWA). Based on said water audit, a copy of which is included in **Appendix G** herein, the City's water system losses were approximately 738 acre-feet in 2015.

Based on City records, water losses have varied over the years, and losses during 2010 through 2014 are listed in **Table 8-1** below.

TABLE 8-1
DISTRIBUTION SYSTEM WATER LOSSES (AF/yr)

Year	Quantity (AF/yr)	Percent of Total
2010	812	9.7
2011	944	11.2
2012	557	6.5
2013	811	9.3
2014	860	10.2
2015	738	11.0

As part of the City's normal operations, the City repairs major leaks to the distribution system as soon as possible after they are discovered. Further, under the City's capital improvement plan, old leaking pipes are continually being replaced.

8.2.6 Water Conservation Program Coordination and Staffing Support

The City's Superintendent of Water/Wastewater serves as a part-time water conservation coordinator. The City's Public Works staff also assists with coordinating conservation efforts and providing public information about water conservation. Should the need arise, the City will designate a full-time water conservation coordinator, designate additional staffing support, or both.

8.2.7 Other Demand Management Measures

In addition to the DMMs described above, the City posts water conservation tips and other information on its website, www.ci.banning.ca.us. The City provides additional conservation information and answers questions from its customers upon request. The City has developed a hotline for customer use in reporting leaks, overwatering, and other misuse of water.

8.3 PLANNED IMPLEMENTATION TO ACHIEVE URBAN WATER USE TARGET

As described in **Chapter 4** herein, the City's compliance year 2015 water use is 196 gallons per capita per day (GPCD), which demonstrates that the City has met its interim urban water use target of 283 GPCD and is on track to meet its urban water use target of 252 GPCD by 2020.

Although the City's urban water use is already below its urban water use target of 252, it will still need to meet this target in compliance year 2020, and the City plans to continue its conservation efforts described herein for at least the next five years.

APPENDIX A

CALIFORNIA URBAN WATER MANAGEMENT PLANNING ACT
AND
APPLICABLE SECTIONS OF THE CALIFORNIA WATER CONSERVATION ACT

California Water Code Division 6, Part 2.6.
Chapter 1. General Declaration and Policy §10610-10610.4
Chapter 2. Definitions §10611-10617
Chapter 3. Urban Water Management Plans
Article 1. General Provisions §10620-10621
Article 2. Contents of Plans §10630-10634
Article 2.5. Water Service Reliability §10635
Article 3. Adoption And Implementation of Plans §10640-10645
Chapter 4. Miscellaneous Provisions §10650-10656

Chapter 1. General Declaration and Policy

SECTION 10610-10610.4

10610. This part shall be known and may be cited as the "Urban Water Management Planning Act."

10610.2. (a) The Legislature finds and declares all of the following:

(1) The waters of the state are a limited and renewable resource subject to ever-increasing demands.

(2) The conservation and efficient use of urban water supplies are of statewide concern; however, the planning for that use and the implementation of those plans can best be accomplished at the local level.

(3) A long-term, reliable supply of water is essential to protect the productivity of California's businesses and economic climate.

(4) As part of its long-range planning activities, every urban water supplier should make every effort to ensure the appropriate level of reliability in its water service sufficient to meet the needs of its various categories of customers during normal, dry, and multiple dry water years.

(5) Public health issues have been raised over a number of contaminants that have been identified in certain local and imported water supplies.

(6) Implementing effective water management strategies, including groundwater storage projects and recycled water projects, may require specific water quality and salinity targets for meeting groundwater basins water quality objectives and promoting beneficial use of recycled water.

(7) Water quality regulations are becoming an increasingly important factor in water agencies' selection of raw water sources, treatment alternatives, and modifications to existing treatment facilities.

(8) Changes in drinking water quality standards may also impact the usefulness of water supplies and may ultimately impact supply reliability.

(9) The quality of source supplies can have a significant impact on water management strategies and supply reliability.

(b) This part is intended to provide assistance to water agencies in carrying out their long-term resource planning responsibilities to ensure adequate water supplies to meet existing and future demands for water.

10610.4. The Legislature finds and declares that it is the policy of the state as follows:

(a) The management of urban water demands and efficient use of water shall be actively pursued to protect both the people of the state and their water resources.

(b) The management of urban water demands and efficient use of urban water supplies shall be a guiding criterion in public decisions.

(c) Urban water suppliers shall be required to develop water management plans to actively pursue the efficient use of available supplies.

Chapter 2. Definitions

SECTION 10611-10617

10611. Unless the context otherwise requires, the definitions of this chapter govern the construction of this part.

10611.5. “Demand management" means those water conservation measures, programs, and incentives that prevent the waste of water and promote the reasonable and efficient use and reuse of available supplies.

10612. "Customer" means a purchaser of water from a water supplier who uses the water for municipal purposes, including residential, commercial, governmental, and industrial uses.

10613. "Efficient use" means those management measures that result in the most effective use of water so as to prevent its waste or unreasonable use or unreasonable method of use.

10614. "Person" means any individual, firm, association, organization, partnership, business, trust, corporation, company, public agency, or any agency of such an entity.

10615. "Plan" means an urban water management plan prepared pursuant to this part. A plan shall describe and evaluate sources of supply, reasonable and practical efficient uses,

reclamation and demand management activities. The components of the plan may vary according to an individual community or area's characteristics and its capabilities to efficiently use and conserve water. The plan shall address measures for residential, commercial, governmental, and industrial water demand management as set forth in Article 2 (commencing with Section 10630) of Chapter 3. In addition, a strategy and time schedule for implementation shall be included in the plan.

10616. "Public agency" means any board, commission, county, city and county, city, regional agency, district, or other public entity.

10616.5. "Recycled water" means the reclamation and reuse of wastewater for beneficial use.

10617. "Urban water supplier" means a supplier, either publicly or privately owned, providing water for municipal purposes either directly or indirectly to more than 3,000 customers or supplying more than 3,000 acre-feet of water annually. An urban water supplier includes a supplier or contractor for water, regardless of the basis of right, which distributes or sells for ultimate resale to customers. This part applies only to water supplied from public water systems subject to Chapter 4 (commencing with Section 116275) of Part 12 of Division 104 of the Health and Safety Code.

Chapter 3. Urban Water Management Plans

Article 1. General Provisions

SECTION 10620-10621

10620. (a) Every urban water supplier shall prepare and adopt an urban water management plan in the manner set forth in Article 3 (commencing with Section 10640).

(b) Every person that becomes an urban water supplier shall adopt an urban water management plan within one year after it has become an urban water supplier.

(c) An urban water supplier indirectly providing water shall not include planning elements in its water management plan as provided in Article 2 (commencing with Section 10630) that would be applicable to urban water suppliers or public agencies directly providing water, or to their customers, without the consent of those suppliers or public agencies.

(d) (1) An urban water supplier may satisfy the requirements of this part by participation in areawide, regional, watershed, or basinwide urban water management planning where those plans will reduce preparation costs and contribute to the achievement of conservation and efficient water use.

(2) Each urban water supplier shall coordinate the preparation of its plan with other appropriate agencies in the area, including other water suppliers that

share a common source, water management agencies, and relevant public agencies, to the extent practicable.

(e) The urban water supplier may prepare the plan with its own staff, by contract, or in cooperation with other governmental agencies.

(f) An urban water supplier shall describe in the plan water management tools and options used by that entity that will maximize resources and minimize the need to import water from other regions.

10621. (a) Each urban water supplier shall update its plan at least once every five years on or before December 31, in years ending in five and zero, except as provided in subdivision (d).

(b) Every urban water supplier required to prepare a plan pursuant to this part shall, at least 60 days before the public hearing on the plan required by Section 10642, notify any city or county within which the supplier provides water supplies that the urban water supplier will be reviewing the plan and considering amendments or changes to the plan. The urban water supplier may consult with, and obtain comments from, any city or county that receives notice pursuant to this subdivision.

(c) The amendments to, or changes in, the plan shall be adopted and filed in the manner set forth in Article 3 (commencing with Section 10640).

(d) Each urban water supplier shall update and submit its 2015 plan to the department by July 1, 2016.

Article 2. Contents of Plan

SECTION 10630-10634

10630. It is the intention of the Legislature, in enacting this part, to permit levels of water management planning commensurate with the numbers of customers served and the volume of water supplied.

10631. A plan shall be adopted in accordance with this chapter that shall do all of the following:

(a) Describe the service area of the supplier, including current and projected population, climate, and other demographic factors affecting the supplier's water management planning. The projected population estimates shall be based upon data from the state, regional, or local service agency population projections within the service area of the urban water supplier and shall be in five-year increments to 20 years or as far as data is available.

(b) Identify and quantify, to the extent practicable, the existing and planned sources of water available to the supplier over the same five-year increments described in subdivision (a). If groundwater is identified as an existing or planned source of

water available to the supplier, all of the following information shall be included in the plan:

(1) A copy of any groundwater management plan adopted by the urban water supplier, including plans adopted pursuant to Part 2.75 (commencing with Section 10750), or any other specific authorization for groundwater management.

(2) A description of any groundwater basin or basins from which the urban water supplier pumps groundwater. For basins that a court or the board has adjudicated the rights to pump groundwater, a copy of the order or decree adopted by the court or the board and a description of the amount of groundwater the urban water supplier has the legal right to pump under the order or decree. For basins that have not been adjudicated, information as to whether the department has identified the basin or basins as overdrafted or has projected that the basin will become overdrafted if present management conditions continue, in the most current official departmental bulletin that characterizes the condition of the groundwater basin, and a detailed description of the efforts being undertaken by the urban water supplier to eliminate the long-term overdraft condition.

(3) A detailed description and analysis of the location, amount, and sufficiency of groundwater pumped by the urban water supplier for the past five years. The description and analysis shall be based on information that is reasonably available, including, but not limited to, historic use records.

(4) A detailed description and analysis of the amount and location of groundwater that is projected to be pumped by the urban water supplier. The description and analysis shall be based on information that is reasonably available, including, but not limited to, historic use records.

(c) (1) Describe the reliability of the water supply and vulnerability to seasonal or climatic shortage, to the extent practicable, and provide data for each of the following:

(A) An average water year.

(B) A single-dry water year.

(C) Multiple-dry water years.

(2) For any water source that may not be available at a consistent level of use, given specific legal, environmental, water quality, or climatic factors, describe plans to supplement or replace that source with alternative sources or water demand management measures, to the extent practicable.

(d) Describe the opportunities for exchanges or transfers of water on a short-term or long-term basis.

(e) (1) Quantify, to the extent records are available, past and current water use, over the same five-year increments described in subdivision (a), and projected water use, identifying the uses among water use sectors, including, but not necessarily limited to, all of the following uses:

(A) Single-family residential.

(B) Multifamily.

(C) Commercial.

(D) Industrial.

(E) Institutional and governmental.

(F) Landscape.

(G) Sales to other agencies.

(H) Saline water intrusion barriers, groundwater recharge, or conjunctive use, or any combination thereof.

(I) Agricultural.

(J) Distribution system water loss.

(2) The water use projections shall be in the same five-year increments described in subdivision (a).

(3) (A) For the 2015 urban water management plan update, the distribution system water loss shall be quantified for the most recent 12-month period available. For all subsequent updates, the distribution system water loss shall be quantified for each of the five years preceding the plan update.

(B) The distribution system water loss quantification shall be reported in accordance with a worksheet approved or developed by the department through a public process. The water loss quantification worksheet shall be based on the water system balance methodology developed by the American Water Works Association.

(4) (A) If available and applicable to an urban water supplier, water use projections may display and account for the water savings estimated to result from adopted codes, standards, ordinances, or transportation and land use plans identified by the urban water supplier, as applicable to the service area.

(B) To the extent that an urban water supplier reports the information described in subparagraph (A), an urban water supplier shall do both of the following:

(i) Provide citations of the various codes, standards, ordinances, or transportation and land use plans utilized in making the projections.

(ii) Indicate the extent that the water use projections consider savings from codes, standards, ordinances, or transportation and land use plans. Water use projections that do not account for these water savings shall be noted of that fact.

(f) Provide a description of the supplier's water demand management measures. This description shall include all of the following:

(1) (A) For an urban retail water supplier, as defined in Section 10608.12, a narrative description that addresses the nature and extent of each water demand management measure implemented over the past five years. The narrative shall describe the water demand management measures that the supplier plans to implement to achieve its water use targets pursuant to Section 10608.20.

(B) The narrative pursuant to this paragraph shall include descriptions of the following water demand management measures:

(i) Water waste prevention ordinances.

(ii) Metering.

(iii) Conservation pricing.

(iv) Public education and outreach.

(v) Programs to assess and manage distribution system real loss.

(vi) Water conservation program coordination and staffing support.

(vii) Other demand management measures that have a significant impact on water use as measured in gallons per capita per day, including innovative measures, if implemented.

(2) For an urban wholesale water supplier, as defined in Section 10608.12, a narrative description of the items in clauses (ii), (iv), (vi), and (vii) of subparagraph (B) of paragraph (1), and a narrative description of its distribution system asset management and wholesale supplier assistance programs.

(g) Include a description of all water supply projects and water supply programs that may be undertaken by the urban water supplier to meet the total projected water

use, as established pursuant to subdivision (a) of Section 10635. The urban water supplier shall include a detailed description of expected future projects and programs that the urban water supplier may implement to increase the amount of the water supply available to the urban water supplier in average, single-dry, and multiple-dry water years. The description shall identify specific projects and include a description of the increase in water supply that is expected to be available from each project. The description shall include an estimate with regard to the implementation timeline for each project or program.

(h) Describe the opportunities for development of desalinated water, including, but not limited to, ocean water, brackish water, and groundwater, as a long-term supply.

(i) For purposes of this part, urban water suppliers that are members of the California Urban Water Conservation Council shall be deemed in compliance with the requirements of subdivision (f) by complying with all the provisions of the "Memorandum of Understanding Regarding Urban Water Conservation in California," dated December 10, 2008, as it may be amended, and by submitting the annual reports required by Section 6.2 of that memorandum.

(j) An urban water supplier that relies upon a wholesale agency for a source of water shall provide the wholesale agency with water use projections from that agency for that source of water in five-year increments to 20 years or as far as data is available. The wholesale agency shall provide information to the urban water supplier for inclusion in the urban water supplier's plan that identifies and quantifies, to the extent practicable, the existing and planned sources of water as required by subdivision (b), available from the wholesale agency to the urban water supplier over the same five-year increments, and during various water-year types in accordance with subdivision (c). An urban water supplier may rely upon water supply information provided by the wholesale agency in fulfilling the plan informational requirements of subdivisions (b) and (c).

10631.1. (a) The water use projections required by Section 10631 shall include projected water use for single-family and multifamily residential housing needed for lower income households, as defined in Section 50079.5 of the Health and Safety Code, as identified in the housing element of any city, county, or city and county in the service area of the supplier.

(b) It is the intent of the Legislature that the identification of projected water use for single-family and multifamily residential housing for lower income households will assist a supplier in complying with the requirement under Section 65589.7 of the Government Code to grant a priority for the provision of service to housing units affordable to lower income households.

10631.2. (a) In addition to the requirements of Section 10631, an urban water management plan may, but is not required to, include any of the following information:

(1) An estimate of the amount of energy used to extract or divert water supplies.

(2) An estimate of the amount of energy used to convey water supplies to the water treatment plants or distribution systems.

(3) An estimate of the amount of energy used to treat water supplies.

(4) An estimate of the amount of energy used to distribute water supplies through its distribution systems.

(5) An estimate of the amount of energy used for treated water supplies in comparison to the amount used for nontreated water supplies.

(6) An estimate of the amount of energy used to place water into or withdraw from storage.

(7) Any other energy-related information the urban water supplier deems appropriate.

(b) The department shall include in its guidance for the preparation of urban water management plans a methodology for the voluntary calculation or estimation of the energy intensity of urban water systems. The department may consider studies and calculations conducted by the Public Utilities Commission in developing the methodology.

10631.5. (a) (1) Beginning January 1, 2009, the terms of, and eligibility for, a water management grant or loan made to an urban water supplier and awarded or administered by the department, state board, or California Bay-Delta Authority or its successor agency shall be conditioned on the implementation of the water demand management measures described in Section 10631, as determined by the department pursuant to subdivision (b).

(2) For the purposes of this section, water management grants and loans include funding for programs and projects for surface water or groundwater storage, recycling, desalination, water conservation, water supply reliability, and water supply augmentation. This section does not apply to water management projects funded by the federal American Recovery and Reinvestment Act of 2009 (Public Law 111-5).

(3) Notwithstanding paragraph (1), the department shall determine that an urban water supplier is eligible for a water management grant or loan even though the supplier is not implementing all of the water demand management measures described in Section 10631, if the urban water supplier has

submitted to the department for approval a schedule, financing plan, and budget, to be included in the grant or loan agreement, for implementation of the water demand management measures. The supplier may request grant or loan funds to implement the water demand management measures to the extent the request is consistent with the eligibility requirements applicable to the water management funds.

(4) (A) Notwithstanding paragraph (1), the department shall determine that an urban water supplier is eligible for a water management grant or loan even though the supplier is not implementing all of the water demand management measures described in Section 10631, if an urban water supplier submits to the department for approval documentation demonstrating that a water demand management measure is not locally cost effective. If the department determines that the documentation submitted by the urban water supplier fails to demonstrate that a water demand management measure is not locally cost effective, the department shall notify the urban water supplier and the agency administering the grant or loan program within 120 days that the documentation does not satisfy the requirements for an exemption, and include in that notification a detailed statement to support the determination.

(B) For purposes of this paragraph, "not locally cost effective" means that the present value of the local benefits of implementing a water demand management measure is less than the present value of the local costs of implementing that measure.

(b) (1) The department, in consultation with the state board and the California Bay-Delta Authority or its successor agency, and after soliciting public comment regarding eligibility requirements, shall develop eligibility requirements to implement the requirement of paragraph (1) of subdivision (a). In establishing these eligibility requirements, the department shall do both of the following:

(A) Consider the conservation measures described in the Memorandum of Understanding Regarding Urban Water Conservation in California, and alternative conservation approaches that provide equal or greater water savings.

(B) Recognize the different legal, technical, fiscal, and practical roles and responsibilities of wholesale water suppliers and retail water suppliers.

(2) (A) For the purposes of this section, the department shall determine whether an urban water supplier is implementing all of the water demand management measures described in Section 10631 based on either, or a combination, of the following:

(i) Compliance on an individual basis.

(ii) Compliance on a regional basis. Regional compliance shall require participation in a regional conservation program consisting of two or more urban water suppliers that achieves the level of conservation or water efficiency savings equivalent to the amount of conservation or savings achieved if each of the participating urban water suppliers implemented the water demand management measures. The urban water supplier administering the regional program shall provide participating urban water suppliers and the department with data to demonstrate that the regional program is consistent with this clause. The department shall review the data to determine whether the urban water suppliers in the regional program are meeting the eligibility requirements.

(B) The department may require additional information for any determination pursuant to this section.

(3) The department shall not deny eligibility to an urban water supplier in compliance with the requirements of this section that is participating in a multiagency water project, or an integrated regional water management plan, developed pursuant to Section 75026 of the Public Resources Code, solely on the basis that one or more of the agencies participating in the project or plan is not implementing all of the water demand management measures described in Section 10631.

(c) In establishing guidelines pursuant to the specific funding authorization for any water management grant or loan program subject to this section, the agency administering the grant or loan program shall include in the guidelines the eligibility requirements developed by the department pursuant to subdivision (b).

(d) Upon receipt of a water management grant or loan application by an agency administering a grant and loan program subject to this section, the agency shall request an eligibility determination from the department with respect to the requirements of this section. The department shall respond to the request within 60 days of the request.

(e) The urban water supplier may submit to the department copies of its annual reports and other relevant documents to assist the department in determining whether the urban water supplier is implementing or scheduling the implementation of water demand management activities. In addition, for urban water suppliers that are signatories to the Memorandum of Understanding Regarding Urban Water Conservation in California and submit biennial reports to the California Urban Water Conservation Council in accordance with the memorandum, the department may use these reports to assist in tracking the implementation of water demand management measures.

(f) This section shall remain in effect only until July 1, 2016, and as of that date is repealed, unless a later enacted statute, that is enacted before July 1, 2016, deletes or extends that date.

10631.7. The department, in consultation with the California Urban Water Conservation Council, shall convene an independent technical panel to provide information and recommendations to the department and the Legislature on new demand management measures, technologies, and approaches. The panel shall consist of no more than seven members, who shall be selected by the department to reflect a balanced representation of experts. The panel shall have at least one, but no more than two, representatives from each of the following: retail water suppliers, environmental organizations, the business community, wholesale water suppliers, and academia. The panel shall be convened by January 1, 2009, and shall report to the Legislature no later than January 1, 2010, and every five years thereafter. The department shall review the panel report and include in the final report to the Legislature the department's recommendations and comments regarding the panel process and the panel's recommendations.

10632. (a) The plan shall provide an urban water shortage contingency analysis that includes each of the following elements that are within the authority of the urban water supplier:

(1) Stages of action to be undertaken by the urban water supplier in response to water supply shortages, including up to a 50 percent reduction in water supply, and an outline of specific water supply conditions that are applicable to each stage.

(2) An estimate of the minimum water supply available during each of the next three water years based on the driest three-year historic sequence for the agency's water supply.

(3) Actions to be undertaken by the urban water supplier to prepare for, and implement during, a catastrophic interruption of water supplies including, but not limited to, a regional power outage, an earthquake, or other disaster.

(4) Additional, mandatory prohibitions against specific water use practices during water shortages, including, but not limited to, prohibiting the use of potable water for street cleaning.

(5) Consumption reduction methods in the most restrictive stages. Each urban water supplier may use any type of consumption reduction methods in its water shortage contingency analysis that would reduce water use, are

appropriate for its area, and have the ability to achieve a water use reduction consistent with up to a 50 percent reduction in water supply.

(6) Penalties or charges for excessive use, where applicable.

(7) An analysis of the impacts of each of the actions and conditions described in paragraphs (1) to (6), inclusive, on the revenues and expenditures of the urban water supplier, and proposed measures to overcome those impacts, such as the development of reserves and rate adjustments.

(8) A draft water shortage contingency resolution or ordinance.

(9) A mechanism for determining actual reductions in water use pursuant to the urban water shortage contingency analysis.

(b) Commencing with the urban water management plan update due July 1, 2016, for purposes of developing the water shortage contingency analysis pursuant to subdivision (a), the urban water supplier shall analyze and define water features that are artificially supplied with water, including ponds, lakes, waterfalls, and fountains, separately from swimming pools and spas, as defined in subdivision (a) of Section 115921 of the Health and Safety Code.

10633. The plan shall provide, to the extent available, information on recycled water and its potential for use as a water source in the service area of the urban water supplier. The preparation of the plan shall be coordinated with local water, wastewater, groundwater, and planning agencies that operate within the supplier's service area, and shall include all of the following:

(a) A description of the wastewater collection and treatment systems in the supplier's service area, including a quantification of the amount of wastewater collected and treated and the methods of wastewater disposal.

(b) A description of the quantity of treated wastewater that meets recycled water standards, is being discharged, and is otherwise available for use in a recycled water project.

(c) A description of the recycled water currently being used in the supplier's service area, including, but not limited to, the type, place, and quantity of use.

(d) A description and quantification of the potential uses of recycled water, including, but not limited to, agricultural irrigation, landscape irrigation, wildlife habitat enhancement, wetlands, industrial reuse, groundwater recharge, indirect potable reuse, and other appropriate uses, and a determination with regard to the technical and economic feasibility of serving those uses.

(e) The projected use of recycled water within the supplier's service area at the end of 5, 10, 15, and 20 years, and a description of the actual use of recycled water in comparison to uses previously projected pursuant to this subdivision.

(f) A description of actions, including financial incentives, which may be taken to encourage the use of recycled water, and the projected results of these actions in terms of acre-feet of recycled water used per year.

(g) A plan for optimizing the use of recycled water in the supplier's service area, including actions to facilitate the installation of dual distribution systems, to promote recirculating uses, to facilitate the increased use of treated wastewater that meets recycled water standards, and to overcome any obstacles to achieving that increased use.

10634. The plan shall include information, to the extent practicable, relating to the quality of existing sources of water available to the supplier over the same five-year increments as described in subdivision (a) of Section 10631, and the manner in which water quality affects water management strategies and supply reliability.

Article 2.5. Water Service Reliability

SECTION 10635

10635. (a) Every urban water supplier shall include, as part of its urban water management plan, an assessment of the reliability of its water service to its customers during normal, dry, and multiple dry water years. This water supply and demand assessment shall compare the total water supply sources available to the water supplier with the total projected water use over the next 20 years, in five-year increments, for a normal water year, a single dry water year, and multiple dry water years. The water service reliability assessment shall be based upon the information compiled pursuant to Section 10631, including available data from state, regional, or local agency population projections within the service area of the urban water supplier.

(b) The urban water supplier shall provide that portion of its urban water management plan prepared pursuant to this article to any city or county within which it provides water supplies no later than 60 days after the submission of its urban water management plan.

(c) Nothing in this article is intended to create a right or entitlement to water service or any specific level of water service.

(d) Nothing in this article is intended to change existing law concerning an urban water supplier's obligation to provide water service to its existing customers or to any potential future customers.

Article 3. Adoption and Implementation of Plans

SECTION 10640-10645

10640. Every urban water supplier required to prepare a plan pursuant to this part shall prepare its plan pursuant to Article 2 (commencing with Section 10630). The supplier shall likewise periodically review the plan as required by Section 10621, and any amendments or changes required as a result of that review shall be adopted pursuant to this article.

10641. An urban water supplier required to prepare a plan may consult with, and obtain comments from, any public agency or state agency or any person who has special expertise with respect to water demand management methods and techniques.

10642. Each urban water supplier shall encourage the active involvement of diverse social, cultural, and economic elements of the population within the service area prior to and during the preparation of the plan. Prior to adopting a plan, the urban water supplier shall make the plan available for public inspection and shall hold a public hearing thereon. Prior to the hearing, notice of the time and place of hearing shall be published within the jurisdiction of the publicly owned water supplier pursuant to Section 6066 of the Government Code. The urban water supplier shall provide notice of the time and place of hearing to any city or county within which the supplier provides water supplies. A privately owned water supplier shall provide an equivalent notice within its service area.

After the hearing, the plan shall be adopted as prepared or as modified after the hearing.

10643. An urban water supplier shall implement its plan adopted pursuant to this chapter in accordance with the schedule set forth in its plan.

10644. (a) (1) An urban water supplier shall submit to the department, the California State Library, and any city or county within which the supplier provides water supplies a copy of its plan no later than 30 days after adoption. Copies of amendments or changes to the plans shall be submitted to the department, the California State Library, and any city or county within which the supplier provides water supplies within 30 days after adoption.

(2) The plan, or amendments to the plan, submitted to the department pursuant to paragraph (1) shall be submitted electronically and shall include any standardized forms, tables, or displays specified by the department.

(b) (1) Notwithstanding Section 10231.5 of the Government Code, the department shall prepare and submit to the Legislature, on or before December 31, in the years ending in six and one, a report summarizing the status of the plans adopted pursuant to this part.

The report prepared by the department shall identify the exemplary elements of the individual plans. The department shall provide a copy of the report to each urban water supplier that has submitted its plan to the department. The department shall also prepare reports and provide data for any legislative hearings designed to consider the effectiveness of plans submitted pursuant to this part.

(2) A report to be submitted pursuant to paragraph (1) shall be submitted in compliance with Section 9795 of the Government Code.

(c) (1) For the purpose of identifying the exemplary elements of the individual plans, the department shall identify in the report water demand management measures adopted and implemented by specific urban water suppliers, and identified pursuant to Section 10631, that achieve water savings significantly above the levels established by the department to meet the requirements of Section 10631.5.

(2) The department shall distribute to the panel convened pursuant to Section 10631.7 the results achieved by the implementation of those water demand management measures described in paragraph (1).

(3) The department shall make available to the public the standard the department will use to identify exemplary water demand management measures.

10645. Not later than 30 days after filing a copy of its plan with the department, the urban water supplier and the department shall make the plan available for public review during normal business hours.

Chapter 4. Miscellaneous Provisions

SECTION 10650-10656

10650. Any actions or proceedings to attack, review, set aside, void, or annul the acts or decisions of an urban water supplier on the grounds of noncompliance with this part shall be commenced as follows:

(a) An action or proceeding alleging failure to adopt a plan shall be commenced within 18 months after that adoption is required by this part.

(b) Any action or proceeding alleging that a plan, or action taken pursuant to the plan, does not comply with this part shall be commenced within 90 days after filing of the plan or amendment thereto pursuant to Section 10644 or the taking of that action.

10651. In any action or proceeding to attack, review, set aside, void, or annul a plan, or an action taken pursuant to the plan by an urban water supplier on the grounds of noncompliance with this part, the inquiry shall extend only to whether there was a prejudicial abuse of discretion. Abuse of discretion is established if the supplier has not proceeded in a manner required by law or if the action by the water supplier is not supported by substantial evidence.

10652. The California Environmental Quality Act (Division 13 (commencing with Section 21000) of the Public Resources Code) does not apply to the preparation and adoption of plans pursuant to this part or to the implementation of actions taken pursuant to Section 10632. Nothing in this part shall be interpreted as exempting from the California Environmental Quality Act any project that would significantly affect water supplies for fish and wildlife, or any project for implementation of the plan, other than projects implementing Section 10632, or any project for expanded or additional water supplies.

10653. The adoption of a plan shall satisfy any requirements of state law, regulation, or order, including those of the State Water Resources Control Board and the Public Utilities Commission, for the preparation of water management plans or conservation plans; provided, that if the State Water Resources Control Board or the Public Utilities Commission requires additional information concerning water conservation to implement its existing authority, nothing in this part shall be deemed to limit the board or the commission in obtaining that information. The requirements of this part shall be satisfied by any urban water demand management plan prepared to meet federal laws or regulations after the effective date of this part, and which substantially meets the requirements of this part, or by any existing urban water management plan which includes the contents of a plan required under this part.

10654. An urban water supplier may recover in its rates the costs incurred in preparing its plan and implementing the reasonable water conservation measures included in the plan. Any best water management practice that is included in the plan that is identified in the "Memorandum of Understanding Regarding Urban Water Conservation in California" is deemed to be reasonable for the purposes of this section.

10655. If any provision of this part or the application thereof to any person or circumstances is held invalid, that invalidity shall not affect other provisions or applications of this part which can be given effect without the invalid provision or application thereof, and to this end the provisions of this part are severable.

10656. An urban water supplier that does not prepare, adopt, and submit its urban water management plan to the department in accordance with this part, is ineligible to receive funding pursuant to Division 24 (commencing with Section 78500) or Division 26

(commencing with Section 79000), or receive drought assistance from the state until the urban water management plan is submitted pursuant to this article.

California Water Code Division 6, Part 2.55.

Chapter 1. General Declarations and Policy §10608-10608.8
Chapter 2. Definitions §10608.12
Chapter 3. Urban Retail Water Suppliers §10608.16-10608.44
Chapter 4. Agricultural Water Suppliers §10608.48
Chapter 5. Sustainable Water Management §10608.50
Chapter 6 Standardized Data Collection §10608.52
Chapter 7 Funding Provisions §10608.56-10608.60
Chapter 8 Quantifying Agricultural Water Use Efficiency §10608.64

Chapter 1. General Declarations and Policy

SECTION 10608-10608.8

10608. The Legislature finds and declares all of the following:

(a) Water is a public resource that the California Constitution protects against waste and unreasonable use.

(b) Growing population, climate change, and the need to protect and grow California's economy while protecting and restoring our fish and wildlife habitats make it essential that the state manage its water resources as efficiently as possible.

(c) Diverse regional water supply portfolios will increase water supply reliability and reduce dependence on the Delta.

(d) Reduced water use through conservation provides significant energy and environmental benefits, and can help protect water quality, improve streamflows, and reduce greenhouse gas emissions.

(e) The success of state and local water conservation programs to increase efficiency of water use is best determined on the basis of measurable outcomes related to water use or efficiency.

(f) Improvements in technology and management practices offer the potential for increasing water efficiency in California over time, providing an essential water management tool to meet the need for water for urban, agricultural, and environmental uses.

(g) The Governor has called for a 20 percent per capita reduction in urban water use statewide by 2020.

(h) The factors used to formulate water use efficiency targets can vary significantly from location to location based on factors including weather, patterns of urban and suburban development, and past efforts to enhance water use efficiency.

(i) Per capita water use is a valid measure of a water provider's efforts to reduce urban water use within its service area. However, per capita water use is less useful for measuring relative water use efficiency between different water providers. Differences in weather, historical patterns of urban and suburban development, and density of housing in a particular location need to be considered when assessing per capita water use as a measure of efficiency.

10608.4. It is the intent of the Legislature, by the enactment of this part, to do all of the following:

(a) Require all water suppliers to increase the efficiency of use of this essential resource.

(b) Establish a framework to meet the state targets for urban water conservation identified in this part and called for by the Governor.

(c) Measure increased efficiency of urban water use on a per capita basis.

(d) Establish a method or methods for urban retail water suppliers to determine targets for achieving increased water use efficiency by the year 2020, in accordance with the Governor's goal of a 20-percent reduction.

(e) Establish consistent water use efficiency planning and implementation standards for urban water suppliers and agricultural water suppliers.

(f) Promote urban water conservation standards that are consistent with the California Urban Water Conservation Council's adopted best management practices and the requirements for demand management in Section 10631.

(g) Establish standards that recognize and provide credit to water suppliers that made substantial capital investments in urban water conservation since the drought of the early 1990s.

(h) Recognize and account for the investment of urban retail water suppliers in providing recycled water for beneficial uses.

(i) Require implementation of specified efficient water management practices for agricultural water suppliers.

(j) Support the economic productivity of California's agricultural, commercial, and industrial sectors.

(k) Advance regional water resources management.

10608.8. (a) (1) Water use efficiency measures adopted and implemented pursuant to this part or Part 2.8 (commencing with Section 10800) are water conservation measures subject to the protections provided under Section 1011.

(2) Because an urban agency is not required to meet its urban water use target until 2020 pursuant to subdivision (b) of Section 10608.24, an urban retail water supplier's failure to meet those targets shall not establish a violation of law for purposes of any state administrative or judicial proceeding prior to

January 1, 2021. Nothing in this paragraph limits the use of data reported to the department or the board in litigation or an administrative proceeding. This paragraph shall become inoperative on January 1, 2021.

(3) To the extent feasible, the department and the board shall provide for the use of water conservation reports required under this part to meet the requirements of Section 1011 for water conservation reporting.

(b) This part does not limit or otherwise affect the application of Chapter 3.5 (commencing with Section 11340), Chapter 4 (commencing with Section 11370), Chapter 4.5 (commencing with Section 11400), and Chapter 5 (commencing with Section 11500) of Part 1 of Division 3 of Title 2 of the Government Code.

(c) This part does not require a reduction in the total water used in the agricultural or urban sectors, because other factors, including, but not limited to, changes in agricultural economics or population growth may have greater effects on water use. This part does not limit the economic productivity of California's agricultural, commercial, or industrial sectors.

(d) The requirements of this part do not apply to an agricultural water supplier that is a party to the Quantification Settlement Agreement, as defined in subdivision (a) of Section 1 of Chapter 617 of the Statutes of 2002, during the period within which the Quantification Settlement Agreement remains in effect. After the expiration of the Quantification Settlement Agreement, to the extent conservation water projects implemented as part of the Quantification Settlement Agreement remain in effect, the conserved water created as part of those projects shall be credited against the obligations of the agricultural water supplier pursuant to this part.

Chapter 2 Definitions

SECTION 10608.12

10608.12. Unless the context otherwise requires, the following definitions govern the construction of this part:

(a) "Agricultural water supplier" means a water supplier, either publicly or privately owned, providing water to 10,000 or more irrigated acres, excluding recycled water. "Agricultural water supplier" includes a supplier or contractor for water, regardless of the basis of right, that distributes or sells water for ultimate resale to customers. "Agricultural water supplier" does not include the department.

(b) "Base daily per capita water use" means any of the following:

(1) The urban retail water supplier's estimate of its average gross water use, reported in gallons per capita per day and calculated over a continuous 10-year period ending no earlier than December 31, 2004, and no later than December 31, 2010.

(2) For an urban retail water supplier that meets at least 10 percent of its 2008 measured retail water demand through recycled water that is delivered within the service area of an urban retail water supplier or its urban wholesale water supplier, the urban retail water supplier may extend the calculation described in paragraph (1) up to an additional five years to a maximum of a continuous 15-year period ending no earlier than December 31, 2004, and no later than December 31, 2010.

(3) For the purposes of Section 10608.22, the urban retail water supplier's estimate of its average gross water use, reported in gallons per capita per day and calculated over a continuous five-year period ending no earlier than December 31, 2007, and no later than December 31, 2010.

(c) "Baseline commercial, industrial, and institutional water use" means an urban retail water supplier's base daily per capita water use for commercial, industrial, and institutional users.

(d) "Commercial water user" means a water user that provides or distributes a product or service.

(e) "Compliance daily per capita water use" means the gross water use during the final year of the reporting period, reported in gallons per capita per day.

(f) "Disadvantaged community" means a community with an annual median household income that is less than 80 percent of the statewide annual median household income.

(g) "Gross water use" means the total volume of water, whether treated or untreated, entering the distribution system of an urban retail water supplier, excluding all of the following:

(1) Recycled water that is delivered within the service area of an urban retail water supplier or its urban wholesale water supplier.

(2) The net volume of water that the urban retail water supplier places into long-term storage.

(3) The volume of water the urban retail water supplier conveys for use by another urban water supplier.

(4) The volume of water delivered for agricultural use, except as otherwise provided in subdivision (f) of Section 10608.24.

(h) "Industrial water user" means a water user that is primarily a manufacturer or processor of materials as defined by the North American Industry Classification System code sectors 31 to 33, inclusive, or an entity that is a water user primarily engaged in research and development.

(i) "Institutional water user" means a water user dedicated to public service. This type of user includes, among other users, higher education institutions, schools, courts, churches, hospitals, government facilities, and nonprofit research institutions.

(j) "Interim urban water use target" means the midpoint between the urban retail water supplier's base daily per capita water use and the urban retail water supplier's urban water use target for 2020.

(k) "Locally cost effective" means that the present value of the local benefits of implementing an agricultural efficiency water management practice is greater than or equal to the present value of the local cost of implementing that measure.

(l) "Process water" means water used for producing a product or product content or water used for research and development, including, but not limited to, continuous manufacturing processes, water used for testing and maintaining equipment used in producing a product or product content, and water used in combined heat and power facilities used in producing a product or product content. Process water does not mean incidental water uses not related to the production of a product or product content, including, but not limited to, water used for restrooms, landscaping, air conditioning, heating, kitchens, and laundry.

(m) "Recycled water" means recycled water, as defined in subdivision (n) of Section 13050, that is used to offset potable demand, including recycled water supplied for direct use and indirect potable reuse, that meets the following requirements, where applicable:

(1) For groundwater recharge, including recharge through spreading basins, water supplies that are all of the following:

(A) Metered.

(B) Developed through planned investment by the urban water supplier or a wastewater treatment agency.

(C) Treated to a minimum tertiary level.

(D) Delivered within the service area of an urban retail water supplier or its urban wholesale water supplier that helps an urban retail water supplier meet its urban water use target.

(2) For reservoir augmentation, water supplies that meet the criteria of paragraph (1) and are conveyed through a distribution system constructed specifically for recycled water.

(n) "Regional water resources management" means sources of supply resulting from watershed-based planning for sustainable local water reliability or any of the following alternative sources of water:

(1) The capture and reuse of stormwater or rainwater.

(2) The use of recycled water.

(3) The desalination of brackish groundwater.

(4) The conjunctive use of surface water and groundwater in a manner that is consistent with the safe yield of the groundwater basin.

(o) "Reporting period" means the years for which an urban retail water supplier reports compliance with the urban water use targets.

(p) "Urban retail water supplier" means a water supplier, either publicly or privately owned, that directly provides potable municipal water to more than 3,000 end users or that supplies more than 3,000 acre-feet of potable water annually at retail for municipal purposes.

(q) "Urban water use target" means the urban retail water supplier's targeted future daily per capita water use.

(r) "Urban wholesale water supplier," means a water supplier, either publicly or privately owned, that provides more than 3,000 acre-feet of water annually at wholesale for potable municipal purposes.

Chapter 3 Urban Retail Water Suppliers

SECTION 10608.16-10608.44

10608.16.(a) The state shall achieve a 20-percent reduction in urban per capita water use in California on or before December 31, 2020.

(b) The state shall make incremental progress towards the state target specified in subdivision (a) by reducing urban per capita water use by at least 10 percent on or before December 31, 2015.

10608.20.(a) (1) Each urban retail water supplier shall develop urban water use targets and an interim urban water use target by July 1, 2011. Urban retail water suppliers may elect to determine and report progress toward achieving these targets on an individual or regional basis, as provided in subdivision (a) of Section 10608.28, and may determine the targets on a fiscal year or calendar year basis.

(2) It is the intent of the Legislature that the urban water use targets described in paragraph (1) cumulatively result in a 20-percent reduction from the baseline daily per capita water use by December 31, 2020.

(b) An urban retail water supplier shall adopt one of the following methods for determining its urban water use target pursuant to subdivision (a):

(1) Eighty percent of the urban retail water supplier's baseline per capita daily water use.

(2) The per capita daily water use that is estimated using the sum of the following performance standards:

(A) For indoor residential water use, 55 gallons per capita daily water use as a provisional standard. Upon completion of the department's 2016 report to the Legislature pursuant to Section 10608.42, this standard may be adjusted by the Legislature by statute.

(B) For landscape irrigated through dedicated or residential meters or connections, water efficiency equivalent to the standards of the Model Water Efficient Landscape Ordinance set forth in Chapter 2.7 (commencing with Section 490) of Division 2 of Title 23 of the California Code of Regulations, as in effect the later of the year of the landscape's installation or 1992. An urban retail water supplier using the approach specified in this subparagraph shall use satellite imagery, site visits, or other best available technology to develop an accurate estimate of landscaped areas.

(C) For commercial, industrial, and institutional uses, a 10-percent reduction in water use from the baseline commercial, industrial, and institutional water use by 2020.

(3) Ninety-five percent of the applicable state hydrologic region target, as set forth in the state's draft 20x2020 Water Conservation Plan (dated April 30, 2009). If the service area of an urban water supplier includes more than one hydrologic region, the supplier shall apportion its service area to each region based on population or area.

(4) A method that shall be identified and developed by the department, through a public process, and reported to the Legislature no later than December 31, 2010. The method developed by the department shall identify per capita targets that cumulatively result in a statewide 20-percent reduction in urban daily per capita water use by December 31, 2020. In developing urban daily per capita water use targets, the department shall do all of the following:

(A) Consider climatic differences within the state.

(B) Consider population density differences within the state.

(C) Provide flexibility to communities and regions in meeting the targets.

(D) Consider different levels of per capita water use according to plant water needs in different regions.

(E) Consider different levels of commercial, industrial, and institutional water use in different regions of the state.

(F) Avoid placing an undue hardship on communities that have implemented conservation measures or taken actions to keep per capita water use low.

(c) If the department adopts a regulation pursuant to paragraph (4) of subdivision (b) that results in a requirement that an urban retail water supplier achieve a reduction in daily per capita water use that is greater than 20 percent by December 31, 2020, an urban retail water supplier that adopted the method

described in paragraph (4) of subdivision (b) may limit its urban water use target to a reduction of not more than 20 percent by December 31, 2020, by adopting the method described in paragraph (1) of subdivision (b).

(d) The department shall update the method described in paragraph (4) of subdivision (b) and report to the Legislature by December 31, 2014. An urban retail water supplier that adopted the method described in paragraph (4) of subdivision (b) may adopt a new urban daily per capita water use target pursuant to this updated method.

(e) An urban retail water supplier shall include in its urban water management plan due in 2010 pursuant to Part 2.6 (commencing with Section 10610) the baseline daily per capita water use, urban water use target, interim urban water use target, and compliance daily per capita water use, along with the bases for determining those estimates, including references to supporting data.

(f) When calculating per capita values for the purposes of this chapter, an urban retail water supplier shall determine population using federal, state, and local population reports and projections.

(g) An urban retail water supplier may update its 2020 urban water use target in its 2015 urban water management plan required pursuant to Part 2.6 (commencing with Section 10610).

(h) (1) The department, through a public process and in consultation with the California Urban Water Conservation Council, shall develop technical methodologies and criteria for the consistent implementation of this part, including, but not limited to, both of the following:

(A) Methodologies for calculating base daily per capita water use, baseline commercial, industrial, and institutional water use, compliance daily per capita water use, gross water use, service area population, indoor residential water use, and landscaped area water use.

(B) Criteria for adjustments pursuant to subdivisions (d) and (e) of Section 10608.24.

(2) The department shall post the methodologies and criteria developed pursuant to this subdivision on its Internet Web site, and make written copies available, by October 1, 2010. An urban retail water supplier shall use the methods developed by the department in compliance with this part.

(i) (1) The department shall adopt regulations for implementation of the provisions relating to process water in accordance with subdivision (l) of Section 10608.12, subdivision (e) of Section 10608.24, and subdivision (d) of Section 10608.26.

(2) The initial adoption of a regulation authorized by this subdivision is deemed to address an emergency, for purposes of Sections 11346.1 and 11349.6 of the Government Code, and the department is hereby exempted for that purpose from the requirements of subdivision (b) of Section 11346.1 of the

Government Code. After the initial adoption of an emergency regulation pursuant to this subdivision, the department shall not request approval from the Office of Administrative Law to readopt the regulation as an emergency regulation pursuant to Section 11346.1 of the Government Code.

(j) (1) An urban retail water supplier is granted an extension to July 1, 2011, for adoption of an urban water management plan pursuant to Part 2.6 (commencing with Section 10610) due in 2010 to allow the use of technical methodologies developed by the department pursuant to paragraph (4) of subdivision (b) and subdivision (h). An urban retail water supplier that adopts an urban water management plan due in 2010 that does not use the methodologies developed by the department pursuant to subdivision (h) shall amend the plan by July 1, 2011, to comply with this part.

(2) An urban wholesale water supplier whose urban water management plan prepared pursuant to Part 2.6 (commencing with Section 10610) was due and not submitted in 2010 is granted an extension to July 1, 2011, to permit coordination between an urban wholesale water supplier and urban retail water suppliers.

10608.22. Notwithstanding the method adopted by an urban retail water supplier pursuant to Section 10608.20, an urban retail water supplier's per capita daily water use reduction shall be no less than 5 percent of base daily per capita water use as defined in paragraph(3) of subdivision (b) of Section 10608.12. This section does not apply to an urban retail water supplier with a base daily per capita water use at or below 100 gallons per capita per day.

10608.24.(a) Each urban retail water supplier shall meet its interim urban water use target by December 31, 2015.

(b) Each urban retail water supplier shall meet its urban water use target by December 31, 2020.

(c) An urban retail water supplier's compliance daily per capita water use shall be the measure of progress toward achievement of its urban water use target.

(d) (1) When determining compliance daily per capita water use, an urban retail water supplier may consider the following factors:

(A) Differences in evapotranspiration and rainfall in the baseline period compared to the compliance reporting period.
(B) Substantial changes to commercial or industrial water use resulting from increased business output and economic development that have occurred during the reporting period.

(C) Substantial changes to institutional water use resulting from fire suppression services or other extraordinary events, or from new or expanded operations, that have occurred during the reporting period.

(2) If the urban retail water supplier elects to adjust its estimate of compliance daily per capita water use due to one or more of the factors described in

paragraph (1), it shall provide the basis for, and data supporting, the adjustment in the report required by Section 10608.40.

(e) When developing the urban water use target pursuant to Section 10608.20, an urban retail water supplier that has a substantial percentage of industrial water use in its service area may exclude process water from the calculation of gross water use to avoid a disproportionate burden on another customer sector.

(f) (1) An urban retail water supplier that includes agricultural water use in an urban water management plan pursuant to Part 2.6 (commencing with Section 10610) may include the agricultural water use in determining gross water use. An urban retail water supplier that includes agricultural water use in determining gross water use and develops its urban water use target pursuant to paragraph (2) of subdivision (b) of Section 10608.20 shall use a water efficient standard for agricultural irrigation of 100 percent of reference evapotranspiration multiplied by the crop coefficient for irrigated acres.

(2) An urban retail water supplier, that is also an agricultural water supplier, is not subject to the requirements of Chapter 4 (commencing with Section 10608.48), if the agricultural water use is incorporated into its urban water use target pursuant to paragraph (1).

10608.26.(a) In complying with this part, an urban retail water supplier shall conduct at least one public hearing to accomplish all of the following:

(1) Allow community input regarding the urban retail water supplier's implementation plan for complying with this part.

(2) Consider the economic impacts of the urban retail water supplier's implementation plan for complying with this part.

(3) Adopt a method, pursuant to subdivision (b) of Section 10608.20, for determining its urban water use target.

(b) In complying with this part, an urban retail water supplier may meet its urban water use target through efficiency improvements in any combination among its customer sectors. An urban retail water supplier shall avoid placing a disproportionate burden on any customer sector.

(c) For an urban retail water supplier that supplies water to a United States Department of Defense military installation, the urban retail water supplier's implementation plan for complying with this part shall consider the conservation of that military installation under federal Executive Order 13514.

(d) (1) Any ordinance or resolution adopted by an urban retail water supplier after the effective date of this section shall not require existing customers as of the effective date of this section, to undertake changes in product formulation, operations, or equipment that would reduce process water use, but may provide technical assistance and financial incentives to those customers to implement efficiency measures for process water. This section shall not limit

an ordinance or resolution adopted pursuant to a declaration of drought emergency by an urban retail water supplier.

(2) This part shall not be construed or enforced so as to interfere with the requirements of Chapter 4 (commencing with Section 113980) to Chapter 13 (commencing with Section 114380), inclusive, of Part 7 of Division 104 of the Health and Safety Code, or any requirement or standard for the protection of public health, public safety, or worker safety established by federal, state, or local government or recommended by recognized standard setting organizations or trade associations.

10608.28.(a) An urban retail water supplier may meet its urban water use target within its retail service area, or through mutual agreement, by any of the following:

(1) Through an urban wholesale water supplier.

(2) Through a regional agency authorized to plan and implement water conservation, including, but not limited to, an agency established under the Bay Area Water Supply and Conservation Agency Act (Division 31 (commencing with Section 81300)).

(3) Through a regional water management group as defined in Section 10537.

(4) By an integrated regional water management funding area.

(5) By hydrologic region.

(6) Through other appropriate geographic scales for which computation methods have been developed by the department.

(b) A regional water management group, with the written consent of its member agencies, may undertake any or all planning, reporting, and implementation functions under this chapter for the member agencies that consent to those activities. Any data or reports shall provide information both for the regional water management group and separately for each consenting urban retail water supplier and urban wholesale water supplier.

10608.32. All costs incurred pursuant to this part by a water utility regulated by the Public Utilities Commission may be recoverable in rates subject to review and approval by the Public Utilities Commission, and may be recorded in a memorandum account and reviewed for reasonableness by the Public Utilities Commission.

10608.36. Urban wholesale water suppliers shall include in the urban water management plans required pursuant to Part 2.6 (commencing with Section 10610) an assessment of their present and proposed future measures, programs, and policies to help achieve the water use reductions required by this part.

10608.40. Urban water retail suppliers shall report to the department on their progress in meeting their urban water use targets as part of their urban water management plans

submitted pursuant to Section 10631. The data shall be reported using a standardized form developed pursuant to Section 10608.52.

10608.42.(a) The department shall review the 2015 urban water management plans and report to the Legislature by July 1, 2017, on progress towards achieving a 20-percent reduction in urban water use by December 31, 2020. The report shall include recommendations on changes to water efficiency standards or urban water use targets to achieve the 20-percent reduction and to reflect updated efficiency information and technology changes.

(b) A report to be submitted pursuant to subdivision (a) shall be submitted in compliance with Section 9795 of the Government Code.

10608.43. The department, in conjunction with the California Urban Water Conservation Council, by April 1, 2010, shall convene a representative task force consisting of academic experts, urban retail water suppliers, environmental organizations, commercial water users, industrial water users, and institutional water users to develop alternative best management practices for commercial, industrial, and institutional users and an assessment of the potential statewide water use efficiency improvement in the commercial, industrial, and institutional sectors that would result from implementation of these best management practices. The taskforce, in conjunction with the department, shall submit a report to the Legislature by April 1, 2012, that shall include a review of multiple sectors within commercial, industrial, and institutional users and that shall recommend water use efficiency standards for commercial, industrial, and institutional users among various sectors of water use. The report shall include, but not be limited to, the following:

(a) Appropriate metrics for evaluating commercial, industrial, and institutional water use.

(b) Evaluation of water demands for manufacturing processes, goods, and cooling.

(c) Evaluation of public infrastructure necessary for delivery of recycled water to the commercial, industrial, and institutional sectors.

(d) Evaluation of institutional and economic barriers to increased recycled water use within the commercial, industrial, and institutional sectors.

(e) Identification of technical feasibility and cost of the best management practices to achieve more efficient water use statewide in the commercial, industrial, and institutional sectors that is consistent with the public interest and reflects past investments in water use efficiency.

10608.44. Each state agency shall reduce water use at facilities it operates to support urban retail water suppliers in meeting the target identified in Section 10608.16.

Chapter 4 Agricultural Water Suppliers

SECTION 10608.48

10608.48.(a) On or before July 31, 2012, an agricultural water supplier shall implement efficient water management practices pursuant to subdivisions (b) and (c).

(b) Agricultural water suppliers shall implement all of the following critical efficient management practices:

(1) Measure the volume of water delivered to customers with sufficient accuracy to comply with subdivision (a) of Section 531.10 and to implement paragraph (2).

(2) Adopt a pricing structure for water customers based at least in part on quantity delivered.

(c) Agricultural water suppliers shall implement additional efficient management practices, including, but not limited to, practices to accomplish all of the following, if the measures are locally cost effective and technically feasible:

(1) Facilitate alternative land use for lands with exceptionally high water duties or whose irrigation contributes to significant problems, including drainage.

(2) Facilitate use of available recycled water that otherwise would not be used beneficially, meets all health and safety criteria, and does not harm crops or soils.

(3) Facilitate the financing of capital improvements for on-farm irrigation systems.

(4) Implement an incentive pricing structure that promotes one or more of the following goals:

(A) More efficient water use at the farm level.

(B) Conjunctive use of groundwater.

(C) Appropriate increase of groundwater recharge.

(D) Reduction in problem drainage.

(E) Improved management of environmental resources.

(F) Effective management of all water sources throughout the year by adjusting seasonal pricing structures based on current conditions.

(5) Expand line or pipe distribution systems, and construct regulatory reservoirs to increase distribution system flexibility and capacity, decrease maintenance, and reduce seepage.

(6) Increase flexibility in water ordering by, and delivery to, water customers within operational limits.

(7) Construct and operate supplier spill and tailwater recovery systems.

(8) Increase planned conjunctive use of surface water and groundwater within the supplier service area.

(9) Automate canal control structures.

(10) Facilitate or promote customer pump testing and evaluation.

(11) Designate a water conservation coordinator who will develop and implement the water management plan and prepare progress reports.

(12) Provide for the availability of water management services to water users. These services may include, but are not limited to, all of the following:

(A) On-farm irrigation and drainage system evaluations.

(B) Normal year and real-time irrigation scheduling and crop evapotranspiration information.

(C) Surface water, groundwater, and drainage water quantity and quality data.

(D) Agricultural water management educational programs and materials for farmers, staff, and the public.

(13) Evaluate the policies of agencies that provide the supplier with water to identify the potential for institutional changes to allow more flexible water deliveries and storage.

(14) Evaluate and improve the efficiencies of the supplier's pumps.

(d) Agricultural water suppliers shall include in the agricultural water management plans required pursuant to Part 2.8 (commencing with Section 10800) a report on which efficient water management practices have been implemented and are planned to be implemented, an estimate of the water use efficiency improvements that have occurred since the last report, and an estimate of the water use efficiency improvements estimated to occur five and 10 years in the future. If an agricultural water supplier determines that an efficient water management practice is not locally cost effective or technically feasible, the supplier shall submit information documenting that determination.

(e) The data shall be reported using a standardized form developed pursuant to Section 10608.52.

(f) An agricultural water supplier may meet the requirements of subdivisions (d) and (e) by submitting to the department a water conservation plan submitted to the United States Bureau of Reclamation that meets the requirements described in Section 10828.

(g) On or before December 31, 2013, December 31, 2016, and December 31, 2021, the department, in consultation with the board, shall submit to the Legislature a report on the agricultural efficient water management practices that have been implemented and are planned to be implemented and an assessment of the manner in which the implementation of those efficient water management practices has affected and will affect agricultural operations, including estimated water use efficiency improvements, if any.

(h) The department may update the efficient water management practices required pursuant to subdivision (c), in consultation with the Agricultural Water Management Council, the United States Bureau of Reclamation, and the board. All efficient water management practices for agricultural water use pursuant to this chapter shall be adopted or revised by the department only after the department conducts public hearings to allow participation of the diverse geographical areas and interests of the state.

(i) (1) The department shall adopt regulations that provide for a range of options that agricultural water suppliers may use or implement to comply with the measurement requirement in paragraph (1) of subdivision (b).

(2) The initial adoption of a regulation authorized by this subdivision is deemed to address an emergency, for purposes of Sections 11346.1 and 11349.6 of the Government Code, and the department is hereby exempted for that purpose from the requirements of subdivision (b) of Section 11346.1 of the Government Code. After the initial adoption of an emergency regulation pursuant to this subdivision, the department shall not request approval from the Office of Administrative Law to readopt the regulation as an emergency regulation pursuant to Section 11346.1 of the Government Code.

Chapter 5 Sustainable Water Management

Section 10608.50

10608.50.(a) The department, in consultation with the board, shall promote implementation of regional water resources management practices through increased incentives and removal of barriers consistent with state and federal law. Potential changes may include, but are not limited to, all of the following:

(1) Revisions to the requirements for urban and agricultural water management plans.

(2) Revisions to the requirements for integrated regional water management plans.

(3) Revisions to the eligibility for state water management grants and loans.

(4) Revisions to state or local permitting requirements that increase water supply opportunities, but do not weaken water quality protection under state and federal law.

(5) Increased funding for research, feasibility studies, and project construction.

(6) Expanding technical and educational support for local land use and water management agencies.

(b) No later than January 1, 2011, and updated as part of the California Water Plan, the department, in consultation with the board, and with public input, shall propose new statewide targets, or review and update existing statewide targets, for regional water resources management practices, including, but not limited to, recycled water, brackish groundwater desalination, and infiltration and direct use of urban stormwater runoff.

Chapter 6 Standardized Data Collection

SECTION 10608.52

10608.52.(a) The department, in consultation with the board, the California Bay-Delta Authority or its successor agency, the State Department of Public Health, and the Public Utilities Commission, shall develop a single standardized water use reporting form to meet the water use information needs of each agency, including the needs of urban water suppliers that elect to determine and report progress toward achieving targets on a regional basis as provided in subdivision (a) of Section 10608.28.

(b) At a minimum, the form shall be developed to accommodate information sufficient to assess an urban water supplier's compliance with conservation targets pursuant to Section 10608.24 and an agricultural water supplier's compliance with implementation of efficient water management practices pursuant to subdivision (a) of Section 10608.48. The form shall accommodate reporting by urban water suppliers on an individual or regional basis as provided in subdivision (a) of Section 10608.28.

Chapter 7 Funding Provisions

Section 10608.56-10608.60

10608.56.(a) On and after July 1, 2016, an urban retail water supplier is not eligible for a water grant or loan awarded or administered by the state unless the supplier complies with this part.

(b) On and after July 1, 2013, an agricultural water supplier is not eligible for a water grant or loan awarded or administered by the state unless the supplier complies with this part.

(c) Notwithstanding subdivision (a), the department shall determine that an urban retail water supplier is eligible for a water grant or loan even though the supplier has not met the per capita reductions required pursuant to Section 10608.24, if the urban retail water supplier has submitted to the department for approval a schedule, financing plan, and budget, to be included in the grant or loan agreement, for achieving the per capita reductions. The supplier may request grant or loan funds to achieve the per capita reductions to the extent the request is consistent with the eligibility requirements applicable to the water funds.

(d) Notwithstanding subdivision (b), the department shall determine that an agricultural water supplier is eligible for a water grant or loan even though the supplier is not implementing all of the efficient water management practices described in Section 10608.48, if the agricultural water supplier has submitted to the department for approval a schedule, financing plan, and budget, to be included in the grant or loan agreement, for implementation of the efficient water management practices. The supplier may request grant or loan funds to implement the efficient water management practices to the extent the request is consistent with the eligibility requirements applicable to the water funds.

(e) Notwithstanding subdivision (a), the department shall determine that an urban retail water supplier is eligible for a water grant or loan even though the supplier has not met the per capita reductions required pursuant to Section 10608.24, if the urban retail water supplier has submitted to the department for approval documentation demonstrating that its entire service area qualifies as a disadvantaged community.

(f) The department shall not deny eligibility to an urban retail water supplier or agricultural water supplier in compliance with the requirements of this part and Part 2.8 (commencing with Section 10800), that is participating in a multiagency water project, or an integrated regional water management plan, developed pursuant to Section 75026 of the Public Resources Code, solely on the basis that one or more of the agencies participating in the project or plan is not implementing all of the requirements of this part or Part 2.8 (commencing with Section 10800).

10608.60.(a) It is the intent of the Legislature that funds made available by Section 75026 of the Public Resources Code should be expended, consistent with Division 43 (commencing with Section 75001) of the Public Resources Code and upon appropriation by the Legislature, for grants to implement this part. In the allocation of funding, it is the intent of the Legislature that the department give consideration to disadvantaged communities to assist in implementing the requirements of this part.

(b) It is the intent of the Legislature that funds made available by Section 75041 of the Public Resources Code, should be expended, consistent with Division 43 (commencing with Section 75001) of the Public Resources Code and upon appropriation by the Legislature, for direct expenditures to implement this part.

Chapter 8 Quantifying Agricultural Water Use Efficiency

SECTION 10608.64

10608.64. The department, in consultation with the Agricultural Water Management Council, academic experts, and other stakeholders, shall develop a methodology for quantifying the efficiency of agricultural water use. Alternatives to be assessed shall include, but not be limited to, determination of efficiency levels based on crop type or irrigation system distribution uniformity. On or before December 31, 2011, the department shall report to the Legislature on a proposed methodology and a plan for implementation. The plan shall include the estimated implementation costs and the types of data needed to support the methodology. Nothing in this section authorizes the department to implement a methodology established pursuant to this section.

APPENDIX B

2015 UWMP STANDARDIZED TABLES

Total		13,659	0	15,218	0	15,102	0	14,998	0	14,998	0

NOTES: Quantities of groundwater listed do not include the 46,774 AF that the City of Banning currently has in storage in the Beaumont Storage Unit. Quantities of SWP water received by the City are recharged to the Beaumont Basin for storage in the City's Beaumont Basin storage account for the City's subsequent extraction and use. Quantities of recycled water available beginning in 2025 are based on the assumption that the City's WWTP expansion project has been completed and that the associated tertiary treatment facilities are operational.

Table 7-1 Retail: Basis of Water Year Data			
Year Type	**Base Year** *If not using a calendar year, type in the last year of the fiscal, water year, or range of years, for example, water year 1999-2000, use 2000*	**Available Supplies if Year Type Repeats**	
		☐ Quantification of available supplies is not compatible with this table and is provided elsewhere in the UWMP. Location _____	
		☐ Quantification of available supplies is provided in this table as either volume only, percent only, or both.	
		Volume Available	**% of Average Supply**
Average Year	2001	15585	100%
Single-Dry Year	2007	15585	100%
Multiple-Dry Years 1st Year	2012	16785	100%
Multiple-Dry Years 2nd Year	2013	16785	100%
Multiple-Dry Years 3rd Year	2014	16193	100%
Multiple-Dry Years 4th Year *Optional*			
Multiple-Dry Years 5th Year *Optional*			
Multiple-Dry Years 6th Year *Optional*			
Agency may use multiple versions of Table 7-1 if different water sources have different base years and the supplier chooses to report the base years for each water source separately. If an agency uses multiple versions of Table 7-1, in the "Note" section of each table, state that multiple versions of Table 7-1 are being used and identify the particular water source that is being reported in each table.

APPENDIX C

2015 UWMP CHECKLIST

Checklist Arranged by Water Code Section

CWC Section	UWMP Requirement	Subject	Guidebook Location	UWMP Location *(Optional Column for Agency Use)*
10608.20(b)	Retail suppliers shall adopt a 2020 water use target using one of four methods.	Baselines and Targets	Section 5.7 and App E	Section 4.2
10608.20(e)	Retail suppliers shall provide baseline daily per capita water use, urban water use target, interim urban water use target, and compliance daily per capita water use, along with the bases for determining those estimates, including references to supporting data.	Baselines and Targets	Chapter 5 and App E	Chapter 4
10608.22	Retail suppliers' per capita daily water use reduction shall be no less than 5 percent of base daily per capita water use of the 5 year baseline. This does not apply if the suppliers base GPCD is at or below 100.	Baselines and Targets	Section 5.7.2	Section 4.3
10608.24(a)	Retail suppliers shall meet their interim target by December 31, 2015.	Baselines and Targets	Section 5.8 and App E	Section 4.4
10608.24(d)(2)	If the retail supplier adjusts its compliance GPCD using weather normalization, economic adjustment, or extraordinary events, it shall provide the basis for, and data supporting the adjustment.	Baselines and Targets	Section 5.8.2	Not Applicable
10608.26(a)	Retail suppliers shall conduct a public hearing to discuss adoption, implementation, and economic impact of water use targets.	Plan Adoption, Submittal, and Implementation	Section 10.3	Section 4.1
10608.36	Wholesale suppliers shall include an assessment of present and proposed future measures, programs, and policies to help their retail water suppliers achieve targeted water use reductions.	Baselines and Targets	Section 5.1	Not Applicable
10608.40	Retail suppliers shall report on their progress in meeting their water use targets. The data shall be reported using a standardized form.	Baselines and Targets	Section 5.8 and App E	Appendix H
10620(b)	Every person that becomes an urban water supplier shall adopt an urban water management plan within one year after it has become an urban water supplier.	Plan Preparation	Section 2.1	Section 1.2.2
10620(d)(2)	Coordinate the preparation of its plan with other appropriate agencies in the area, including other water suppliers that share a common source, water management agencies, and relevant public agencies, to the extent practicable.	Plan Preparation	Section 2.5.2	Section 1.2.3

10620(f)	Describe water management tools and options to maximize resources and minimize the need to import water from other regions.	Water Supply Reliability Assessment	Section 7.4	Section 6.4 and Chapter 8
10621(b)	Notify, at least 60 days prior to the public hearing, any city or county within which the supplier provides water that the urban water supplier will be reviewing the plan and considering amendments or changes to the plan.	Plan Adoption, Submittal, and Implementation	Section 10.2.1	Section 1.2.3
10621(d)	Each urban water supplier shall update and submit its 2015 plan to the department by July 1, 2016.	Plan Adoption, Submittal, and Implementation	Sections 10.3.1 and 10.4	Section 1.3
10631(a)	Describe the water supplier service area.	System Description	Section 3.1	Section 2.2
10631(a)	Describe the climate of the service area of the supplier.	System Description	Section 3.3	Section 2.4
10631(a)	Indicate the current population of the service area.	System Description and Baselines and Targets	Sections 3.4 and 5.4	Section 2.5
10631(a)	Provide population projections for 2020, 2025, 2030, and 2035.	System Description	Section 3.4	Section 2.5
10631(a)	Describe other demographic factors affecting the supplier's water management planning.	System Description	Section 3.4	Section 2.6
10631(b)	Identify and quantify the existing and planned sources of water available for 2015, 2020, 2025, 2030, and 2035.	System Supplies	Chapter 6	Chapter 5
10631(b)	Indicate whether groundwater is an existing or planned source of water available to the supplier.	System Supplies	Section 6.2	Section 5.1
10631(b)(1)	Indicate whether a groundwater management plan has been adopted by the water supplier or if there is any other specific authorization for groundwater management. Include a copy of the plan or authorization.	System Supplies	Section 6.2.2	Section 5.1
10631(b)(2)	Describe the groundwater basin.	System Supplies	Section 6.2.1	Section 5.1
10631(b)(2)	Indicate if the basin has been adjudicated and include a copy of the court order or decree and a description of the amount of water the supplier has the legal right to pump.	System Supplies	Section 6.2.2	Section 5.1 and Appendix I
10631(b)(2)	For unadjudicated basins, indicate whether or not the department has identified the basin as overdrafted, or projected to become overdrafted. Describe efforts by the supplier to eliminate the long-term overdraft condition.	System Supplies	Section 6.2.3	Section 5.1
10631(b)(3)	Provide a detailed description and analysis of the location, amount, and sufficiency of	System Supplies	Section 6.2.4	Section 5.1

	groundwater pumped by the urban water supplier for the past five years			
10631(b)(4)	Provide a detailed description and analysis of the amount and location of groundwater that is projected to be pumped.	System Supplies	Sections 6.2 and 6.9	Section 5.1
10631(c)(1)	Describe the reliability of the water supply and vulnerability to seasonal or climatic shortage.	Water Supply Reliability Assessment	Section 7.1	Sections 6.1 and 6.2
10631(c)(1)	Provide data for an average water year, a single dry water year, and multiple dry water years	Water Supply Reliability Assessment	Section 7.2	Section 6.2
10631(c)(2)	For any water source that may not be available at a consistent level of use, describe plans to supplement or replace that source.	Water Supply Reliability Assessment	Section 7.1	Section 6.2
10631(d)	Describe the opportunities for exchanges or transfers of water on a short-term or long-term basis.	System Supplies	Section 6.7	Section 6.4.1
10631(e)(1)	Quantify past, current, and projected water use, identifying the uses among water use sectors.	System Water Use	Section 4.2	Section 3.1
10631(e)(3)(A)	Report the distribution system water loss for the most recent 12-month period available.	System Water Use	Section 4.3	Section 3.2
10631(f)(1)	Retail suppliers shall provide a description of the nature and extent of each demand management measure implemented over the past five years. The description will address specific measures listed in code.	Demand Management Measures	Sections 9.2 and 9.3	Section 8.2
10631(f)(2)	Wholesale suppliers shall describe specific demand management measures listed in code, their distribution system asset management program, and supplier assistance program.	Demand Management Measures	Sections 9.1 and 9.3	Not Applicable
10631(g)	Describe the expected future water supply projects and programs that may be undertaken by the water supplier to address water supply reliability in average, single-dry, and multiple-dry years.	System Supplies	Section 6.8	Section 6.4.2
10631(h)	Describe desalinated water project opportunities for long-term supply.	System Supplies	Section 6.6	Section 6.4.3
10631(i)	CUWCC members may submit their 2013-2014 CUWCC BMP annual reports in lieu of, or in addition to, describing the DMM implementation in their UWMPs. This option is only allowable if the supplier has been found to be in full compliance with the CUWCC MOU.	Demand Management Measures	Section 9.5	Not Applicable
10631(j)	Retail suppliers will include documentation that they have provided their wholesale supplier(s) – if any - with water use	System Supplies	Section 2.5.1	Section 1.2.3

	projections from that source.			
10631(j)	Wholesale suppliers will include documentation that they have provided their urban water suppliers with identification and quantification of the existing and planned sources of water available from the wholesale to the urban supplier during various water year types.	System Supplies	Section 2.5.1	Not Applicable
10631.1(a)	Include projected water use needed for lower income housing projected in the service area of the supplier.	System Water Use	Section 4.5	Section 3.3
10632(a) and 10632(a)(1)	Provide an urban water shortage contingency analysis that specifies stages of action and an outline of specific water supply conditions at each stage.	Water Shortage Contingency Planning	Section 8.1	Chapter 7
10632(a)(2)	Provide an estimate of the minimum water supply available during each of the next three water years based on the driest three-year historic sequence for the agency.	Water Shortage Contingency Planning	Section 8.9	Section 6.2
10632(a)(3)	Identify actions to be undertaken by the urban water supplier in case of a catastrophic interruption of water supplies.	Water Shortage Contingency Planning	Section 8.8	Section 7.1.2
10632(a)(4)	Identify mandatory prohibitions against specific water use practices during water shortages.	Water Shortage Contingency Planning	Section 8.2	Section 7.1.3
10632(a)(5)	Specify consumption reduction methods in the most restrictive stages.	Water Shortage Contingency Planning	Section 8.4	Section 7.1.3
10632(a)(6)	Indicated penalties or charges for excessive use, where applicable.	Water Shortage Contingency Planning	Section 8.3	Section 7.1.5
10632(a)(7)	Provide an analysis of the impacts of each of the actions and conditions in the water shortage contingency analysis on the revenues and expenditures of the urban water supplier, and proposed measures to overcome those impacts.	Water Shortage Contingency Planning	Section 8.6	Section 7.1.7
10632(a)(8)	Provide a draft water shortage contingency resolution or ordinance.	Water Shortage Contingency Planning	Section 8.7	Appendix N
10632(a)(9)	Indicate a mechanism for determining actual reductions in water use pursuant to the water shortage contingency analysis.	Water Shortage Contingency Planning	Section 8.5	Section 7.1.6
10633	For wastewater and recycled water, coordinate with local water, wastewater, groundwater, and planning agencies that operate within the supplier's service area.	System Supplies (Recycled Water)	Section 6.5.1	Section 5.3
10633(a)	Describe the wastewater collection and treatment systems in the supplier's service area. Include quantification of the amount of	System Supplies (Recycled Water)	Section 6.5.2	Section 5.3.1

	wastewater collected and treated and the methods of wastewater disposal.			
10633(b)	Describe the quantity of treated wastewater that meets recycled water standards, is being discharged, and is otherwise available for use in a recycled water project.	System Supplies (Recycled Water)	Section 6.5.2.2	Section 5.3.1
10633(c)	Describe the recycled water currently being used in the supplier's service area.	System Supplies (Recycled Water)	Section 6.5.3 and 6.5.4	Section 5.3.2
10633(d)	Describe and quantify the potential uses of recycled water and provide a determination of the technical and economic feasibility of those uses.	System Supplies (Recycled Water)	Section 6.5.4	Sections 5.3.1 and 5.3.2
10633(e)	Describe the projected use of recycled water within the supplier's service area at the end of 5, 10, 15, and 20 years, and a description of the actual use of recycled water in comparison to uses previously projected.	System Supplies (Recycled Water)	Section 6.5.4	Section 5.3.1
10633(f)	Describe the actions which may be taken to encourage the use of recycled water and the projected results of these actions in terms of acre-feet of recycled water used per year.	System Supplies (Recycled Water)	Section 6.5.5	Section 5.3.3
10633(g)	Provide a plan for optimizing the use of recycled water in the supplier's service area.	System Supplies (Recycled Water)	Section 6.5.5	Section 5.3.2
10634	Provide information on the quality of existing sources of water available to the supplier and the manner in which water quality affects water management strategies and supply reliability	Water Supply Reliability Assessment	Section 7.1	Section 6.3
10635(a)	Assess the water supply reliability during normal, dry, and multiple dry water years by comparing the total water supply sources available to the water supplier with the total projected water use over the next 20 years.	Water Supply Reliability Assessment	Section 7.3	Section 6.2
10635(b)	Provide supporting documentation that Water Shortage Contingency Plan has been, or will be, provided to any city or county within which it provides water, no later than 60 days after the submission of the plan to DWR.	Plan Adoption, Submittal, and Implementation	Section 10.4.4	Section 1.2.3
10642	Provide supporting documentation that the water supplier has encouraged active involvement of diverse social, cultural, and economic elements of the population within the service area prior to and during the preparation of the plan.	Plan Preparation	Section 2.5.2	Section 1.2
10642	Provide supporting documentation that the urban water supplier made the plan available for public inspection, published notice of the public hearing, and held a public hearing	Plan Adoption, Submittal, and Implementation	Sections 10.2.2, 10.3, and 10.5	Section 1.2 Section 1.3 Appendix D Appendix E

	about the plan.			
10642	The water supplier is to provide the time and place of the hearing to any city or county within which the supplier provides water.	Plan Adoption, Submittal, and Implementation	Sections 10.2.1	Appendix D
10642	Provide supporting documentation that the plan has been adopted as prepared or modified.	Plan Adoption, Submittal, and Implementation	Section 10.3.1	Appendix E
10644(a)	Provide supporting documentation that the urban water supplier has submitted this UWMP to the California State Library.	Plan Adoption, Submittal, and Implementation	Section 10.4.3	Appendix E
10644(a)(1)	Provide supporting documentation that the urban water supplier has submitted this UWMP to any city or county within which the supplier provides water no later than 30 days after adoption.	Plan Adoption, Submittal, and Implementation	Section 10.4.4	Section 1.2.3 Appendix E
10644(a)(2)	The plan, or amendments to the plan, submitted to the department shall be submitted electronically.	Plan Adoption, Submittal, and Implementation	Sections 10.4.1 and 10.4.2	Appendix E
10645	Provide supporting documentation that, not later than 30 days after filing a copy of its plan with the department, the supplier has or will make the plan available for public review during normal business hours.	Plan Adoption, Submittal, and Implementation	Section 10.5	Section 1.2.2

APPENDIX D

DOCUMENTATION OF 60-DAY NOTICE TO CITIES AND COUNTIES WITHIN WHICH BANNING PROVIDES WATER SERVICE AND TO OTHER INTERESTED PARTIES

City of Banning
Public Works Department

February 18, 2016

Steve Weiss, AICP, Planning Director
Riverside County Planning Department
P.O. Box 1409
Riverside, CA 92502-1409

Subject: City of Banning 2015 Urban Water Management Plan
Notice Pursuant to Section 10621(b) of the California Water Code

Dear Mr. Weiss:

The purpose of this letter is to provide notice that the City of Banning is revising its Urban Water Management Plan (UWMP) in compliance with the Urban Water Management Planning Act and the Water Conservation Act of 2009.

City of Banning will hold a public hearing to consider, and to receive public comments on, its draft 2015 UWMP. The public hearing will be held a minimum of 60 days from the date of this letter at the City's offices located at 99 East Ramsey Street, Banning CA 92220. A public notice stating the specific date, time, and location of the public hearing will be issued 30 days prior to said hearing.

All interested parties are invited to attend the public hearing and to comment on City of Banning's draft 2015 UWMP. Alternatively, interested parties may submit written comments to the City. At least 30 days prior to the public hearing, a draft copy of City of Banning's 2015 Urban Water Management Plan will be made available at the City of Banning Public Works Department, 99 East Ramsey Street, Banning CA 92220.

Sincerely,

Art Vela, P.E.
Acting Director of Public works

99 E. Ramsey St. • P.O. Box 998 • Banning, CA 92220-0998 • (951) 922-3130 • Fax (951) 922-3141

Bill Blankenship
Building Industry Association
of Southern California
3891 11th St.
Riverside, CA 92501

Subject: City of Banning 2015 Urban Water Management Plan
Notice Pursuant to Section 10621(b) of the California Water Code

Dear Mr. Blankenship:

The purpose of this letter is to provide notice that the City of Banning is revising its Urban Water Management Plan (UWMP) in compliance with the Urban Water Management Planning Act and the Water Conservation Act of 2009.

City of Banning will hold a public hearing to consider, and to receive public comments on, its draft 2015 UWMP. The public hearing will be held a minimum of 60 days from the date of this letter at the City's offices located at 99 East Ramsey Street, Banning CA 92220. A public notice stating the specific date, time, and location of the public hearing will be issued 30 days prior to said hearing.

All interested parties are invited to attend the public hearing and to comment on City of Banning's draft 2015 UWMP. Alternatively, interested parties may submit written comments to the City. At least 30 days prior to the public hearing, a draft copy of City of Banning's 2015 Urban Water Management Plan will be made available at the City of Banning Public Works Department, 99 East Ramsey Street, Banning CA 92220.

Subject: City of Banning 2015 Urban Water Management Plan

Dear Mr. Weiss:

As stated in the previous notice we provided, dated February 18, 2016, the City of Banning is revising its Urban Water Management Plan (UWMP) in compliance with the Urban Water Management Planning Act and the Water Conservation Act of 2009.

Prior to adoption of its 2015 UWMP, the City of Banning will hold a public hearing to consider, and to receive public comments on, its Draft 2015 UWMP. The public hearing will be held at the City's offices located at 99 East Ramsey Street, Banning, CA 92220 and is scheduled for Tuesday, May 24, 2016 at 5:00 p.m. A public notice stating the specific date, time, and location of the public hearing will be published prior to said hearing. We would value the receipt of your comments prior to May 24, 2016.

The Draft 2015 UWMP will be made available at the City of Banning Public Works Department, 99 East Ramsey Street, Banning CA 92220 on April 19, 2016.

The Final 2015 UWMP will return to City Council with a recommendation for adoption at the City Council's regular meeting scheduled for June 14, 2016.

If your agency would like to learn more about the City of Banning 2015 UWMP, please contact me at (951)922-3130.

Sincerely,

Arturo Vela, P.E.

Subject: City of Banning 2015 Urban Water Management Plan

Dear Mr. Blankenship:

As stated in the previous notice we provided, dated February 18, 2016, the City of Banning is revising its Urban Water Management Plan (UWMP) in compliance with the Urban Water Management Planning Act and the Water Conservation Act of 2009.

Prior to adoption of its 2015 UWMP, the City of Banning will hold a public hearing to consider, and to receive public comments on, its Draft 2015 UWMP. The public hearing will be held at the City's offices located at 99 East Ramsey Street, Banning, CA 92220 and is scheduled for Tuesday, May 24, 2016 at 5:00 p.m. A public notice stating the specific date, time, and location of the public hearing will be published prior to said hearing. We would value the receipt of your comments prior to May 24, 2016.

The Draft 2015 UWMP will be made available at the City of Banning Public Works Department, 99 East Ramsey Street, Banning CA 92220 on April 19, 2016.

The Final 2015 UWMP will return to City Council with a recommendation for adoption at the City Council's regular meeting scheduled for June 14, 2016.

If your agency would like to learn more about the City of Banning 2015 UWMP, please contact me at (951)922-3130.

Sincerely,

Arturo Vela, P.E.

City Engineer

PUBLIC COMMENTS ON THE
DRAFT 2015 UWMP AND RESPONSES THERETO

The following paragraphs are in response to comments on the City of Banning 2015 Urban Water Management Plan, which were received via email by City of Banning on June 9, 2016 from Greg Hohman of Pardee Homes. The numbered responses below correspond to the numbering added to the comments from Pardee Homes, as shown on the attached copy of said comments.

- **Response to Comment 1**

  Based on the *Water Supply Assessment for the Butterfield Specific Plan*, dated December 2011 (Butterfield WSA) and the *Water Supply Assessment Rancho San Gorgonio Specific Plan*, dated September 30, 2015 (RSG WSA), our calculations to determine the quantities of projected water demands for the City of Banning included the demands set forth in **Table 1** below for the Butterfield Ranch Specific Plan and the Rancho San Gorgonio Specific Plan developments.

Table 1
City Of Banning
Water Demands for Proposed Specific Plan Developments

	2020	2025	2030	2035	2040
Butterfield [1]	1,587	1,908	2,239	2,633	2,972
Rancho San Gorgonio [2]	22	75	49	16	16
Total [3]	**1,609**	**1,983**	**2,288**	**2,649**	**2,988**

[1] These quantities are based on the net projected project water demand (minus conservation savings) set forth in Tables 1.6.1 and 5.3.2.4 of the Butterfield WSA.

[2] These quantities are based on the net increase in water demand resulting from the project, as set forth in Table 4-11 of the RSG WSA.

[3] These quantities represent the total projected water demand for the Butterfield Specific Plan and the Rancho San Gorgonio Specific Plan and are included in Table 3-1 of the 2015 UWMP under the "Proposed Specific Plan Developments" column.

To address your concern, additional text pertaining to the Butterfield Ranch Specific Plan and the Rancho San Gorgonio Specific Plan has been added to Section 2.6 and its subsections in the 2015 UWMP.

- **Response to Comment 2**

  As shown in **Table 1**in the above **Response to Comment 1**, net quantities of water needed for the Rancho San Gorgonio Specific Plan decrease after 2025. This is due to quantities of water that are estimated to be recharged due to the project, as well as additional recycled water and return flows from irrigation that are expected to result from the project, as described in the RSG WSA. As these quantities increase between 2025 and 2040, net water demands decrease during that same period. These decreases in net project water demand account partially for the projected water demands in the 2015 UWMP being lower than those projected in the Butterfield WSA.

  The remaining differences in the projections from 2020 to 2040 between the 2015 UWMP and the Butterfield WSA resulted from our using a factor of 220 gallons per capita per day (gpcd) for non-specific plan development to estimate future demands for the 2015 UWMP, while the Butterfield WSA used a factor that accounted for water use up to the City's urban water use target of 252 gpcd, as was done in the City's 2010 UWMP.

The City's urban water use target remains at 252 gpcd. The City's actual water use for 2015 was 196 gpcd; therefore, assuming that the City will continue its conservation efforts into the future, while accounting for some increase in per capita water use, we used a factor of 220 gpcd.

- **Response to Comment 3a**

Banning's 2015 UWMP does not include the City's balance in its Beaumont Basin storage account (46,774 acre-feet) as a source of supply; however, the UWMP does include the annual projected quantity of 2,718 AF of groundwater recharge to the Beaumont Basin as a source of supply (refer to Table 5-4 of the UWMP). Although the City continues to purchase State Water Project (SWP) water and recharge same to the Beaumont Basin, growth in the City's Beaumont Basin storage account is not accounted for in the UWMP, as a conservative approach. This approach considers the water in the storage account as a backup supply for use in the event that there is a demand that cannot be met by the City's other sources of water supply.

- **Response to Comment 3b**

Text pertaining to the Beaumont Basin in Section 5.1.1 of the 2015 UWMP has been modified for clarity.

- **Response to Comment 4a**

The estimated recharge quantity of 2,718 acre-feet per year (AF/yr) is based on a draft Regional Water Allocation Agreement for Water Imported by the San Gorgonio Pass Water Agency based on a water retailer's sphere of influence within the SGPWA service area. The allocation agreement identifies that the City of Banning would receive 27.3% of the SGPWA Table A allocation which has been allocated by DWR in the amount of 17,300 AF/yr. SGPWA's Table A allocation is subject to the reliability of the SWP water deliveries, which the City's 2015 UWMP states that 58% was used (based on DWR's 2013 Final SWP Reliability Report). It should be noted that the draft allocation agreement has not been adopted by SGPWA, although it does provide a methodology for water supply planning related to imported water deliveries from SGPWA.

Based on the above, the estimated annual recharge quantity was determined as follows:

17,300 AF/yr X 57.5% X 27.3% = 2,718 AF/yr

- **Response to Comment 4b**

The text of Section 6.2 of the 2015 UWMP has been modified to clarify the basis for the quantities used in the water supply and demand projections.

- **Response to Comment 4c**

Although the City's WWTP expansion project is not on its original schedule, 2025 is considered a very conservative estimate of when the project facilities will be operational. The City is currently working on a funding plan for the project, and although a specific date has not yet been set, it is likely that the expansion will be online before 2025.

- **Response to Comment 5**

  Table 7-2 is one of a series of tables in Appendix B, which are standardized tables required by the California Department of Resources (DWR). Table 7-2 is autofilled from data in other tables in Appendix B. In particular, the supply totals are autofilled from data in Table 6-9 and the demand totals are autofilled from data in Table 4-3. In turn, Table 4-3 is autofilled from data entered into Tables 4-1 and 4-2. Due to an ambiguity in DWR's data entry format, data entered in Tables 4-1, 4-2, and 6-9 resulted in some quantities of projected supplies and demands being double-counted. This has been corrected; however, the numbers in Table 7-2 still do not match the numbers in Table 6-4 of the UWMP because Table 7-2 includes potential recycled water supplies that are anticipated to be available beginning in 2025, as well as projected quantities of secondary treated wastewater that are recharged to the Cabazon Storage Unit, while these quantities are not included in Table 6-4 of the UWMP. The tables in Appendix B of the UWMP have been replaced with the corrected tables.

I. Demand Projections

The Draft 2015 UWMP specifically identifies Pardee's Butterfield Project as one of two "Proposed Specific Plan Developments" which are used to project future population and water supply demands. (See Draft 2015 UWMP section 2.6.1; see also Table 3-1.)

1

* **Recommended Revision:** The introductory sentence of Section 2.6 should specify that, "pursuant to development agreements with Pardee Homes, the water supply required to serve the Butterfield project's projected new demands is committed and is not available to serve other demands." Both section 2.6.1 and section 2.6.2 should specify the amount of projected demand for the Butterfield project, specifically and separate from the Rancho San Gorgonio project, as a basis for the combined number on Table 3-1.

The Draft 2015 UWMP projects a similar demand in 2020 (10,515 AF) as does the 2011 Butterfield WSA (10,183). However, in later years beginning in 2030, the 2015 UWMP projects significantly less demand than the Butterfield WSA does, with a difference of more than 1,500 AFY by 2040. On its face, these demand projections do not add up, especially in light of the addition of the massive new Rancho San Gorgonio project. A significant portion of the previously identified projected demand must have been abandoned, or the demand calculations (demand/unit) must have been modified as a result of increased efficiency or conservation, to support these projections. We cannot determine this from the information provided in the UWMP.

2

* **Recommended Revision:** Provide an explanation for the reduced demand projections.

II. Supply Projections

a Like the 2010 UWMP, the Draft 2015 UWMP does not include the Beaumont Storage Account as a source of supply. However, the Draft 2015 UWMP does not project growth in the amount in the storage account, despite the fact that the City continues to request, purchase and take delivery of imported water. This is a more conservative analysis, which is OK, but should be explained.

3

b In one location (page 5-3), the 2015 UWMP incorrectly describes the City's rights under the judgment beginning in 2014. The City is entitled to 31.43 of the unused overlying production – a number to be determined by the Watermaster annually – plus any water in storage. However, the correct calculation appears to be used in Table 5-4.

* **Recommended Revisions:** Provide an explanation for not projecting growth in the storage account. Revise the text at the bottom of page 5-3 to correctly describe the City's annual rights in the Beaumont Basin (see Butterfield WSA § 6.1.5.9), in addition to its right to extract water in storage.

a The Draft 2015 UWMP indicates that imported water supplies are assumed to be 2,718 AFY, which is greater than projected in the WSA (2,595) AFY, without explanation and without analysis of the reliability of the supply. Historical deliveries do not appear to support the increased number. Given the substantial impact that the drought has had on the reliability of surface water, more explanation is required.

4

* **Recommended Revision:** Explain why the increase in the average annual quantity of imported water (over that projected in 2010) is justified. Has the City revised its application to purchase SWP water

b from the SGPWA? Also, Tables 6-2, 6-4 and 6-5 may create confusion because no differences are shown in supply between dry and wet years. It would be beneficial to include a short explanation of the fact that the numbers projected for groundwater are based on the average annual (or safe) yield of each of the groundwater subbasins, which necessarily takes into account the reliability of these basins. The same is true with the "SWP water". The projected available imported supply is calculated based on the reliability of the supply across all year types. Again, this is OK because the amount projected is an average annual quantity. Further, because the City does not take direct delivery of the water, fluctuations in the reliability of SWP are moderated by the City's conjunctive use operations.

4, continued

c

The UWMP has only a very limited discussion of recycled water which appears to come entirely from the City's 2006 Recycled Master Plan. It assumes that Phase I of the development of tertiary capacity will not be completed until 2025 and at that time 1,680 AF will be available for direct (irrigation) use. This is a 10-year delay from prior projections.

* **Recommended Revision:** Provide further explanation for the delay. Also, consider discussing the fact that the City's Cabazon supply provides an alternative, non-potable source of supply.

III. Miscellaneous

5

Draft 2015 UWMP Appendix B, Table 7-2 contains numbers that are inconsistent with the corresponding Table 6-4. The numbers on Table 7-2 appear to be in error.

CITY OF BANNING

M E M O R A N D U M

QUESTIONS RAISED ON THE CITY OF BANNING 2015 URBAN WATER MANAGEMENT PLAN AT THE CITY COUNCIL WORKSHOP ON MAY 24, 2016

1. Does the UWMP deal with the Chromium-6 issue?

   Chromium-6 is dealt with as a water quality issue. It does not affect supply.

2. Do the projections include the Pardee and Rancho San Gorgonio projects?

   If so, will there be enough water for these projects?

   Yes, the UWMP projections do include the Pardee and Rancho San Gorgonio Projects.

   Yes, there is enough water as long as residential demand is held at 220 gallons per capita per day or less through 2035. The City is currently at 196 gallons per capita per day. Additionally, the City has approximately 46,774 acre feet of water in its reserve storage account in the Beaumont Basin, which will provide sufficient additional water supplies beyond 2040.

3. How often is the UWMP updated? What if there are substantial changes to the City's situation. For example, Integrated Regional Water Management or formal allocation?

   The standard for updating the UWMP is every five years. It can be amended sooner if something substantial changes that would require it.

4. The UWMP states there is a 47,000 acre feet reserve. Is it physically there?

   How do we know it is not being overdrawn?

   Yes, the water is physically there. The Beaumont Basin is closely monitored. The City of Banning actually has a reserve storage account with a capacity of 80,000 acre feet. We are currently storing approximately 46,774 acre-feet in said storage account now.

QUESTION RAISED ON THE CITY OF BANNING 2015 URBAN WATER MANAGEMENT PLAN AT THE PUBLIC HEARING ON MAY 24, 2016

5. If the City has water for thousands of new homes why are the current residents having to conserve water?

   Based on a series of Executive Orders by Governor Brown, beginning in 2014, California is currently in a state of emergency due to severe drought conditions. As a result of said executive orders, water conservation is required throughout the state of California. Water suppliers who do not meet minimum conservation standards face steep fines from the state. Additionally, water conservation is not measured based on the total water use in the City, but rather the average gallons used per person per day.

AGENDA
SPECIAL CITY COUNCIL MEETING
CITY OF BANNING
BANNING, CALIFORNIA

May 24, 2016
1:00 p.m.

Banning Civic Center
Council Chambers
99 E. Ramsey St.

I. CALL TO ORDER

- Roll Call – Councilmembers Franklin, Miller, Moyer, Peterson, Mayor Welch

II. PUBLIC COMMENTS – *On Items Not on the Agenda*

A five-minute limitation shall apply to each member of the public who wishes to address the Mayor and Council on a matter not on the agenda. No member of the public shall be permitted to "share" his/her five minutes with any other member of the public. (Usually, any items received under this heading are referred to staff or future study, research, completion and/or future Council Action.) (See last page. PLEASE STATE YOUR NAME AND ADDRESS FOR THE RECORD.

III. WORKSHOP REPORTS

1. Budget Workshop for Fiscal Year 2016/17 and 2017/18 ..... **1**

1) City Overview – Michael Rock, City Manager
2) Public Works Department – CIP – Art Vela, Public Works Director/City Engineer
3) Electric Utility Department – Fred Mason, Electric Utility Director
4) Police Department – Alex Diaz, Police Chief
5) Community Services Department – Heidi Meraz, Community Services Director
6) Community Development Department – Brian Guillot, Community Development Director
7) Administrative Services Department – Rochelle Clayton, Administrative Services Director/Deputy City Manager
8) Department of the City Manager – Michael Rock, City Manager

2. Urban Water Management Plan Workshop (ORAL)
Staff Report – Art Vela, Public Works Director

IV. ADJOURNMENT

The City of Banning promotes and supports a high quality of life that ensures a safe and friendly environment, fosters new opportunities and provides responsive, fair treatment to all and is the pride of its citizens.

Pursuant to amended Government Code Section 54957.5(b) staff reports and other public records related to open session agenda items are available at City Hall, 99 E. Ramsey St., at the office of the City Clerk during regular business hours, Monday through Friday, 8 a.m. to 5 p.m.

NOTICE: Any member of the public may address this meeting of the Mayor and Council on any item appearing on the agenda by approaching the microphone in the Council Chambers and asking to be recognized, either before the item about which the member desires to speak is called, or at any time during consideration of the item. A five-minute limitation shall apply to each member of the public, unless such time is extended by the Mayor. No member of the public shall be permitted to "share" his/her five minutes with any other member of the public.

Any member of the public may address this meeting of the Mayor and Council on any item which does not appear on the agenda, but is of interest to the general public and is an item upon which the Mayor and Council may act. A five-minute limitation shall apply to each member of the public, unless such time is extended by the Mayor. No member of the public shall be permitted to "share" his/her five minutes with any other member of the public. The Mayor and Council will in most instances refer items of discussion which do not appear on the agenda to staff for appropriate action or direct that the item be placed on a future agenda of the Mayor and Council. However, no other action shall be taken, nor discussion held by the Mayor and Council on any item which does not appear on the agenda, unless the action is otherwise authorized in accordance with the provisions of subdivision (b) of Section 54954.2 of the Government Code.

In compliance with the Americans with Disabilities Act, if you need special assistance to participate in this meeting, please contact the City Clerk's Office (951) 922-3102. **Notification 48 hours prior to the meeting** will enable the City to make reasonable arrangements to ensure accessibility to this meeting. [28 CFR 35.02-35.104 ADA Tile II]

AGENDA
REGULAR MEETING
CITY OF BANNING
BANNING, CALIFORNIA

May 24, 2016
6:00 p.m.

Banning Civic Center
Council Chambers
99 E. Ramsey St.

The following information comprises the agenda for a regular meeting of the City Council; a joint meeting of the Banning City Council, the City Council Sitting in Its Capacity of a Successor Agency and the Banning Utility Authority; and a Scheduled Meeting of the Banning Utility Authority.

Per City Council Resolution No. 2010-38 matters taken up by the Council before 9:00 p.m. may be concluded, but no new matters shall be taken up after 9:00 p.m. except upon a unanimous vote of the council members present and voting, but such extension shall only be valid for one hour and each hour thereafter shall require a renewed action for the meeting to continue.

I. CALL TO ORDER

- Invocation
- Pledge of Allegiance
- Roll Call – Councilmembers Franklin, Miller, Moyer, Peterson, Mayor Welch

II. REPORT ON CLOSED SESSION

III. PUBLIC COMMENTS

PUBLIC COMMENTS – *On Items Not on the Agenda*

A five-minute limitation shall apply to each member of the public who wishes to address the Mayor and Council on a matter not on the agenda. No member of the public shall be permitted to "share" his/her five minutes with any other member of the public. (Usually, any items received under this heading are referred to staff or future study, research, completion and/or future Council Action.) (See last page. PLEASE STATE YOUR NAME AND ADDRESS FOR THE RECORD.

CORRESPONDENCE: Items received under this category may be received and filed or referred to staff for future research or a future agenda.

The City of Banning promotes and supports a high quality of life that ensures a safe and friendly environment, fosters new opportunities and provides responsive, fair treatment to all and is the pride of its citizens.

VI. **ANNOUNCEMENTS/REPORTS** *(Upcoming Events/Other Items if any)*

- City Council
- City Committee Reports
- Report by City Attorney
- Report by City Manager

V. **CONSENT ITEMS**

(The following items have been recommended for approval and will be acted upon simultaneously, unless a member of the City Council wishes to remove an item for separate consideration.)

Motion: To approve Consent Items 1 through 6
Items to be pulled ____, ____, ____, ____ for discussion.
(Resolutions require a recorded majority vote of the total membership of the City Council)

1. Approval of Minutes – Special Meeting – 05/10/16 *(Closed Session)* **1**
2. Approval of Minutes – Regular Meeting – 05/10/16 . . . . . **3**
3. Resolution No. 2016-44, Establishing Time Limits for Conduct of Business at City Council Meetings and Repealing Resolution No. 2010-38. . . . . **35**
4. Adoption of Resolution No. 2016-45, Establishing an Ad Hoc 2+2 Committee with the City of Beaumont to Discuss Cannabis Regulation and Resolution No. 2016-46, Establishing an Ad Hoc 2+2 Committee with the City of Beaumont to Discuss Transit Operational Issues. **43**
5. Report of Investments for March 2016. . . . . **51**

- **Open for Public Comments**
- **Make Motion**

RECESS REGULAR CITY COUNCIL MEETING AND CALL TO ORDER A JOINT MEETING OF THE CITY COUNCIL, THE CITY COUNCIL SITTING IN ITS CAPACITY OF A SUCCESSOR AGENCY AND THE BANNING UTILITY AUTHORITY

I. **REPORTS OF OFFICERS**

1. Review and Requested Direction concerning the Draft Demand Letter to the Banning Chamber of Commerce requiring payment of overdue utility bills and requiring compliance with other terms of its lease with the Successor Agency. **59**

(Staff Report – Anthony R. Taylor, City Attorney)

Recommendations: **1) That the City Council, Utility Authority Board and Successor Agency Board review the attached draft demand letter requiring the Banning Chamber of Commerce pay its overdue utility bills and requiring it comply with the terms of its lease with the Successor Agency; and 2) Provide comments and direction to the City Attorney on the attached demand letter.**

2. FY 2015/16 Mid-Year Budget Review and Adjustments . . . . . 64 a
(Staff Report –Rochelle Clayton, Deputy City Manager/Administrative Services Director)

Recommendations: **1) That the City Council approve Resolution No. 2016-47, the Banning Utility Authority Resolution No. 2016-08 UA, and the Successor Agency Resolution No. 2016-03 SA, authorizing the Administrative Services Director to make necessary budget adjustments to implement the mid-year analysis.**

Adjourn Joint Meeting.

CALL TO ORDER A SCHEDULED MEETING OF THE BANNING UTILITY AUTHORITY

I. BANNING UTILITY AUTHORITY (BUA)

Roll Call: Boardmembers Franklin, Miller, Moyer, Peterson, Chairman Welch

PUBLIC HEARING

1. Receive and File Comments related to the 2015 Urban Water Management Plan 65
(Staff Report – Art Vela, Public Works Director)

Recommendation: **The Banning Utility Authority Receive and file comments related to the 2015 Urban Water Management Plan.**

BUA ADJOURNMENT - Next regular meeting: Tuesday, June 14, 2016.

BANNING FINANCING AUTHORITY (BFA) – no meeting.

RECONVENE REGULAR CITY COUNCIL MEETING

VI. REPORTS OF OFFICERS

1. Resolution No. 2016-34, Renewing the Contract for the Operation and Maintenance of the City of Banning's Landscape Maintenance District ("LMD") No. 1 69
(Staff Report – Art Vela, Public Works Director)

Recommendation: **Adopt Resolution No. 2016-34, Renewing the Contract for the Operation and Maintenance of the City of Banning's Landscape Maintenance District ("LMD") No. 1 with Artistic Maintenance, Inc. of Lake Forest, California, in the amount of $71,440.00 for Fiscal Year 2016/17.**

VII. PUBLIC HEARING

1. Public Hearing regarding City Council Elections by Districts. 79
(Staff Report – Anthony R. Taylor, City Attorney)

Recommendations: **A) Receive public testimony regarding electoral districts for city council elections, with or without a mayor elected at-large; and B) Provide direction to staff regarding any action to be taken at future scheduled public hearings, if the Council agrees to the same, concerning district elections on June 6, 2016 and June 28, 2016.**

VIII. ITEMS FOR FUTURE AGENDAS

New Items –

Pending Items – City Council

1. Housing Element *(2016)*

(Note: Dates attached to pending items are the dates anticipated when it will be on an agenda. The item(s) will be removed when completed.)

IX. ADJOURNMENT

Pursuant to amended Government Code Section 54957.5(b) staff reports and other public records related to open session agenda items are available at City Hall, 99 E. Ramsey St., at the office of the City Clerk during regular business hours, Monday through Friday, 8 a.m. to 5 p.m.

NOTICE: Any member of the public may address this meeting of the Mayor and Council on any item appearing on the agenda by approaching the microphone in the Council Chambers and asking to be recognized, either before the item about which the member desires to speak is called, or at any time during consideration of the item. A five-minute limitation shall apply to each member of the public, unless such time is extended by the Mayor. No member of the public shall be permitted to "share" his/her five minutes with any other member of the public.

Any member of the public may address this meeting of the Mayor and Council on any item which does not appear on the agenda, but is of interest to the general public and is an item upon which the Mayor and Council may act. A five-minute limitation shall apply to each member of the public, unless such time is extended by the Mayor. No member of the public shall be permitted to "share" his/her five minutes with any other member of the public. The Mayor and Council will in most instances refer items of discussion which do not appear on the agenda to staff for appropriate action or direct that the item be placed on a future agenda of the Mayor and Council. However, no other action shall be taken, nor discussion held by the Mayor and Council on any item which does not appear on the agenda, unless the action is otherwise authorized in accordance with the provisions of subdivision (b) of Section 54954.2 of the Government Code.

In compliance with the Americans with Disabilities Act, if you need special assistance to participate in this meeting, please contact the City Clerk's Office (951) 922-3102. **Notification 48 hours prior to the meeting** will enable the City to make reasonable arrangements to ensure accessibility to this meeting. APPENDIX E

- **RESOLUTION ADOPTING THE 2015 URBAN WATER MANAGEMENT PLAN**
- **DOCUMENTATION OF SUBMITTAL OF FINAL 2015 UWMP TO CITIES AND COUNTIES WITHIN WHICH BANNING PROVIDES WATER SERVICE AND TO OTHER INTERESTED PARTIES**
- **DOCUMENTATION OF FINAL UWMP SUBMITTAL TO CALIFORNIA STATE LIBRARY**
- **DOCUMENTATION OF FINAL UWMP SUBMITTAL TO DWR**

RESOLUTION ADOPTING THE 2015 URBAN WATER MANAGEMENT PLAN

RESOLUTION NO. 2016-10 UA

A RESOLUTION OF THE BANNING UTILITY AUTHORITY OF BANNING, CALIFORNIA, ADOPTING THE 2015 URBAN WATER MANAGEMENT PLAN AND APPROVING ITS SUBMITTAL TO THE CALIFORNIA DEPARTMENT OF WATER RESOURCES

WHEREAS, according to the Urban Water Management Planning Act, an urban water supplier is defined as a supplier, publicly or privately owned, that either provides over 3,000 acre-feet of water annually for municipal purposes or serves more than 3,000 customers; and

WHEREAS, urban water suppliers are required to assess the reliability of its water sources over a 20 year planning horizon considering normal and dry years and include said assessment in an Urban Water Management Plan ("UWMP"); and

WHEREAS, the UWMP must be adopted, after public review and hearing, and filed with the California Department of Water Resources ("DWR"); and

WHEREAS, the City of Banning is an urban water supplier; and

WHEREAS, the City of Banning has prepared its 2015 UWMP in compliance with California Water Code and the 2015 Urban Management Plans Guidebook for Urban Water Suppliers, circulated for public review and held a workshop and public hearing; and

WHEREAS, on June 14, 2016 the Banning Utility Authority approved the UWMP and its submittal to the DWR for final approval.

NOW, THEREFORE, BE IT RESOLVED by the Banning Utility Authority of the City of Banning as follows:

SECTION 1. The Banning Utility Authority adopts Resolution No. 2016-10 UA approving the 2015 Urban Water Management Plan.

SECTION 2. The Public Works Director is authorized to file the 2015 Urban Water Management Plan with the California Department of Water Resources.

PASSED, APPROVED AND APPROVED this 14th day of June, 2016.

Arthur L. Welch, Chairman
Banning Utility Authority

ATTEST:

Marie A. Calderon, Secretary

APPROVED AS TO FORM AND LEGAL CONTENT:

Anthony R. Taylor, Authority Counsel

Subject: City of Banning's 2015 Urban Water Management Plan

Dear Mr. Romberg:

The City of Banning (City) adopted its 2015 Urban Water Management Plan (UWMP) at a scheduled meeting of the Banning Utility Authority held on June 14, 2016.

On behalf of the City, we submit to you a copy of the City's Final 2015 UWMP in PDF on the enclosed compact disc. Said document is also available for review at the following locations:

- Online at: www.ci.banning.ca.us/2015uwmp
- In person at: City of Banning
  99 East Ramsey Street
  Banning, CA 92220

Sincerely,

KRIEGER & STEWART

Water Audit Report for: City of Banning
Reporting Year: 2015 (1/2015 - 12/2015)

Please enter data in the white cells below. Where available, metered values should be used; if metered values are unavailable please estimate a value. Indicate your confidence in the accuracy of the input data by grading each component (n/a or 1-10) using the drop-down list to the left of the input cell. Hover the mouse over the cell to obtain a description of the grades

All volumes to be entered as: ACRE-FEET PER YEAR

To select the correct data grading for each input, determine the highest grade where the utility meets or exceeds all criteria for that grade and all grades below it.

Master Meter and Supply Error Adjustments

WATER SUPPLIED

<---------- Enter grading in column 'E' and 'J' ----------> | Pcnt: | Value:

Volume from own sources:	8	6,709.700	acre-ft/yr	4				acre-ft/yr
Water imported:	n/a	0.000	acre-ft/yr					acre-ft/yr
Water exported:	n/a	0.000	acre-ft/yr					acre-ft/yr
WATER SUPPLIED:		**6,709.700**	acre-ft/yr					

Enter negative % or value for under-registration
Enter positive % or value for over-registration

AUTHORIZED CONSUMPTION

Click here: ? for help using option buttons below

Pcnt: | Value:

Billed metered:	10	5,971.300	acre-ft/yr			
Billed unmetered:	n/a	0.000	acre-ft/yr			
Unbilled metered:	10	0.000	acre-ft/yr			
Unbilled unmetered:	8	0.010	acre-ft/yr		0.010	acre-ft/yr
AUTHORIZED CONSUMPTION:		**5,971.310**	acre-ft/yr			

Use buttons to select percentage of water supplied **OR** value

WATER LOSSES (Water Supplied - Authorized Consumption)

738.390 acre-ft/yr

Apparent Losses

Pcnt: | Value:

Unauthorized consumption:	7	0.010	acre-ft/yr		0.010	acre-ft/yr
Customer metering inaccuracies:	10	0.000	acre-ft/yr			acre-ft/yr
Systematic data handling errors:	8	0.010	acre-ft/yr		0.010	acre-ft/yr
Apparent Losses:		**0.020**	acre-ft/yr			

Real Losses (Current Annual Real Losses or CARL)

Real Losses = Water Losses - Apparent Losses:		**738.370**	acre-ft/yr			
WATER LOSSES:		**738.390**	acre-ft/yr			

NON-REVENUE WATER

NON-REVENUE WATER: **738.400** acre-ft/yr

= Water Losses + Unbilled Metered + Unbilled Unmetered

SYSTEM DATA

Length of mains:	8	145.5	miles
Number of active AND inactive service connections:	10	10,649	
Service connection density:		73	conn./mile main
Are customer meters typically located at the curbstop or property line?		Yes	
Average length of customer service line:			(length of service line, beyond the property boundary, that is the responsibility of the utility)

Average length of customer service line has been set to zero and a data grading score of 10 has been applied

Average operating pressure:	8	90.0	psi

COST DATA

Total annual cost of operating water system:	7	$11,115,016	$/Year	
Customer retail unit cost (applied to Apparent Losses):	8	$2.27	$/100 cubic feet (ccf)	
Variable production cost (applied to Real Losses):	4	$988.81	$/acre-ft	☑ Use Customer Retail Unit Cost to value real losses

WATER AUDIT DATA VALIDITY SCORE:

*** YOUR SCORE IS: 80 out of 100 ***

A weighted scale for the components of consumption and water loss is included in the calculation of the Water Audit Data Validity Score

PRIORITY AREAS FOR ATTENTION:

Based on the information provided, audit accuracy can be improved by addressing the following components:

1: Volume from own sources
2: Variable production cost (applied to Real Losses)
3: Total annual cost of operating water system

APPENDIX H

2015 SB X7-7 VERIFICATION FORM

SB X7-7 Table 0: Units of Measure Used in UWMP* *(select one from the drop down list)*
Acre Feet
**The unit of measure must be consistent with Table 2-3*
NOTES:

SB X7-7 Table-1: Baseline Period Ranges			
Baseline	**Parameter**	**Value**	**Units**
10- to 15-year baseline period	2008 total water deliveries	9,606	Acre Feet
	2008 total volume of delivered recycled water		Acre Feet
	2008 recycled water as a percent of total deliveries	0.00%	Percent
	Number of years in baseline period[1, 2]	10	Years
	Year beginning baseline period range	2001	
	Year ending baseline period range[3]	2010	
5-year baseline period	Number of years in baseline period	5	Years
	Year beginning baseline period range	2006	
	Year ending baseline period range[4]	2010	

[1] If the 2008 recycled water percent is less than 10 percent, then the first baseline period is a continuous 10-year period. If the amount of recycled water delivered in 2008 is 10 percent or greater, the first baseline period is a continuous 10- to 15-year period. *[2] The Water Code requires that the baseline period is between 10 and 15 years. However, DWR recognizes that some water suppliers may not have the minimum 10 years of baseline data.*

[3] The ending year must be between December 31, 2004 and December 31, 2010.

[4] The ending year must be between December 31, 2007 and December 31, 2010.

NOTES:

SB X7-7 Table 2: Method for Population Estimates	
Method Used to Determine Population (may check more than one)	
☑	**1. Department of Finance** (DOF) DOF Table E-8 (1990 - 2000) and (2000-2010) and DOF Table E-5 (2011 - 2015) when available
☐	**2. Persons-per-Connection Method**
☐	**3. DWR Population Tool**
☑	**4. Other** DWR recommends pre-review
NOTES: Current population estimate based on DOF data, and population projections based on DOF data and Southern California Association of Governments (SCAG) document: Draft Program Environmental Impact Report for the 2016 Regional Transportation

a California corporation; MERLIN PROPERTIES, LLC; LEONARD M. STEARNS and DOROTHY D. STEARNS, individually and as Trustees of the LEONARD M. STEARNS FAMILY TRUST OF 1991; and DOES 1 through 500, inclusive,

Defendants.

I. STIPULATING PARTIES IDENTIFIED

The following parties, and each of them, agree to the terms of this Stipulation:

Plaintiff:

SAN TIMOTEO WATERSHED MANAGEMENT AUTHORITY

Overlying Defendants:

1. SHARONDALE MESA OWNERS ASSOCIATION, an unincorporated association
2. CALIFORNIA OAK VALLEY GOLF AND RESORT LLC, a California limited liability company
3. OAK VALLEY PARTNERS LP, a Texas limited partnership
4. SOUTHERN CALIFORNIA SECTION OF THE PROFESSIONAL GOLFERS ASSOCIATION OF AMERICA, a California corporation
5. SUNNY-CAL EGG AND POULTRY COMPANY, a California corporation
6. MANHEIM, MANHEIM & BERMAN, a California general partnership
7. WALTER M. BECKMAN, individually, and as Trustee of the BECKMAN FAMILY TRUST dated December 11, 1990
8. THE ROMAN CATHOLIC BISHOP of San Bernardino, a California corporation
9. MERLIN PROPERTIES, LLC
10. LEONARD M. STEARNS and DOROTHY D. STEARNS, individually and as Trustees of the LEONARD M. STEARNS FAMILY TRUST OF 1991
11. PLANTATION ON THE LAKE LLC, a California limited liability company

Appropriating Defendants:

1. CITY OF BANNING, a municipal corporation
2. BEAUMONT-CHERRY VALLEY WATER DISTRICT, an irrigation district
3. SOUTH MESA MUTUAL WATER COMPANY, a mutual water company
4. YUCAIPA VALLEY WATER DISTRICT, a county water district

///

RIVERSIDE, CALIFORNIA 92501
(909) 682-5480

II. RECITALS

WHEREAS, plaintiff is a joint powers public agency, formed in 2001 for the purpose, among others, of preparing and implementing a Water Resources Management Plan for the San Timoteo Watershed and the waters tributary thereto, including the Beaumont Basin, in order to conserve local water supplies, improve surface and subsurface water quality and quantity, and to protect and enhance groundwater storage, for the benefit of the public;

WHEREAS, the Beaumont Basin, also known as the Beaumont Storage Unit, is the common source of water supply for appropriative water uses within the communities of Banning, Beaumont, Cherry Valley and Calimesa, and for various overlying uses including, but not limited to, golf courses and related facilities and agricultural production, including egg production and related agricultural irrigation uses;

WHEREAS, the maximum quantity of water which can be produced from the Beaumont Basin, at safe yield, is currently estimated to be 8650 acre feet per year, and the total groundwater production from the Beaumont Basin has exceeded and continues to exceed its safe yield;

WHEREAS, much of the land area within and adjacent to the Beaumont Basin is proposed to be intensively developed with residential, commercial and industrial uses, which will place additional demands on local water resources;

WHEREAS, it is estimated that the Beaumont Basin has the capability of storing more than 200,000 acre feet of water for overlying and appropriative use by water users within and

RIVERSIDE, C. ORNIA 92501
(909) 682-5480

adjacent to the Beaumont Basin;

WHEREAS, the plaintiff proposes to invest substantial public funds to construct facilities that will enable the storage of water within the Beaumont Basin, in addition to the storage that occurs naturally;

WHEREAS, the Overlying and Appropriating Defendants wish to secure the provision and availability of a reliable, affordable, long-term water supply for the area within plaintiff's jurisdiction, making reasonable and beneficial use of the native groundwater in the Beaumont Basin, and other local water resources, promoting the importation of water into the area, and storage of such water, and local surface waters, in the Beaumont Basin;

WHEREAS, the Overlying Defendants believe that it is in their best interest to enter into this Stipulation and be subject to the attached Judgment, rather than continue to litigate the safe yield of the Beaumont Basin, the quantity of their overlying rights, both historical and unexercised, the rights they may have to use the storage volume existing beneath their respective lands, and other issues;

WHEREAS, in order to protect existing overlying and appropriative uses and to justify and protect the public investment necessary to utilize the available groundwater storage capacity in the Beaumont Basin, it is necessary to adjudicate the Beaumont Basin and to define the respective water rights of the overlying and appropriative producers of groundwater.

NOW, THEREFORE, the undersigned parties, and each of them, hereby agree to the following Stipulated Terms.

AKLUFI & WYSOCKI
3403 TENTH ST, SUITE 610
RIVERSIDE, CALIFORNIA 92501
(909) 682-5480

III. STIPULATED TERMS

1. Form of Judgment: Judgment may be filed and entered in the form attached hereto as Exhibit "1" and made a part hereof.

2. Fees and Costs: Each party shall bear its own costs, attorneys fees and litigation expenses arising out of this adjudication.

3. Waiver: Notice of entry of judgment, the right to trial, stay of execution and appeal, is hereby waived, except as expressly set forth in the Judgment.

4. Binding Effect: This Stipulation and all obligations herein, shall be binding on and shall inure to the benefit of the heirs, executors, administrators, successors and assigns of the parties hereto.

5. Construction and Interpretation: No adverse construction or interpretation of this Stipulation shall be made under the Civil Code simply because the parties drafted or participated in the drafting of this Stipulation. The terms of the Judgment shall be interpreted to further the purposes of this Stipulation.

6. Jurisdiction and Venue: The Superior Court of California in and for the County of Riverside shall have jurisdiction of this matter. In the event of any litigation arising out of this Stipulation, venue shall conclusively be deemed to lie in the County of Riverside.

7. Advice of Counsel: The undersigned each have had the opportunity to consult with or have consulted with their own legal counsel regarding this Stipulation and all matters set forth herein, or have knowingly waived the right to do so.

I. INTRODUCTION

1. Pleadings, Parties and Jurisdiction

The complaint herein was filed on February 20, 2003, seeking an adjudication of water rights, injunctive relief and the imposition of a physical solution. The defaults of certain defendants have been entered, and certain other defendants dismissed. Other than defendants who have been dismissed or whose defaults have been entered, all defendants have appeared herein. This Court has jurisdiction of the subject matter of this action and of the parties herein.

2. Stipulation for Judgment

Stipulation for Entry of Judgment has been filed by and on behalf of all defendants who have appeared herein.

3. Definitions

As used in this Judgment, these terms shall have the following meanings:

A. Appropriator or Appropriator Parties: the pumpers identified in Exhibit "C" attached hereto.

B. Appropriator's Production Right: consists of an Appropriator's share of Operating Yield, plus (1) any water acquired by an Appropriator from an Overlying Producer or other Appropriator pursuant to this Judgment, (2) any water

3403 TENTH ST, SUITE 610
RIVERSIDE, CALIFORNIA 92501
(909) 682-5480

withdrawn from the Appropriator's storage account, (3) and New Yield created by the Appropriator.

C. Appropriative Water: the amount of Safe Yield remaining after satisfaction of Overlying Water Rights.

D. Appropriative Water Right: each Appropriator's share of Appropriative Water, such share expressed as a percentage as shown on Exhibit "C".

E. Beaumont Basin or Beaumont Storage Unit: the area situated within the boundaries shown on Exhibit "A" attached hereto.

F. Conjunctive Use: the storage of water in a Groundwater Basin for use at a later time.

G. Groundwater: water beneath the surface of the ground within the zone below the water table in which soil is saturated with water.

H. Groundwater Basin: an area underlain by one or more permeable formations capable of furnishing a substantial water supply.

I. Groundwater Storage Agreement: a standard form of written agreement between the Watermaster and any Person requesting the storage of Supplemental Water.

J. Groundwater Storage Capacity: the space available in a Groundwater Basin that is not utilized for storage or regulation of Safe Yield and is reasonably available for Stored Water and Conjunctive Use.

K. Minimal Producer: any Producer who pumps 10 or fewer acre feet of Groundwater from the Beaumont Basin per year.

AKLUFI & WYSOCKI
3403 TENTH ST, SUITE 610
RIVERSIDE, CALIFORNIA 92501
(909) 682-5480

L. New Yield: increases in yield in quantities greater than historical amounts from sources of supply including, but not limited to, capture of available storm flow, by means of projects constructed after February 20, 2003, as determined by the Watermaster.

M. Operating Yield: the maximum quantity of water which can be produced annually by the Appropriators from the Beaumont Basin, which quantity consists of Appropriative Water plus Temporary Surplus.

N. Overdraft: a condition wherein the total annual production from a Groundwater Basin exceeds the Safe Yield thereof.

O. Overlying Parties: the Persons listed on Exhibit "B", who are owners of land which overlies the Beaumont Basin and have exercised Overlying Water Rights to pump therefrom. Overlying Parties include successors in interest and assignees.

P. Overlying Water Rights: the quantities decreed to Overlying Parties in Column 4 of Exhibit "B" to this Judgment.

Q. Overproduction: by an Appropriator, measured by an amount equal to the Appropriator's actual annual production minus the Appropriator's Production Right. By a new overlying producer, an amount equal to what the overlying producer pumped during the year.

R. Party (Parties): any Person(s) named in this action, or who has intervened, or has become subject to this Judgment either through stipulation, trial or otherwise

LAW OFFICES
3403 TENTH ST, SUITE 610
RIVERSIDE, CALIFORNIA 92501
(909) 682-5480

S. Person: any individual, partnership, association, corporation, governmental entity or agency, or other organization.

T. Physical Solution: the physical solution set forth in Part V of this Judgment.

U. Produce, Producing, Production, Pump or Pumping: the extraction of groundwater.

V. Producer or Pumper: any Person who extracts groundwater.

W. Recycled Water: has the meaning provided in Water Code Section 13050(n) and includes other nonpotable water for purposes of this Judgment.

X. Safe Yield: the maximum quantity of water which can be produced annually from a Groundwater Basin under a given set of conditions without causing a gradual lowering of the groundwater level leading eventually to depletion of the supply in storage. The Safe Yield of the Beaumont Basin is 8650 acre feet per year in each of the ten (10) years following entry of this Judgment.

Y. San Timoteo Watershed Management Authority: a joint powers public agency whose members are the Beaumont-Cherry Valley Water District, the City of Beaumont, the South Mesa Mutual Water Company and the Yucaipa Valley Water District.

Z. Stored Water: Supplemental Water stored in the Beaumont Basin pursuant to a Groundwater Storage Agreement with the Watermaster.

AA. Supplemental Water: water imported into the

AKLUFI & WYSOCKI
3403 TENTH ST, SUITE 610
RIVERSIDE, CALIFORNIA 92501
(909) 682-5480

Beaumont Basin from outside the Beaumont Basin including, without limitation, water diverted from creeks upstream and tributary to Beaumont Basin and water which is recycled and useable within the Beaumont Basin.

BB. Temporary Surplus: the amount of groundwater that can be pumped annually in excess of Safe Yield from a Groundwater Basin necessary to create enough additional storage capacity to prevent the waste of water.

CC. Watermaster: the Person appointed by the Court to administer and enforce the Physical Solution.

4. List of Exhibits

The following exhibits are attached to this Judgment and made a part hereof:

Exhibit "A" -- "Location Map of Beaumont Basin"
Exhibit "B" -- "Overlying Owners and Their Water Rights"
Exhibit "C" -- "Appropriators and Their Water Rights"
Exhibit "D" -- "Legal Description of Lands of the Overlying Parties"
Exhibit "E" -- "Location of Overlying Producer Parcels and Boundary of the Beaumont Basin"

II. INJUNCTIONS

1. Injunction Against Unauthorized Production of Beaumont Basin Water

Each party herein is enjoined, as follows:

A. Overlying Parties: Each defendant who is an Overlying Party, and its officers, agents, employees, successors and assigns, is hereby enjoined and restrained from producing groundwater from the Beaumont Basin in any five-year period hereafter in excess of five times the share of the Safe Yield assigned to the Overlying Parties as set

3403 TENTH ST, SUITE 610
RIVERSIDE, CALIFORNIA 92501
(909) 682-5480

forth in Column 4 of Exhibit "B", as more fully described in the Physical Solution.

B. Appropriator Parties: Each defendant who is an Appropriator Party, and its officers, agents, employees, successors and assigns, is hereby enjoined and restrained from producing groundwater from the Beaumont Basin in any year hereafter in excess of such party's Appropriator's Production Right, except as additional annual Production may be authorized by the provisions of the Physical Solution.

2. Injunction Against Unauthorized Storage or Withdrawal of Stored Water

Each and every Party, and its officers, agents, employees, successors and assigns, is hereby enjoined and restrained from storing Supplemental Water in the Beaumont Basin for withdrawal, or causing withdrawal of water stored by that Party, except pursuant to the terms of a written Groundwater Storage Agreement with the Watermaster and in accordance with Watermaster Rules and Regulations. Any Supplemental Water stored in the Beaumont Basin, except pursuant to a Groundwater Storage Agreement, shall be deemed abandoned and not classified as Stored Water.

III. DECLARATION AND ADJUSTMENT OF RIGHTS

1. Overlying Rights

The Overlying Parties are currently exercising Overlying Water Rights in the Beaumont Basin. As shown on Exhibit "B", the aggregate Projected Maximum Production of water from the Beaumont Basin pursuant to Overlying Water Rights is 8610 acre feet and the Overlying Water Rights are individually decreed, in Column 4 of Exhibit "B", for each Overlying Party. The Overlying Parties

8650

AKLUFI & WYSOCKI
3403 TENTH ST, SUITE 610
RIVERSIDE, CALIFORNIA 92501
(909) 682-5480

shall continue to have the right to exercise their respective Overlying Water Right as set forth in Column 4 of Exhibit "B" except to the extent their respective properties receive water service from an Appropriator Party, as contemplated by Paragraph III.3 of this Judgment.

2. Appropriator's Share of Operating Yield

Each Appropriator Party's share of Operating Yield is shown on Exhibit "C". Notwithstanding any other provision of this Judgment, each Appropriator Party may use its Appropriator's Production Right anywhere within its service area.

3. Adjustment of Rights

A. The Overlying Parties shall have the right to exercise their respective Overlying Water Rights except as provided in this Paragraph 3.

B. To the extent any Overlying Party requests, and uses its Exhibit "B", Column 4 water to obtain water service from an Appropriator Party, an equivalent volume of potable groundwater shall be earmarked by the Appropriator Party which will serve the Overlying Party, up to the volume of the Overlying Water Right as reflected in Column 4 of Exhibit "B" attached hereto, for the purpose of serving the Overlying Party. The intent of this provision is to ensure that the Overlying Party is given credit towards satisfying the water availability assessment provisions of Government Code, Section 66473.7 et seq. and Water Code, Section 10910 et seq. or other similar provisions of law, equal to the amount of groundwater earmarked hereunder.

C. When an Overlying Party receives water service as

K I F N O C I
...03 ...ENT, ...ET, SUITE 610
RIVERSIDE, CALIFORNIA 92501
(909) 682-5480

provided for in subparagraph III.3.B the Overlying Party shall forebear the use of that volume of the Overlying Water Right earmarked by the Appropriator Party. The Appropriator Party providing such service shall have the right to produce the volume of water foregone by the Overlying Party, in addition to other rights otherwise allocated to the Appropriator Party.

D. Should the volume of the Overlying Water Right equal or exceed the volume of potable groundwater earmarked as provided in subparagraph 3.B, the Appropriator Party which will serve the Overlying Party shall (i) impose potable water charges and assessments upon the Overlying Party and its successors in interest at the rates charged to the then-existing regular customers of the Appropriator Party, and (ii) not collect from such Overlying Party any development charge that may be related to the importation of water into the Beaumont Basin. The Appropriator Party which will serve the Overlying Party pursuant to Subparagraph III.3.B shall also consider, and negotiate in good faith regarding, the provision of a meaningful credit for any pipelines, pump stations, wells or other facilities that may exist on the property to be served.

E. In the event an Overlying Party receives Recycled Water from an Appropriator Party to serve an overlying use served with groundwater, the Overlying Water Right of the Overlying Party shall not be diminished by the receipt and use of such Recycled Water. Recycled Water provided by an Appropriator Party to an Overlying Party shall satisfy the

AKLUFI & WYSOCKI
3403 TENTH ST, SUITE 610
RIVERSIDE, CALIFORNIA 92501
(909) 682-5480

criteria set forth in the California Water Code including, without limitation, the criteria set forth in Water Code Sections 13550 and 13551. The Appropriator Party which will serve the Recycled Water shall have the right to use that portion of the Overlying Water Right of the Overlying Party offset by the provision of Recycled Water service pursuant to the terms of this subparagraph; provided, however, that such right of use by the Appropriator Party shall no longer be valid if the Recycled Water, provided by the Appropriator Party to the Overlying Party, does not satisfy the requirements of Sections 13550 and 13551 and the Overlying Party ceases taking delivery of such Recycled Water.

F. Nothing in this Judgment is intended to impair or adversely affect the ability of an Overlying Party to enter into annexation or development agreements with any Appropriator Party.

G. Oak Valley Partners LP ("Oak Valley") is developing its property pursuant to Specific Plans 216 and 216A adopted by the County of Riverside ("County") in May 1990, and Specific Plan 318 adopted by the County in August, 2001, (Specific Plans 216, 216A and 318 are collectively referred to as the "Specific Plans"). The future water supply needs at build-out of the Specific Plans will greatly exceed Oak Valley's Projected Maximum Production, as reflected in Exhibit "B" to the Judgment, and may be as much as 12,811 acre feet per year. Oak Valley has annexed the portion of its property now within the City of Beaumont into the Beaumont-Cherry Valley Water District ("BCVWD"), and is in

RIVERSIDE, CALIFORNIA 92501
(909) 682-5480

the process of annexing the remainder portion of its property into the Yucaipa Valley Water District ("YVWD"), in order to obtain retail water service for the development of the Oak Valley property pursuant to the Specific Plans (for purposes of this subparagraph BCVWD and YVWD are collectively referred to as the "Water Districts", and individually as a "Water District"). YVWD covenants to use its best efforts to finalize the annexation of the Oak Valley property within the Calimesa City limits. Oak Valley, for itself and its successors and assigns, hereby agrees, by this stipulation and upon final annexation of its property by YVWD, to forbear from claiming any future, unexercised, overlying rights in excess of the Projected Maximum Production of Exhibit "B" of 1806 acre feet per year. As consideration for the forbearance, the Water Districts agree to amend their respective Urban Water Management Plans ("UWMP") in 2005 as follows: BCVWD agrees that 2,400 acre feet per year of projected water demand shall be included for the portion of Oak Valley to be served by BCVWD in its UWMP, and YVWD agrees to include 8,000 acre feet per year of projected water demand as a projected demand for the portion of Oak Valley to be served by YVWD in its UWMP by 2025. The Water Districts agree to use their best judgment to accurately revise this estimate to reflect the projected water demands for the UWMP prepared in 2010. Furthermore, the Water Districts further agree that, in providing water availability assessments prior to 2010, as required by Water Code §10910 and water supply verifications as required by Government Code §§66455.3 and

AKLUFI & WYSOCKI
3403 TENTH ST, SUITE 610
RIVERSIDE, CALIFORNIA 92501
(909) 682-5480

66473.7, or any similar statute, and in maintaining their respective UWMP, each shall consider the foregoing respective projected water demand figures for Oak Valley as proposed water demands. The intent of the foregoing requirements is to ensure that Oak Valley is credited for the forbearance of its overlying water rights and is fully accounted for in each Water District's UWMP and overall water planning. The Water Districts' actions in performance of the foregoing planning obligations shall not create any right or entitlement to, or priority or allocation in, any particular water supply source, capacity or facility, or any right to receive water service other than by satisfying the applicable Water District's reasonable requirements relating to application for service. Nothing in this subparagraph G is intended to affect or impair the provision of earmarked water to Overlying Parties who request and obtain water service from Appropriator Parties, as set forth in subparagraph III.3.B, above.

H. Persons who would otherwise qualify as Overlying Producers based on an interest in land lying within the City of Banning's service area shall not have the rights described in this Paragraph III.3.

4. Exemption for Minimal Producers

Unless otherwise ordered by the Court, Minimal Producers are exempt from the provisions of this Judgment.

IV. CONTINUING JURISDICTION

Full jurisdiction, power and authority is retained and reserved to the Court for purposes of enabling the Court, upon

RIVERSIDE, CALIFORNIA 92501
(909) 682-5480

application of any Party, by a motion noticed for at least a 30-day period (or consistent with the review procedures of Paragraph VII.6 herein, if applicable), to make such further or supplemental order or directions as may be necessary or appropriate for interim operation of the Beaumont Basin before the Physical Solution is fully operative, or for interpretation, or enforcement or carrying out of this Judgment, and to modify, amend or amplify any of the provisions of this Judgment or to add to the provisions hereof consistent with the rights herein decreed; except that the Court's jurisdiction does not extend to the redetermination of (a) Safe Yield during the first ten years of operation of the Physical Solution, and (b) the fraction of the share of Appropriative Water of each Appropriator.

V. THE PHYSICAL SOLUTION

1. Purpose and Objective

In accordance with the mandate of Section 2 of Article X of the California Constitution, the Court hereby adopts, and orders the parties to comply with, a Physical Solution. The purpose of the Physical Solution is to establish a legal and practical means for making the maximum reasonable beneficial use of the waters of Beaumont Basin, to facilitate conjunctive utilization of surface, ground and Supplemental Waters, and to satisfy the requirements of water users having rights in, or who are dependent upon, the Beaumont Basin. Such Physical Solution requires the definition of the individual rights of all Parties within the Beaumont Basin in a manner which will fairly allocate the native water supplies and which will provide for equitable sharing of costs of Supplemental Water.

ARLOFT AND WYSOCKI
3403 TENTH ET, SUITE 610
RIVERSIDE, C FORNIA 92501
(909) 682-5480

2. Need for Flexibility

The Physical Solution must provide maximum flexibility and adaptability in order that the Watermaster and the Court may be free to use existing and future technological, social, institutional and economic options. To that end, the Court's retained jurisdiction shall be utilized, where appropriate, to supplement the discretion granted herein to the Watermaster.

3. Production and Storage in Accordance With Judgment

This Judgment, and the Physical Solution decreed herein, address all Production and Storage within the Beaumont Basin. Because the Beaumont Basin is at or near a condition of Overdraft, any Production outside the framework of this Judgment and Physical Solution will potentially damage the Beaumont Basin, injure the rights of all Parties, result in the waste of water and interfere with the Physical Solution. The Watermaster shall bring an action or a motion to enjoin any Production that is not in accordance with the terms of this Judgment.

4. General Pattern of Operation

One fundamental premise of the adjudication is that all Producers shall be allowed to pump sufficient water from the Beaumont Basin to meet their respective requirements. Another fundamental premise of the adjudication is that Overlying Parties who pump no more than the amount of their Overlying Water Right as shown on Column 4 of Exhibit "B" hereto, shall not be charged for the replenishment of the Beaumont Basin. To the extent that pumping exceeds five (5) times the share of the Safe Yield assigned to an Overlying Party (Column 4 of Exhibit "B") in any five (5) consecutive years, or the share of Operating Yield

RIVERSIDE, CALIFORNIA 92501
(909) 682-5480

Right of each Appropriator Party, each such Party shall provide funds to enable the Watermaster to replace such Overproduction.

5. Use of Available Groundwater Storage Capacity

A. There exists in the Beaumont Basin a substantial amount of available Groundwater Storage Capacity. Such Capacity can be reasonably used for Stored Water and Conjunctive Use and may be used subject to Watermaster regulation to prevent injury to existing Overlying and Appropriative water rights, to prevent the waste of water, and to protect the right to the use of Supplemental Water in storage and Safe Yield of the Beaumont Basin.

B. There shall be reserved for Conjunctive Use a minimum of 200,000 acre feet of Groundwater Storage Capacity in the Beaumont Basin provided that such amount may be reduced as necessary to prevent injury to existing water rights or existing uses of water within the Basin, and to prevent the waste of water. Any Person may make reasonable beneficial use of the Groundwater Storage Capacity for storage of Supplemental Water; provided, however, that no such use shall be made except pursuant to a written Groundwater Storage Agreement with the Watermaster. The allocation and use of Groundwater Storage Capacity shall have priority and preference for Producers within the Beaumont Basin over storage for export. The Watermaster may, from time-to-time, redetermine the available Groundwater Storage Capacity.

///

///

AKLUFI & WYSOCKI
3403 TENTH STREET, SUITE 610
RIVERSIDE, CALIFORNIA 92501
(909) 682-5480

VI. ADMINISTRATION

1. Administration and Enforcement by Watermaster

The Watermaster shall administer and enforce the provisions of this Judgment and any subsequent order or instructions of the Court.

2. Watermaster Control

The Watermaster is hereby granted discretionary powers to develop and implement a groundwater management plan and program for the Beaumont Basin, which plan shall be filed with and shall be subject to review and approval by, the Court, and which may include water quantity and quality considerations and shall reflect the provisions of this Judgment. Except for the exercise by Overlying Parties of their respective Rights described in Column 4 of Exhibit "B" hereto in accordance with the provisions of the Physical Solution, groundwater extractions and the replenishment thereof, and the storage of Supplemental Water, shall be subject to procedures established and administered by the Watermaster. Such procedures shall be subject to review by the Court upon motion by any Party.

3. Watermaster Standard of Performance

The Watermaster shall, in carrying out its duties and responsibilities herein, act in an impartial manner without favor or prejudice to any Party or purpose of use.

4. Watermaster Appointment

The Watermaster shall consist of a committee composed of persons nominated by the City of Banning, the City of Beaumont, the Beaumont-Cherry Valley Water District, the South Mesa Mutual Water Company and the Yucaipa Valley Water District, each of

RIVERSIDE, CA... ORNIA 92501
(909) 682-5480

which shall have the right to nominate one representative to the Watermaster committee who shall be an employee of or consultant to the nominating agency. Each such nomination shall be made in writing, served upon the other parties to this Judgment and filed with the Court, which shall approve or reject such nomination. Each Watermaster representative shall serve until a replacement nominee is approved by the Court. The nominating agency shall have the right to nominate that representative's successor.

5. Powers and Duties of the Watermaster

Subject to the continuing supervision and control of the Court, the Watermaster shall have and may exercise the following express powers, and shall perform the following duties, together with any specific powers, authority, and duties granted or imposed elsewhere in this Judgment or hereafter ordered or authorized by the Court in the exercise of its continuing jurisdiction:

A. Rules and Regulations: The adoption of appropriate rules and regulations for the conduct of Watermaster affairs, copies of which shall be provided to all interested parties.

B. Wellhead Protection and Recharge: The identification and management of wellhead protection areas and recharge areas.

C. Well Abandonment: The administration of a well abandonment and well destruction program.

D. Well Construction: The development of minimum well construction specifications and the permitting of new wells.

AKLUFI AND WYSOCKI
3403 TENTH ST, SUITE 610
RIVERSIDE, CALIFORNIA 92501
(909) 682-5480

E. Mitigation of Overdraft: The mitigation of conditions of uncontrolled overdraft.

F. Replenishment: The acquisition and recharge of Supplemental Water.

G. Monitoring: The monitoring of groundwater levels, ground levels, storage, and water quality.

H. Conjunctive Use: The development and management of conjunctive-use programs.

I. Local Projects: The coordination of construction and operation, by local agencies, of recharge, storage, conservation, water recycling, extraction projects and any water resource management activity within or impacting the Beaumont Basin.

J. Land Use Plans: The review of land use plans and coordination with land use planning agencies to mitigate or eliminate activities that create a reasonable risk of groundwater contamination.

K. Acquisition of Facilities: The purchase, lease and acquisition of all necessary real and personal property, including facilities and equipment.

L. Employment of Experts and Agents: The employment or retention of such technical, clerical, administrative, engineering, accounting, legal or other specialized personnel and consultants as may be deemed appropriate. The Watermaster shall maintain records allocating the cost of such services as well as all other expenses of Watermaster administration.

M. Measuring Devices: Except as otherwise provided

3403 TENTH ST, SUITE 610
RIVERSIDE, CALIFORNIA 92501
(909) 682-3480

by agreement the Watermaster shall install and maintain in good operating condition, at the cost of the Watermaster, such necessary measuring devices or meters as Watermaster may deem appropriate. Such devices shall be inspected and tested as deemed necessary by the Watermaster and the cost thereof borne by the Watermaster. Meter repair and retesting will be a Producer expense.

N. Assessments: The Watermaster is empowered to levy and collect the following assessments:

(1) Annual Replenishment Assessments

The Watermaster shall levy and collect assessments in each year, in amounts sufficient to purchase replenishment water to replace Overproduction by any Party.

(2) Annual Administrative Assessments

a. Watermaster Expenses: The expenses of administration of the Physical Solution shall be categorized as either "General Watermaster Administration Expenses", or "Special Project Expenses".

i. General Watermaster Administration Expenses: shall include office rent, labor, supplies, office equipment, incidental expenses and general overhead. General Watermaster Administration Expenses shall be assessed by the Watermaster equally against the Appropriators who have appointed representatives to the Watermaster.

AKLUFI AND VYSOCKI
3403 TENTH ST, SUITE 610
RIVERSIDE, CALIFORNIA 92501
(909) 682-5480

ii. Special Project Expenses: shall include special engineering, economic or other studies, litigation expenses, meter testing or other major operating expenses. Each such project shall be assigned a task order number and shall be separately budgeted and accounted for. Special Project Expenses shall be allocated to the Appropriators, or portion thereof, on the basis of benefit.

O. Investment of Funds; Borrowing: The Watermaster may hold and invest Watermaster funds as authorized by law, and may borrow, from time-to-time, amounts not exceeding annual receipts.

P. Contracts: The Watermaster may enter into contracts for the performance of any of its powers.

Q. Cooperation With Other Agencies: The Watermaster may act jointly or cooperate with other local, state and federal agencies.

R. Studies: The Watermaster may undertake relevant studies of hydrologic conditions and operating aspects of the management program for the Beaumont Basin.

S. Groundwater Storage Agreements: The Watermaster shall adopt uniform rules and a standard form of agreement for the storage of Supplemental Water, provided that the activities undertaken pursuant to such agreements do not injure any Party.

T. Administration of Groundwater Storage Capacity: Except for the exercise by the Overlying Parties of their

RIVERSIDE, CALIFORNIA 92501
(909) 682-5480

respective Overlying Water Rights described in Part III, above, in accordance with the provisions of the Physical Solution, all Groundwater Storage Capacity in the Beaumont Basin shall be subject to the Watermaster's rules and regulations, which regulations shall ensure that sufficient storage capacity shall be reserved for local projects. Any Person or entity may apply to the Watermaster to store water in the Beaumont Basin.

U. Accounting for Stored Water: The Watermaster shall calculate additions, extractions and losses and maintain an annual account of all stored water in the Beaumont Basin, and any losses of water supplies or Safe Yield resulting from such stored water.

V. Accounting for New Yield: Recharge of the Beaumont Basin with New Yield water shall be credited to the Party that creates the New Yield. The Watermaster shall make an independent scientific assessment of the estimated New Yield created by each proposed project. New Yield will be allocated on an annual basis, based upon monitoring data and review by the Watermaster.

W. Accounting for Acquisitions of Water Rights: The Watermaster shall maintain an accounting of acquisitions by Appropriators of water otherwise subject to Overlying Water Rights as the result of the provision of water service thereto by an Appropriator.

X. Annual Administrative Budget: The Watermaster shall prepare an annual administrative budget for public review, and shall hold a public hearing on each such budget

AKLUFI & WYSOCKI
3403 TENTH ST, SUITE 610
RIVERSIDE, CALIFORNIA 92501
(909) 682-5480

prior to adoption. The budget shall be prepared in sufficient detail so as to make a proper allocation of the expenses and receipts. Expenditures within budgeted items may thereafter be made by the Watermaster as a matter of course.

Y. Redetermining the Safe Yield: The Safe Yield of the Beaumont Basin shall be redetermined at least every 10 years beginning 10 years after the date of entry of this Judgment.

6. Reports and Accounting

(a) Production Reports: Each Pumper shall periodically file, pursuant to Watermaster rules and regulations, a report showing the total production of such Pumper from each well during the preceding report period, and such additional information as the Watermaster may reasonably require.

(b) Watermaster Report and Accounting: The Watermaster shall prepare an annual report of the preceding year's operations, which shall include an audit of all assessments and Watermaster expenditures.

7. Replenishment

Supplemental Water may be obtained by the Watermaster from any source. The Watermaster shall seek the best available quality of Supplemental Water at the most reasonable cost for recharge in the Basin. Sources may include, but are not limited to:

(a) Recycled Water;

(b) State Water Project Water;

3403 TENTH ST, SUITE 610
RIVERSIDE, CALIFORNIA 92501
(909) 682-5480

(c) Other imported water.

Replenishment may be accomplished by any reasonable method including:

(a) Spreading and percolation, or injection of water in existing or new facilities; and/or

(b) In-lieu deliveries for direct surface use, in lieu of groundwater extraction.

VII. MISCELLANEOUS PROVISIONS

1. Designation of Address for Notice and Service

Each Party shall designate, in writing to the plaintiff, the name and address to be used for purposes of all subsequent notices and service herein, such designation to be delivered to the plaintiff within 30 days after the Judgment has been entered. The plaintiff shall, within 45 days after judgment has been entered, file the list of designees with the Court and serve the same on the Watermaster and all Parties. Such designation may be changed from time-to-time by filing a written notice of such change with the Watermaster. Any Party desiring to be relieved of receiving notices of Watermaster activity may file a waiver of notice on a form to be provided by the Watermaster. The Watermaster shall maintain, at all times, a current list of Parties to whom notices are to be sent and their addresses for purposes of service. The Watermaster shall also maintain a full current list of names and addresses of all Parties or their successors, as filed herein. Copies of such lists shall be available to any Person. If no designation is made, a Party's designee shall be deemed to be, in order of priority: (i) the Party's attorney of record; or (ii) if the Party does not have an

AKLUFI & WYSOCKI
3403 TENTH ST, SUITE 610
RIVERSIDE, CALIFORNIA 92501
(909) 682-5480

attorney of record, the Party itself at the address on the Watermaster list.

2. Intervention After Judgment

Any Person who is neither a Party to this Judgment nor a successor or assignee of a Party to this Judgment may seek to become a party to this Judgment by filing a petition in intervention.

3. Interference with Pumping

Nothing in this judgment shall be deemed to prevent any party from seeking judicial relief against any other party whose pumping activities constitute an unreasonable interference with the complaining party's ability to extract groundwater.

4. Successors and Assigns

This Judgment and all provisions herein shall be binding on and shall inure to the benefit of the heirs, executors, administrators, successors and assigns of the parties hereto.

5. Severability

The provisions of this Judgment are severable. If any provision of this Judgment is held by the Court to be illegal, invalid or unenforceable, that provision shall be excised from the Judgment. The remainder of the terms of the Judgment shall remain in full force and effect and shall in no way be affected, impaired or invalidated by such excision. This Judgment shall be reformed to add, in lieu of the excised provision, a provision as similar in terms to the excised provision as may be possible and be legal, valid and enforceable.

6. Review Procedures

Any action, decision, rule or procedure of the Watermaster

RIVERSIDE, CALIFORNIA 92501
(909) 682-5480

pursuant to this Judgment shall be subject to review by the Court on its own motion or on timely motion by any Party, as follows:

A. Effective Date of Watermaster Action: Any order, decision or action of the Watermaster pursuant to this Judgment on noticed specific agenda items shall be deemed to have occurred on the date of the order, decision or action.

B. Notice of Motion: Any Party may, by a regularly-noticed motion, petition the Court for review of the Watermaster's action or decision pursuant to this Judgment. The motion shall be deemed to be filed when a copy, conformed as filed with the Court, has been delivered to the Watermaster, together with the service fee established by the Watermaster sufficient to cover the cost to photocopy and mail the motion to each Party. The Watermaster shall prepare copies and mail a copy of the motion to each Party or its designee according to the official service list which shall be maintained by the Watermaster according to Part VII, paragraph 1, above. A Party's obligation to serve the notice of a motion upon the Parties is deemed to be satisfied by filing the motion as provided herein. Unless ordered by the Court, any petition shall not operate to stay the effect of any Watermaster action or decision which is challenged.

C. Time for Motion: A motion to review any Watermaster action or decision shall be filed within 90 days after such Watermaster action or decision, except that motions to review Watermaster assessments hereunder shall be filed within 30 days of mailing of notice of the assessment.

AKLUFI & WYSOCKI
3403 TENTH STREET, SUITE 610
RIVERSIDE, CALIFORNIA 92501
(909) 682-5480

D. De Novo Nature of Proceeding: Upon filing of a petition to review a Watermaster action, the Watermaster shall notify the Parties of a date when the Court will take evidence and hear argument. The Court's review shall be de novo and the Watermaster decision or action shall have no evidentiary weight in such proceeding.

E. Decision: The decision of the Court in such proceedings shall be an appealable Supplemental Order in this case. When the same is final, it shall be binding upon the Watermaster and the Parties.

Dated: FEB - 4 2004

Zone	Pressure Zone

1.0 INTRODUCTION

1.1 Authorization

This report has been prepared in accordance with the consulting engineering agreement for the water, sewer, and recycled water master plan update project between the City of Banning (City) and Carollo Engineers (Carollo), dated March 14, 2006. This report represents the findings of the work conducted for Task C (Water Reuse Master Plan Update). The findings of tasks A (Water Master Plan Update) and Task B (Sewer Master Plan Update) are presented in separate reports.

1.2 Purpose and Objectives

1.2.1 Purpose

The purpose of this Recycled Water Master Plan is to define the capital improvements required to serve recycled water customers where feasible in the City of Banning (City).

1.2.2 Objectives

The objectives of this Recycled Water Master Plan are:

1. Identify the potential recycled water customers and their demands in the City.
2. Define planning and evaluation criteria for the recycled water distribution system.
3. Size and optimize the location of the recycled water distribution system pipelines and facilities.
4. Prepare a capital improvement program including phasing and cost estimates for the proposed recycled water system.

1.3 Background

The City recognized a need to provide irrigation water to customers in 1991, when the City conducted a study to evaluate the feasibility of constructing an irrigation water system [1]. At that time, the City had been experiencing a high growth rate and irrigation water demands had increased substantially due to completion of the Sun Lakes Development, a planned residential community with golf courses. Other major irrigation water users were identified as well, such as municipal parks, industrial and commercial areas, and freeway landscaping. Due to economic feasibility constraints, the irrigation water system has not been developed yet.

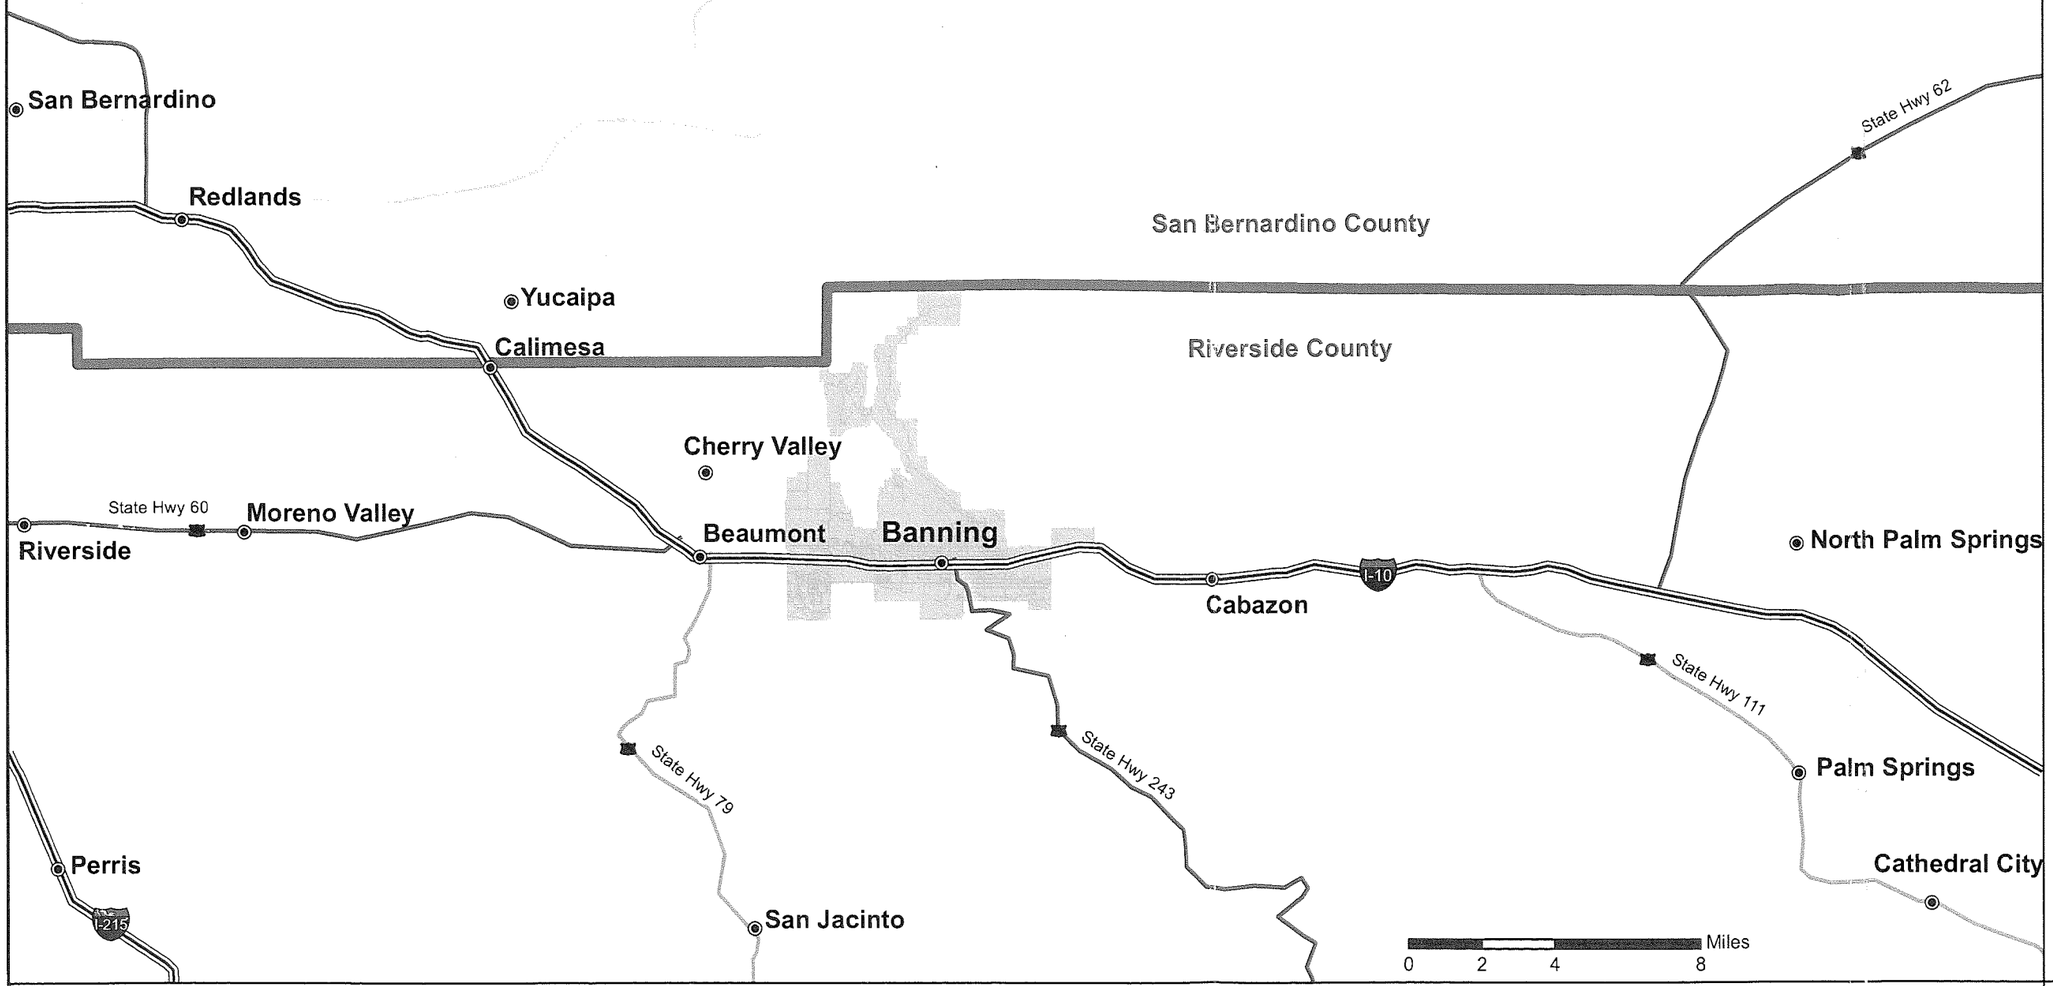
During the last decade, the City has experienced an increased level of land use planning activities that will result in increased water demands and water supply cost. Five new residential developments that are currently being planned within City's service area will further increase the City's water supply needs. These developments are:

- Five Bridges Project by Lennar
- Pardee Project by Pardee Homes
- Black Bench Project by SunCal Companies
- Loma Linda Project (Banning Bench)
- BDS Project south of I-10

These developments are depicted on Figure 2.1. The City understands the need for a recycled water distribution system to supply irrigation water to these proposed projects to reduce the increase in potable water supply needs. The recycled water system for these new developments will also provide opportunities to convert some existing large volume users potable water customers to recycled water. By providing recycled water for landscape irrigation, limited groundwater supplies can be dedicated to domestic uses.

1.3.1 Previous Studies

CM Engineering Associates, Inc. completed a report titled "*Irrigation Water Project Feasibility Study*" [1] in July 1991 that evaluated the feasibility of constructing an irrigation water system using the City's existing Well R-1 and treated wastewater from the City's wastewater treatment plant to serve the Sun Lakes' golf course, Interstate 10 freeway landscapes, municipal parks, and other industrial/ commercial areas. The report concluded that a water main along Lincoln Street could deliver irrigation water to the Sun Lakes golf course and other identified landscaped areas south of Interstate 10. A preliminary cost estimate was prepared for the proposed irrigation water system, including pipelines, pumping and storage facilities. Estimates for the upgrade to the City's wastewater treatment plant to tertiary treatment were not provided.



Montgomery Watson Harza (MWH) completed a report titled "*Irrigation Water Feasibility Study*" [2] in January 2003 that updated the cost estimates contained in the 1991 CM Engineering Associates report. The MWH report also included some preliminary cost estimating for upgrading the City's wastewater treatment plant to tertiary treatment.

In addition, MWH completed a draft report titled "*Update of the Banning Wastewater Treatment Facility Expansion*" [3] in March 2006 that evaluated process alternatives for the phased expansion of the treatment plant to produce recycled water of acceptable quality for landscape irrigation and other uses.

City of Banning, CA - Recycled Water Master Plan

August 2006

The "*Water Master Plan Update*" [4] prepared by NBS Lowry and Associates in 1994, did not consider the use of recycled water for irrigation purposes, and all system analysis and all recommended improvements were based on potable water supply only.

A "*Water System Hydraulic Modeling Report*"[19], prepared by MWH in May 2002, updated the City's Water Master Plan but did not consider the use of recycled water. A subsequent update of the City's water system model is in progress by MWH.

Wildermuth Environmental Inc. prepared the City's "*2005 Urban Water Management Plan*" [5], which identified that the recycled water production was about twice the potential recycled water demand in 2005, and continues to increase at a much higher rate than the recycled water demand. It also mentioned the need for the wastewater treatment plant upgrade to meet Title 22 tertiary treatment standards.

1.4 Study Area

The study area of this recycled water master plan includes the area within the existing city limits. The City is located in the northwest portion of Riverside County and is situated along Interstate 10 approximately 30 east of the City of Riverside and 25 miles west of Palm Springs. The study area is shown on Figure 1.1.

The City encompasses approximately 25 square miles and has a current population of approximately 29,000. Approximately 8 square miles or 32 percent of the City's service area is currently developed. The City is growing rapidly and has an estimated build-out population of nearly 100,000. The five near-term developments as indicated on Figure 2.1 have a combined area of nearly 4 square miles and are projected to increase the City's population by 31,000 to 60,000. Hence, the City's population is projected to continue to growth significantly after the completion of these developments.

1.5 Scope of Work

The scope of work for this Recycled Water Master Plan Update consists of the following tasks:

1) Data Collection and Review

2) Recycled Water Supply and Demand Assessment

3) Database Creation and Population

4) Supply and Production Demand Curves

5) Recycled Water Model and Distribution System

1.6 Acknowledgements

Carollo Engineers wishes to acknowledge and thank all of the City's staff for their support and assistance in completing this project. Special thanks go to Paul Toor (Public Utilities Director), George Thacker (Assistant Director for Water and Wastewater Utility), John Holub (Operations and Maintenance Technician), and Jerry Aguilar (GIS Manager).

1.7 Project Staff

The following Carollo Engineers staff members were principally involved in this project:

David Prasifka, P.E.	: Partner-In-Charge
Dennis Wood, P.E.	: Technical Review
Jonathan Howard, P.E.	: Technical Review
Inge Wiersema, P.E.	: Project Engineer/Project Manager
Dan Aruta, P.E.	: Staff Engineer
Chris Graf	: Staff Engineer
Coleen Sullivan	: Technical Staff/GIS

2.0 LAND USE AND RECYCLED WATER DEMANDS

This Section describes the City's land use and the estimated recycled water demands, which are based upon the City's land use plans. The land use discussion is divided into existing land use, specific plan land use for the near-term developments, and general plan land use for the City's ultimate land use. The recycled water demand discussion is divided into water demand factors, peaking factors, potential customers, and concludes with a recycled water demand summary.

2.1 Land Use

The existing, near-term, and build out land use types in the City described in this Section are based on the City's General Plan [6] , parcel information [7], aerial photography [8], and the specific plans for Five Bridges [9], Pardee [10], Black Bench [11], Loma Linda [12], and BDS [13]. The land use designations that are described in these documents are summarized below.

- ✓ **Residential - Rural.** This land use category includes all residential designations that have a density of 0-1 dwelling units per acre (du/ac).
- ✓ **Residential - Very Low Density.** This land use category includes all residential designations that have a density of 1-2 dwelling units per acre (du/ac). Based on this definition, this category includes the following land use designations: Very Low Density Residential [6]; Residential [13]; and PA-12, PA-13, and PA-15 [11].
- ✓ **Residential - Low Density.** This land use category includes all residential designations that have a density of 2-5 dwelling units per acre (du/ac). Based on this definition, this category includes the following land use designations: Low Density Residential [6], PA-1 through PA-11, PA-14, and PA-16 through PA-18 [11]; Minimum residential area of 6,000 square foot and greater [9]; Residential Areas 4, 8, 18, 24, 31, 33, 46, 47, 52, 53, 60, and 61 [10]; and Residential Areas 1, 3, 4, and 5 [12].
- ✓ **Residential - Medium Density.** This land use category includes all residential designations that have a density of 5-9 dwelling units per acre (du/ac). Based on this definition, this category includes the following land use designations:
- ✓ **Residential - High Density.** This land use category includes all residential designations that have a density of 9-20 dwelling units per acre (du/ac). Based on this definition, this category includes the following land use designations:
- ✓ **Commercial.** This land use category includes markets, service stations, restaurants, office buildings, hospitals, car washes, and other commercial service establishments.

- ✓ **Industrial.** This land use category includes all service industry and manufacturing establishments. This City does not include any heavy industry or water intensive industrial customers.

- ✓ **Public.** This land use category includes various types of public facilities, such as schools, libraries, office buildings, parking structures, and recreational areas. The (recycled) water demand in this category varies greatly.

- ✓ **Streets and Right-of-Way.** This land use category includes all major streets, flood control channels, powerline easements, and freeway right-of-ways, such as Interstate 10. Small residential streets are included in the gross residential area.

- ✓ **Airport.** This category includes the airport buildings, runways, and all airport related industrial and commercial areas. These include the Airport Operations District, the Airport Clear Zone District, the Airport Facilities District, and the Airport Planned Development areas.

2.1.1 Existing Land Use

The City of Banning has approximately 4,901 acres of development area, which equals to about 21 percent of the City's service area. An aerial view of the City, that depicts the location of the existing developments [8], is shown on Figure 2.1. This figure shows that the majority of the developments are located along Interstate 10, while the non-developed areas are mostly located north of Interstate 10 and are partially covered with steep hillsides of the San Bernardino Mountains. The land use distribution of the existing developments is summarized in Table 2.1. As shown on this table, the majority (63 percent) of the developed areas are residential land use categories, while the remaining 37 percent of the developments are public, industrial, and commercial land uses.

2.1.2 Specific Plan Land Use

As mentioned in Section 1, the City has recently received five Specific Plans that describe the land use plans for proposed developments within the City boundaries. The five specific plans cover a combined area of approximately 3,270 acres, which equals approximately 14 percent of the City's service area. The developments and their respective planning areas and the distribution of the planned 10,308 dwelling units are as follows:

- ✓ Black Bench : 1,500 dwelling units
- ✓ Sunset : 2,160 dwelling units
- ✓ BDS : 481 dwelling units
- ✓ Pardee : 5,224 dwelling units
- ✓ Loma Linda : 944 dwelling units

The specific plan boundaries are depicted on Figure 2.1. The land use distribution of these five specific plans is summarized in Table 2.2, while details are included in **Appendix B**.

Table 2.2 Specific Plan Land Use Summary

Public	0	0%	10	2%
Parks	37	13%	74	16%
Golf Course	185	65%	185	40%
Loma Linda Total	**284**	**100%**	**467**	**100%**
GRAND TOTAL	**1,243**		**3,270**	

Note: For the phasing of parks and golf courses, it is assumed that 50 percent of parks and 100 percent of golf course would be developed in Phase 1.

As listed in Table 2.2, the development of these specific plan areas is divided into two periods, Phase 1 and Build Out. Phase 1 is anticipated to be completed around year 2010, while build out conditions are projected to be reached around year 2030. The combined area of Phase 1 is approximately 1,243 acres, or 38 percent of the entire specific plans area at build out (3,270 acres).

2.1.3 General Plan

The ultimate land use for the City's service area is specified in the City's General Plan, which was adopted by City Council [6]. The City's general plan differentiates 27 land categories. For the purpose of this master plan, these categories are consolidated into ten generic land use designations, as shown on Figure 2.2. The areas of these ten land use categories are calculated from the City's GIS and are summarized in Table 2.3.

City of Banning, CA
Recycled Water Master Plan

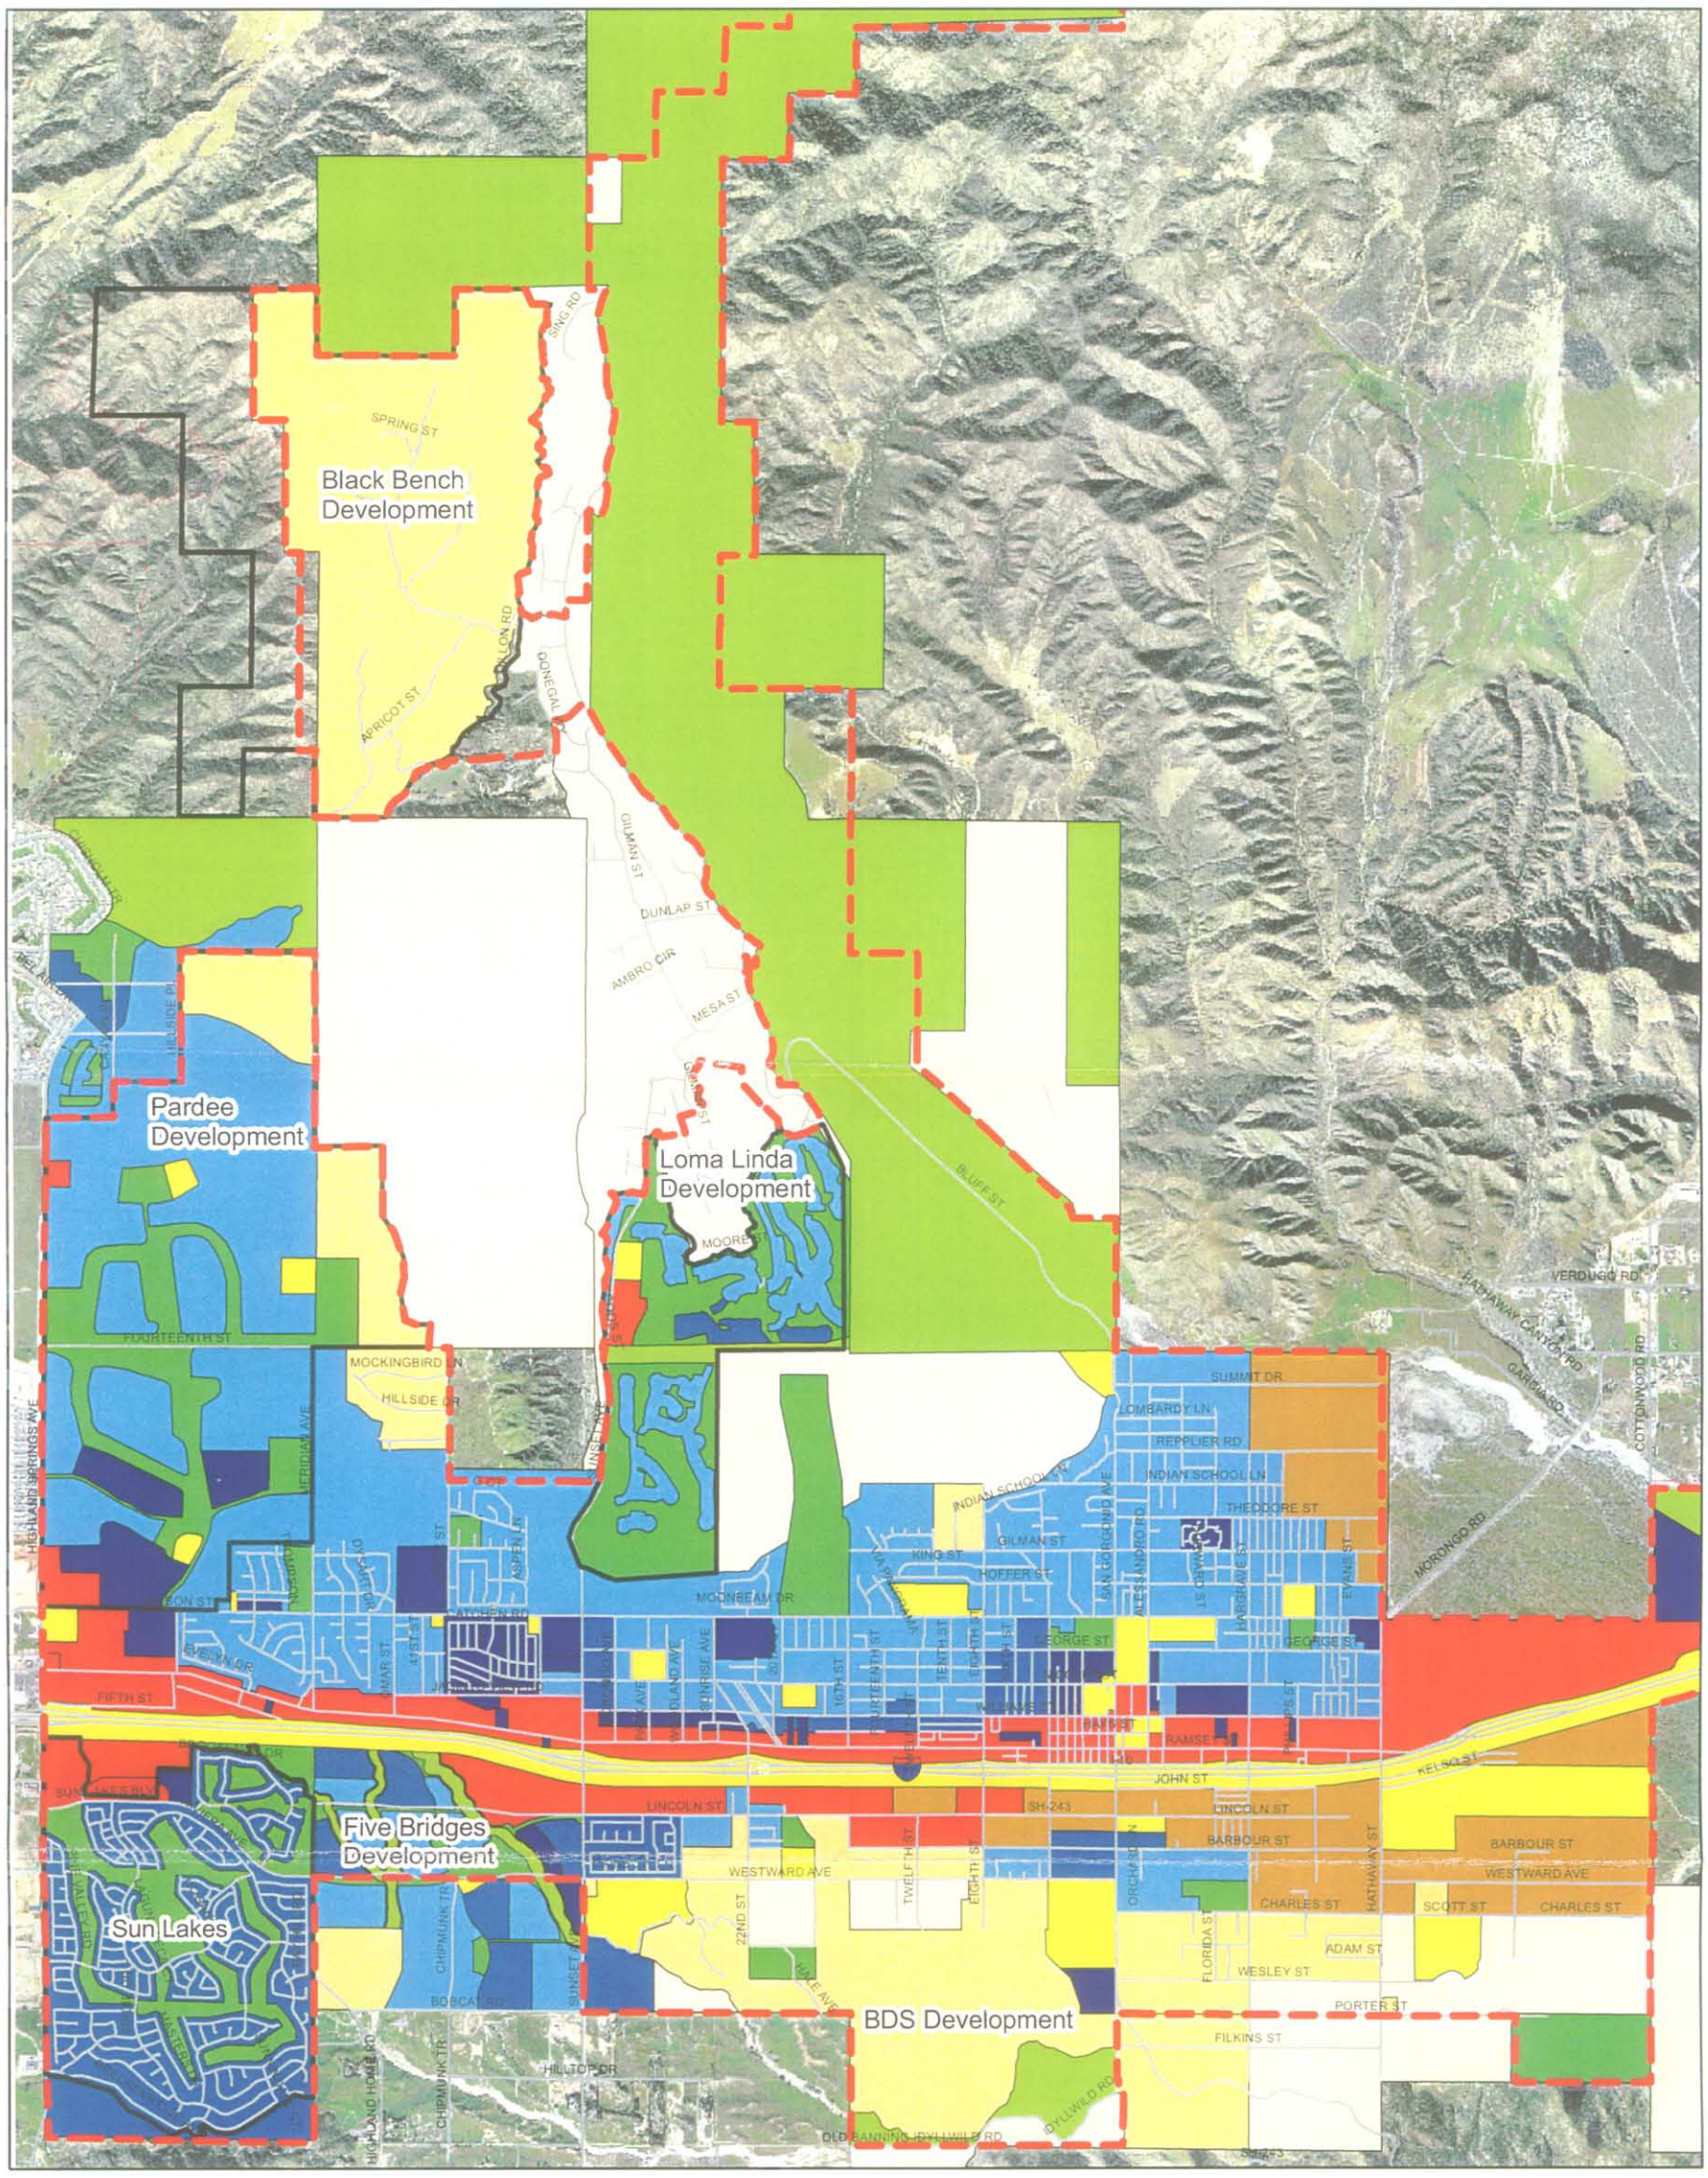

Figure 2.2 - General Plan Land Use

N

General Plan Residential	Other Land Uses	
Rural (RR)	Commercial (C)	I-10
Very Low Density (VLDR)	Industrial (I)	Streets
Low Density (LDR)	Public (P)	City Boundary
Medium Density (MDR)	Open Space Nature (OS-N)	
High Density (HDR)	Open Space Parks (OS-Pk)	

Note:

2. This map is intended for display and planning purposes only.

0 1,300 2,600 5,200 Feet

carollo engineers

Table 2.3 General Plan Land Use Summary Recycled Water Master Plan City of Banning		
Land Use Category	**Area (acres)**	**Area (%)**
Rural Residential	6,759	29%
Very Low Residential	2,369	10%
Low Residential	3,385	14%
Medium Residential	1,099	5%
High Residential	510	2%
Commercial	1,090	5%
Industrial	773	3%
Public	1,061	4%
Open Space - Parks	1,292	5%
Open Space - Nature	5,288	22%
Total	**23,628**	**100%**

As shown in Table 2.3, residential land use categories cover 60 percent of the City's service area, while natural open space is the second largest land use, covering about 22 percent of the City's service area.

As shown on Figure 2.2, the majority of the areas that are not currently developed or part of the specific plans, are designated as natural open space and rural residential and cover hillsides of the San Bernardino Mountains.

2.2 Population

The City's population will increase significantly with the addition of the five new developments. The total developed area and the project population for Phase 1 and Built Out conditions are summarized in Table 2.4. This table shows that the five developments will increase the population to about 60 percent of the City's built out population, while covering only 31 percent of the City's service area. Hence, the development of the remaining areas will primarily consist of lower density land use types, such as LDR and AR. Based on 2.9 people per dwelling unit, the average density of the remaining development beyond the planning horizon of this master plan is approximately 0.9 du/ac.

Table 2.4 Population Projections Recycled Water Master Plan City of Banning				
Area Description	**Area (acres)**	**Area (%)**	**Population (ppl)**	**Population (%)**
Existing Development	4,901	21%	28,982	29%
5 Developments - Phase 1	598	3%	7,239	7%
5 Developments - Phase 2 to Build Out	1,911	8%	21,913	22%
Remaining Development	16,218	69%	41,651	42%
Total	**23,628**	**100%**	**99,785**	**100%**

2.3 Demand Estimating Parameters

The recycled water demand estimates presented in Section 2 are based on various assumptions and criteria. These factors are discussed below.

2.3.1 Irrigation Season

The amount of water required for potential landscape irrigation customers is directly dependent on precipitation and evapotranspiration. Net irrigation demand is defined as the difference between evapotranspiration (ET) and rainfall, adjusted for irrigation efficiency and leaching factors.

The following formula was used to calculate the amount of evapotranspiration from landscaped areas in Banning:

$$ET_L = K_L * ET_0$$

where:

ET_L = Evapotranspiration of landscaped areas (in inches)

K_L = Landscaped area crop coefficient

ET_0 = Reference evapotranspiration (in inches)

The estimated average monthly landscape irrigation needs based on calculated evapotranspiration and average rainfall is presented in Table 2.5. As shown in this table, the rainfall in the months of January, February, March and December exceed the evapotranspiration. Hence, these months are excluded from the irrigation season. Based on this historical data the irrigation season is defined by the eight-month annual period from April through November. It is assumed that the proposed recycled water distribution system will only operate during the defined eight-month irrigation season.

2.3.2 Demand Factors

As described in detail in Section 2, the water demand factor used in this master plan to estimate recycled water demands is 3,650 gpd/ac. Based on discussion with City staff, it is assumed that the potential recycled water use for commercial and industrial users is insignificant.

Table 2.5 Average Monthly Landscape Irrigation Needs Recycled Water Master Plan City of Banning					
	Month	ET[(1)] (inches)	Rainfall[(2)] (inches)	Irrigation Needed[(3)] (inches)	Irrigation Needed[(4)] (%)
	January	2.28	3.76	0	
	February	2.66	3.44	0	
	March	3.80	3.12	0.9	
Irrigation Season	April	4.82	1.36	4.7	10%
	May	5.43	0.63	6.5	14%
	June	6.00	0.16	7.9	17%
	July	6.60	0.23	8.6	18%
	August	6.32	0.22	8.3	17%
	September	4.89	0.51	5.9	12%
	October	3.70	0.60	4.2	9%
	November	2.69	1.65	1.4	3%
	December	2.34	2.09	0.3	
Annual Total		**51.5**	**17.8**	**48.7**	**100%**
Irrigation Season Total		**40.5**	**5.4**	**47.5**	**100%**

Notes:
(1) Source: California Irrigation Management Information System, Average Yearly ET_0 Report, U.C. Riverside Station [16]. Adjusted for landscape irrigation coefficient, k_L.
(2) Source: Western Regional Climate Center, Station No. 040609, Beaumont, CA. 1948-2005 [17].
(3) [Evapotranspiration - Rainfall] * 1.15 / 0.85. Where 0.85 = 85% Irrigation Efficiency Factor (Average value from Carlos and Guitjens, University of Nevada) and 1.15 = 15% Leaching Fraction (Average value from Ayers and Westcot, "Water Quality for Agriculture", Food and Agriculture Organization of the United Nations).
(4) Current month net irrigation requirement divided by total net irrigation requirement.

2.3.3 Peaking Factors

The following peaking factors are used for the hydraulic analysis and sizing of the City's recycled water system:

- ✓ Maximum Month Demand (MMD) factor
- ✓ Maximum Day Demand (MDD) factor
- ✓ Peak Hour Demand (PHD) factor for 8-hr irrigation
- ✓ Peak Hour Demand (PHD) factor for 12-hr irrigation
- ✓ Peak Hour Demand (PHD) factor for 24-hr irrigation

These peaking factors are based on the following assumptions and calculations:

The MMD factor is based on the assumption that irrigation will occur during an 8-month period or 244 days, from April through November. As listed in Table 3.1, the month of July is the month with the greatest irrigation needs. Based on annual and maximum month irrigation needs, MMD peaking factor is calculated as follows:

$$\text{Maximum Month Peak Factor} = \frac{8.6 \text{ inches/month}}{47.5 \text{ inches/year}} * 12 \text{ months/year} = 2.17$$

The MDD factor is based on typical demand variation in hot summer months. Historical records from water companies in Southern California show that the MDD is approximately 20 to 30 percent higher than the MDD. As the majority of the increase is caused by an increase irrigation use, a MDD factor of 1.30 is used in this master plan.

The 8-hr PHD factor for golf courses, parks, and schools is based on an 8-hour irrigation period, which equates to a peaking factor of 3.0 (24 hours / 8 hours). Irrigation of parks and schools areas is assumed to take place between 10 PM and 6 AM. The irrigation of golf courses is assumed to take place slightly earlier, between 8 PM and 4 AM, to allow the greens to dry before golfers show up.

The 12-hr PHD factor for Caltrans irrigation is based on a 12-hour irrigation period, which equates to a peaking factor of 2.0 (24 hours / 12 hours). The irrigation of Caltrans right-of-ways is assumed to take place between 6 AM and 6 PM.

The 24-hr PHD factor for Golfcourse irrigation is based on a 24-hour constant delivery of recycled water to the golf course ponds. This delivery pattern equates to a peaking factor of 1.0 (24 hours / 24 hours).

2.4 Recycled Water Demands

The recycled water demand estimates used in this master plan are based on land use type, irrigated area, water demand factors, and peaking factors. These factors are discussed below, followed with a summary of potential recycled water customers.

2.4.1 Recycled Water Demand Factors

A water demand factor (WDF) is the estimated amount of water usage for a certain land use type. WDFs are typically expressed in gallons per day per acre (gpd/ac). These factors are used to estimate the average day demand (ADD) for existing and potential customers by multiplying the WDF with the total number of acres.

This study assumes that recycled water is only used for irrigation purposes. Recycled water demand factors used in previous studies are summarized below.

- ✓ Willdan Associates prepared a master water plan for the City in 1983 which calculated the following irrigation demands: 4,000 gallons per day per acre (gpd/ac) for industrial land use, and 3,500 gpd/ac for schools and parks [14].

- ✓ James Smith, consulting engineer, developed a master water plan for the Presley Property in the City in 1985 in which the average demand factor of 4,400 gpd/ac was used [15].

- ✓ CM Engineering Associates, compiled one year's worth of actual metered water consumption data for the Sun Lakes Development in 1991. This study calculated an average water consumption of 4,477 gpd/ac, which was very close to the Presley Master Plan design factor.

- ✓ Pardee Homes provided the City a detailed breakdown of irrigation water demands for its proposed Banning Tract development in March 2006 that used demand factors of 3,500 gpd/ac and 4,400 gpd/ac for parks and an estimated irrigation water demand for a proposed golf course that results in a demand factor of 3,683 gpd/ac.

For this project, a new irrigation water demand factor is calculated based on the local net irrigation needs. The net irrigation needs is estimated to be 4.1 ft/yr based on historical evapotranspiration and rainfall data in the City's service area. This calculation is described in detail in Section 3. The water demand factor is calculated as follows:

$$\text{Water Demand Factor} = \frac{4.1 \text{ ft/yr} * 43{,}560 \text{ sf/ac} * 7.48 \text{ gal/cf}}{365 \text{ days/yr}} = 3{,}623 \text{ gpd/ac}$$

Carollo's calculated irrigation demand factor of 3,623 gpd/ac is consistent with Pardee's golf course irrigation factor. For planning purposes, an irrigation demand factor of 3,650 gpd/ac is used to estimate the City's potential irrigation water demands in this master plan.

2.4.2 Peaking Factors

It is important to consider the variability of water demands when evaluating system hydraulics and sizing water system facilities and pipelines. Water demands vary both seasonally and hourly. Water demands are typically higher than average on hot summer days, primarily due to increased water demands for irrigation. On cool winter days, water demands are lower than average due to lower temperatures and increased precipitation, which significantly reduces irrigation demands. Peaking factors are used to account for these demand fluctuations. Peaking factors are determined by dividing the water demand for a selected period by the average day demand (ADD). In this master plan, the following two seasonal peaking factors are used:

- ✓ Maximum Month Demand (MMD) = MMD/ADD

- ✓ Maximum Day Demand (MDD) = MDD/ADD

In addition, water demands vary throughout a 24-hour period. In residential areas, demand peaks typically occur in the morning and late afternoon. Areas with automatic sprinkler systems used for irrigation typically see peak demand periods late at night through the early morning hours. An hourly water use curve, also knows as diurnal curve, is used to describe and simulate water demands throughout the day. In this master plan, the following three diurnal curves are used:

- ✓ Irrigation of Parks and School areas = 8 hours per day from 10 PM to 6 AM
- ✓ Irrigation of Golf Courses = 24 hours per day from midnight to midnight
- ✓ Irrigation of Caltrans right-of-way areas = 12 hours per day from 6 AM to 6 PM

The peaking factors used in this master plan are summarized in Table 2.6, while the assumptions and calculations of these factors are described in more detail in Section 3.

Table 2.6 Peaking Factors
Recycled Water Master Plan

2.4.3 Potential Customers

It is assumed that recycled water will be treated and distributed for irrigation use only. Sufficient landscape irrigation water demand from existing and future customers is available to allow for beneficial use of the treated wastewater from the City's wastewater treatment plant or satellite plants. Areas suitable for irrigation with recycled water include golf courses, commercial and industrial planting areas, greenbelts, freeway landscaping, parks, playgrounds and schoolyards. Potential customers need to meet the following three criteria to qualify for recycled water for irrigation use:

1) Their location shall be near a recycled water distribution pipeline or in proximity of other potential customers.

2) Their ADD exceeds 10,000 gpd. Potential customers with ADD less than 10,000 gpd may be eligible if their location is near a recycled water pipeline.

3) All irrigation areas should be located within City limits.

Based on these criteria, 18 potential recycled water customers were identified. These users can be divided into two categories; 1) current potable water customers that could convert to recycled water for their irrigation needs, and 2) future customers such as parks and golf courses identified in the specific plans. The location of these potential customers are depicted on Figure 2.3, while their estimated recycled water demands are summarized in Table 2.7.

(4) This excludes the greenspace along the steep slopes in the southern portion of the development.

2.4.4 Recycled Water Demand Summary

To prioritize the potential recycled water customers, a prioritization matrix was developed to consider: 1) the potential recycled water demand, 2) the proximity to the proposed recycled water backbone system, and 3) the estimated unit cost. The unit cost, expressed in dollar per acre-ft, reflect the annual capital cost of the pipelines required to serve the customer from the backbone system assuming a 30-year useful life. The backbone system consists of the pipelines from the Banning WWTP to the two proposed reservoirs as shown on Figure 2.4. The cost of the backbone system is proportionally divided over the potential customers based on their demands.

To prioritize the connection of potential recycled water customers, a ranking scheme was developed based on the range in demand, distance to the backbone system and unit cost. The ranking criteria used are summarized in Table 2.8.

Table 2.8 Ranking Criteria
Recycled Water Master Plan
City of Banning

Ranking Criteria	Ranking 1	Ranking 2	Ranking 3
Potential Demand (acre-ft/yr)	<100	100-300	>300
Distance to Backbone System (mi)	>1.0	0.5-1.0	<0.5
Unit Cost ($/acre-ft).	>$800	$500-$800	<$500

As shown in this table, a customer is assigned a ranking of 1, 2, or 3 for each of the criteria. Hence, each customer is assigned a ranking score ranging between 3 and 9, depending on the customers demand, distance to the backbone system and unit cost. Based on the total score, the customers are divided into three priority groups:

- ✓ Priority 1: Customers with a ranking score equal or greater than 7
- ✓ Priority 2: Customers with a ranking score equal to 6
- ✓ Priority 3: Customers with a ranking score equal or less than 5

It is recommended that customers with Priority 1 be connected first, followed by customers with Priority 2 and 3, if feasible. The results of the analysis are presented in Table 2.9.

11	Roosevelt Williams Park	19	0.7	$2,344	4	3

5,576 - 19 = 5,557

As shown in Table 2.9, it can be concluded that it is cost-effective to serve most of the customers, with the exception of Roosevelt Williams Park (Priority 3). Customers with a high priority (Priority 1) are Loma Linda Development, CalTrans along I-10, Banning High School, Repplier Park, Deutsch Company Park, Neighborhood Park, Sun Lakes Development, and Pardee Development. It should be noted that recycled water service to the Black Bench development would be more costly than presented in Table 2.9, as the unit cost exclude the 700 hp pump station and energy cost required to deliver recycled water to this development, which is located 1,000-1,500 feet above the existing City. This customer is therefore included in phase 3 (see Table 7.1).

Recycled water service to Roosevelt Williams Park is relatively expensive due to its small demand (19 ac-ft/yr) and relatively long pipeline (0.7 miles). Based on the high unit cost, this customer is excluded from the backbone system and alternative analyses presented in Section 6. The recycled water demands of the customers that are included in the alternative analyses presented in Section 6 are summarized in Table 2.10.

Table 2.10 Recycled Water Demand Projections Summary Recycled Water Master Plan City of Banning					
Customers	Irrigation Area		Build Out Demand		
	(acre)	(percent)	ADD (ac-ft/yr)	ADD (mgd)	MDD (mgd)
Existing Potable Water Users	578	44%	2,644	2.4	6.7
Specific Plan Developments	738	56%	2,911	2.6	7.3
Total	**1,316**	**100%**	**5,555**	**5.0**	**14.0**

Note: All values exclude Roosevelt Park.

The irrigation water demands from the Black Bench and Pardee developments could potentially be served with untreated State Water Project (SWP) water from a pipeline that ends near the northwestern portion of the City's service area. The feasibility of using untreated SWP for these developments is evaluated in Section 6.

As listed in Table 2.10, approximately 44 percent of the potential recycled water demands identified are existing potable water customers that could be converted to recycled water, while the remaining 56 percent of demand is associated with the near-term future developments. As mentioned in the population discussion, only 31 percent of the City's service area will be developed after the completion of the five near-term developments. Hence, an increase in recycled water demands beyond the projected 5.0 mgd or 5,555 ac-ft/yr should be anticipated and system sizing should accommodate this future growth potential.

3.0 RECYCLED WATER SUPPLIES

This Section includes a discussion of the following recycled water supply sources:

- ✓ Banning Wastewater Treatment Plant (WWTP)
- ✓ Groundwater Well R-1
- ✓ Untreated State Water Project (SWP) water
- ✓ Loma Linda Satellite Plant
- ✓ Black Bench Satellite Plant
- ✓ Intercepted Storm Flow

The locations of these potential recycled water sources are depicted on Figure 3.1. This section concludes with a comparison of the available recycled water supplies and the projected recycled water demands.

3.1 Banning Wastewater Treatment Plant

The Banning WWTP is located in the southeast portion of the City will be the primary source for recycled water. The quantity of recycled water that can supply current demands depends on the available wastewater and plant capacity. The existing plant has a rated capacity of 3.6 mgd, and currently treats average flows of approximately 2.8 mgd to secondary standards. The treatment process includes screening, grit removal, primary clarification, trickling filters, and secondary clarifiers. Anaerobic digesters and sludge drying beds are used for sludge stabilization and dewatering. The headworks, completed in 1999, was sized for an ultimate capacity of 7.8 mgd [2]. The plant currently discharges its effluent to percolation ponds.

According to Title 22 of the California Code of Regulations, recycled water to be used for unrestricted irrigation of public spaces must be filtered and disinfected to tertiary standards. To meet the tertiary standards, the current treatment process needs to be substantially upgraded including filters or microfiltration, and disinfection either with chlorination or ultraviolet light [2].

The existing secondary treatment plant operates on an unsteady state mode; it treats the normal diurnal influent wastewater flows as they peak and ebb throughout the day. A new tertiary treatment process will operate on a steady state mode, and potentially reduce the amount of equalization storage required as presented in this report. Inter-plant flows between secondary treatment and tertiary treatment will need to be equalized. This can be accomplished by sending intermediate effluent from the secondary treatment process to an equalization basin before sending flow to tertiary treatment.

After recycled water is produced by tertiary treatment, it will be stored on-site for the distribution system. On-site storage for recycled water can consist of a lined earthen reservoir with a floating cover.

The plant currently discharges its effluent to percolation ponds; it is assumed that when the recycled water system is in operation the primary disposal method will be the recycled water system. Up to one hundred percent of the plant effluent can be used to produce recycled water. The percolation ponds may be used during periods when the effluent flow exceeds the recycled water demand. The WWTP upgrade to a total capacity of 5.1 mgd is currently under design.

3.2 Groundwater Well R-1

When the City conducted a study to evaluate the feasibility of constructing an irrigation water system in 1991, a new groundwater well, Well R-1, was identified as the initial source for irrigation water. This well has a potential discharge capacity of 1,500 gallons per minute (gpm) [1]. This well is located 0.2 miles east of the WWTP near the intersection of Hathaway Street and Westward Avenue (see Figure 3.1).

With the increase in potential recycled water demands associated with the new developments, the capacity of Well R-1 is no longer sufficient to supply all the existing and future potential customers with recycled water. The Banning Wastewater Treatment Plant will be the primary source for producing the major supply of recycled water to all the potential customers, while groundwater pumped from Well R-1 has been identified as a secondary source. Due to its close proximity to the WWTP, it is assumed that the City would connect this well with the recycled water pump station forebay at the WWTP.

3.3 Untreated State Project Water

A third potential recycled water source is untreated State Water Project (SWP) water. There is a 36-inch diameter SWP pipeline, the East Branch Extension Pipeline, which delivers untreated SWP water to the Noble Creek Spreading Grounds. The location of the spreading grounds is shown on Figure 3.1. As shown in this figure, the pipeline ends in the City of Beaumont, approximately 2 miles west of the City's northwest boundary.

Although this pipeline is sized to deliver SWP water for groundwater recharge, it is assumed that this pipeline would have sufficient capacity to convey untreated SWP water to the northern portions of the City. The potential use of this source to serve the irrigation demands in the Pardee and Black Bench developments, with a combined demand of 1,643 ac-ft/yr or 4.1 mgd under MDD conditions, is evaluated in Section 6. The availability of this supply would also need to be confirmed with the San Gorgonio Pass Water Agency (Pass Agency). Based on a velocity of 5 feet per second (ft/s), the irrigation demand of the Black Bench development would require approximately 18 percent of the pipeline capacity under MDD conditions.

City of Banning
Recycled Water Master Pan

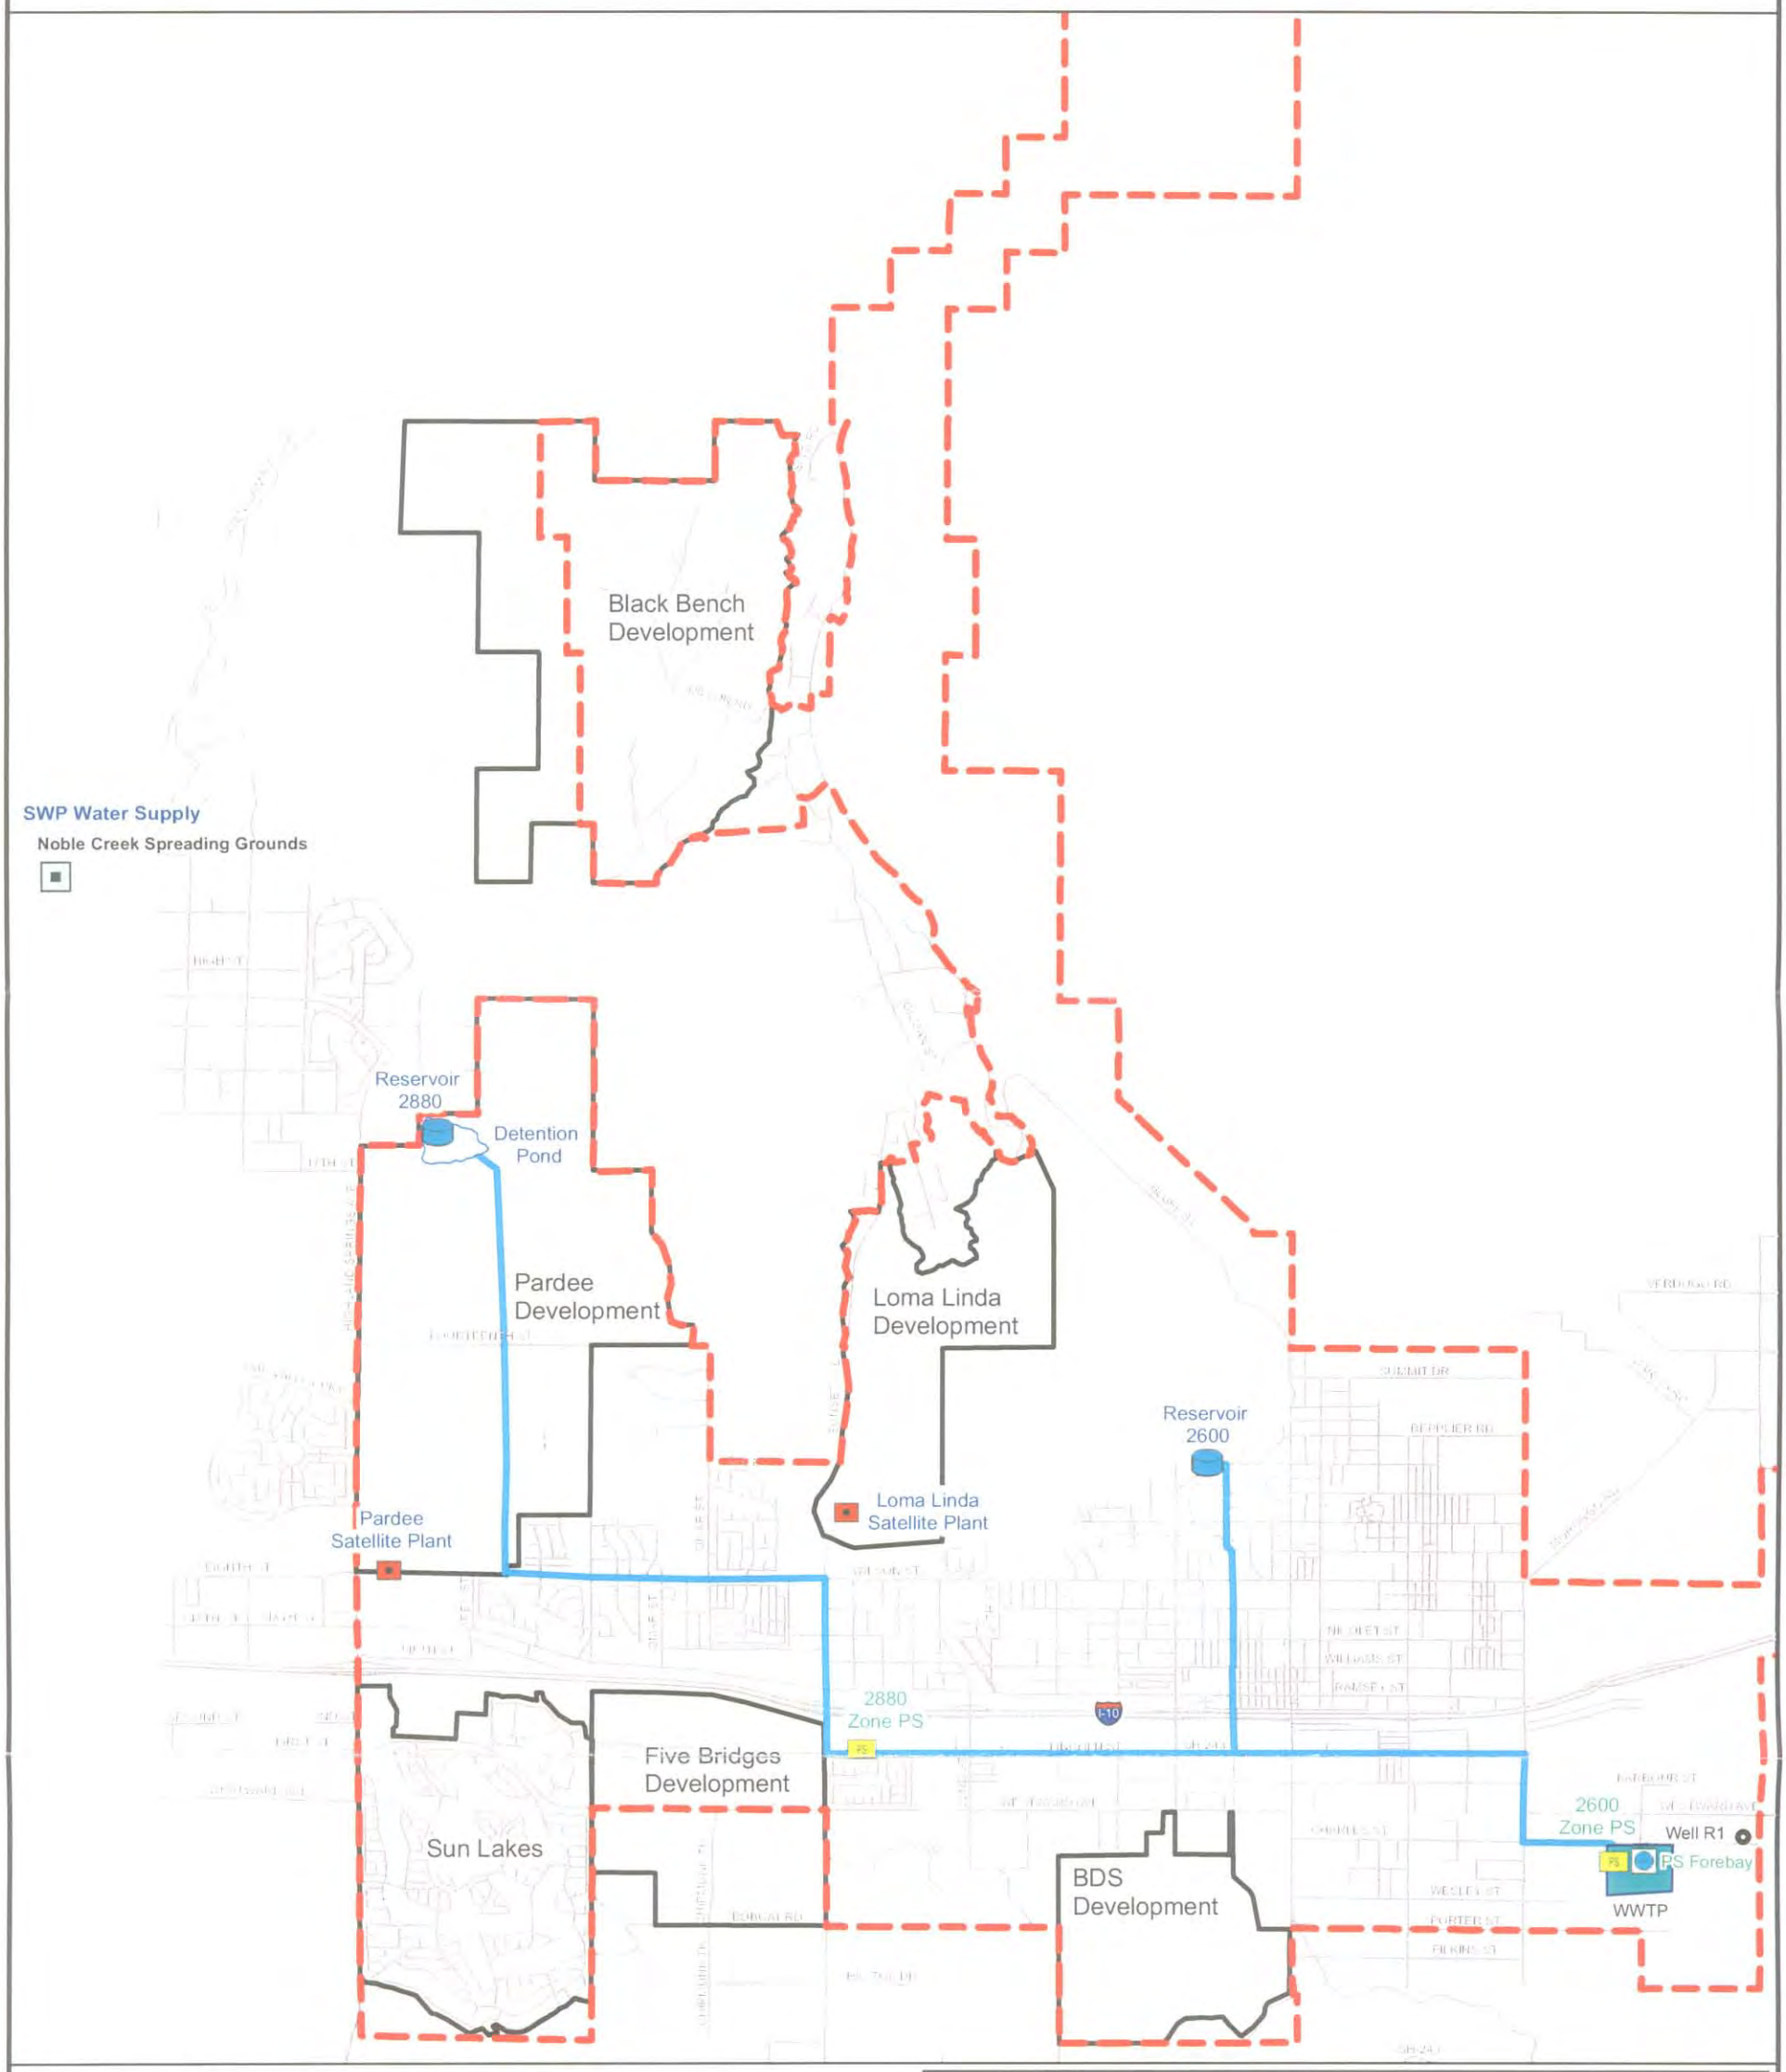

Figure 3.1 - Recycled Water Supply Sources

carollo engineers

Note:
1. This map contains data from the City of Banning GIS.
2. This map is intended for display and planning purposes only.

3.4 Loma Linda Satellite Plant

The Sewer Master Plan that is currently being developed includes an evaluation of the use of satellite WWTPs in combination with the planned Banning WWTP upgrade and expansion. One of the alternatives considers the construction of a satellite WWTP for the Loma Linda development. This plant would be located near the intersection of Sunset Avenue and Wilson Street, where it can collect all the future wastewater flows of the Loma Linda and Black Bench developments.

The Loma Linda development consist of 944 dwelling units and has a projected wastewater flow of 0.08 mgd and 0.27 mgd under Phase 1 and Build Out conditions, respectively. The Black Bench development consist of 1,499 dwelling units and has a projected wastewater flow of 0.11 mgd and 0.41 mgd under Phase 1 and Build Out conditions, respectively. Hence, this satellite plant could serve approximately 0.68 mgd or 760 acre-ft of recycled water demand per year.

It should be noted that this recycled water supply capacity is in lieu of the supply from the Banning WWTP, as the expansion includes the projected sewer flows from the Loma Linda and Black Bench developments. A satellite plant could provide a benefit to the recycled water and sewer distribution systems, as local recycled demands could be served directly from the satellite plant as it avoids the need for sewer transmission capacity to the WWTP and conveyance and pumping of recycled water from the WWTP to the irrigation customers in the development.

3.5 Pardee Satellite Plant

Similarly to the Loma Linda Satellite Plant, this plant would provide for a local supply of recycled water for the Pardee Development. This plant would be located near the intersection of Wilson Street and Highland Springs Avenue (east of Highland Springs Road in the vicinity of Smith Creek), where it can collect all the future wastewater flows of this new development. With 5,224 dwelling units, this development has a projected wastewater flow of 0.22 mgd and 1.36 mgd under Phase 1 and Build Out conditions, respectively. Hence, this satellite plant could serve approximately 1,526 acre-ft of recycled water demand per year.

3.6 Intercepted Storm Flow

There is an existing detention pond located in the northern portion of the Pardee Development (see Figure 3.1). This detention pond could be used to capture storm flow from the areas north of the Pardee development. The approximate amount of storm flow that could be captured would need to be evaluated as well as its water quality characteristics, if intercepted storm flow would be considered as a supply source for the recycled water system. The ground elevation near the detention ponds is approximately 2,880 ft msl. Based on an estimated useful area of 25 acres and an average depth of 10

feet, the volume of the pond is estimated at 80 MG. As the availability of this supply source would greatly depend upon rainfall, it is not likely that this would directly contribute to the recycled water supply mix under MDD conditions. This source is therefore not included in the supply summary presented in Section 3.7. Based on discussions with City staff it is assumed that a recycled water reservoir tank would be located at the detention pond site to serve the 2880 Zone. The remainder of the site could be used to construct a detention pond that could be used for 1) groundwater recharge and 2) supplemental supply for the recycled water system if sufficient storm water runoff is available that meets water quality standards. It is recommended that the use of intercepted storm flow as recycled water supply source is investigated in more detail.

3.7 Supply and Demand Summary

The potential recycled water supplies and their capacities are summarized in Table 3.1.

Table 3.1 Recycled Water Supplies and Demand Comparison
Recycled Water Master Plan
City of Banning

Supply Source	Phase 1 Capacity (mgd)	Ultimate Capacity (mgd)
WWTP existing capacity	3.6	3.6
WWTP current expansion	1.5	1.5
WWTP future expansions thru 2030 (1)	n/a	0.7
WWTP future expansions thru Build Out (2)	n/a	3.1
Satellite Plant - Loma Linda(3)	0.2	0.7
Satellite Plant - Pardee	0.2	1.4
Groundwater Well R-1	2.2	2.2
Untreated SWP water(4)	0.2	1.5
Total(5)	**7.6**	**12.6**

(1) Based on the average wastewater flow projected for year 2030 of 7.9 mgd [22].
(2) Based on the average wastewater flow projected for build out of 11.0 mgd [22].
(3) Based on combined wastewater flow from Loma Linda and Black Bench developments.
(4) Capacity is based on the combined recycled water demand of the Pardee and Black Bench developments. The use of this source would need to be confirmed with the Pass Agency. The feasibility of this source is analyzed in Section 6.
(5) Total excludes the capacity of the two satellite plants to avoid double counting.

As shown in Table 3.1, the available recycled supply under build out conditions is 12.6 mgd, while the projected ADD under build out conditions is 4.5 mgd (see Table 2.9). This recycled water supply surplus is consistent with the City's 2005 Urban Water Management Plan [5]. However, the projected MDD under build out conditions is 12.6 mgd, which indicates that the recycled water demand potential slightly exceeds the available supplies. The City could supplement the difference with additional SWP supply.

Based on this comparison, it can be concluded that the City has the potential to use all its recycled water produced at the upgraded WWTP and Well R-1. To offset the need for domestic supplies, the City has excellent opportunities to maximize the use of recycled water to serve the irrigation demands in the new developments and convert existing potable water customers, where most beneficial as identified Table 2.8.

4.0 PLANNING CRITERIA AND ASSUMPTIONS

This section includes a description of the planning criteria and assumptions used in this master plan to size and evaluate the recycled water distribution system and associated facilities. Items discussed are; regulatory requirements, demand estimating parameters, hydraulic parameters, and construction standards. This section concludes with a summary of cost estimating assumptions.

4.1 Regulatory Requirements

The recycled water distribution system should be designed to protect public health and safety in conformance with the guidelines and requirements of California Code of Regulations, Title 22, Division 4, Chapter 3, Article 1 through 10, Sections 60301 through 60355, the Riverside County Department of Health Services and the City of Banning.

The Regional Water Quality Control Board should issue the Discharge Order. The Riverside County Department of Health Services should also inspect the user sites and issue user permits.

4.1.1 Water Quality

According to Title 22 of the California Code of Regulations, recycled water to be used for unrestricted irrigation of golf courses, commercial planting areas, greenbelts, freeway landscaping, parks, playgrounds and schoolyards must be filtered and disinfected to tertiary standards to allow for full body contact. Irrigation water shall not come in contact with drinking fountains and picnic tables.

To meet tertiary water quality standards at the Banning WWTP, the treatments process at the plant would need to be substantially upgraded including filters or microfiltration, and disinfection either with chlorination or ultraviolet light [2].

Based on analysis of samples taken from Well R-1, it can be concluded that this source meets Title 22 requirements for irrigation water use, provided that groundwater is disinfected. A comparison of sampling at Well R-1 and Well C-6 is presented in Table 4.1.

Table 4.1 Groundwater Quality Comparison Recycled Water Master Plan City of Banning

Constituent	MCL	Unit	Well R-1	Well C-6
Nitrate (as NO_3)	45(1)	mg/l	2.0	7.4
Total Dissolved Solids (TDS)	500(2)	mg/l	307	220

Source: Average values from water quality records for 4th Quarter 2005 and 1st and 2nd Quarters of 2006.
(1) National Primary Drinking Water Standard
(2) National Secondairy Drinking Water Standard

Based on these test results it appears that the percolation ponds at the nearby wastewater treatment plant are not impacting the water quality of Well R-1.

4.1.2 AWWA Design Standards

The American Water Works Association has guidelines and requirements in their Manual of Water Supply Practices on Dual Water Systems (AWWA M24) that focuses on the following when planning a recycled water system [20]:

- ✓ Protect and maintain public health
- ✓ Define limitations and conditions for use of non-potable, recycled water
- ✓ Control improper use of non-potable, recycled water
- ✓ Prevent cross connection with potable water systems
- ✓ Provide physical separation from potable water systems conforming to similar standards for separation for potable water and sewer systems
- ✓ Incorporate design and construction standards
- ✓ Establish safeguards to minimize the effects of human carelessness

4.2 Hydraulic Parameters

Hydraulic planning criteria and assumptions discussed in this subsection are; network configuration, standard pipeline sizes, system pressures, pipeline velocity, pipeline headloss, storage sizing criteria, and pump station sizing criteria.

4.2.1 Network Configuration

The distribution system will consist of a network of pressurized pipelines. The configuration will comprise a single transmission main, the backbone system, that connects the City's WWTP with the gravity storage reservoirs in each pressure zone.

The backbone system will provide turnouts to connect smaller distribution system pipelines that will serve individual customers or groups of customers. The two alternative alignments for the backbone transmission main are evaluated in Section 6.

All recycled water system pipelines are sized to meet PHD.

4.2.2 Standard Pipeline Sizes

Pipeline sizes are based on the City's standard diameters as listed in Table 4.3. The non-standard 20-inch diameter pipeline is considered as an alternative to 24-inches with respect to potential cost savings. As shown in Table 4.3, the smallest pipeline considered is 8-inches in diameter.

Table 4.3 Standard Pipeline Sizes Recycled Water Master Plan City of Banning	
Pipe Diameter	**Type Size**
8 inches	Standard Size
12 inches	Standard Size
16 inches	Standard Size
20 inches	Non-standard Size
24 inches	Standard Size
30 inches	Standard Size

4.2.3 System Pressures

The system pressure in a recycled water system is typically designed to be slightly lower than the system pressure in the potable water system pipelines that are located in close vicinity of the recycled water pipelines to reduce the risk of contamination in the event of a pipeline break and low disinfectant residual in the recycled water system. However, this requirement can often not be met due to the following two reasons:

1) System pressure in potable water systems vary and pressure zone boundaries of potable and recycled water systems often do not overlap.

2) It is preferred to maintain a minimum pressure in the recycled water system of approximately 60 psi to meet the operating requirements for most sprinkler systems. However, the minimum pressure in potable water systems is typically 40 psi.

As the chance of cross contamination is minimal due to disinfection and a minimum horizontal separation of 10 feet between potable and recycled water pipelines, it is assumed that the recycled water system does not need to be coordinated with the existing potable water system pressure ranges.

The minimum system pressure used for pipeline sizing in this master plan is 60 psi under PHD conditions. The maximum system pressure is 200 psi, to avoid the need for more costly high-pressure class pipelines.

4.2.4 Pipeline Velocities

The maximum pipe velocity should not exceed 6 ft/s under PHD conditions with the entire distribution network in service.

4.2.5 Pipeline Headloss

The maximum headloss should not exceed 5 feet per thousand feet (ft/kft) under PHD conditions with the entire distribution network in service.

4.2.6 Storage Sizing Criteria

To operate a recycled water system with gravity reservoirs that is supplied from the Banning WWTP, three types of storage are required. These are:

1) Storage required to attenuate the hourly variation in wastewater flow and to provide a constant recycled water supply. With wastewater flows primarily occurring during the day and recycled water demands during the night, this storage component can be significant. The presence of primary or secondary storage at the WWTP will greatly affect the volume required for this storage component, which will typically be provided as a pump station forebay.

2) Storage reservoirs required to buffer demand fluctuations under MDD conditions, including the difference between PHD and MDD. The volume required for this storage component is highly dependent upon the hourly variation of the customers' demand, or the composite diurnal curve of each pressure zone.

3) Storage volume required protecting reservoirs from complete drainage. This "dead" storage provides operational flexibility and it protects pumps from pumping air, which can cause cavitation problems.

The first storage component, PS forebay storage, was calculated based on hourly production flows from the City's WWTP for May 24, 2006 [21], during which a total of 3.1 mgd of wastewater was produced. These wastewater flows were normalized to 5.2 mgd, to predict the wastewater flow variation under build out conditions.

The second storage component, gravity storage, is calculated based on the estimated water demand of the potential customers and their associated diurnal patterns. By comparing the hourly demand fluctuation with the available recycled water supply from the WWTP and Well R-1, the storage volume can be determined. The total gravity storage volume is divided over the two pressure zones based on the their proportional demand.

The third storage component, dead storage, is required for both the PS forebay and gravity storage. The depth of all reservoirs is increased by 10 feet to account for dead storage, with a maximum storage tank height of 32 feet.

It should be noted that recycled water systems do not require storage for fire flow or emergencies, as the potable water system storage is sized for these components.

4.2.7 Pump Station Sizing Criteria

Two pump station sizing criteria were used for the system analysis in this master plan, depending on the location of reservoir storage.

1) Alternatives with gravity reservoir storage have the benefit that reservoirs provide additional supply during the peak hours of MDD (reservoir drainage) and provide buffer capacity during the minimum hours of MDD (reservoir filling). This allows

pump station sizing for the average hour demand of MDD. Hence, all pump stations that pump into a zone with gravity storage are sized for MDD.

2) Alternatives without gravity reservoir storage do not provide the benefit of additional supply from reservoirs during the peak hours of MDD. Hence, all pump stations that pump into a zone without gravity storage (closed system) need to be sized for PHD.

It is assumed that booster stations do not require backup pumping capacity for emergencies, as irrigation water supply could temporary be interrupted and the existing customers could fall back on their potable water connection if needed. The golf courses planned in the new developments are assumed to use their lakes for operational storage, which should also provide operational flexibility during temporary pump station failures.

4.3 Construction Standards

4.3.1 Pipeline Materials

The City's preferred pipeline materials are Ductile Iron Pipe (DIP) and C200 Steel pipelines. It is assumed that all pipelines are DIP, with the exception of pipelines that require a pressure rating above 150 psi.

4.3.2 Construction Techniques

The majority of the pipeline network will use open trench construction methods in all places practical. Crossings of all channels, freeways, major arterials, and train tracks will be accomplished utilizing trenchless construction techniques.

4.4 Cost Estimating Assumptions

The construction and capital cost presented in this master plan do not include the cost for facilities required serve recycled water within the development areas, such as storage, booster pumping, land, and pipelines.

4.4.1 Cost Index

Cost estimates presented in this master plan are based on the current engineering and news record (ENR) cost index for the Los Angeles metropolitan area of 8,547 published in June, 2006. Future adjustments of cost estimates presented in this report can be estimated by increasing the estimated capital cost by the ratio of the future ENR to 8,547.

4.4.2 Unit Cost

The preparation of cost estimates presented in this report are based on the assumptions and unit construction costs listed in Table 4.4.

Table 4.4 Cost Estimating Assumptions Recycled Water Master Plan City of Banning		
Category	**Description**	**Assumption**
Pipelines	***Diameter***	***Unit Cost ($/lineal ft)***
	8 inches	$ 106
	12 inches	$ 126
	16 inches	$ 152
	20 inches	$ 189
	24 inches	$ 242
	30 inches	$ 268
	36 inches	$ 340
Storage Reservoirs	***Volume (MG)***	***Unit Cost ($/gallon)***
	<1	$ 2.10
	1-3	$ 1.60
	3-5	$ 1.30
	5-10	$ 1.10
Pump Stations	***Capacity (hp)***	***Unit Cost ($/hp)***
	<100	$ 6,200
	100-500	$ 4,130
	600-1000	$ 3,100
	1000-2000	$ 2,580
Land Acquisition	***Area (acres)***	***Unit Cost ($/acre)***
	All	$350,000
Mark-ups	***Category***	***Mark-up (%)***
	Contingency	30% of Capital Cost (CC)
	Engineering, Design and Construction Mgmt	15% of CC + Contingency
	Legal and Administration	10% of CC + Contingency
Special Pipelines Construction	***Construction Condition***	***Mark-up (%)***
	Pipelines in dirt terrain	80 % of standard unit cost
	Jack-and-Bore Crossings	150 % of standard unit cost
	Tunneling	300 % of standard unit cost
Amortization	***Category***	***Unit***
	Interest	5 %
	Depreciation Period	30 years

Land acquisition cost estimates are included for gravity reservoirs and booster stations. The land area required for storage reservoirs is based on the use of cylindrical tanks with 100-foot clearance around the tank to allow space for on-site pump stations, electrical and operational equipment, and access roads. Booster stations are assumed to require 0.5 acres per facility. Land acquisition costs for the satellite plants are not included.

It should be noted that the cost of wastewater treatment is not included in this study. For the purpose of alternatives comparison it is assumed that the cost of the regional plant upgrade is comparable with cost of constructing satellite plants. A detailed cost comparison of these treatment options is included in the Banning Sewer Master Plan.

5.0 MODEL DEVELOPMENT

5.1 Model Creation

For the purpose of this master plan, a hydraulic model was created in H_2OMAP Water Version 6.0. The model creation consisted of the following steps:

- ✓ Digitizing the distribution system pipelines
- ✓ Input of model demands and diurnal curves
- ✓ Input of model facilities and associated attribute data
- ✓ Determination of pressure zones boundaries and hydraulic grade lines (HGLs)
- ✓ Setup of Model Scenarios, Demand Sets, and Facility Sets
- ✓ Sizing of pipelines and facilities for various alternatives

The model creation steps and the data used in the model are described in more detail below. It should be noted that the model was not calibrated because the entire network consists of proposed pipelines and facilities.

5.2 Recycled Water Demands

All potential recycled water customers listed in Table 2.6 were modeled as separate demand nodes. The maximum month demand (in gpm) of each customer was input as a "base demand", while the 24-hour diurnal pattern was input to simulate the demand variation during the day. The diurnal curves scale the demand per hour from maximum month demand to maximum day demand by multiplying the base demand with a 1.3 peaking factor and the hourly factor associated with the customer's diurnal pattern.

For example, the maximum month demand of Repplier Park is 37.5 gpm and irrigation is assumed to occur during an 8-hour period from 10 PM to 6 AM (see Table 2.5). With an aggregate peaking factor of 3.9 (1.3 MDD/MMD * 3.0 PHD/MDD), the simulated model demand varies from 0 gpm (between 6 AM and 10 PM) to 146 gpm during irrigation hours.

The model includes five demand sets that were used to simulate the following demand conditions:

1) MDD under Build Out conditions
2) MDD under Phase 1 conditions
3) MDD under Build Out conditions with one satellite WWTP for the Loma Linda Development

4) MDD under Build Out conditions with one satellite WWTP for the Pardee Development

5) MDD under Build Out conditions with satellite WWTPs for the Loma Linda and Pardee Developments

The demand sets 3, 4, and 5, were used to determine the recycled water system benefits by using satellite plants for the Loma Linda and Pardee developments. The demands of these developments were reduced in these demand sets as the projected wastewater flows for these satellite WWTPs were lower than the projected recycled water demands. More details on this analysis is included in Section 6.

5.3 Recycled Water Supplies

The Banning WWTP was modeled as a fixed grade node with a HGL of 2,127 feet above mean sea level (msl), which is the approximate ground elevation of the WWTP site. This source was connected with a booster pump to feed the recycled water distribution system.

The groundwater well, Well R-1, is not included in the model, as it is assumed that this well will directly discharge into the pump station forebay at the WWTP. The pump station modeled at the WWTP simulates the combined flow of these two supply sources.

Two satellite WWTPs are modeled to evaluate the impact on the sizing of the recycled water system. These satellite plants are located at the southern portion of the Loma Linda and Pardee developments to capture the wastewater generated by these developments. The HGL of the fixed grade nodes that represent the Loma Linda and Pardee satellite WWTPs are 2,665 and 2,584 feet msl, respectively, which correspond to the approximate ground elevation of the sites. The pump stations at these sites are sized to pump the estimated wastewater flow of the plants.

The SWP supply is modeled as a fixed grade node with a HGL of 2,910 ft msl at the location of the Noble Creek Spreading Grounds. The East Branch Extension Pipeline that feeds these spreading grounds is not included in the model. A pump station is modeled to feed the pipeline to the Black Bench development.

5.4 Recycled Water System

The recycled water system was digitized by connecting the WWTP with the potential recycled water customers. The network configuration consists one backbone transmission pipeline that starts at the WWTP and continues west to the Sunset Lakes and Pardee developments. The remaining customers are connected to this backbone system with smaller, dead-end, distribution system pipelines. The recycled water system does not include any looping for redundancy, as temporary interruptions of recycled water supply are considered acceptable. The backbone system also extends to the gravity reservoirs that are proposed along the San Bernardino foothills, as discussed in Section 5.4.1.

5.4.1 Pressure Zones

The proposed recycled water system includes three pressure zones. The HGL of these zones was determined by the range in ground elevations and the minimum and maximum system pressure criteria of 60 psi and 200 psi, respectively.

A lower maximum pressure would be preferred, however, this would result in more pressure zones, requiring additional booster stations and reservoirs. The pressure zone characteristics are summarized in Table 5.1.

Table 5.1 Pressure Zone Characteristics Recycled Water Master Plan City of Banning

Pressure Zone HGL (ft msl)	Ground Elevation Range (ft msl)	Static Pressure Range (ft msl)
2600	2,127 - 2,450	65 - 205
2880	2,405 - 2,711	60 - 193
3400(1)	2,910 - 3,180	212 - 294
4100	3,360 - 3,927	75 - 320

(1): The 3400 Zone is recommended for the upper portions of the Loma Linda and Pardee developments.

It should be noted that the Zone 4100 is required to serve the Black Bench development. Due to the large variation in ground elevation, the southern portion of this development would need to be served through a pressure reducing station to avoid excessive system pressures.

5.4.2 Pipelines

The recycled water system pipelines were digitized to connect the recycled water supply sources with the potential customers using the shortest routes possible. Due to the location of the WWTP on the far eastern portion of the City's service area, the pipeline diameters of the backbone decrease gradually in westerly direction as the design flow rate decreases. Distribution system pipelines branch in both north and south directions to serve customers. The distribution system pipeline characteristics are summarized in Table 5.2.

As listed in Table 5.2, the recycled water model includes 37 miles of pipeline, ranging from 8-inch to 30-inch in diameter. This includes all pipelines required to evaluate the various alternatives. As not all pipeline routes evaluated are part of the proposed system, the model pipeline length exceeds the length presented in the Capital Improvement Program (CIP) of this master plan.

Table 5.2 Pipeline Characteristics Recycled Water Master Plan City of Banning				
Pipeline Diameter (in)	Pipeline Length (mi)			
	Zone 2600	Zone 2880	Zone 4100	Total
8	0.4	0.4		0.8
12	2.8	2.5		5.3
16	2.1	9.1	6.0	17.2
24		4.4		4.4
30		0.8		0.8
36	8.0	0.7		8.7
Total	**13.3**	**17.9**	**6.0**	**37.1**

It should be noted that the pipeline distribution includes all potential pipelines includes, and is different from the proposed system configuration included in the Capital Improvement Program (CIP) of this master plan (Section 7).

5.4.3 Reservoir Storage

The hydraulic model includes two gravity reservoirs for zones 2600 and 2880. A gravity reservoir is not considered cost-effective for Zone 4100. Hence, it is recommended that this zone be operated as a hydro-pneumatic zone.

The total required storage volume for the City under build out conditions was calculated to be 1.4 MG. Approximately 0.4 MG of this storage is required to buffer the wastewater flow fluctations at the plant. It is assumed that this storage will be provided at the suction side of the 2600 Zone Pump Station as a pumping forebay. The remaining 1.0 MG was divided amongst the Zone 2600 and Zone 2880 reservoirs based on the proportional demand of each pressure zone.

All gravity reservoirs are modeled as circular tanks with a diameter that corresponds to the required volume with a tank height of 22 feet. Subsequently, 10 feet was added to provide for dead storage, resulting in a total tank height of 32 feet. The gravity reservoir characteristics are summarized in Table 5.3.

Table 5.3 Reservoir Characteristics Recycled Water Master Plan City of Banning				
Reservoir	Diameter (ft)	Height (ft)	Operational Volume[1] (MG)	Total Volume[2] (MG)
Equalization at WWTP	61	32	0.7	1.0
Zone 2600	51	32	0.5	0.7
Zone 2880	41	32	0.3	0.5
Total	**n/a**	**n/a**	**1.5**	**2.2**

(1) Based on a reservoir height of 22 feet.
(2) Based on a reservoir height of 32 feet.

5.4.4 Pumping Stations

The hydraulic model includes a large number of booster pumping stations and pump curves that were used to evaluate various system configurations. Depending upon the system alternative, certain pump stations and pump curves are selected (activated) to model the appropriate system conditions, while other facilities are excluded from the model runs. The pump stations and their respective modeled design points are summarized in Table 5.4.

It should be noted that the pump curves are created such that they reflect variable frequency drive (VFD) pumps to limit the variation in discharge head, while operating over significant demand fluctuations. It is recommended that the City evaluate the option to use VFDs in the preliminary design stage of the booster pumping stations.

Table 5.4 Pump Station Characteristics
Recycled Water Master Plan
City of Banning

Pump Station	From Zone	To Zone	Alternative	Flow (gpm)	Head (ft)
Zone 2600 PS	WWTP	2600	1A	8,900	490
			1B	8,900	490
Zone 2880 PS	2600	2880	1A	7,200	310
			1B	7,200	310
Zone 2600 PS	WWTP	2600	2A	8,900	490
			2B	13,000	490
			2C	15,500	490
Zone 2800 PS	2600	2880	2A	7,200	310
			2B & 2C	11,300	310
Zone 2600 PS	WWTP	2600	3A	7,000	490
			3B	7,900	490

			4C	5,700	400
Zone 3400 PS(2)	3000	3400	All	4,500	520
Zone 4100 PS	SWP	4100	4A, 4B & 5B	2,800	1200
	3400	4100	4C	2,800	700

(1) To Loma Linda Development (Zone 3000 is the assumed HGL of golf course ponds, Zone 3400 is to serve demand)
(2) To Pardee Development (Zone 3400 is to serve demand in the upper portion of the development).

6.0 SYSTEM ANALYSIS

This section describes the hydraulic analysis performed to define the proposed recycled water system. This section consists of a discussion of the evaluation methodology, the alternative analysis, and concludes with a proposed recycled water system layout. The phasing of the system components and cost estimates of the proposed system are presented in Section 7, the Capital Improvement Program. It should be noted that the cost estimates and system configurations presented in this Section are for comparison purposes and should not be used as a reference for the proposed system layout.

6.1 Evaluation Methodology

The evaluation methodology used to determine the most cost-effective and operational recycled water system is based on the evaluation of a number of alternatives that represent various system configurations. This process is schematically shown in Figure 6.1, while the location of the various system components are shown on Figure 6.2.

As shown in Figure 6.1, the evaluation methodology is based on a progressive process in the sense that the conclusion from the first analysis is used in the second analysis, etc. This methodology was used to reduce the number of variables amongst the alternatives and maintain a clear picture of the impact of one particular variable. For example, two backbone alignments were evaluated in the first analysis. The best alignment was then used in the second analysis, which then evaluates the best storage configuration.

To provide a consistent basis for the comparison of alternatives, capital cost estimates were prepared for the entire distribution system of each alternative using the cost estimating assumptions described in section 4.5.

In addition, a unit cost in dollars per ac-ft of recycled water served ($/ac-ft) was calculated to compare alternatives where the total system demand varies. Unit costs are a better comparison base than capital cost only. The results of the alternatives evaluation are discussed below. Two types of unit cost are calculated for alternatives that involve separate recycled water systems for one or more developments. These alternatives include 1) a system wide unit cost where total cost of the City's recycled water system is divided by the total City-wide recycled water demand, and 2) a developers unit cost where the cost the recycled water backbone system for the development is divided by the development's recycled water demand. It should be noted that the development cost does not include in-tract distribution pipelines, reservoirs, and satellite treatment plants.

All alternatives are evaluated under build out conditions, as the ultimate system demand determines the system sizing. The phasing of facilities is discussed in Section 7.

6.2 Backbone Analysis

The first analysis performed with the recycled water model was to determine the most cost-effective alignment for the recycled water backbone system. Determining the alignment of this transmission main is a critical first step since it determines the sizing and length of all remaining distribution system pipelines. The two alternatives considered for the analysis were:

- ✓ Alternative 1A - Lincoln Street alignment
- ✓ Alternative 1B - Smith Creek alignment

The location of these alignments is depicted on Figure 6.2. The pipelines and facilities required for each alternative to serve all the potential recycled water customers, as listed in Table 2.6, were input in the model. A separate model scenario was created for each of the alternative to size the pipelines and facilities such that the planning criteria (see Section 4) were met.

Both alternatives include a 30-inch diameter backbone pipeline, 16-inch diameters that connect to the gravity reservoirs in the 2600 and 2880 zones, the 2600 PS at the WWTP, and a 2880 PS to supply the 2880 Zone. In addition, the 3400 Zone PS to the upper portions of the Loma Linda and Pardee Developments are included. Based on the Loma Linda topography and land use plan, it is assumed that recycled water will first be pumped to the Loma Linda Golf Course lakes at an approximate HGL of 3000 ft and subsequently pumped to the 3400 Zone to serve the customers. It is assumed that the 3400 Zone PS for the Pardee development be located near Reservoir 2880 at the detention pond site. These alternatives do not include the facilities, pipelines, and demands of the 4100 Zone (Black Bench Alternative), as supply to this Zone is considered not feasible based on the analysis presented in Table 2.8.

A description of the system configuration for the alternatives and a summary of the estimated cost are discussed below, while system schematics are included in Appendix C and detailed cost estimates are included in Appendix D.

6.2.1 Alternative 1A - Lincoln Street Alignment

The 3.9 miles (mi) backbone system in the Lincoln Street Alternative consists of a 30-inch diameter pipeline that runs north from the Banning WWTP along Scott Street to Charles Street, where it continues west to Hathaway Street. The pipeline runs north on Hathaway Street, and then continues west along Lincoln Street until it reaches Sunset Avenue. The 2880 Zone PS would be located along Lincoln Street between 22nd Street and Sunset Avenue.

Two reservoir feed/drain pipelines, with a combined length of 5.5 mi, are connected to the backbone system. The 16-inch diameter 2600 Zone reservoir pipeline starts at the intersection of 4th Street and Lincoln Street and runs for about 1.3 mi north along 4th Street. The 2880 Zone reservoir pipeline starts at the intersection of Lincoln Street and Sunset Avenue, where one major distribution pipeline branches off from the backbone system to feed the Sunset Lakes Golf Course and the Five Bridges development. The 24-inch diameter reservoir pipeline runs north for about 0.8 mi along Sunset Avenue, crosses Interstate 10, continues to the intersection with Wilson Street, where it reduces to a 20-inch diameter pipeline and continues west for approximately 1.4 miles to the intersection of Wilson Street and Highland Home Road. From this intersection, the pipeline is reduced to 16-inch in diameter and continues north for about 2.0 mi. The 2880 Zone reservoir pipelines has a combined length of 4.2 miles.

The distribution system consists of 8.0 miles pipeline that ranges from 8-inch to 20-inch in diameter. This does not include distribution system pipelines within the development areas and excludes the 12-inch diameter pipeline in the Sunlakes Development (see Figure 6.3).

The total pipeline length of this alternative is 17.3 miles, including 5.1 miles of construction in dirt terrain. Approximately 5.1 miles of these pipelines could be constructed in dirt terrain, with a 20 percent construction cost discount per Table 4.4.

This alternative includes five pumping stations: the 2600 Zone PS at the regional WWTP (1500 hp), the 2880 Zone PS along Lincoln Street (800 hp), the 3000 Zone PS to Loma Linda (125 hp), the 3400 Zone PS to Loma Linda (400 hp), and the 3400 Zone PS to Pardee (800 hp).

The reservoirs included in this alternative are a 0.4 MG forebay at the WWTP, a 0.6 MG Zone 2600 Reservoir, and a 1.0 MG Zone 2880 Reservoir. . This does not include storage capacity for the demands in the development areas, which is likely to be provided in golf course lakes.

It is assumed that 5.4 acres of land would need to be acquired for the two reservoir sites, the 2880 Zone PS along Lincoln Street, the 3000 Zone PS to the Loma Linda golf course ponds, and the two 3400 Zone PSs to the upper portions of the Loma Linda and Pardee Developments. This does not include land for treatment facilities, equalization storage at the regional plant, or operational storage to serve the recycled water demands in the development areas.

6.2.2 Alternative 1B - Smith Creek Alignment

The 4.9 mi backbone system in the Smith Creek Alternative consists of a 30-inch diameter pipeline that runs in southwest direction from the Banning WWTP to intersection of Hathaway Street and Porter Street. The pipeline continues west along Porter Street until it reaches San Gorgonio Avenue, where it continues further west to follow the proposed sewer main alignment that crosses Montgomery Creek. Once it reaches the westside of

the creek, the pipeline continues west along Bobcat Road to Sunset Avenue. The 2880 Zone PS would be located along Sunset Avenue between Bobcat Road and Westward Avenue. The backbone pipeline continues further west from the discharge side of the pump station to Sunset Avenue, where it turns north and ends at the intersection with Lincoln Street.

Two reservoir feed/drain pipelines, with a combined length of 6.5 mi, are connected to the backbone system. The 16-inch diameter 2600 Zone reservoir pipeline starts at the intersection of San Gorgonio Avenue and Porter Street and runs north along San Gorgonio Avenue for about 0.5 mi, then west along Westward Avenue for about 0.2 mi, and then north again along 4th Street for about 0.7 mi. The 2600 Zone reservoir pipeline has a combined length of 2.3 miles. The 2880 Zone reservoir pipeline is identical to Alternative 1A and has a combined length of 4.2 miles.

The distribution system consists of 9.0 miles pipeline that ranges from 8-inch to 20-inch in diameter.

The total pipeline length of this alternative is 20.3 miles. Approximately 10.2 miles of these pipelines could be constructed in dirt terrain, with a 20 percent construction cost discount per Table 4.4. The total length of jack-and-bore crossing under the riverbed is estimated at 1,200 lineal feet, which has a 50 percent construction cost mark-up per Table 4.4.

This alternative also includes the five PSs listed for Alternative 1A. One exception would be the location of the 2880 Zone PS along Sunset Avenue, instead of Lincoln Street.

The reservoirs and land acquisition requirements included in this alternative are the same as listed for Alternative 1A.

6.2.3 Recommendation

The estimated construction cost, land acquisition cost, total capital cost, and unit cost are summarized in Table 6.1. Detailed cost estimates are included in Appendix D.

As shown in table 6.1, the Lincoln Street alternative is more cost effective. This cost difference is solely due to a difference in overall pipeline length, with 17.3 mi for the Lincoln Street Alternative and 20.3 mi for the Smith Creek Alternative. Also, the Smith Creek alternative has a higher potential for environmental impacts due to the creek crossing. Because the Lincoln Street Alternative does not have any major concerns that would justify the cost difference, this alternative is selected as the preferred alignment and is used for further analysis.

Table 6.1 Backbone Analysis Results Recycled Water Master Plan City of Banning		
System Component	**Alternative 1A Lincoln Street ($ million)**	**Alternative 1B Smith Creek ($ million)**
Pipelines	$16.0	$17.6
Reservoir Storage	$4.6	$4.6
Pump Stations	$10.6	$10.6
Total Construction Cost	**$31.2**	**$32.8**
Land Acquisition	$1.9	$1.9
Mark-ups	$19.5	$20.5
Total Capital Cost	**$52.7**	**$55.2**
Total Demand (ac-ft/yr)	5,035	5,035
Unit Cost ($/ac-ft)	**$680**	**$713**

Note: All numbers excludes wastewater treatment cost.

6.3 Reservoir Analysis

Recycled water storage is required to buffer the hourly fluctuation in recycled water demands and the available recycled water supply from the Banning WWTP under MDD conditions. To calculate the required storage, a spreadsheet was developed that compares the available recycled water supply and the estimated recycled water demands in 15-minute intervals for a duration of 11 days. Historical wastewater flows from the Banning wastewater treatment plant were used to simulate the variation in supply [21].

The difference between supply and demand is compensated with storage. The maximum cumulative storage between a fill and a drain cycle determines the total required storage volume. The calculated reservoir size is verified with a graph that presents the variation in recycled water demands and storage volume over the 11-day period. Once this graph shows a repetitive pattern of fill and drain cycles, the calculation is balanced. The storage calculation considers the following parameters:

- ✓ Stage of development (Phase 1 or Build Out)
- ✓ Diurnal curve for each customer (8-hr irrigation for Parks and Schools; 12-hr irrigation for Caltrans, and 24-hr delivery to Golf Courses)
- ✓ Wastewater flow rates based historical data (3.1 mgd for Phase 1 and normalized to 5.2 mgd for Build Out)
- ✓ Potential use of Groundwater Well R-1 (1,500 gpm or 2.2 mgd)
- ✓ Potential use of State Water Project (SWP) water to compensate supply shortfall.

The calculated storage volume for Phase 1 and Build Out conditions are summarized in Table 6.2. These volumes refer to total system storage and does not specify the zoning or location of the storage reservoirs.

Table 6.2 Storage Volumes
Recycled Water Master Plan
City of Banning

Storage Component	Phase 1 (MG)	Build Out (MG)
PS Forebay Storage at WWTP[1]	0.6	1.0
Operational System Storage[1]	0.3	1.2
Subtotal - City Storage	***0.9***	***2.2***
On-site Operational Storage at Golf Courses[2]	8.0	8.0
Total System Storage	**8.9**	**10.2**

(1) Does include dead storage.
(2) Does not include dead storage and excludes Black Bench storage (1.4 MG)

It should be noted that all three alternatives are based on the assumption that golf courses receive a constant amount of recycled water (24-hr delivery) and that the required storage for golf courses (8.0 MG) should be provided as on-site storage in lakes. Hence, the total required operational storage to be constructed by the City is 2.0 MG under build out conditions. As shown in Table 6.2, 1.0 MG of this storage needs to be constructed at the WWTP to buffer the fluctuations in wastewater flows and allow a constant recycled water delivery. The remaining 1.0 MG is needed to buffer the fluctuation in recycled water demands during the day.

To determine the most cost-effective location to construct operational storage, the following three alternatives were evaluated:

- ✓ Alternative 2A - Two Gravity Reservoirs (Zone 2600 and 2880)
- ✓ Alternative 2B - One Gravity Reservoir (Zone 2600)
- ✓ Alternative 2C - No Gravity Storage (all storage is located at the WWTP).

The hydraulic model was used to size the pipelines and pump stations for each alternative. The Lincoln Street Alignment was used in all alternatives as the backbone system. A description of the system configuration for the alternatives and a summary of the estimated cost are discussed below, while system schematics are included in Appendix C and detailed cost estimates are included in Appendix D. The locations of the gravity reservoirs are depicted on Figure 6.2.

6.3.1 Alternative 2A - Two Gravity Reservoirs

This alternative includes forebay storage at the Banning WWTP (1.0 MG) and gravity storage in Zone 2600 (0.7 MG) and Zone 2880 (0.5 MG). The distribution of the gravity storage is prorated based on the proportional demand of each zone.

The system configuration in this alternative is identical to system configuration of Alternative 1A, the Lincoln Street Backbone System.

6.3.2 Alternative 2B - One Gravity Reservoir

This alternative includes forebay storage at the Banning WWTP (1.0 MG) and gravity storage in Zone 2600 (1.2 MG). As there would not be any gravity storage in Zone 2880, this zone would be operated as a closed system. This alternative requires land acquisition for only one reservoir site and avoids the need for the feed/drain pipeline to Reservoir 2880. However, the 2880 Zone PS in this alternative are designed to deliver PHD instead of MDD, and should be equipped with a pump station that is designed to deliver PHD instead of MDD and is preferably equipped with variable frequency drive (VFD) pumps to maintain a fairly constant discharge pressure.

The system configuration is similar to system configuration of Alternative 1A, with the exception of the following components:

- ✓ The entire distribution system including the backbone system is 15.3 miles versus 17.3 miles in Alternative 1A.
- ✓ The estimated required land is 3.6 acres versus 5.4 acres in Alternative 1A.
- ✓ The 2880 Zone booster station is 1250 hp versus 800 hp in Alternative 1A.

6.3.3 Alternative 2C - No Gravity Reservoirs

This alternative does not include any gravity reservoirs and all system storage (2.2 MG) would be located at the Banning WWTP. As a result, both Zone 2600 and Zone 2880 would be operated as closed systems. This alternative requires no land acquisition for reservoir sites and avoids the need for reservoir feed/drain pipelines. However, the pump stations in this alternative are sized to deliver PHD instead of MDD, and should be equipped with VFD pumps to maintain a fairly constant discharge pressure.

The system configuration is similar to system configuration of Alternative 1A, with the exception of the following components:

- ✓ The entire distribution system including the backbone system is 14.6 miles versus 17.3 miles in Alternative 1A.
- ✓ The estimated required land is 2.0 acres versus 5.4 acres in Alternative 1A.
- ✓ The 2600 Zone booster station is 2500 hp versus 1500 hp in Alternative 1A.

- ✓ The 2880 Zone booster station is 1250 hp versus 800 hp in Alternative 1A.

6.3.4 Recommendation

The estimated construction cost, land acquisition cost, total capital cost, and unit cost are summarized in Table 6.3. Detailed cost estimates are included in Appendix D.

Table 6.3 Reservoir Analysis Results Recycled Water Master Plan City of Banning

System Component	Alternative 2A 2 Reservoirs ($ million)	Alternative 2B 1 Reservoir ($ million)	Alternative 2C No Reservoirs ($ million)
Pipelines	$16.0	$15.2	$13.8
Reservoir Storage	$4.6	$4.0	$3.5
Pump Stations	$10.6	$12.1	$12.7
Total Construction Cost	**$31.2**	**$31.4**	**$30.0**
Land Acquisition	$1.9	$1.3	$0.7
Mark-ups	$19.5	$19.6	$18.7
Total Capital Cost	**$52.7**	**$52.3**	**$49.4**
Total Demand (ac-ft/yr)	5,035	5,035	5,035
Unit Cost ($/ac-ft)	**$680**	**$675**	**$638**

Note: All numbers excludes wastewater treatment cost.

As shown in table 6.3, it is more cost-effective to construct larger pump stations than gravity reservoir storage, even if these reservoirs can be located fairly close to the customers. However, the benefit of gravity reservoirs for system operations is not expressed in these costs. Operating a closed pressurized water distribution system with large demand fluctuations, such as a recycled water system, is not desirable from an operational standpoint. The use of VFD pumps may reduce the pressure fluctuations, however, pumps are anticipated to continuously ramp up and down when customers turn their irrigation sprinklers systems on and off. This causes wear and tear on pumps. In addition, potential pressure spikes may cause problems at customer connections. Based on the operational constraints of closed systems, it is considered justifiable to recommend the construction of two gravity reservoirs at an incremental cost of less than $300,000 annually. Hence, alternative 2A is the preferred alternative.

6.4 Satellite Plant Analysis

The third analysis performed with the recycled water model was to determine the cost impact on the recycled water system if one or two satellite WWTPs were to be constructed to treat wastewater from the Pardee and/or Loma Linda developments. The locations of these satellite plants are depicted on Figure 6.2.

The primary advantage of using a satellite WWTP for the wastewater treatment and recycled water supply is the fact that this reduces the amount of wastewater and recycled water conveyance, as well as recycled water pumping cost. With the Banning WWTP located on the eastern end of the City's service area and the developments located on the northwestern side of the City's service area, use of satellite plant could reduce conveyance as much as 12 miles (6 miles for sewer and 6 miles for recycled water).

The sewer master plan that is currently being prepared includes a detailed cost analysis for these satellite plants. The analysis in this master plan is limited to the recycled water system components, including the recycled water pumping forebay and all downstream facilities and pipelines. The four alternatives considered for the analysis were:

- ✓ Alternative 3A - One Satellite WWTP at the Loma Linda Development
- ✓ Alternative 3B - One Satellite WWTP at the Pardee Development
- ✓ Alternative 3C - Two Satellite WWTPs at the Loma Linda and Pardee Developments
- ✓ Alternative 3D - No Satellite WWTPs, all wastewater flow is treated at the (expanded) Banning WWTP.

The hydraulic model was used to size the pipelines and pump stations for each alternative. Per the recommendations of the first and second analyses, the Lincoln Street Alignment was used in all alternatives as the backbone system and both gravity storage reservoirs were included. A description of the system configuration for the alternatives and a summary of the estimated cost are discussed below, while system schematics are included in Appendix C and detailed cost estimates are included in Appendix D.

6.4.1 Alternative 3A - One Satellite WWTP at Loma Linda

This alternative includes one satellite WWTP for the Loma Linda Development. The projected wastewater flow of this plant is 0.7 mgd under build out conditions (see Section 3.4). The remaining wastewater flow of the City would be treated at the Banning WWTP. The projected capacity of this plant under this alternative is 7.1 mgd (7.8 - 0.7).

With the objective to reduce conveyance through pipelines, it is assumed that the Loma Linda recycled water system would operate as a separate isolated recycled water system. This means that the recycled water demand that can be served is limited to the available supply. However, the estimated recycled water demand of the Loma Linda Golf Course is 1,059 acr-ft/yr or 0.95 mgd, which is greater than the available supply. The difference would need to be supplemented with potable water supply. An annual supply and demand balance is included in Appendix F. This balance shows that the average annual demand that can be served from the satellite plant is 477 ac-ft/yr, an overall system reduction of 582 ac-ft/yr. It is assumed that reservoir storage would not be required because the satellite

plant would pump its recycled water directly into the on-site storage (lake) at the Loma Linda Golf Course.

The system configuration of this alternative is similar to system configuration of Alternative 1A, with the exception of the following components:

- ✓ The 2600 Zone booster station is 1250 hp versus 1500 hp in Alternative 1A.
- ✓ The 2880 Zone booster station is 500 hp versus 800 hp in Alternative 1A.
- ✓ The 3000 Zone booster station to Loma Linda is 100 hp versus 125 hp in Alternative 1A.
- ✓ The 3400 Zone booster station to Loma Linda is 100 hp versus 300 hp in Alternative 1A.
- ✓ The potential demand is 4,453 ac-ft/yr versus 5,035 ac-ft/yr in Alternative 1A.

6.4.2 Alternative 3B- One Satellite WWTP at Pardee

This alternative includes one satellite WWTP for the Pardee Development. The projected wastewater flow of this plant is 1.4 mgd under build out conditions. The remaining wastewater flow of the City would be treated at the Banning WWTP. The projected capacity of this plant under this alternative is 6.4 mgd (7.8 - 1.4).

Due to the location of Reservoir 2880, it is assumed that the Pardee Satellite Plant would feed into the City-wide recycled water system through the Zone 2880 Reservoir feedline. This means that the entire recycled water demand of the Pardee development (1,123 acr-ft/yr) can be served as it would not be limited to the available supply from the Satellite Plant.

An annual supply and demand balance is included in Appendix F. This balance shows that the average annual demand that can be served from the satellite plant is 872 ac-ft/yr, and that 251 ac-ft/yr would need to be supplemented from the regional WWTP.

The system configuration is similar to the system configuration of Alternative 1A, with the exception of the following components:

- ✓ The entire distribution system including the backbone system is 17.7 miles versus 17.3 miles in Alternative 1A.
- ✓ The 2600 Zone booster station is 1250 hp versus 1500 hp in Alternative 1A.
- ✓ The 2880 Zone booster station is 700 hp versus 800 hp in Alternative 1A.
- ✓ An additional 2880 Zone booster station of 150 hp would be required to serve the 2880 Zone from the Pardee Satellite Plant.

6.4.3 Alternative 3C- Two Satellite WWTPs at Loma Linda and Pardee

This alternative includes two satellite WWTPs for the Loma Linda and the Pardee developments. Under build out conditions, the projected wastewater flow of these plants is 0.7 mgd and 1.4 mgd, respectively. The remaining wastewater flow of the City would be treated at the Banning WWTP. The projected capacity of this plant under this alternative is 5.7 mgd (7.8 - 0.7 - 1.4).

Similarly to Alternatives 3A and 3B, it is assumed that the Loma Linda recycled water systems would operate as a separate isolated recycled water system, while the Pardee recycled water system would be connected with the City's system-wide recycled water system. This means that the recycled water demand that can be served is limited to the available supply. As described under Alternatives 3A, the average annual demand that can be served with an isolated system for the Loma Linda development is 4,453 ac-ft/yr, an overall system reduction of 582 ac-ft/yr. In addition, the regional WWTP would need to supplement 251 ac-ft/yr to the Pardee development to compensate for the difference between it wastewater supply and recycled water demand.

The system configuration is similar to the system configuration of Alternative 1A, with the exception of the following components:

- ✓ The entire distribution system including the backbone system is 17.6 miles versus 17.3 miles in Alternative 1A.
- ✓ The 2600 Zone booster station is 1,000 hp versus 1500 hp in Alternative 1A.
- ✓ The 2880 Zone booster station is 500 hp versus 800 hp in Alternative 1A.
- ✓ The 3000 Zone booster station to Loma Linda is 100 hp versus 125 hp in Alternative 1A.
- ✓ The 3400 Zone booster station to Loma Linda is 100 hp versus 300 hp in Alternative 1A.
- ✓ The potential demand is 4,453 ac-ft/yr versus 5,035 ac-ft/yr in Alternative 1A.

6.4.4 Alternative 3D - No Satellite WWTPs

This alternative does not include any satellite WWTPs, and it is assumed that all wastewater flow would be treated at the Banning WWTP. The projected capacity of this plant is 7.8 mgd.

The system configuration in this alternative is identical to system configuration of Alternative 1A, the Lincoln Street Backbone System. The potential recycled water system demand of this alternative is 5,035 ac-ft/yr.

6.4.5 Recommendation

The estimated construction cost, land acquisition cost, total capital cost, and unit cost are summarized in Table 6.4. Detailed cost estimates are included in Appendix D. These costs are based on the total system cost and the total system demand. Table 6.5 summarizes the cost estimates of the backbone facilities required to serve the developments only. Details are included in Appendix E.

Table 6.4 Satellite Plant Analysis Results - City-wide Cost
Recycled Water Master Plan
City of Banning

System Component	Alt. 3A Loma Linda ($ million)	Alt. 3B Pardee ($ million)	Alt. 3C LL & Pardee ($ million)	Alt. 3D No Sat. Plants ($ million)
Pipelines	$15.6	$16.0	$15.5	$16.0
Reservoir Storage	$4.6	$4.6	$4.6	$4.6
Pump Stations	$8.5	$11.1	$8.5	$10.6
Total Construction Cost	**$28.7**	**$31.8**	**$28.6**	**$31.2**
Land Acquisition	$1.9	$1.9	$1.9	$1.9
Mark-ups	$18.5	$19.9	$17.9	$19.5
Total Capital Cost	**$49.9**	**$53.5**	**$48.3**	**$52.7**
Total Demand (ac-ft/yr)	4,453	5,035	4,453	5,035
Unit Cost ($/ac-ft)	**$728**	**$691**	**$706**	**$680**

Note: All numbers excludes wastewater treatment cost.

Table 6.5 Satellite Plant Analysis Results - Development Cost
Recycled Water Master Plan
City of Banning

System Component	Alt. 3A Loma Linda ($ million)	Alt. 3B Pardee ($ million)	Alt. 3C LL & Pardee ($ million)	Alt. 3D No Sat. Plants ($ million)
Pipelines	$1.1	$1.1	$2.1	n/a
Reservoir Storage	$0.0	$0.0	$0.0	n/a
Pump Stations	$1.8	$2.5	$4.2	n/a
Total Construction Cost	**$2.8**	**$3.6**	**$6.4**	**n/a**
Land Acquisition	$0.4	$0.2	$0.5	n/a
Mark-ups	$1.8	$2.2	$4.0	n/a
Total Capital Cost	**$4.9**	**$6.0**	**$10.9**	**n/a**
Total Demand (ac-ft/yr)	477	872	1,349	n/a
Unit Cost ($/ac-ft)	**$674**	**$448**	**$524**	**n/a**

Note: All numbers excludes wastewater treatment cost.

As shown in Table 6.4, the most cost-effective options are Alternatives 3B and 3D. The alternatives that include a separate recycled water system served from the Loma Linda satellite WWTP (Alternatives 1A and 1C) are less attractive based on a unit cost comparison. The difference is caused by the relative substantial reduction in recycled water demand (582 ac-ft/yr), while the pipeline cost are nearly the same due to the short distance (900 lineal ft) between the Loma Linda Satellite WWTP and the proposed backbone system. As the treatment cost for the satellite plant are not included in the cost comparisons, it is expected that the total unit cost with treatment for Alternative 3B would be higher than the unit cost of Alternative 3D. In addition, satellite plants are typically not preferred due to neighborhood concerns related to odor and esthetics, and other issues such as finding an appropriate site for the plant in a new development and increased operational complexity.

Based on these considerations, it is recommended that the City implements the system configuration of Alternative 3D.

6.5 Black Bench Supply Analysis

The fourth analysis performed with the recycled water model was to determine the cost effectiveness of serving the Black Bench development with recycled water. This development is in relatively close proximity to a SWP pipeline, the East Branch Extension Pipeline, which delivers untreated SWP water to the Noble Creek Spreading Grounds.

As discussed in Section 3, the potential recycled water demand in the City under MDD conditions exceeds the available recycled water supply. It would therefore be beneficial to connect the untreated SWP supply to the City's recycled water system, and further reduce the potable water supply needs. The following three alternatives were identified for this analysis:

- ✓ Alternative 4A - SWP water delivery to Black Bench through a pipeline along Smith Creek.
- ✓ Alternative 4B - SWP water delivery to Black Bench through a pipeline and tunnel
- ✓ Alternative 4C - WWTP delivery to Black Bench through a pipeline along Sunset Avenue.

The location of the SWP pipeline, the spreading grounds, and the pipeline alignments involved in these alternatives are depicted on Figure 6.2.

The hydraulic model was used to size the pipelines and pump stations for each alternative. Per the recommendations of the first three analyses, the Lincoln Street Alignment was used in all alternatives as the backbone system, both gravity storage reservoirs were included, and all developments are supplied from the WWTP (no satellite plants). A description of the system configuration for the alternatives and a summary of the estimated cost are

discussed below, while system schematics are included in Appendix C and detailed cost estimates are included in Appendix D.

6.5.1 Alternative 4A - SWP to Black Bench through a pipeline

This alternative includes a recycled water system for the Black Bench development that would be served with untreated SWP water through a 3.9-mile 16-inch diameter pipeline. This pipeline would start at the Noble Creek Spreading Grounds and then continue east along Dutton Street to Bellflower Avenue, where it would continue south to Cherry Valley Boulevard. The pipeline would run south east along Cherry Valley Boulevard and then continue east along Grand Plaza where it would branch off in the northeast direction along Smith Creek to the southwestern portion of the Black Bench development. It should be noted that this may cause environmental concerns and would require an Environmental Impact Report (EIR). This pipeline would serve the entire Black Bench demand, which is estimated at 520 ac-ft/yr.

As discussed in Section 5.4.1, the proposed HGL to serve this development is 4,100 ft msl. As the spreading grounds are located at a ground elevation of approximately 2,190 ft msl, a booster station would be required. Based on an average irrigation period of 8 hours, this development would require approximately 1.4 MG in storage. However, to avoid additional pipelines to a site with a ground elevation of nearly 4100 ft msl, it is recommended that the booster station and pipelines that would supply this development be sized to deliver peak hour demand.

The remaining portion of the system configuration is similar to recycled water system proposed for Alternative 1A, with the exception of the following components:

- ✓ The entire distribution system including the backbone system is 21.2 miles versus 17.3 miles in Alternative 1A.
- ✓ A 1250 hp booster station would be required to feed the 4100 Zone.
- ✓ The estimated required land is estimated at 5.9 acres versus 5.4 acres in Alternative 1A, to accommodate the installation of the booster station to Zone 4100.
- ✓ The potential demand is 5,555 ac-ft/yr versus 5,035 ac-ft/yr in Alternative 1A.

6.5.2 Alternative 4B - SWP to Black Bench through a pipeline and tunnel

This alternative includes a recycled water system for the Black Bench development that would be served with untreated SWP water through a 3.0-mile 16-inch diameter pipeline, of which approximately 4,000 lineal feet would needed to be tunneled. This pipeline would start at the Noble Creek Spreading Grounds and then continue east along Dutton Street to Bellflower Avenue, cross Bellflower Avenue, and continue further east along Frontier Trail. The pipeline would branch in northeast direction to the southwestern portion of the Black

Bench development. This last portion of the pipeline would require tunneling due to topography, as shown on Figure 6.2.

Similarly to Alternative 4A, this pipeline would serve 520 ac-ft/yr to the Black Bench development.

The remaining portion of the system configuration is similar to recycled water system proposed for Alternative 1A, with the exception of the following components:

- ✓ The entire distribution system including the backbone system is 20.3 miles versus 17.3 miles in Alternative 1A.
- ✓ A 1250 hp booster station would be required to feed the 4100 Zone.
- ✓ The estimated required land is estimated at 5.9 acres versus 5.4 acres in Alternative 1A, to accommodate the installation of the booster station to Zone 4100..
- ✓ The potential demand is 5,555 ac-ft/yr versus 5,035 ac-ft/yr in Alternative 1A.

6.5.3 Alternative 4C - WWTP delivery to Black Bench through a pipeline

This alternative includes a recycled water system for the Black Bench development that would be served with from the Banning WWTP through a 2.6-mile 16-inch diameter pipeline, that would be connected to the 2880 Zone. This pipeline would start just north of the intersection of Wilson Street and Sunset Avenue and then continue north along Sunset Avenue to the intersection with Bluff Street. The pipeline would continue further north along Bluff Street to Kendal Road, where it would connect with the southeastern portion of the Black Bench development.

Similarly to Alternative 4A, this pipeline would serve 520 ac-ft/yr to the Black Bench development.

The remaining portion of the system configuration is similar to recycled water system proposed for Alternative 1A, with the exception of the following components:

- ✓ The entire distribution system including the backbone system is 19.9 miles versus 17.3 miles in Alternative 1A.
- ✓ The 2600 Zone booster station is 2000 hp versus 1500 hp in Alternative 1A.
- ✓ The 2880 Zone booster station is 1000 hp versus 800 hp in Alternative 1A.
- ✓ The 3000 Zone booster station to Loma Linda is 1250 hp versus 125 hp in Alternative 1A.
- ✓ The 3400 Zone booster station to Loma Linda is 700 hp versus 300 hp in Alternative 1A.

- ✓ A 1250 hp booster station would be required to feed the 4100 Zone.
- ✓ The estimated required land is estimated at 5.9 acres versus 5.4 acres in Alternative 1A, to accommodate the installation of the booster station to Zone 4100.
- ✓ The potential demand is 5,555 ac-ft/yr versus 5,035 ac-ft/yr in Alternative 1A.

6.5.4 Recommendation

The estimated construction cost, land acquisition cost, total capital cost, and unit cost are summarized in Table 6.6. Detailed cost estimates are included in Appendix D. These costs are based on the total system cost and the total system demand. Table 6.7 summarizes the cost estimates of the backbone facilities required to serve the developments only. Details are included in Appendix E.

Table 6.6 SWP Supply Analysis Results - City-wide Cost
Recycled Water Master Plan
City of Banning

System Component	Alt. 4A ($ million)	Alt. 4B (million)	Alt. 4C ($ million)
Pipelines	$19.2	$19.7	$18.1
Reservoir Storage	$4.6	$4.6	$4.6
Pump Stations	$13.7	$13.7	$21.1
Total Construction Cost	**$37.5**	**$38.0**	**$43.8**

Total Capital Cost	**$63.0**	**$63.8**	**$73.2**
Total Demand (ac-ft/yr)	5,555	5,555	5,555
Unit Cost ($/ac-ft)	**$738**	**$747**	**$858**

Note: All numbers excludes wastewater treatment cost.

Table 6.7 SWP Supply Analysis Results - Development Cost Only Recycled Water Master Plan City of Banning			
System Component	Alt. 4A ($ million)	Alt. 4B (million)	Alt. 4C ($ million)
Pipelines	$3.1	$4.6	$2.1
Reservoir Storage	$3.9	$3.9	$1.8
Pump Stations	$0.0	$0.0	$0.0
Total Construction Cost	**$7.0**	**$8.4**	**$3.9**
Land Acquisition	$0.2	$0.2	$0.2
Mark-ups	$4.4	$5.3	$2.5
Total Capital Cost	**$11.6**	**$13.9**	**$6.6**
Total Demand (ac-ft/yr)	520	520	520
Unit Cost ($/ac-ft)	**$1,445**	**$1,738**	**$823**

Note: All numbers excludes wastewater treatment cost.

As shown in Table 6.6, the most cost-effective alternative to serve the Black Bench development is Alternative 4C, which delivers recycled water from the regional WWTP via the Sunset Avenue alignment to the development.

It should be noted that the unit cost to serve this development is relatively high compared to the other alternatives due to the far distance to the remaining portion of the recycled water system or the SWP supply (3-4 miles) and the booster stations (700-1250 hp) required to serve customers at the high elevation of this development.

6.6 Pardee Supply Analysis

The fifth analysis performed with the recycled water model was to determine the cost effectiveness of serving the Pardee development with recycled water. This development is in relatively close proximity to a SWP pipeline, the East Branch Extension Pipeline, which delivers untreated SWP water to the Noble Creek Spreading Grounds.

As discussed in Section 3, the potential recycled water demand in the City under MDD conditions exceeds the available recycled water supply. It would therefore be beneficial to connect the untreated SWP supply to the City's recycled water system, and further reduce the potable water supply needs. The following three alternatives were identified for this analysis:

- ✓ Alternative 5A - SWP water delivery to Pardee from the Noble Ground Spreading Ground to Reservoir 2880.
- ✓ Alternative 5B - SWP water delivery to Pardee and Black Bench from the Noble Ground Spreading Ground to Reservoir 2880.
- ✓ Alternative 5C - No SWP water delivery to Pardee or Black Bench

The location of the SWP pipeline, the spreading grounds, and the pipeline alignments involved in these alternatives are depicted on Figure 6.2.

The hydraulic model was used to size the pipelines and pump stations for each alternative. Per the recommendations of the first three analyses, the Lincoln Street Alignment was used in all alternatives as the backbone system, both gravity storage reservoirs were included, and all developments are supplied from the WWTP (no satellite plants). A description of the system configuration for the alternatives and a summary of the estimated cost are discussed below, while system schematics are included in Appendix C and detailed cost estimates are included in Appendix D.

6.6.1 Alternative 5A - SWP to Pardee only

This alternative includes a recycled water system for the Pardee development that would be served with untreated SWP water through a 2.5-mile 12-inch diameter pipeline. This pipeline would start at the Noble Creek Spreading Grounds and then continue east along Dutton Street to Bellflower Avenue, where it would continue south to Cherry Valley Boulevard. The pipeline would run south east along Cherry Valley Boulevard and then continue further south along Canyon Plaza till it reaches Reservoir 2880. This pipeline is sized to serve the entire Pardee demand, which is estimated at 1,123 ac-ft/yr.

The spreading grounds are located at a ground elevation of approximately 2,910 ft msl. Although this is higher than the high water level of Reservoir 2880, a booster station would be required due to a high point of approximately 2,990 feet msl near the intersection of Dutton Street and Bellflower Avenue.

The remaining portion of the system configuration is similar to recycled water system proposed for Alternative 1A, with the exception of the following components:

- ✓ The entire distribution system including the backbone system is 19.8 miles versus 17.3 miles in Alternative 1A.
- ✓ A 50 hp booster station would be required to feed the 2880 Zone Reservoir from the spreading grounds.
- ✓ The estimated required land is estimated at 5.9 acres versus 5.4 acres in Alternative 1A, to accommodate the installation of the second 2880 Zone booster station.
- ✓ The potential demand is 5,555 ac-ft/yr versus 5,035 ac-ft/yr in Alternative 1A.

6.6.2 Alternative 4B - SWP to Pardee and Black Bench

This alternative includes a recycled water system for the Pardee and Black Bench developments that would be served with untreated SWP water. The same 2.5-mile pipeline would be required to connect the SWP supply source with Reservoir 2880. Due to the increased demand, the majority of this pipeline would be upsized to a 20-inch diameter. In addition, a pipeline would be required to connect to the Black Bench development. This

pipeline is assumed to connect from the intersection of Bel Air Drive and Grand Plaza via the Smith Creek to the southwestern portion of Black Bench (same as Alternative 4A). This 1.9-mile pipeline would be 16-inch in diameter.

These pipelines are sized to serve the entire Pardee and Black Bench demand, which is estimated at 1,643 ac-ft/yr.

Two booster stations would be required to deliver SWP water to these developments. One booster station would pump water from the Spreading Grounds to Reservoir 2880, while the second station would pump to the 4100 Zone that serves the Black Bench development.

The remaining portion of the system configuration is similar to recycled water system proposed for Alternative 1A, with the exception of the following components:

- ✓ The entire distribution system including the backbone system is 21.7 miles versus 17.3 miles in Alternative 1A.
- ✓ A 200 hp booster station would be required to feed the 2880 Zone Reservoir from the spreading grounds.
- ✓ A 1250 hp booster station would be required to feed the 4100 Zone Reservoir from the 2880 Zone.
- ✓ The estimated required land is estimated at 6.4 acres versus 5.4 acres in Alternative 1A, to accommodate the installation of the second 2880 Zone booster station and the 4100 Zone booster station.
- ✓ The potential demand is 5,555 ac-ft/yr versus 5,035 ac-ft/yr in Alternative 1A.

6.6.3 Alternative 5C - No SWP delivery to Pardee or Black Bench

This alternative does not include SWP water supply and does not include the Black Bench development.

The system configuration in this alternative is identical to system configuration of Alternative 1A, the Lincoln Street Backbone System. The potential recycled water system demand of this alternative is 5,035 ac-ft/yr.

6.6.4 Recommendation

The estimated construction cost, land acquisition cost, total capital cost, and unit cost are summarized in Table 6.8. Detailed cost estimates are included in Appendix D. These costs are based on the total system cost and the total system demand. Table 6.9 summarizes the cost estimates of the backbone facilities required to serve the developments only. Details are included in Appendix E.

Table 6.8 Pardee Supply Analysis Results - City-wide Cost Recycled Water Master Plan City of Banning

System Component	**Alternative 5A SWP to Pardee ($ million)**	**Alternative 5B SWP to Pardee & BB ($ million)**	**Alternative 5C No SWP Delivery ($ million)**
Pipelines	$2.6	$2.6	n/a
Reservoir Storage	$0.3	$2.4	n/a
Pump Stations	$0.0	$4.7	n/a
Total Construction Cost	**$2.9**	**$0.0**	**n/a**
Land Acquisition	$0.2	$0.4	n/a
Mark-ups	$1.8	$3.2	n/a
Total Capital Cost	**$4.8**	**$16.1**	**n/a**
Total Demand (ac-ft/yr)	1,123	1,643	n/a
Unit Cost ($/ac-ft)	**$279**	**$638**	**n/a**

Note: All numbers excludes wastewater treatment cost.

As shown in Table 6.8, it is more cost-effective to serve the Pardee development with SWP water (Alternative 5A) than with recycled water from the WWTP (Alternative 5C). It should be noted that treatment cost of SWP water is not included in the comparison.

Although there is a cost difference between Alternatives 5A and 5C, and the treatment cost of SWP water are not included in the comparison, it is recommended that the City further investigate the options to use SWP as a non-potable water supply source. As listed in Table 3.1, the City's recycled water demand exceeds the projected supply, and additional sources are therefore required. Without additional supplies, the City could only serve 90 percent of the potential 5,035 ac-ft/yr of recycled water demand, which actually increases the unit cost of Alternative 5C to $756/ac-ft. Hence, if the impact of available supplies is considered, it is more cost-effective to implement Alternative 5A than Alternative 5C. By

implementing the system configuration of Alternative 5A, SWP water would be delivered at Reservoir 2880, which can benefit the entire 2880 Zone.

6.7 Proposed Recycled Water System

Based on the alternative evaluation presented herein, a combination of Alternatives 4C and 5A has been selected as the recommended recycled water system configuration for the City taking into account economic and non-economic considerations.

The proposed recycled water system consists of a backbone system along Lincoln Street, two gravity storage reservoirs in Zone 2600 and Zone 2880, and a connection with the SWP supply to the Pardee Development, and supply to Black Bench via the Sunset Avenue alignment. This alternative does not include any Satellite Plants.

The SWP supply would connect the Noble Creek Spreading Grounds with Reservoir 2880 in the northern portion of the Pardee Development. This additional supply source is crucial for the development of the City's recycled water system, as the City would have a supply shortfall of 4.7 mgd without the use of SWP water through year 2030. To provide flexibility for future expansions of the recycled water system and/or supply to a potential future water treatment plant, it is recommended that the pipeline from the SWP connection to Reservoir 2880 be sized to deliver at least 8.0 mgd or 5,500 gpm, which would require a 24-inch diameter pipeline.

The proposed recycled water system configuration is shown on Figure 6.3.

7.0 CAPITAL IMPROVEMENT PLAN

The objective of this Section is to present the City's recycled water capital improvement program (CIP). This CIP consists of the phasing, cost estimates, and the allocation of project cost for the recommended recycled water system as defined in Section 6. The purpose of this CIP is to provide the City with a guideline for the planning and budgeting of its recycled water system, which will assist the City to accommodate future growth as it offsets the need for some of the projected potable water supplies. Due to the increasing scarcity and cost of potable water cost in Southern California, it is recommended that the City work closely with the upcoming development agencies to implement this CIP and continue to provide a reliable water supply to the City's customers.

7.1 Phasing of Improvements

The recommended improvements are divided into two development stages, Phase 1, and Build Out. The Phase 1 system consists of the infrastructure needed to serve the first phase of the five new developments and the Priority 1 customers. These customers were assigned a high ranking as discussed in Section 2 and summarized in Table 2.7. This stage also includes the following three Priority 2 customers:

1) Banning USD, because this customer can be served from the pipeline that serves Repplier Park, a Priority 1 customer.

2) Five Bridges development, because this customer can be served from the pipeline that serves Sun Lakes Golf Course, a Priority 1 customer.

3) Mountain Avenue Park, because this customers is located along the Reservoir 2880 Feed/Drain pipeline.

The Build Out system consists of the remaining infrastructure components to serve the Priority 2 customers. The demand of the Build Out system is divided into Phase 2 and Phase 3. Phase 2 includes all remaining customers and the build out demand of the five developments, with the exception of the Black Bench development, which is included in Phase 3. It should be noted that Roosevelt Williams Park (Priority 3) is not included in the proposed system. Future recycled water system expansions to serve this and other potential customers that are not identified in this master plan may be desirable beyond the planning horizon of this report. The phasing of demands is summarized in Table 7.1, while the phasing of the proposed system is shown on Figure 7.1.

Table 7.1 Phasing of Recycled Water Customers Recycled Water Master Plan City of Banning					
ID	Customer Name	Demand (ac-ft/yr)	Ranking[1]	Priority[1]	Phasing

TOTAL PHASE 2 DEMAND		***1,797***			
18	Black Bench Development	520	6	2	3
TOTAL PHASE 3 DEMAND		***520***			
11	Roosevelt Williams Park	19	4	3	not included
TOTAL POST PHASE 3 DEMAND		***19***			

(1) From Table 2.8.
(2) Phase 1 and Phase 2 demands are prorated by area using the data presented in Tables 2.2 and 2.6.

7.2 Cost Estimates

The estimated construction cost, land acquisition cost, total capital cost, and unit cost are summarized in by Phase in Table 7.2, while detailed cost estimates are included in Appendix D. It should be noted that unit costs for recycled water do not include treatment cost, which are evaluated in the Sewer Master Plan.

As shown in Table 7.2 and Figure 7.2, the majority of the recycled water system is included in Phase 1. However, it is anticipated that the increase of demand will occur more gradually, which results in a more even distribution of demands between Phase 1 and Phase 2.

City of Banning
Recycled Water Master Pan

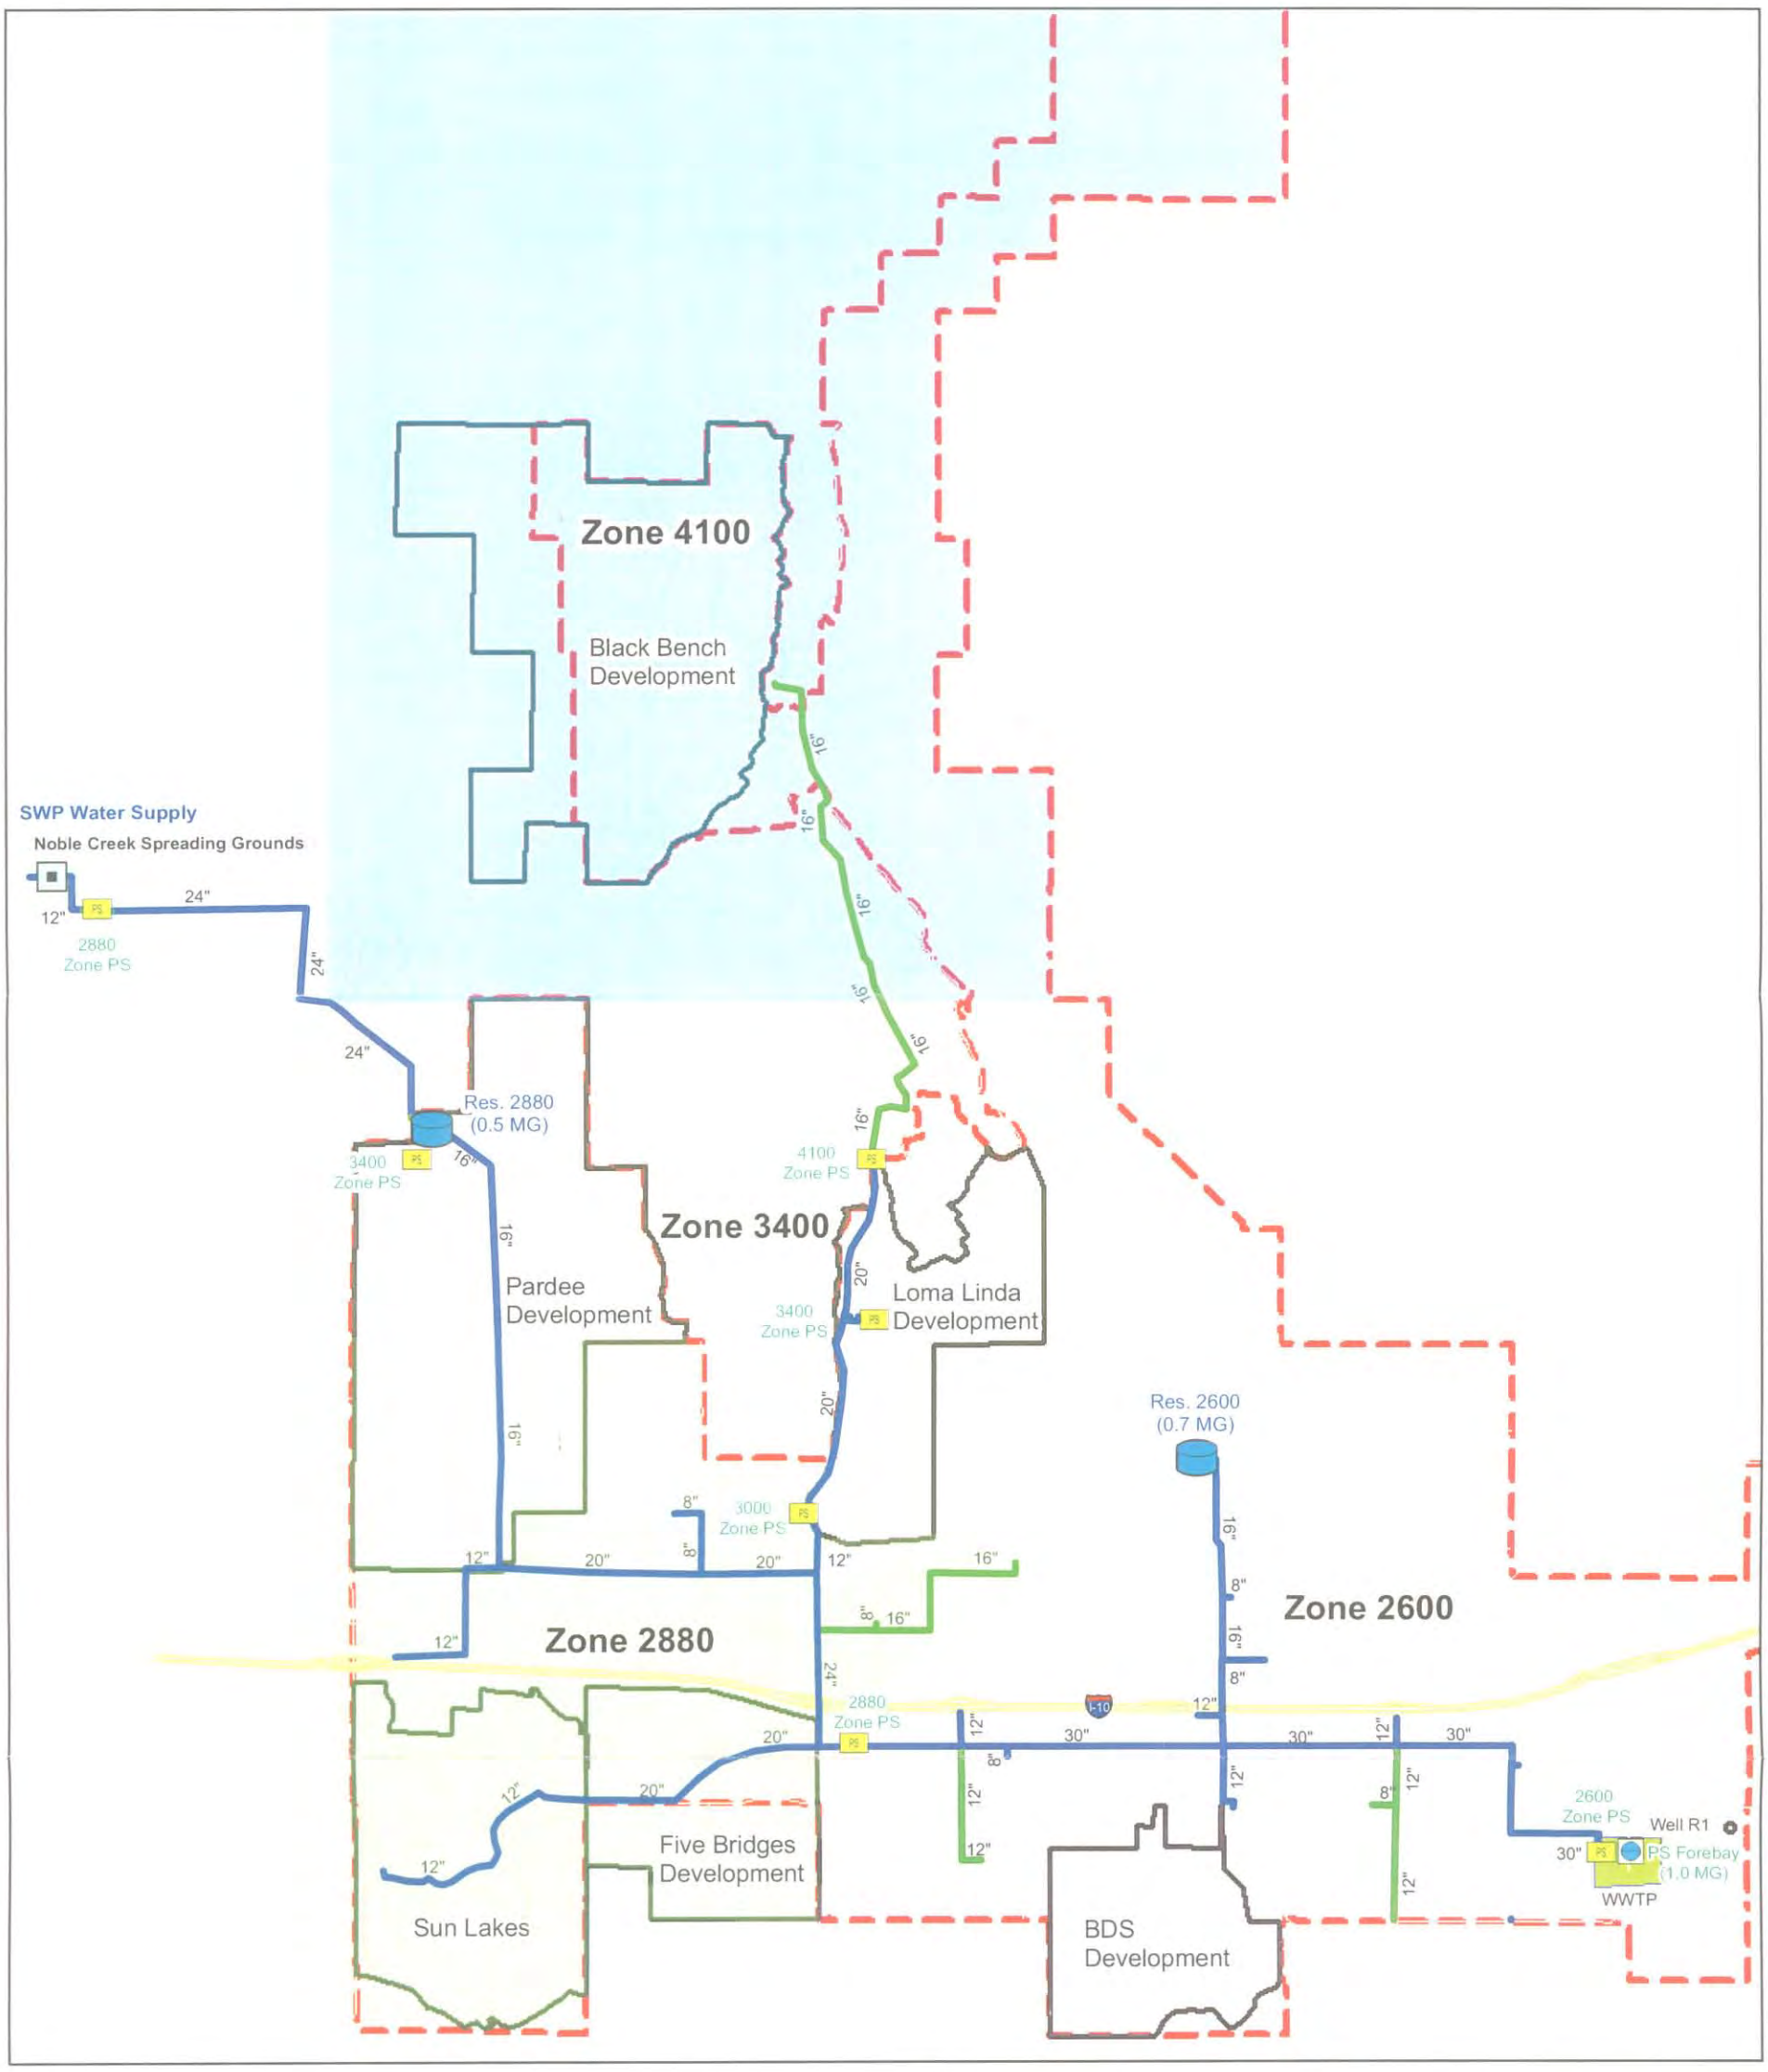

Figure 7.1 - Phasing of Proposed Recycled Water System

carollo engineers

Note:
1. This map contains data from the City of Banning GIS.
2. This map is intended for display and planning purposes only.

Table 7.2 Phasing of Recycled Water Cost Recycled Water Master Plan City of Banning				
System Component	**Phase 1 ($ million)**	**Phase 2 ($ million)**	**Phase 3 ($ million)**	**Build Out ($ million)**
Pipelines	$18.3	$2.1	$2.1	$22.5
Reservoir Storage	$4.6	$0.0	$0.0	$4.6
Pump Stations	$6.1	$5.1	$2.2	$13.4
Total Construction Cost	**$29.1**	**$7.1**	**$4.3**	**$40.5**
Land Acquisition	$2.1	$0.0	$0.2	$2.2
Mark-ups	$18.2	$4.5	$2.7	$25.3
Total Capital Cost	**$49.3**	**$11.6**	**$7.2**	**$68.0**
Total Demand (ac-ft/yr)	3,238	1,797	520	5,555
Unit Cost ($/ac-ft)	**$990**	**$420**	**$896**	**$797**

As a result, the unit cost of the Phase 1 system is much higher ($990/ac-ft) than the unit cost of the Phase 2 expansion ($420/ac-ft), and the Phase 3 expansion ($896/ac-ft). The weighted average unit cost of the proposed recycled water system is $797/ac-ft (not including treatment cost).

Although this unit cost is higher than the cost of imported potable water, it is expected that the potable water costs will exceed the $797/ac-ft within the next five or ten years due to potable water rate increases, particularly in Southern California where water supply is limited and rapid growth is forecasted for the next decades.

Hence, the cost of recycled water will become very attractive in the near term, as these cost are expected to remain constant, not including the effects of inflation or changes in interest rate. In addition, the investment in a recycled water system is extremely beneficial to the City as it reduces the need for additional potable water supply sources.

7.3 Distribution of Construction Cost

The distribution of construction and land acquisition cost for the proposed system under build out conditions is graphically presented in Figure 7.3. As shown in Figure 7.3, pipelines contribute to the majority of the overall system cost.

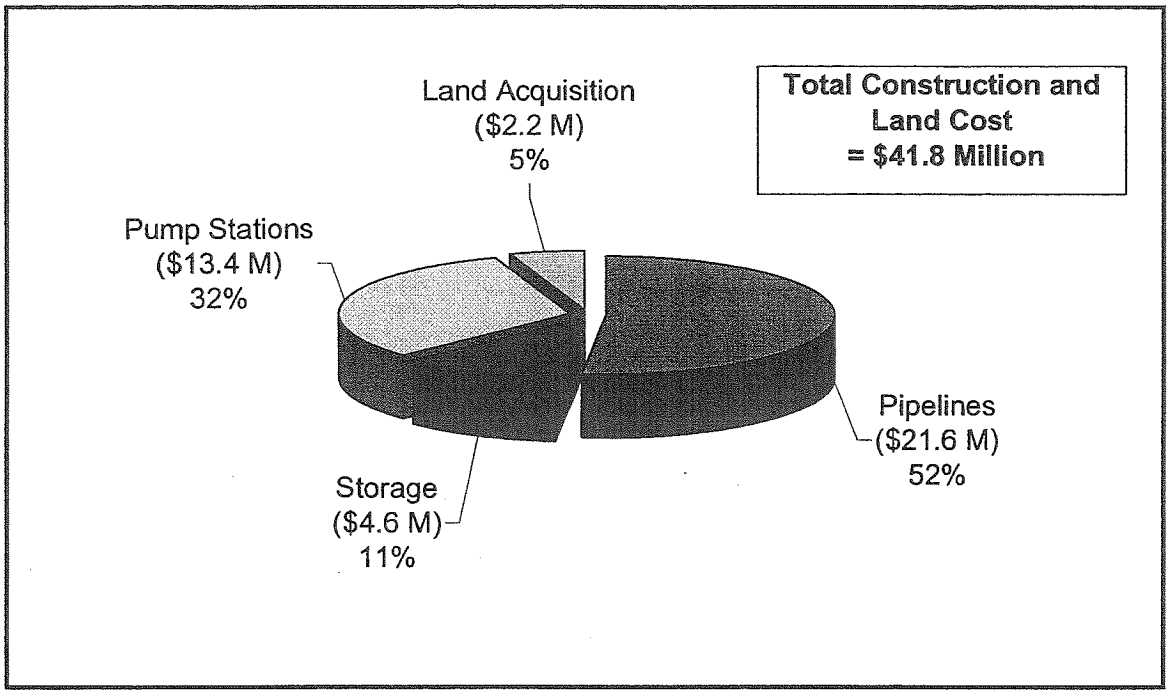

Figure 7.3 Distribution of System Construction and Land Acquisition Cost

7.4 Allocation of Capital Cost

The overall recycled water system cost can be allocated to the various developments and other small customers based on their proportional demand. This allocation is presented in Table 7.3. The allocation of treatment cost is included in the Sewer Master Plan.

Table 7.3 Allocation of Capital Cost
Recycled Water Master Plan
City of Banning

Customer	Demand (ac-ft/yr)				Capital Cost ($ million)			
	Phase 1	Phase 2	Phase 3	Total	Phase 1	Phase 2	Phase 3	Total
Loma Linda	644	414	-	1,058	$9.8	$2.7	-	$12.5

Other City Customers	2,171	474	-	2,645	$33.0	$3.1	-	$36.1
Total	**3,238**	**1,797**	**520**	**5,555**	**$49.3**	**$11.6**	**$7.2**	**$68.0**

APPENDIX K

WATER CONSERVATION ORDINANCE AND RESOLUTION

ORDINANCE NO. 1489

ORDINANCE NO. 1489

AN ORDINANCE OF THE CITY OF BANNING, CALIFORNIA, RELATED TO WATER CONSERVATION DURING CALIFORNIA'S STATE OF EMERGENCY DUE TO DROUGHT CONDITIONS

WHEREAS, on January 17, 2014 Governor Jerry Brown ("Governor") issued a proclamation of a state of emergency under the California Emergency Services Act based on California's drought conditions and continued the state of emergency by issuing a proclamation on April 25, 2014; and

WHEREAS, on April 1, 2015, the Governor issued Executive Order No. B-29-15 imposing mandatory water use reductions which also provides direction to the State Water Resources Control Board ("SWRCB") to impose restrictions on water use to achieve a statewide 25 percent reduction in potable urban water use; and

WHEREAS, California's water supplies continue to be severely depleted, severe drought conditions continue to present urgent challenges, and new expedited actions are needed to reduce the harmful impacts of the drought; and

WHEREAS, on April 7, 2015, the SWRCB proposed a mandatory Regulatory Framework that apportions water reductions according to consumption. The SWRCB revised the apportionment of water reductions on April 18 and April 28th. The conservation savings for all urban water suppliers are now allocated across nine tiers of increasing levels of residential water use ("R-GPCD") to reach the statewide 25 percent reduction mandate. Agencies in Tier 8, including the City of Banning, having residential water use of 179.4 R-GPCD, must reduce water use by 32 percent between June 2015 to February 2016, as compared to the same periods in 2013; and

WHEREAS, on May 5, 2015 the SWRCB adopted Article 22.5, Drought Emergency Water Conservation ("Drought Regulation") which includes a prohibition against certain irrigation practices and an order that all urban water suppliers reduce their total potable water production by a defined percentage which has been applied to each urban water supplier; and

WHEREAS, the intention of the proposed ordinance is to facilitate the implementation of the requirements of the SWRCB Drought Regulation as well as to provide additional tools to achieve the City's required reduction of 32 percent.

BE IT ORDAINED BY THE CITY COUNCIL OF THE CITY OF BANNING AS FOLLOWS:

Section 1. Incorporation of Recitals. All of the foregoing Recitals are true and correct and are incorporated herein and made an operative part of this Ordinance.

Section 2. Public Hearing. A Public Hearing was conducted on May 26, 2015 at 5:00 p.m., in the Council Chamber located at 99 E. Ramsey Street, Banning, CA 92220 and all written and oral testimony has been incorporated into the record.

Section 3. The City Council hereby adopts Ordinance No. 1489, Drought Water Conservation in order to preserve the public health and safety by conserving water during the ongoing drought and to comply with Governor Jerry Brown's Executive Order and the State Water Resource Control Board Drought Regulation.

Section 4. Ordinance No. 1489 requires the following:

A. Mandatory Prohibitions: The following mandatory prohibitions as required by the State Water Resource Control Board Drought Regulation are hereby adopted for the period provided in the Executive Order (the "Water Emergency"). The Ordinance prohibits the following:

1. The application of potable water to outdoor landscapes in a manner that causes runoff such that water flows onto adjacent property, non-irrigated areas, private and public walkways, roadways, parking lots, or structures.
2. The use of a hose that dispenses potable water to wash a motor vehicle, except where the hose is fitted with a shut-off nozzle or device attached to it that causes it to cease dispensing water immediately when not in use.
3. The application of potable water to driveways and sidewalks.
4. The use of potable water in a fountain or other decorative water feature, except where the water is part of a recirculating system.
5. The application of potable water to outdoor landscapes during and within 48 hours after measurable rainfall.
6. The serving of beverages other than upon request in eating or drinking establishments, including but not limited to restaurants, hotels, cafes, cafeterias, bars, or other public places where food or drink are served and/or purchased.
7. The irrigation with potable water of ornamental turf on public street medians.
8. The irrigation with potable water of landscapes outside of newly constructed homes and buildings in a manner inconsistent with regulations or other requirements established by the California Building Standards Commission and the Department of Housing and Community Development.

B. Additional Water Restrictions: The following additional water restrictions shall apply during the Water Emergency:

1. Operators of hotels and motels shall provide guests with the option of choosing not to have towels and linens laundered daily. The hotel or motel shall prominently display notice of this option in each guestroom using clear and easily understood language
2. Commercial, industrial and institutional properties, such as campuses, golf courses and cemeteries shall implement water efficiency measures to reduce potable water usage in an amount consistent with the reduction target.

3. No person shall empty and refill a swimming pool except to prevent or repair structural damage or to comply with health regulations.
4. Parks and schools shall be watered on alternate days during the hours between sunset and sunrise.
5. Lawn watering and landscape irrigating including, construction water use, are restricted as follows: customers with even numbered street addresses shall water only on Monday, Wednesday, and Friday and customers with odd numbered street addresses shall water only Tuesday, Thursday and Sunday. Watering and irrigating shall occur between sunset and sunrise.
6. Broken sprinklers shall be repaired within 24 hours of notification, and leaks shall be repaired as soon as practicable.

C. Recommended Practices: The following practices are recommended during the Water Emergency:

1. The City of Banning strongly encourages Home Owner Associations ("HOA") and other enforcement agencies to suspend code enforcement and fines for brown turf areas and encourage the replacement of turf areas with drought tolerant landscaping.
2. Planting of spray irrigated annual flower beds is strongly discouraged.
3. Irrigation of non-functional ornamental turf, such as parkways is strongly discouraged.
4. Installation of irrigation smart controllers is strongly encouraged.
5. Use of pool covers when not in use, especially during summer months is strongly encouraged.
6. Over-seeding is strongly discouraged.

D. Civil Penalties: Violations of this Ordinance shall be subject to the following penalties:

1. First Violation. For a first violation, the City shall issue a written notice of violation to the water user.
2. Second Violation. For a second violation, within a twelve month period, a one month surcharge of 25 percent of the previous month's water bill will be imposed.
3. Third Violation. For a third violation, within a twelve month period, a one month surcharge of 50 percent of the previous month's water bill will be imposed.
4. At the discretion of the City Manager, subsequent violations will continue with a penalty as described in Civil Penalties No. 3 or a penalty of up to $500 per day for which the violation occurs.

Section 5. CEQA. The Board finds that adopting and enforcing mandatory restrictions on water use in order to comply with SWRCB requirements is exempt from the California Environmental Quality Act ("CEQA") pursuant to State CEQA Guidelines Section 15268 and Public Resources Code Section 21080(b)(I) as a ministerial action.

Section 6. The Mayor shall sign this ordinance and the City Clerk shall attest thereto and shall publish it or a summary of it in a newspaper printed and published within the City, and thereafter this ordinance shall be in force and effect according to law.

PASSED, APPROVED AND ADOPTED this 9th day of June, 2015.

RESOLUTION NO. 2010-06

City of Banning
Office of the City Clerk

January 27, 2010

Mr. Simon Eching
California Department of Water Resource
Water Use and Efficiency Branch
P.O. Box 942836
Sacramento, CA 94236-0001

Subject: Water Conservation in Landscaping Act (AB 1881)

Dear Mr. Eching:

As required by AB 1881, enclosed with this letter is a certified copy of City Council Resolution No. 2010-06 adopted on January 26, 2010 making certain findings that the City's adopted landscaping ordinance and water conservation ordinance are as effective as the State's model water efficiency landscape ordinance.

If you have questions regarding this correspondence, please contact Zai Abu Bakar, Community Development Director at (951) 922-3131.

Regards,

Marie A. Calderon
City Clerk

encl.

99 E. Ramsey St. • P.O. Box 998 • Banning, CA 92220-0998 • (951) 922-3102 • Fax (951) 922-3128

RESOLUTION NO. 2010-06

A RESOLUTION OF THE CITY COUNCIL OF THE CITY OF BANNING MAKING CERTAIN FINDINGS THAT THE CITY'S WATER EFFICIENT LANDSCAPE ORDINANCE IS AS EFFECTIVE AS THE STATE'S MODEL WATER EFFICIENT LANDSCAPE ORDINANCE (MWELO) IN CONNECTION WITH AB 1881 WATER CONSERVATION IN LANDSCAPING ACT.

WHEREAS, California is experiencing its third consecutive year of sustained drought and historically drought has been a part of the California environment; and

WHEREAS, it is estimated that about half of urban water use is from landscape irrigation; and

WHEREAS, Assembly Bill (AB) 1881 the *Water Conservation in Landscaping Act* was approved by the Governor of the State of California on September 28, 2006; and

WHEREAS, AB 1881 requires local agencies to adopt a water efficient landscape ordinance by January 1, 2010, or the State's Model Water Efficient Landscape Ordinance prepared by the Department of Water Resources shall apply; and

WHEREAS, on February 14, 2006 the City Council for the City of Banning adopted new zoning regulations by approving Ordinance No. 1339; the new zoning regulations include Chapter 17.32 *Landscaping Standards* that correspond to the requirements of AB 1881. Additionally, Chapter 13.16 *Water Conservation* and Chapter 13.24 *Stormwater Code* of the municipal code contain elements that correspond to the various requirements of AB 1881; and

WHEREAS, the City now desires to notify the Department of Water Resources of compliance with AB 1881 requirements;

NOW THEREFORE BE IT RESOLVED, that the City Council of the City of Banning does hereby find, determine, and resolve as follows:

1. That the adopted regulations codified in Chapter 17.32 *Landscaping Standards,* Chapter 13.16 *Water Conservation,* and Chapter 13.24 *Stormwater Code,* copies of which are included as Exhibit "A" of this resolution and specifically detailed in the comparison chart listed below, are at least as effective in conserving water as the State's Model Water Efficient Landscape Ordinance.

2. That the City Clerk is directed to submit a copy of this resolution to the Department of Water Resources in accordance with the requirements of AB 1881.

CERTIFIED TO BE A TRUE AND CORRECT COPY OF THE ORIGINAL DOCUMENT ON FILE IN THE OFFICE OF THE CITY CLERK.

BY Marie A. Calderon

TITLE City Clerk

DATE 1-27-10

Comparison Chart

AB 1881 Requirement	Corresponding City Code/Program
65595. (a) (1) To the extent funds are appropriated, not later than January 1, 2009, by regulation, the department shall update the model water efficient landscape ordinance adopted pursuant to Chapter 1145 of the Statutes of 1990, after holding one or more public hearings. The updated model ordinance shall be based on the recommendations set forth in the report prepared pursuant to Chapter 682 of the Statutes of 2004 and shall meet the requirements of Section 65596. (c) On or **before January 1, 2010, a local agency shall adopt** one of the following: (1) **A water efficient landscape ordinance** that is, based on evidence in the record, at least as effective in conserving water as the updated model ordinance adopted by the department pursuant to subdivision (a). (2) The updated model ordinance described in paragraph (1). (d) If the local agency has not adopted, on or before January 1, 2010, a water efficient landscape ordinance pursuant to subdivision (c), the updated model ordinance adopted by the department pursuant to subdivision (a) shall apply within the jurisdiction of the local agency as of that date, shall be enforced by the local agency, and shall have the same force and effect as if adopted by the local agency.	The Zoning Code as adopted on February 14, 2006 contains Chapter 17.32 *Landscaping Standards* that corresponds with the requirements of AB 1881; also, Chapter 13.16 *Water Conservation* adopted in 1965.
65596. The updated model ordinance adopted pursuant to Section 65595 shall do all the following in order to reduce water use: (a) **Include provisions for water conservation** and the appropriate use and groupings of plants that are well-adapted to particular sites and to particular climatic, soil, or topographic conditions. The model ordinance shall not prohibit or require specific plant species, but it may include conditions for the use of plant species or encourage water conserving plants. However, the model ordinance shall not include conditions that have the effect of prohibiting or requiring specific plant species.	17.32.070; Chapter 13.16
(b) **Include a landscape water budget component** that establishes the maximum amount of water to be applied through the irrigation system, based on climate, landscape size, irrigation efficiency, and plant needs.	17.32.090
(c) **Promote the benefits** of consistent local ordinances in neighboring areas.	17.32.030(A)
(d) Encourage the capture and **retention of stormwater** onsite to improve water use efficiency or water quality.	13.24.120
(e) Include **provisions for the use of automatic irrigation systems** and irrigation schedules based on climatic conditions, specific terrains and soil types, and other environmental	17.32.030(H)

conditions. The model ordinance shall include references to local, state, and federal laws and regulations regarding standards for water-conserving irrigation equipment. The model ordinance may include climate information for irrigation scheduling based on the California Irrigation Management Information System.	
(f) Include **provisions for onsite soil assessment** and soil management plans that include grading and drainage to promote healthy plant growth and to prevent excessive erosion and runoff, and the use of mulches in shrub areas, garden beds, and landscaped areas where appropriate.	17.32.090(A)(8)
(g) **Promote the use of recycled water** consistent with Article 4 (commencing with Section 13520) of Chapter 7 of Division 7 of the Water Code.	17.32.090
(h) Seek to **educate water users** on the efficient use of water and the benefits of doing so.	17.32.100
(i) Address regional differences, including fire prevention needs.	17.32.160(A); 17.32.170(C); 8.16.020
(j) Exempt landscaping that is part of a registered historical site.	13.16.030(D)(3)
(k) Encourage the use of **economic incentives** to promote the efficient use of water.	13.08.040 – escalating commodity charge.
(*l*) Include provisions for **landscape maintenance practices** that foster long-term landscape water conservation. Landscape maintenance practices may include, but are not limited to, performing routine irrigation system repair and adjustments, conducting water audits, and prescribing the amount of water applied per landscaped acre.	17.32.050
(m) Include provisions to **minimize landscape irrigation overspray** and runoff.	17.32.090
65598. Any model ordinance adopted pursuant to this article shall **exempt cemeteries** from all provisions of the ordinance except those set forth in subdivisions (h), (k), and (*l*) of Section 65596. In adopting language specific to cemeteries, the department shall recognize the special landscape management needs of cemeteries.	13.16.030(D)(2)
535. (a) A water purveyor shall require as a condition of new retail water service on and after January 1, 2008, the installation of **separate water meters** to measure the volume of water used exclusively for landscape purposes.	Include in conditions of approval for applicable projects.

17.32.170 Installation and maintenance.

Article I.
General Provisions

17.32.010 Purpose.

The purpose of this chapter is to establish landscaping regulations that are intended to:

A. Protect and preserve the natural environment in the City of Banning, and to incorporate green space, vegetation, and shade into the urban landscape.

B. Enhance the aesthetic appearance of development in all areas of the City by providing standards for quality, quantity and functional aspects of landscaping and landscape screening.

C. Reduce the heat and glare generated by development

D. Increase the compatibility between residential land uses and those abutting commercial and industrial land uses.

E. Provide privacy within residential developments, and to provide privacy on the perimeter of residential areas from various residential, commercial or other uses outside of the development.

F. Protect the public health, safety and welfare by minimizing the impact of all forms of physical and visual pollution, controlling soil erosion, screening incompatible land uses, preserving the integrity of neighborhoods, and enhancing pedestrian, cyclist and vehicular traffic and safety.

G. Increase the liveability of the City of Banning for children, adults, and visitors. (Zoning Ord. dated 1/31/06, § 9108.01.)

17.32.020 Application.

A. A concept landscaping plan shall be submitted as part of a planning permit application. The concept plan shall meet the intent of this chapter by exhibiting a generalized design layout which adequately demonstrates the desired landscaping program in terms of location, size/scale, function, theme and other attributes.

B. The concept plan shall provide the review authority with a clear understanding of the landscaping program prior to the preparation of a detailed, comprehensive landscaping plan. All landscaping plans must take into account the preservation of natural features including hills, topography, trees, shrubs, wildlife habitat, etc. The landscaping plan should refer to such natural elements, and enhance rather than detract from such elements.

C. Landscaping plans shall rely primarily on indigenous plant and tree species which are suitable to the local climate and soil types, rather than relying on foreign or invasive species which often compete with, and displace local species. The use of indige-

nous plant, shrub and tree types is also important in providing continuity of habitat for wildlife species, including local birds. The use of invasive species which have proven to be detrimental to flora species native to Southern California are strongly discouraged in all landscaping plans. Such species include the tamarisk (or salt cedar tree), and the Russian olive. Likewise many plants and trees from other areas (such as the tropics or the American southeast) have much greater water requirements than native species, and the planting and maintenance of such flora species will undermine the City's goal of water conservation. (Zoning Ord. dated 1/31/06, § 9108.02.)

17.32.030 General regulations.

A comprehensive landscaping plan shall be prepared following approval of the permit application by the review authority, and shall be submitted at the same time as the grading plan and related documents and reports. The landscape and irrigation plans shall be approved by the Community Development Department, and this department may obtain any necessary input from the Public Works Department. Landscaping requirements include the following:

A. Designs shall be in harmony with the surrounding environment.

B. Landscape design and construction shall emphasize drought-tolerant landscaping whenever and wherever possible.

C. A comprehensive landscape and irrigation plan shall include, but not be limited to:

1. List of all plants (common and Latin) including trees and shrubs;
2. Size of plants;
3. Location of plants;
4. Irrigation plan for the plants;
5. Hardscape;
6. Water elements;
7. Any other information deemed necessary by the City.

D. Planting of trees and shrubs shall comply with the following installation requirements:

1. Landscape areas shall include plant material and planting methods which are suitable for the soil of the site. The minimum percentage of plant sizes shall be as follows:

Trees:	20%, 36 inch box 50%, 24 inch box
Shrubs:	100%, 5 gallon
Groundcover:	100% coverage within 1 year

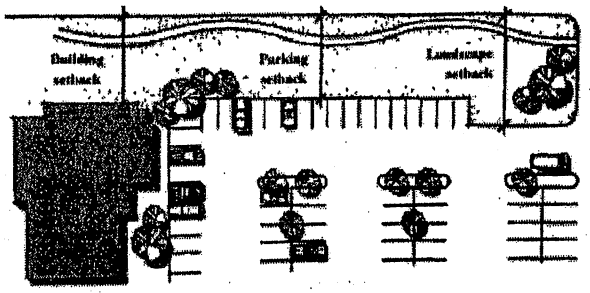
2. Trees and shrubs shall be planted so that at maturity they do not interfere with service lines, traffic safety sight area, and the basic property rights of adjacent property owners.

3. A variety of flowering trees, fragrant trees, and fruit trees, may all be included in the landscaping plan.

4. Trees planted near public rights-of-way shall have a limited deep root system and shall be installed so as to prevent physical damage to sidewalks, curbs, gutters and other public improvements.

5. Tree grates shall surround trees installed in paved areas or sidewalks. Trees with a deep root system shall be used in such areas.

F. Concrete mow strips are required to separate all turf areas from other landscaped areas in the commercial and industrial districts.

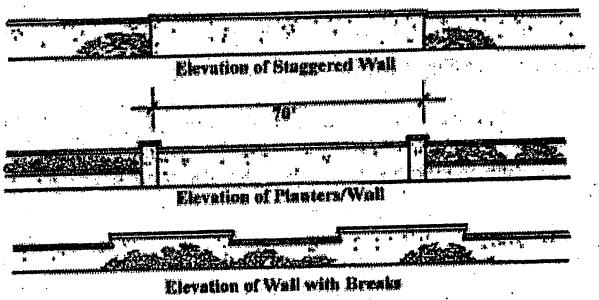


G. Inorganic groundcover shall be used in combination with live plants, and shall be used as an accent feature.

H. All landscaping shall include a water-efficient automatic irrigation system.

I. The front yards, and side yards visible from the public right-of-way, of all residential subdivisions shall be landscaped with trees, shrubs and groundcover. At a minimum, each front yard shall include 2 24 inch box trees, and sufficient shrubs and groundcover to provide full coverage within 2 years of installation. (Zoning Ord. dated 1/31/06, § 9108.03.)

17.32.040 Setback and parkway treatments.



Landscape standards for setback and parkway areas shall include, but not be limited to:

A. Setback and parkway areas shall utilize uniform street tree plantings with complementary landscape materials.

B. Mounding or berming shall be incorporated within the overall design, with landscaped slopes not exceeding a three to one ratio, or four feet in height. A minimum of six feet of landscaping shall be placed on the exterior of perimeter walls and fences.

C. Walls and fences should be incorporated into the landscape design, including meandering walls, wall breaks, or openings where the design shall complement the landscaping of the adjacent development.

D. All designs shall insure compatibility with established setback and parkway areas, including transitions between landscape types and patterns.

E. Street trees shall be 24 inch box specimens or larger. (Zoning Ord. dated 1/31/06, § 9108.04.)

17.32.050 Installation and maintenance.

A. Landscaping shall be permanently maintained by the developer or his/her successors. All required landscaping shall be properly installed, irrigated, and inspected prior to the issuance of a Certificate of Occupancy.

B. Maintenance of approved landscaping shall consist of:

1. Regular watering;
2. Mowing;
3. Pruning;
4. Fertilizing;
5. Clearing of debris and weeds;
6. Removal and replacement of dead plants;
7. The repair and replacement of irrigation systems; and
8. The repair and replacement of integrated architectural features. (Zoning Ord. dated 1/31/06, § 9108.05.)

17.32.060 Removal or destruction of trees.

A. Removal of healthy, shade providing, and aesthetically valuable trees shall be strongly discouraged, and shall be in conformance with the policies and programs of the General Plan. A tree removal and replacement plan shall be required for the removal and replacement of all trees in excess of 50 years of age, unless their removal is required to protect the public health and safety.

B. Each tree that is removed in a new subdivision is considered a part of the common wealth of the citizens of Banning, is an important component of the habitat of surrounding wildlife, and is of value to the City. Each identified tree removed shall be replaced with at least one 36 inch box specimen tree, in addition to any other required landscaping. Individual single family residential lots of less than one-half acre and commercial tree farms shall be exempt from this provision. (Zoning Ord. dated 1/31/06, § 9108.06.)

Article II.
Water Conservation

17.32.070 Purpose and definitions.

A. In order to assure that the City's water resources are not significantly impacted by high water consuming landscape plans, the following standards for water efficiency shall be implemented for all landscaping plans required in this chapter, under Section 17.32.020, Applicability.

B. Definitions.

Anti-drain valve or check valve means a valve located under a sprinkler head to hold water in the system so it minimizes drainage from the lower elevation sprinkler heads.

Application rate means the depth of water applied to a given area, measured in inches per hour. Also known as precipitation rate (sprinklers) or emission rate (drippers/microsprayers) in gallons per hour.

Applied water means the portion of water supplied by the irrigation system to the landscaping.

Automatic controller means a mechanical or solid-state timer, capable of operating valve stations to set the days and length of time of a water application.

Backflow prevention device means a safety device used to prevent pollution or contamination of the water supply due to the reverse flow of water from the irrigation system.

Conversion factor (0.62) means a number that converts the maximum applied water allowance from acre-inches per acre per year to gallons per square foot per year. The conversion factor is calculated as follows:

325,851 gallons/43,560 square feet/12 inches	= (0.62)
325,851 gallons	= one acre foot
43,560 square feet	= one acre
12 inches	= one foot

To convert gallons per year to 100 cubic feet per year, the common billing unit for water, divide gallons per year by 748. (748 gallons = 100 cubic feet.)

Ecological restoration project means a project where the site is intentionally altered to establish a defined, indigenous, historic ecosystem.

Effective precipitation or usable rainfall means the portion of total natural precipitation that is used by the plants.

Emitter means drip irrigation fittings that deliver water slowly from the system to the soil.

Established landscape means the point at which plants in the landscape have developed roots into the soil adjacent to the root ball.

Establishment period means the first year after installing the plant in the landscape.

Estimated annual applied water use means the portion of the estimated annual total water use that is derived from applied water. The estimated annual applied water use shall not exceed the maximum applied water allowance.

Estimated total water use means the annual total amount of water estimated to be needed to keep the plants in the landscaped area healthy. It is based upon such factors as the local evapotranspiration rate, the size of the landscaped area, the types of plants, and the efficiency of the irrigation system.

ET adjustment factor means a factor of 0.6 that, when applied to reference evapotranspiration, adjusts for plant factors and irrigation efficiency, two major influences upon the amount of water that needs to be applied to the landscape. A combined plant mix with a site-wide average 0.45 is the basis of the plant factor portion of this calculation. The irrigation efficiency for purposes of the ET adjustment factor is 0.75. Therefore, the ET adjustment factor (0.6) = (0.45/0.75).

Evapotranspiration means the quantity of water evaporated from adjacent soil surfaces and transpired by plants during a specific time.

Flow rate means the rate at which water flows through pipes and valves (gallons per minute or cubic feet per second).

Hydrozone means a portion of the landscaped area having plants with similar water needs that are served by a valve or set of valves with the same schedule. A hydrozone may be irrigated or nonirrigated. For example, a naturalized area planted with native vegetation that will not need supplemental irrigation once established is a nonirrigated hydrozone.

Infiltration rate means the rate of water entry into the soil expressed as a depth of water per unit of time (inches per hour).

Irrigation efficiency means the measurement of the amount of water beneficially used divided by the

amount of water applied. Irrigation efficiency is derived from measurements and estimates of irrigation system characteristics and management practices. The minimum irrigation efficiency for purposes of this chapter is 0.75. Greater irrigation efficiency can be expected from well-designed and maintained systems.

Landscape irrigation audit means a process to perform site inspections, evaluate irrigation systems, and develop efficient irrigation schedules.

Landscaped area means the entire parcel less the building footprint, driveways, nonirrigated portions of parking lots, hardscapes such as decks and patios, and other nonporous areas. Water features are included in the calculation of the landscaped area.

Lateral line means the water delivery pipeline that supplies water to the emitters or sprinklers from the valve.

Main line means the pressurized pipeline that delivers water from the water meter to the valve or outlet.

Service line means the pressurized pipeline that delivers water from the water source to the water meter.

Maximum applied water allowance means for design purposes, the upper limit of annual applied water for the established landscaped area. It is based upon the area's reference evapotranspiration, the ET adjustment factor, and the size of the landscaped area. The estimated applied water use shall not exceed the maximum applied water allowance.

Mined-land reclamation projects means any surface mining operation with a reclamation plan approved in accordance with the Surface Mining and Reclamation Act of 1975.

Mulch means any material such as gravel, small rocks, pebbles, decorative sand, decomposed granite, bark, straw or other material left loose and applied to the soil surface for the beneficial purpose of reducing evaporation.

Operating pressure means the manufacturer's recommended pressure at which a system of sprinklers, bubblers, drippers or microsprayers is designed to operate.

Overhead sprinkler irrigation systems means those with high flow rates (pop-ups, impulse sprinklers, rotors, etc.)

Overspray means the water which is delivered beyond the landscaped area, wetting pavements, walks, structures, or other non-landscaped areas.

Plant factor means a factor that when multiplied by reference evapotranspiration, estimates the amount of water used by plants. For purposes of this chapter, the average plant factor of very low water using plants ranges from 0.01 to 0.10, for low water using plants the range is 0.10 to 0.35, for moderate water using plants the range is 0.35 to 0.60 and for high water using plants, the range is 0.60 to 0.90.

Rain sensing device means a system which automatically shuts off the irrigation system when it rains.

Record drawing or as-builts means a set of reproducible drawings which show significant changes in the work made during construction which are usually based on drawings marked up in the field and other data furnished by the contractor.

Recreational area means areas of active play or recreation such as sports fields, school yards, picnic grounds, or other areas with intense foot traffic.

Recreational turfgrass means turfgrass that serves as a playing surface for sports and recreational activities. Athletic fields, golf courses, parks and school playgrounds are all examples of areas hosting recreational turf grass.

Recreational turfgrass ET adjustment factor means a factor of 0.82 that, when applied to reference evapotranspiration, adjusts for the additional stress of high traffic on recreational turfgrass and the higher irrigation efficiencies of long range rotary sprinklers. These are the two major influences upon the amount of water that needs to be applied to a recreational landscape. A mixed cool/warm season turfgrass with a seasonal average of 0.7 is the basis of the plant factor portion of this calculation. The irrigation efficiency of long range sprinklers for purposes of the ET adjustment factor is 0.85. Therefore, the ET adjustment factor is 0.82 = 0.7/0.85.

Recycled water, reclaimed water or treated sewage effluent water means treated or recycled

waste water of a quality suitable for nonpotable uses such as landscape irrigation; not intended for human consumption.

Reference evapotranspiration or ETo means a standard measurement of environmental parameters which affect the water use of plants. ETo is given in inches per day, month, or year, and is an estimate of the evapotranspiration of a large field of cool-season grass that is well watered. Reference evapotranspiration is used as a basis of determining the maximum applied water allowances so that regional differences in climate can be accommodated. For purposes of this chapter, the following ETo zone map will be used. (See map attached to the ordinance codified in this chapter.)

Rehabilitated landscape means any relandscaping project whose choice of new plant material and/or new irrigation system components is such that the calculation of the site's estimated water use will be significantly changed. The new estimated water use calculation must not exceed the maximum applied water allowance calculated for the site using a 0.6 ET adjustment factor.

Runoff means water which is not absorbed by the soil or landscape to which it is applied and flows from the planted area. For example, runoff may result from water that is applied at too great a rate (application rate exceeds infiltration rate), when there is a severe slope or when water is misapplied to hardscapes.

Soil moisture sensing device means a device that measures the amount of water in the soil.

Soil texture means the classification of soil based on the percentage of sand, silt and clay in the soil.

Sprinkler head means a device which sprays water through a nozzle.

Static water pressure means the pipeline pressure when water is not flowing.

Station means an area served by one valve or by a set of valves that operates simultaneously.

Turf means a surface layer of earth containing mowed grass with its roots. Perennial and Annual Ryegrass are cool season grasses. Hybrid and common Bermuda grass, are warm season grasses.

Valve means a device used to control the flow of water in the irrigation system.

Water conservation concept statement means a one-page checklist and a narrative summary of the project.

Water feature means any water applied to the landscape for non-irrigation decorative purposes. Fountains, streams, ponds and lakes are considered water features. Water features use more water than efficiently irrigated turf grass and are assigned a plant factor value of 1.1 for a stationary body of water and 1.2 for a moving body of water. (Zoning Ord. dated 1/31/06, § 9108.07(1).)

17.32.080 Applicability.

A. Except as provided in Section 17.32.030, this article shall apply to:

1. All new and rehabilitated landscaping for private, public, commercial and governmental development projects that require a permit; and
2. Developer-installed landscaping in single-family tracts and multifamily projects.

B. Projects subject to this section shall conform to the provisions in this section.

C. This section shall not apply to resident homeowner-provided landscaping at single-family residences. (Zoning Ord. dated 1/31/06, § 9108.07(2).)

17.32.090 Landscape documentation package.

A. Each landscape documentation package shall include the following elements, which are described below under "Elements of Landscape Documentation Package".

1. Water conservation concept statement;
2. Calculation of the maximum applied water allowance;
3. Calculation of the estimated applied water use;
4. Calculation of the estimated total water use;
5. Landscape design plan;
6. Irrigation design plan;
7. Grading design plan:
8. Soil analysis (optional);

9. Certificate of substantial completion. (To be submitted by certified landscape designer, auditor or landscape architect after installation of the project.)

B. Three copies of the landscape documentation package conforming to this chapter shall be submitted to the city. No permit shall be issued until the city reviews and approves the landscape documentation package. Prior to preparation and submission of the landscape documentation package, the preliminary landscape design shall be approved by the Planning Commission.

C. A copy of the approved landscape documentation package shall be provided to the property owner or site manager along with the record drawings and any other information normally forwarded to the property owner or site manager.

D. Upon completion of construction, a copy of the water conservation concept statement and the certificate of substantial completion shall be sent by the project manager to the water management specialist of the water district and city/county having jurisdiction.

ELEMENTS OF LANDSCAPE DOCUMENTATION PACKAGE

A. Water Conservation Concept Statement. Each landscape documentation package shall include a cover sheet, referred to as the water conservation statement similar to the following example. It serves as a checklist to verify that the elements of the landscape documentation package have been completed and has a narrative summary of the project.

SAMPLE WATER CONSERVATION CONCEPT STATEMENT

Project Site:_____ Case Number:_____

Project Location:_____

Landscape Architect/Irrigation Designer/Contractor:_____

Included in this project submittal package are: (Check to indicate completion)

_____1. Maximum Annual Applied Water Allowance:
Conventional Landscape: _____ 100 cubic feet/year
+ Recreational Turfgrass Landscape: _____ 100 cubic feet/year (if applicable)
Total Maximum Annual Applied Water Allowance:_____100 cubic feet/year ____

_____2. Estimated Annual Applied Water Use by Hydrozone:
Turfgrass: _____ 100 cubic feet/year
Recreational Turfgrass: _____ 100 cubic feet/year
Exotic Trees/Shrubs/Groundcovers: _____ 100 cubic feet/year
Desert Plants: _____ 100 cubic feet/year
Water features: _____ 100 cubic feet/year
Other _____: _____ 100 cubic feet/year ____

_____3. Estimated Annual Total Water Use:
_____ 100 cubic feet/year ____

_____4. Landscape Design Plan

Description of Project: (Briefly describe the planning and design actions that are intended to achieve conservation and efficiency in water use.)

_____
_____
_____
_____
_____

Date:_____ Prepared by:_____

B. The Annual Maximum Applied Water Allowance

a. A project's annual maximum applied water allowance shall be calculated using the following formula:

MAWA = (ETo) (0.6) (LA) (0.62) where:

MAWA	=	Maximum applied water allowance (gallons per year)
Eto	=	Reference evaportranspiration (i.e., 75.0 inches per year)
0.6	=	ET adjustment factor
LA	=	Landscaped area (square feet)
0.62	=	Conversion factor (to gallons per square foot)

b. An example calculation of the annual maximum applied water allowance is:

Project site: Landscape area of fifty thousand square feet in Zone No. 3a of the City ETo Map.

MAWA = (ETo) (.6) (LA) (0.62)
= (75.0 inches) (.6) (50,000 square feet) (.62)

Maximum applied water allowance = 1,395,000 gallons per year, 1,865 hundred-cubic-feet per year (billing units), 4.28 acre feet/acre per year or 51.4≤ of water per year.

C. Estimated Annual Applied Water Use.

a. The annual estimated applied water use shall not exceed the annual maximum applied water allowance.
b. A calculation of the estimated annual applied water use shall be submitted with the landscape documentation package.

c. The estimated annual total water use for each hydrozone is calculated from the following formula:

EWU (hydrozones) (in 100 cubic feet) = (ETo) (PF) (HA) (.62)/748 (IE)

EWU (hydrozone)	=	Estimated water use (gallons per year)
Eto	=	Reference evapotranspiration (i.e., ETo Zone 3a = 75.00 inches per year)
PF	=	Plant factor (see definitions)
HA	=	Hydrozone area (square feet)
(.62)	=	Conversion factor
(IE)	=	Irrigation efficiency (see Section 17.04.070, Definitions)
748	=	Conversion to billing units (100 cubic feet)

D. Estimated Annual Total Water Use.

A calculation of the estimated annual total hydrozone water use shall be submitted with the landscape documentation package. The estimated annual total water use for the entire landscaped area equals the sum of the estimated annual water use (EWU) of all hydrozones in that landscaped area.

E. Landscape Design Plan.

A landscape design plan meeting the following requirements shall be submitted as part of the landscape documentation package.

a. Plant Selection and Grouping.

i. Any plants may be used in the landscape, providing the estimated annual applied water use recommended does not exceed the maximum annual applied water allowance and that the plants meet the specifications set forth in subsections (C)(5)(a)(ii), (iii) and (iv) of this section.

ii. Plants having similar water use shall be grouped together in distinct hydrozones.

iii. Plants shall be selected appropriately based upon their adaptability to the climate, geologic, and topographical conditions of the site. Protection and preservation of native species and natural areas is encouraged. The planting of trees is encouraged whenever it is consistent with the other provisions of this chapter.

iv. Fire prevention needs shall be addressed in areas that are fire prone. Information about fire prone areas and appropriate landscaping for fire safety is available from the fire marshal.

b. Water Features.

i. Recirculating water shall be used for decorative water features.

c. Landscape Design Plan Specifications.

The landscape design plan shall be drawn on project base sheets at a scale that accurately and clearly identifies:

i. Designation of hydrozones;
ii. Landscape materials, trees, shrubs, groundcover, turf and other vegetation. Planting symbols shall be clearly drawn and plants labeled by botanical name, common name, water use classification, container size, spacing and quantities of each group of plants indicated;
iii. Property lines and street names;
iv. Streets, driveways, walkways and other paved areas;
v. Pools, ponds, water features, fences and retaining walls;
vi. Existing and proposed buildings and structures including elevation, if applicable;
vii. Location of all overhead and underground utilities.
viii. Natural features including but not limited to rock outcroppings, existing trees and shrubs that will remain;
ix. Tree staking, plant installation, soil preparation details, and any other applicable planting and installation details;
x. A calculation of the total landscaped area;
xi. Designation of recreational areas.

F. Irrigation Design Plan.

An irrigation design plan meeting the following conditions shall be submitted as part of the landscape documentation package.

a. Irrigation Design Criteria.

i. Runoff and Overspray. Soil types and infiltration rate shall be considered when designing irrigation systems. All irrigation systems shall be designed to avoid runoff, low-head drainage, overspray, or other similar conditions where water flows onto adjacent property, nonirrigated areas, walks, roadways or structures. Proper irrigation equipment and schedules, including features such as repeat cycles, shall be used to closely match application rates to infiltration rates therefore minimizing runoff. Special attention shall be given to avoid runoff on slopes and to avoid overspray in planting areas with a width less than ten feet. No overhead sprinkler irrigation systems shall be installed in median strips or islands.
ii. Irrigation Efficiency. For the purpose of determining the maximum applied water allowance, irrigation efficiency is assumed to be 0.75. Mixed irrigation system types shall be designed, maintained and managed to meet or exceed an average of 0.75 efficiency.
iii. Equipment.
(A) Water Meters. Separate landscape water meters shall be installed for all projects except for single-family homes or any project with a landscaped area of less than two thousand five hundred square feet.
(B) Controllers. Automatic control systems (solar or electric) hall be required for all irrigation systems and must be able to accommodate all aspects of the design. Mechanical irrigation controllers are prohibited.
(C) Valves. Plants which require different amounts of water shall be irrigated by separate valves. If one valve is used for a given area, only plants with similar water use shall be used in that area
(D) Anti-drain (check) valves shall be installed in strategic points to prevent low-head drainage.

(E) Sprinkler Heads. Heads shall have application rates appropriate to the plant water use requirements within each control valve circuit. Sprinkler heads shall be selected for proper area coverage, application rate, matched precipitation rate nozzles, operating pressure, adjustment capability and ease of maintenance.

(F) Scheduling Aids—Soil Moisture Sensing Devices. It is required that soil moisture sensing devices be installed on all turfgrass sites exceeding 1.0 acres (43,560 square feet) of planted area.

(G) Scheduling Aids—ETo Controllers. It is recommended that ETo controllers be considered for installation on all sites.

(H) Equipment in Publicly Maintained Areas. Irrigation equipment in areas which may or will be maintained by the city shall conform to specifications of the city.

(I) Emitters. Emitters shall have consistent application rates appropriate to the plant water use requirements within each control valve circuit. Emitters shall be selected for specific area coverage (individual plants), application rates, operating pressure, adjustment capability and ease of maintenance.

b. Recycled Water.

i. The installation of recycled water irrigation systems (dual distribution systems) shall be required to allow for the current and future use of recycled water, unless a written exemption has been granted as described in the subsection (C)(6)(b)(ii) of this section.

ii. Irrigation systems shall make use of recycled water unless a written exemption has been granted by the water district having jurisdiction, stating that recycled water meeting all health standards is not available and will not be available in the foreseeable future.

iii. Recycled water irrigation systems shall be designed and operated in accordance with all local and state codes and be applicable to all of the provisions of this chapter.

c. Irrigation Design Plan Specifications.

Irrigation systems shall be designed to be consistent with hydrozones. The irrigation design plan shall be drawn on project base sheets. It shall be separate from, but use the same format as, the landscape design plan. The scale shall be the same as that used for the landscape design plan. The irrigation design plan shall accurately and clearly identify:

i. Location and size of separate water meters for the landscape;

ii. Location, type, and size of all components of the irrigation system, including automatic controllers, main and lateral lines, valves, sprinkler heads, moisture sensing devices, rain switches, quick couplers, and backflow prevention devices;

iii. Static water pressure at the point of connection to the water supply;

iv. Flow rate (gallons per minute), application rate (inches per hour), and design operating pressure (psi) for each station;

v. Recycled water irrigation systems.

G. Grading Design Plan.

Grading design plans satisfying the city/county grading ordinance and the following conditions shall be submitted as part of the landscape documentation package.

a. A grading design plan shall be drawn on project base sheets. It shall be separate from but use the same format as the landscape design plan.
b. The grading design plan shall indicate finished configurations and elevations of the landscaped area, including the height of graded slopes, drainage patterns, pad elevations, and finish grade.

H. Soil Analysis.

A soil analysis satisfying the following conditions should be submitted as part of the landscape documentation package:

a. Determination of soil texture, indicating the available water holding capacity.
b. An approximate soil infiltration rate (either) measured or derived from soil texture/infiltration rate tables. A range of infiltration rates shall be noted where appropriate.
c. Measure of pH and total soluble salts.

I. Certification.

a. A licensed landscape architect, designer of record or designated city staff shall conduct a final field observation and shall provide a certificate of substantial completion to the city. The certificate shall specifically indicate that plants were installed as specified, that the irrigation system was installed as designed, and that an irrigation audit has been performed, along with a list of any observed deficiencies.
b. Certification shall be accomplished by completing a certificate of substantial completion and delivering it to the city, to the retail water supplier, and to the owner of record. A sample of such a form, which shall be provided by the city is:

EXAMPLE CERTIFICATE OF SUBSTANTIAL COMPLETION

Project Site:_____ Project Number:_____
Project
Location:_____

Preliminary Project Documentation Submitted: (Check indicating submittal)
____1. Total Maximum Applied Water Allowance:
_____ (100 cubic feet/year)

____2. Estimated Applied Water Use by Hydrozone:
Turfgrass: _____ 100 cubic feet/year
Recreational Turfgrass: _____ 100 cubic feet/year
Exotic Trees/Shrubs/Groundcovers: _____ 100 cubic feet/year
Desert Plants: _____ 100 cubic feet/year
Water features: _____ 100 cubic feet/year

Other _____: _____ 100 cubic feet/year

____3. Estimated Total Water Use:
_____ (100 cubic feet/year)

____4. Landscape Design Plan
____5. Irrigation Design Plan
____6. Grading Design Plan
____7. Soil Analysis (optional)

Post-Installation Inspection: (Check indicating substantial completion)

____A. Plants installed as specified
____B. Irrigation system installed as designed
____dual distribution system for recycled water
____minimum run-off or overspray

____Project submittal package and a copy of this certification has been provided to owner/manager and local water agency.

Comments:

I/we certify that work has been installed in accordance with the contract documents:

Contractor	Signature	Date	State License Number

I/we certify that based upon periodic site observations, the work has been substantially completed in accordance with the Water Efficient Landscape Ordinance and that the landscape planting and irrigation installation conform with the approved plans and specifications.

Landscape Architect	Signature	Date	State License Number

or Irrigation Designer/Consultant
or Licensed or Certified Professional in a Related Field

I/we certify that I/we have received all of the contract documents and that it is our responsibility to see that the project is maintained in accordance with the contract documents.

Owner	Signature	Date

(Zoning Ord. dated 1/31/06, § 9108.07(3).)

17.32.100 Public education.

A. Publications.

1. The city will, upon request, provide information to owners of all new, single family residential homes regarding the design, installation, and maintenance of water efficient landscapes.

2. Information about the efficient use of landscape water shall be provided to water users throughout the community.

B. Model Homes. At least one model home that is landscaped in each project consisting of eight or more homes shall demonstrate via signs and information, the principles of water efficient landscapes described in this chapter.

1. Signs shall be used to identify the model as an example of a water efficient landscape and featuring elements such as hydrozones, irrigation equipment, and others which contribute to the overall water efficient theme.

2. Information shall be provided about designing, installing, and maintaining water efficient landscapes. (Zoning Ord. dated 1/31/06, § 9108.07(4).)

17.32.110 Provisions for existing landscapes.

A. Water Management. All existing landscaped areas which use ground water and are over sixty thousand square feet, including golf courses, green belts, common areas, multifamily housing, schools, businesses, parks, and cemeteries shall have a landscape irrigation audit at least every five years unless granted an exemption by the City. At a minimum, the audit shall be in accordance with the California Landscape Irrigation Auditor Handbook, the entire document which is hereby incorporated by reference. (See Landscape Irrigation Audit Handbook, Department of Water Resources, Water Conservation Office (June, 1990), Version 5.5.)

B. Water Waste Prevention. Water waste resulting from inefficient landscape irrigation including run-off, low head drainage, overspray, or other similar conditions where water flows onto adjacent property, nonirrigated areas, walks, roadways, or structures shall be discouraged. Penalties for violation of these prohibitions shall be established. (Zoning Ord. dated 1/31/06, § 9108.07(5).)

17.32.120 Fees for initial review and program monitoring.

A. Fees for the purposes of meeting obligations under this chapter, the following fees are deemed necessary to review landscape documentation packages and monitor landscape irrigation audits and shall be imposed on the subject applicant, property owner or designee.

1. A landscape documentation package review fee will be due at the time initial project application submission to the planning and development department.

2. The project owner/developer must cause a landscape irrigation audit to be completed by a certified landscape irrigation auditor. No city fees will be due for the review of the audit by the planning and development department.

3. If a landscape documentation package is not submitted prior to the start of landscape construction work, for those persons required to submit a package, a late submittal fee of twice the review fee shall be required.

B. The city council, by resolution, shall establish the amount of the above fees in accordance with applicable law. (Zoning Ord. dated 1/31/06, § 9108.07(6).)

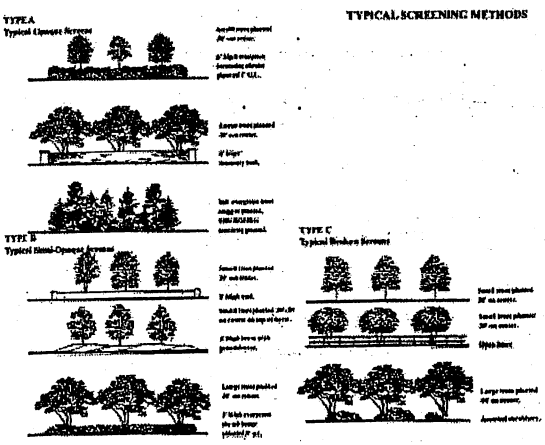
17.32.130 Appeals.

Decisions made by the Director may be appealed by an applicant, property owner(s), or designee(s) of any applicable project to the planning commission and thereafter the city council by an application in writing to the planning and development director and city clerk of the city council respectively within fifteen days from the date of notification of decision. (Zoning Ord. dated 1/31/06, § 9108.07(7).)

Article IV.
Landscape Design Guidelines

17.32.140 Purpose.

The design guidelines which follow are a reference to assist the designer in understanding the City's objectives for high quality landscaping. These guide-



lines will be utilized during the design review process to encourage the highest level of design quality while at the same time providing the necessary flexibility to encourage creativity on the part of the project designers. (Zoning Ord. dated 1/31/06, § 9108.09(1).)

17.32.150 Applicability.

Any addition, remodelling, relocation or construction requiring a building permit subject to review by the Community Development Department, shall adhere to these guidelines unless exempted. (Zoning Ord. dated 1/31/06, § 9108.09(2).)

17.32.160 General guidelines.

A. Landscaping and open spaces should be designed as a central part of the site design, and should integrate development with the surrounding elements of the natural environment. Landscaping should enhance building design, public views and spaces, provide buffers and transitions, preserve and enhance wildlife habitat, provide shade and cooling, and provide screening from other nearby uses.

B. Landscape design should highlight the design theme through the use of arbors and trellises.

C. Landscaped areas should incorporate grasses and groundcovers; shrubs; and trees.

D. The following planting design concepts should be used whenever possible:

1. Trees to create canopies and shade, especially in parking areas;

2. Pots, vases, wall planters and raised planters;

3. Specimen trees used in informal groupings and rows at major focal points;

4. The use of flowering trees in informal groups to provide color;

5. The use of distinctive plants as focal points;

6. Berms, plantings and low walls to screen parking areas from public rights of way.

E. Landscaping should be installed at the base of buildings. Asphalt edges should be avoided.

F. Plantings should be planned to create a simple, non-uniform arrangement. (Zoning Ord. dated 1/31/06, § 9108.09(3).)

17.32.170 Installation and maintenance.

A. Trees, shrubs and vines should have body and fullness that is typical of the species.

B. Herbaceous and flat plant groundcovers should be planted no more than 12 inches on center, and woody, shrub groundcover should be planted no more than 3 feet on center.

C. Plant materials should be spaced so they do not interfere with lighting, and so they do not restrict access to fire hydrants or fire alarm boxes. Proper spacing should insure unobstructed access for vehicles and pedestrians. The following spacing standards should be used:

Use a variety of techniques to buffer non-residential uses.

1. 25 feet from the property corner at a street intersection to the center of the first tree or large shrub.

2. 15 feet between trees and large shrubs.

3. 15 feet between trees or large shrubs and fire hydrants.

4. 10 feet between trees or large shrubs and the edge of any driveway. (Zoning Ord. dated 1/31/06, § 9108.09(4).)

Chapter 13.16

WATER CONSERVATION

Sections:

13.16.010 Urban water management/conservation plan.

13.16.020 Restricting water use during water supply emergencies.

13.16.030 Water conservation using xeriscape principles.

13.16.010 Urban water management/conservation plan.

The City of Banning adopts the urban water management/conservation plan, a copy of which is on file in the office of the city clerk. (Code 1965, § 31-6.)

13.16.020 Restricting water use during water supply emergencies.

A. Definitions. As used in this section:

"Agency" means City of Banning.

"Council" means city council of the city.

"Emergency supply shortage" means any water shortage caused by an earthquake, loss of electrical power, pipe line breakage, or any other threatened or existing water shortage caused by a disaster or facility failure which results in city inability to meet the water demands of its customers.

"Water operations superintendent" means the water services supervisor of the city.

"Waste" means any unreasonable or nonbeneficial use of water, or any unreasonable method of use of water, as determined by the council, including, but not limited to, the specific uses prohibited and restricted by this section as hereinafter set forth.

"Water users" means any person, firm, partnership, association, corporation or political entity using water obtained from the water system of the city.

"Water" means water supplied by the city.

B. Noticed public hearing prior to mandatory conservation. Except when an emergency is caused by the breakage or failure of a dam, pump, pipeline or conduit, a noticed public hearing shall be held prior to the adoption of stages 2, 3 or 4 of the water supply plan for emergency supply shortage as set forth in subsections (C)(2), (C)(3) and (C)(4) of this section. Notice of the time and place of hearing shall be published at least seven days prior to the date of hearing in a newspaper printed, published, and circulated within the area in which the water supply is distributed, or if there is no such newspaper, in any newspaper printed, published, and circulated in the county in which the area is located.

C. Water supply plan for emergency supply shortage.

1. Stage No.1. Normal conditions: voluntary conservation measures. Normal conditions shall be in effect when the city is able to meet all the water demands of its customers in the immediate future. During normal conditions, all water users should continue to use water wisely, to prevent the waste or unreasonable use of water, and to reduce water consumption to that necessary for ordinary domestic and commercial purposes.

2. Stage No. 2. Water shortage alert: mandatory conservation measures. In the event of a sudden and unexpected water supply shortage which could prevent the city from meeting the water demands of its customers, the council shall immediately hold a public hearing at which consumers of the water supply shall have the opportunity to protest and to present their respective needs to the council. No public hearing shall be required in the event of a breakage or failure of a dam, pump, pipeline or conduit causing an immediate emergency. The council may then declare a water shortage emergency condition to prevail, and the following rules and regulations shall be in effect immediately following such declaration.

a. Washing driveways, parking lots, or other hard surfaced area, or building exteriors at any time, except to alleviate immediate fire hazards is prohibited;

b. Parks, golf courses and school grounds are to be irrigated during nighttime hours only, between sunset and sunrise;

c. Lawn watering and landscape irrigating, including construction meter use, is prohibited between the hours of 10:00 A.M. to 5:00 P.M.;

d. Running water shall not be used for washing privately owned vehicles. A bucket may be used for the washing of vehicles and only hoses equipped with shut-off nozzles may be used for rinsing;

e. Restaurants are requested not to provide drinking water to patrons except by request;

f. Commercial nurseries shall use water only during the hours from midnight to 6:00 A.M. Irrigation of propagation beds and watering of livestock is permitted as necessary during any hours.

g. Golf courses using reclaimed water are exempted from these restrictions.

3. Stage No. 3. Water shortage warning. The council may, following a public hearing as set forth in subsection B of this section, declare that an emergency water supply shortage exists, and that the agency is unable to meet all the water demands of its customers. Immediately thereafter, the following water conservation measures shall apply:

a. Parks and schools shall be watered on alternate days during the hours between sunset to sunrise, the schedule of which shall be set following the public hearing;

b. Golf courses which utilize domestic water from the city's domestic system may irrigate greens only during the hours between sunset to sunrise. Golf courses utilizing reclaimed water are exempted from this restriction;

c. Other lawn watering and landscape irrigating, including construction meter use, are restricted as follows: customers with even-numbered street addresses may water only on even-numbered days, customers with odd- numbered street addresses may water only on odd-numbered days, and no watering or irrigating shall be done between the hours of 10:00 A.M. and 5:00 P.M. on any day;

d. Washing down of driveways, parking lots, or other paved surfaces is prohibited;

e. Washing of vehicles is restricted to commercial car wash establishments which recycle their water;

f. Filling or adding water to swimming pools, wading pools, spas, ornamental ponds, fountains and artificial lakes is prohibited;

g. Restaurants shall not serve drinking water to patrons except by request;

h. No new construction meter permits shall be issued by the agency;

i. Construction metered water shall not be used for earth work or road construction purposes;

j. Water of livestock is permitted as necessary during any hours;

k. Commercial nurseries may use water only between the hours of midnight and 6:00 A.M. Irrigation of propagation beds is permitted as necessary during any hours. Commercial nurseries utilizing reclaimed water are exempted from this restriction.

4. Stage No. 4. Mandatory compliance. Water shortage emergency.

Following a declaration by the city council that an emergency water supply shortage due to a major failure in a supply of distribution facility exists, the following water conservation measures shall apply:

a. Watering of parks, school grounds and golf courses is prohibited, except by reclaimed water;

b. Watering of lawn and irrigating of landscape is prohibited;

c. Washing down of driveways, parking lots, or other paved surfaces is prohibited;

d. Washing of vehicles is prohibited, except when done by commercial car wash establishments using recycled or reclaimed water;

e. Filling or adding water to swimming pools, wading pools, spas, ornamental ponds, fountains and artificial lakes is prohibited;

f. No serving of drinking water by restaurants to patrons except by request;

g. No issuing of new construction meter permits by the city;

h. Turning off and locking all existing construction meters;

i. Discontinuing all watering and irrigating of commercial nurseries. Those utilizing reclaimed water are exempted from this restriction. Watering of livestock is permitted as necessary.

D. Council discretion to modify conservation measures upon a showing of necessity therefor. The specific requirements of each mandatory conservation stage shall be effective upon adoption by the

council following a public hearing, except that the council may modify or amend such requirements at the time of adoption upon a showing of the need for such modification or amendment.

E. Implementation and termination of mandatory compliance stages. The water operations superintendent of the city shall monitor the supply and demand for water on a daily basis to determine the level of conservation required by the implementation or termination of the water conservation stages, and shall notify the council of the necessity for the implementation or termination of each stage. Each declaration of the council implementing or terminating a water conservation stage shall be published at least once in a newspaper of general circulation, and shall remain in effect until the city council otherwise declares, as provided herein.

F. Exceptions. Application for exception permit. The water operations superintendent of the city may grant permits for uses of water otherwise prohibited thereby if he/she finds and determines that special circumstances make compliance not reasonably possible, or that restrictions herein would either:

1. Cause an unnecessary and undue hardship to the water user or the public; or

2. Cause an emergency condition affecting the health, sanitation, fire protection or safety of the water user or of the public.

Such exceptions may be granted only upon application therefor. Upon granting any such exception permit, the water operations superintendent may impose any conditions he/she determines to be just and proper.

G. Criminal proceedings for violation. The city council hereby declares that, pursuant to Water Code Section 377, it shall be a misdemeanor for any person to use or apply water contrary to or in violation of any mandatory restriction or requirement established by this section and, upon conviction thereof, that person, firm or corporation shall be punished by imprisonment in the county jail for not more than thirty days or a fine of not more than one thousand dollars or by both such fine and imprisonment.

H. Civil proceedings for violation. In addition to criminal penalties, violators of the mandatory provisions of this section shall be subject to civil action initiated by the city.

1. First violation. For a first violation, the city shall issue a written notice of violation to the water user violating the provisions of this chapter.

2. Second violation: twenty-five percent surcharge. For a second violation of this section within a twelve-month period, a one-month surcharge is hereby imposed in an amount equal to twenty-five percent of the previous month's water bill for the meter through which the wasted water was supplied.

3. Third violation: fifty percent surcharge; installation of flow restrictor. For a third violation of this section within a twelve-month period, a one-month penalty surcharge is hereby imposed in an amount equal to fifty percent of the previous month's water bill for the meter through which the wasted water was supplied. In addition to the surcharge, the agency may at its discretion install a flow-restricting device at such meter with a one-eighth-inch orifice for services up to one and one-half inch size, and comparatively sized restrictors for larger services, on the service of the customer at the premises at which the violation occurred, for a period of not less than forty-eight hours. The charge for installing a flow-restricting device shall be based upon the size of the meter and the cost of installation but shall not be less than twenty-five dollars. The charge for removal of the flow-restricting device and restoration of normal service shall be twenty-five dollars if restoration of normal service is performed during the hours of 7:00 A.M. to 3:30 P.M. on regular working days. If the removal of the flow-restricting device and restoration of normal service is made after regular working hours, on holidays or weekends, the restoration service charge shall be forty dollars.

4. Subsequent violations; discontinuance of service. For any subsequent violation of this section within the twenty-four calendar months after a first violation as provided in subsection (H)(1) of this section, the penalty surcharge provided in subsection (H)(3) of this section shall be imposed and the city shall discontinue water service to that customer at the premises or to the meter where the violation occurred. The charge for reconnection and restoration

of normal service shall be twenty-five dollars. Such restoration of service shall not be made until the water operations superintendent of the city has determined that the water user has provided reasonable assurances that future violations of this section by such user will not occur.

I. Notice.

1. For a first violation, written notice may be given to the customer personally or by certified mail.

2. If the penalty assessed is a surcharge for a second or third violation, notice may be given by certified mail.

3. If the penalty assessed is, or includes, the installation of a flow restrictor or the discontinuance of water service to the customer for any period of time whatever, notice of the violation shall be given in the following manner:

a. By giving written notice thereof by certified mail or to the customer personally; or

b. If he/she is absent from his/her place of residence and from his/her assumed place of business, by leaving a copy with some person of suitable age and discretion at either place, and sending a copy through the United States mail, certified, addressed to the customer at either his/her place of business or residence; or

c. If such place of residence and business cannot be ascertained, or a person of suitable age or discretion cannot be found, then by affixing a copy in a conspicuous place on the property where the failure to comply is occurring and also by delivering a copy to a person residing, if such person can be found, and also sending a copy through the United States mail, certified, addressed to the customer at the place where the property is situated.

4. Any notice provided hereunder shall contain, in addition to the facts of the violation, a statement of the possible penalties for each violation and a statement of the possible penalties for each violation and a statement informing the customer of his right to a hearing on the violation.

J. Hearing. Any customer against whom a penalty is levied pursuant to subsections G and H of this section shall have a right to a hearing, in the first instance by the water operations superintendent, with the right of appeal to the city council, on the merits of the alleged violation upon the written request of that customer within fifteen days of the date of infraction of the violation.

K. Reservation of rights. The rights of the city hereunder shall be cumulative to any other right of the city to discontinue service. All moneys collected by the department pursuant to any of the penalty provisions of this chapter shall be deposited in the operating fund as reimbursement for the city's costs and expenses of administering and enforcing this section.

L. Concurrent authority. The city manager, its water operations superintendent and designated employees, have the duty and are hereby authorized to enforce all provisions of this section, with the qualification that the city through enforcement of this section, the county as to unincorporated territory within the city, are recognized to have concurrent authority for, and shall have the primary responsibility for the control of water flowing in the streets where such occurs within their respective jurisdictions. (Code 1965, § 31-7.)

13.16.030 Water conservation using xeriscape principles.

A. Intent. Water is an increasingly limited and costly resource. It is the intent of this section to establish a water conservation plan to reduce water consumption in the landscape environment using xeriscape principles.

B. Definitions.

"Low water-using drought tolerant plant" includes species suited to our climate, requiring less water in order to grow well.

"Xeriscape" shall mean a combination of landscape features and techniques that in the aggregate reduce the demand for and consumption of water, including appropriate low water using plants, nonliving ground-cover, a low percentage of turf coverage, permeable paving and water conserving irrigation techniques and systems.

C. Applicability. The provisions of this section shall apply to all developments within the city including, but not limited to, the following:

1. All new residential developments (including townhomes and apartment projects) on parcels greater than seven thousand square feet;

2. Rehabilitated landscaping (for projects on parcels greater than ten thousand square feet) for industrial, commercial, institutional, multifamily and residential common areas of PUDs (Planned Unit Developments);

3. Interior remodels, tenant improvements and demolitions for any of the above projects;

4. Schools, parks, golf courses or similar public open spaces;

5. Water conservation landscape requirements shall apply to all new developments. New development applications shall include landscape plans which require final approval at the time of final project approval.

D. Exceptions. The provisions of this section shall not apply to those projects which have been approved or accepted as complete for processing prior to the effective date of the ordinance codified in this section; provided no material amendments or extensions are made to such previously approved projects. These provisions shall also not apply to the following:

1. Homeowner-provided landscaping at single-family and multifamily projects;

2. Cemeteries;

3. Registered historical sites;

4. Ecological restoration projects that do not require a permanent irrigation system;

5. Mined-land reclamation projects that do not require a permanent irrigation system.

E. Requirements.

1. Turf limitation. The maximum allowed turf and/or water area (expressed as percent of planted area) shall be twenty-five percent for industrial, commercial, residential developments with common area, institutions and public/semi-public developments. If turf is an essential part of development, such as playing fields for schools or public parks, a higher percentage will be allowed, and will be evaluated on an individual basis. No turf shall be allowed in median strips or in areas less than eight feet wide.

If a residential development has one or more model homes, it is required that at least one model home in the development be planted with drought tolerant plants and a maximum of twenty-five percent turf and/or water area. Additionally, developers shall provide buyers with sample landscape plans using low water-using plants and a maximum twenty-five percent turf area. The developer shall also provide information about outdoor water conservation by distributing pamphlets to buyers regarding this subject. Such pamphlets are available from local water districts and the state department of water resources. The county community development department will have samples of appropriate types of pamphlets available. Landscape and distribution of literature shall require approval by the community development department.

2. Types of plants in non-turf areas. At least ninety percent of the plants in non-turf areas shall be low water-requiring, drought-resistant plants as approved by the community development department. A small percentage of the planted area (up to ten percent) can be used for nondrought tolerant varieties if they are grouped together and can be irrigated separately.

3. Use of mulch. A minimum of two inches of mulch shall be added to the soil surface after planting. Nonporous material shall not be placed under the mulch.

4. Irrigation.

a. Sprinklers and sprays shall not be used in areas less than eight feet wide. Drip and bubbler shall be used that do not exceed one and one-half gallons per minute per device.

b. Sprinkler heads with a precipitation rate of .85" per hour or less shall be used in slopes exceeding fifteen percent to minimize runoff, or exceeding ten percent within ten feet of hardscape.

c. Valves and circuits shall be separated based on water use.

d. Drip or bubbler irrigation systems are required for trees with the exception of those which can be sustained by ground or rain water.

e. Sprinkler heads must have matched precipitation rates within each control valve circuit.

f. Serviceable check valves are required where elevation differential may cause low head drainage.

g. Sprinkler head spacing shall be designed for head-to-head coverage. The system should be designed for minimum runoff and overspray onto nonirrigated areas.

h. All irrigation systems shall be equipped with a controller capable of dual or multiple programming. Controllers must have multiple cycle start capacity and a flexible calendar program.

5. Ornamental ponds. Water bodies that are part of the landscaping for new developments shall be restricted. Unless the water body is an integral part of the operations of the new development, the surface area of the water body shall be counted as turf in the calculations for limitation of turf for the landscaped area. Fountains or other types of decorative bodies where water is sprayed into the air shall be discouraged. Some allowance will be made for fountains for ponds where reclaimed irrigation is used and the water supply is recirculated.

6. Landscape plans. Landscape plans shall indicate the total landscape area, the area and percentage of drought-resistant plantings and the area and percentage of ornamental nondrought resistant plantings. The plans shall be reviewed by community development director or his designee to check for compliance with this section in regards to plant varieties, planting areas and irrigation design. Commercial, multiple dwellings, country clubs and condominiums shall be required to submit additional landscape plans which include a water budget that incorporates estimated annual water use (in gallons) and the area (in square feet) to be irrigated. Precipitation rates for each valve circuit and a monthly irrigation schedule for the plant establishment period including the year following shall be supplied as well. (Code 1965, § 31-8.)

Chapter 13.24

STORMWATER MANAGEMENT SYSTEM

Sections:

13.24.010 Title.
13.24.020 Purpose and intent.
13.24.030 Definitions.
13.24.040 Responsibility for administration.
13.24.050 Regulatory consistency.
13.24.060 Discharge of pollutants.
13.24.070 Discharge in violation of permit.
13.24.080 Illicit connections.
13.24.090 Reduction of pollutants in stormwater.
13.24.100 Outdoor storage areas—Commercial and industrial facilities.
13.24.110 Construction sites.
13.24.120 New development and redevelopment.
13.24.130 Compliance with general permits.
13.24.140 Compliance with BMPs.
13.24.150 Authority to inspect.
13.24.160 Authority to sample and establish sampling devices.
13.24.170 Notification of spills.
13.24.180 Requirement to test or monitor.
13.24.190 Violations constituting misdemeanors.
13.24.200 Penalties.
13.24.210 Concealment.
13.24.220 Violations deemed a public nuisance.
13.24.230 Judicial review.
13.24.240 Civil actions.
13.24.250 Cease and desist orders.
13.24.260 Notice to clean.
13.24.270 Nonexclusivity of remedies.
13.24.280 Appeal.

13.24.010 Title.

The ordinance codified in this chapter shall be known as the City of Banning stormwater management and discharge control ordinance and may be so cited. (Code 1965, § 34-1.)

13.24.020 Purpose and intent.

The purpose of this chapter is to ensure the future health, safety, and general welfare of the citizens by:

A. Regulating nonstormwater discharges to the municipal separate storm drain; and

B. Controlling the discharge to municipal separate storm drains from spills, dumping or disposal of materials other than stormwater; and

C. Reducing pollutants in stormwater discharges to the maximum extent practicable.

The intent of this chapter is to protect and enhance the water quality of city watercourses, water bodies, groundwater, and wetlands in a manner pursuant to and consistent with the Clean Water Act. (Code 1965, § 34-2.)

13.24.030 Definitions.

The terms as used in this chapter shall have the following meanings:

A. Best Management Practice (BMP). "BMPs" means schedules of activities, prohibitions of practices, general good housekeeping practices, maintenance procedures, educational programs, and other management practices to prevent or reduce the discharge of pollutants directly or indirectly to waters of the United States. BMPs shall include treatment requirements, operating procedures, and practices to control plant site runoff, spillage or leaks, sludge or waste disposal, and drainage from raw materials storage. The California Stormwater Best Management Practice Handbooks for Municipal, Industrial/Commercial and Construction Activity provide a detailed discussion of BMPs.

B. "Director" means the director of the public works department, City of Banning.

C. "Enforcement officer" includes the director of public works, building official, code enforcement officer, city manager and their designees.

D. "Illicit connection" means any physical connection to a storm drain system which has not been permitted by the City of Banning, the Riverside County Flood Control and Water Conservation District, or other appropriate public agency.

E. "Illicit discharge" means any discharge to the storm drain system that is not composed entirely of stormwater runoff except discharges made pursuant to a National Pollutant Discharge Elimination System (NPDES) permit or as otherwise authorized by the Santa Ana or Colorado River Basin Regional Water Quality Control Board.

F. "Municipal NPDES permit" means an area-wide NPDES permit issued to a government agency or agencies for the discharge of stormwater from a stormwater system.

G. "National Pollutant Discharge Elimination System (NPDES) permit" means a stormwater discharge permit issued by the Santa Ana or Colorado River Basin Regional Water Quality Control Board in compliance with the federal Clean Water Act.

H. "Nonstormwater discharge" means any discharge to the storm drain system that is not entirely composed of stormwater.

I. "Person" means any natural person, firm, association, club, organization, corporation, partnership, business trust, company or other entity which is recognized by law as the subject of rights or duties.

J. "Pollutant" means anything which causes the deterioration of water quality such that it impairs subsequent and/or competing uses of the water. Pollutants may include but are not limited to paints, oil and other automotive fluids, soil, rubbish, trash, garbage, debris, refuse, waste, fecal coliform, fecal streptococcus, enterococcus, heavy metals, hazardous waste, chemicals, fresh concrete, yard waste from commercial landscaping operations, animal waste, materials that result from the process of constructing a building or structure, nauseous or offensive matter of any kind.

K. "Premises" means any building, lot, parcel of land, or portion of land whether improved or unimproved.

L. "Storm drain system" means any facility by which storm water may be conveyed to waters of the United States. The storm drain system includes but is not limited to any roads with drainage systems, streets, curbs, gutters, catch basins, natural and artificial channels, ditches, aqueducts, storm drains, inlets, conduit or other drainage structures.

M. "Stormwater runoff" means surface runoff and drainage associated with rainstorm events and snow melt. (Code 1965, § 34-3.)

13.24.040 Responsibility for administration.

This chapter shall be administered for the city by the director of public works. (Code 1965, § 34-4.)

13.24.050 Regulatory consistency.

This chapter shall be construed to assure consistency with the requirements of the federal Clean Water Act and acts amendatory thereof or supplementary thereto, applicable implementing regulations, and any existing or future municipal NPDES permits and any amendments, revisions or reissuance thereof. (Code 1965, § 34-5.)

13.24.060 Discharge of pollutants.

A nonstormwater discharge to the storm drain system is a violation of this chapter.

A. The prohibition of discharges shall not apply to any discharge regulated under a NPDES permit or waiver issued to the discharger and administered by the state of California under the authority of the EPA, provided that the discharger is in full compliance with all requirements of the permit or waiver and other applicable laws or regulations.

B. Discharges from the following activities will not be considered a source of pollutants to waters of the United States when properly managed: water line flushing and other discharges from potable water sources, landscape irrigation and lawn watering, irrigation water, diverted stream flows, rising groundwaters, infiltration to separate storm drains, uncontaminated pumped ground water, foundation and footing drains, water from crawl space pumps, air conditioning condensation, springs, individual residential car washing, flows from riparian habitats and wetlands, dechlorinated swimming pool discharges or flows from fire fighting. (Code 1965, § 34-7.)

13.24.070 Discharge in violation of permit.

A. Any discharge that results in or contributes to a violation of an existing or future municipal NPDES permit(s) and any amendment, revision or reissuance thereof, either separately considered or when combined with other discharges, is a violation of this chapter and is prohibited.

B. Liability for any such discharge shall be the responsibility of the person(s) causing or responsible for the discharge, and such persons shall defend, indemnify and hold harmless the city in any administrative or judicial enforcement action relating to such discharge.

C. A copy of the current municipal NPDES permit will be filed in the city engineer's office. (Code 1965, § 34-8.)

13.24.080 Illicit connections.

It is a violation of this chapter to establish, use, maintain, or continue an illicit connection to the city storm drain system, or to commence or continue any illicit discharge to the city storm drain system. The prohibition against illicit connections is expressly retroactive and applies to connections made in the past, regardless of whether permissible under the law or practices applicable or prevailing at the time of the connection. (Code 1965, § 34-9.)

13.24.090 Reduction of pollutants in stormwater.

A. It is a violation of this chapter to throw, deposit, leave, maintain, keep, or permit to be thrown, deposited, placed, left or maintained, any pollutant, including but not limited to refuse, rubbish, garbage, abandoned vehicles or other discarded or abandoned objects, articles, and accumulation, in or upon any street, alley, sidewalk, storm drain, inlet, catch basin, conduit or other drainage structures, business place, or upon any public or private plot of land in the city.

B. It is an exception to the above that such pollutant is being temporarily placed in an appropriate container with a spill containment system for later collection and removal.

C. It is a violation of this chapter to cause or permit any Dumpster, solid waste bin, or similar container to leak such that any pollutant is discharged into any street, alley, sidewalk, storm drain, inlet, catch basin, conduit or other drainage structures, business place, or upon any public or private plot of land in the city. (Code 1965, § 34-10.)

13.24.100 Outdoor storage areas—Commercial and industrial facilities.

A. It is a violation of this chapter for any person to improperly store grease, oil or other hazardous substances in outdoor areas. In outdoor areas, no person shall improperly store motor vehicles, machine parts, or other objects in a manner that may leak grease, oil, or other hazardous substances.

B. To prevent the discharge of hazardous substances from the property, the city may require the installation of a spill containment system. Spill containment systems may consist of a system of dikes, walls, barriers, berms, or other devices as required.

C. It is a violation of this chapter for any person to operate a spill containment system such that it allows incompatible liquids to mix and thereby create a hazardous condition. (Code 1965, § 34-11.)

13.24.110 Construction sites.

Any person performing construction work in city shall comply with the provisions of this chapter, and the Uniform Building Code, latest edition, for erosion and sediment control. (Code 1965, § 34-12.)

13.24.120 New development and redevelopment.

A. Any new development or redevelopment project shall control the volume and rate of stormwater runoff from the project so as to prevent any deterioration of water quality which would impair the subsequent or competing uses of the water. The director of the public works department shall establish standards and guidelines implementing BMPs designed to control the rate and volume of stormwater runoff from new developments and redevelopments as may be

appropriate to minimize the discharge and transport of pollutants.

B. Acceptable methods and standards for controlling stormwater runoff volumes, rates, and pollutant load may include but are not limited to the following:

1. Increase Permeable Areas. Avoid placing impervious surfaces in highly porous soil areas; incorporate landscaping and open space into the project design; use porous materials for or near driveways and walkways; incorporate detention ponds and infiltration pits into the project's design; avoid placing pavement and other impervious surfaces in low lying areas.

2. Direct Runoff to Permeable Areas. Direct stormwater runoff away from impermeable areas to swales, berms, green strip filters, gravel beds, and french drains. Install raingutters and orient them toward permeable areas. Modify the grade of the property to divert flow to permeable areas and minimize the amount of stormwater runoff leaving the property. When designing curbs, berms or other structures, avoid designs which isolate permeable or landscaped areas.

3. Maximize Stormwater Storage for Reuse. Use retention structures, subsurface areas, cisterns, or other structures to store stormwater runoff for reuse or slow release. (Code 1965, § 34-13.)

13.24.130 Compliance with general permits.

A. Any industrial discharger, discharger associated with construction activity, or other discharger subject to any NPDES permit issued by the United States Environmental Protection Agency, the State Water Resources Control Board, the Santa Ana Regional Water Quality Control Board or the Colorado River Basin Regional Water Quality Control Board, shall comply with all requirements of such permit.

B. Proof of compliance with said NPDES general permits may be required in a form acceptable to the director prior to issuance of any city grading, building, or occupancy permits. (Code 1965, § 34-14.)

13.24.140 Compliance with BMPs.

Where BMP guidelines or requirements have been adopted by any federal, state of California, regional, and/or local agency, for any activity, operation, or facility which may cause or contribute to stormwater pollution or contamination, illicit discharges, and/or discharge of nonstormwater to the stormwater system, every person undertaking such activity or operation, or owning or operating such facility shall comply with guidelines or requirements as may be identified by the director. (Code 1965, § 34-15.)

13.24.150 Authority to inspect.

A. Whenever necessary to make an inspection to enforce any of the provisions of this chapter or whenever an authorized enforcement officer has reasonable cause to believe that there exists in any building or upon any premises any condition which constitutes a violation of the provisions of this chapter, the enforcement officer may enter such building or premises at all reasonable times to inspect the same or perform any duty imposed upon the enforcement officer by this chapter.

B. Entry hereunder shall be subject to the following:

1. If such building or premises be occupied, he or she shall first present proper credentials and request entry; and

2. If such building or premises be unoccupied, he or she shall first make a reasonable effort to locate the owner or other persons having charge or control of the building or obtain a warrant to enter.

C. Any request for entry made hereunder shall state that the property owner or occupant has the right to refuse entry and that in the event such entry is refused, inspection may be made only upon issuance of a search warrant by a duly authorized magistrate. In the event the owner and/or occupant refuses entry after such request has been made, the official is empowered to seek assistance from any court of competent jurisdiction in obtaining such entry.

D. Routine or area inspections shall be based upon such reasonable selection processes as may be deemed necessary to carry out the objectives of this chapter, including but not limited to random sam-

pling and/or sampling in areas with evidence of stormwater contamination, illicit discharges, discharge of non-stormwater to the stormwater system, or similar factors. (Code 1965, § 34-16.)

13.24.160 Authority to sample and establish sampling devices.

With the consent of the owner or occupant or pursuant to a search warrant, any authorized enforcement officer may establish on any property such devices as are necessary to conduct sampling or metering operations. During all inspections as provided herein, the enforcement officer may take any samples deemed necessary to aid in the pursuit of the inquiry or in the recordation of the activities on-site. (Code 1965, § 34-17.)

13.24.170 Notification of spills.

A. All persons in charge of a facility or responsible for emergency response for a facility are personally responsible to train facility personnel and maintain notification procedures to assure that immediate notification is provided to the city of any suspected, confirmed or unconfirmed release of material, pollutants or waste creating a risk of discharge into the city storm drain system.

B. As soon as any person in charge of a facility or responsible for emergency response for a facility has the knowledge described in subsection A of this section, such person shall take all necessary steps to ensure the discovery, containment, and cleanup of such release, and shall notify the city of the occurrence by telephoning and confirming the notification by correspondence to the director of the public works department and fire department. (Code 1965, § 34-18.)

13.24.180 Requirement to test or monitor.

A. Any authorized enforcement officer may request that any person engaged in any activity and/or owning or operating any facility which may cause or contribute to stormwater pollution or contamination, illicit discharges, and/or discharge of nonstormwater to the stormwater system, undertake such monitoring activities and/or analyses and furnish such reports as the enforcement officer may specify. The burden, including costs, of these activities, analyses and reports shall bear a reasonable relationship to the need for the monitoring, analyses and reports and the benefits to be obtained. The recipient of such request shall undertake and provide the monitoring, analyses and/or reports requested.

B. In the event the owner or operator of a facility subject to a monitoring and/or analyses order fails to conduct required monitoring and/or analyses and furnish the required reports in the form required, the authorized enforcement officer may cause such monitoring and/or analyses to be performed.

1. The cost therefor, including the reasonable additional administrative costs incurred by the city, shall be the responsibility of the owner of the property.

2. The cost thereof shall be invoiced to the owner of the property.

3. If the invoice is not paid within sixty days of the issuance thereof, the costs shall be a lien upon and against the property and continue in existence until the same shall be paid.

4. If the lien is not satisfied by the owner of the property within three months after the completion by an authorized enforcement officer of the required monitoring and/or analyses and reports, the property may be sold in satisfaction thereof in a like manner as other real property is sold under execution. (Code 1965, § 34-19.)

13.24.190 Violations constituting misdemeanors.

A. Unless otherwise specified by ordinance, the violation of any provision of this chapter, or failure to comply with any of the mandatory requirements of this chapter shall constitute a misdemeanor.

B. Notwithstanding any other provisions of this chapter, any such violation constituting a misdemeanor under this chapter, at the discretion of the authorized enforcement officer may be charged and prosecuted as an infraction. (Code 1965, § 34-20.)

13.24.200 Penalties.

A. It shall be unlawful for any person to violate any provision of this chapter.

1. Any person violating any provision of this chapter shall be deemed guilty of an infraction or misdemeanor as hereinafter specified.

2. Such person shall be deemed guilty of a separate offense for each and every day or portion thereof during which any violation of any of the provisions of this chapter is committed, continued, or permitted.

B. Any person so convicted shall be:

1. Guilty of an infraction offense and punished by a fine not exceeding one hundred dollars for a first violation;

2. Guilty of an infraction offense and punished by a fine not exceeding two hundred dollars for a second violation;

3. The third and any additional violations shall constitute a misdemeanor offense and shall be punishable by a fine not exceeding one thousand dollars or six months in jail, or both.

C. Notwithstanding the above, a first offense may be charged and prosecuted as a misdemeanor.

D. Payment of any penalty herein shall not relieve a person from the responsibility for correcting the violation. (Code 1965, § 34-21.)

13.24.210 Concealment.

Causing, permitting, aiding, abetting or concealing a violation of any provision of this chapter shall constitute a violation of such provision. (Code 1965, § 34-22.)

13.24.220 Violations deemed a public nuisance.

A. In addition to the penalties hereinbefore provided, any condition caused or permitted to exist in violation of any of the provisions of this chapter is a threat to the public health, safety and welfare, and may be declared and deemed a nuisance, and may be summarily abated and/or restored by any authorized enforcement officer, and/or civil action to abate, enjoin or otherwise compel the cessation of such nuisance may be taken as authorized by this Code.

B. If any violation of this chapter constitutes a seasonal and recurrent nuisance, the director shall so declare. Thereafter such seasonal and recurrent nuisance shall be abated every year without the necessity of any further hearing.

C. In any administrative or civil proceeding under this chapter in which the city prevails, the city shall be awarded all costs of investigation, administrative overhead, out-of-pocket expenses, costs of administrative hearing, costs of suit and reasonable attorney's fees. (Code 1965, § 34-23.)

13.24.230 Judicial review.

The provisions of Section 1094.6 of the California Code of Civil Procedure are applicable to judicial review of city decisions pursuant to this chapter. (Code 1965, § 34-24.)

13.24.240 Civil actions.

In addition to any other remedies provided herein, this chapter may be enforced by civil action brought by the city. In any such action, the city shall grant, as appropriate, any or all of the following remedies:

A. A temporary and/or permanent injunction;

B. Assessment of the violator for the costs of any investigation, inspection, or monitoring survey which led to the establishment of the violation, and for the reasonable costs of preparing and bringing legal action under this section;

C. Costs incurred in removing, correcting, or terminating the adverse effects resulting from the violation;

D. Compensatory damages for loss or destruction to water quality, wildlife, fish and aquatic life. Assessments under this section shall be paid to the city to be used exclusively for costs associated with monitoring and establishing stormwater discharge pollution control systems and/or implementing or enforcing the provisions of this chapter. (Code 1965, § 34-25.)

13.24.250 Cease and desist orders.

When an authorized enforcement officer finds that a discharge has taken place or is likely to take place in violation of this chapter, the officer may issue an

order to cease and desist such discharge, or practice, or operation likely to cause such discharge and direct that those persons not complying shall:

A. Comply with the requirement;

B. Comply with a time schedule for compliance; and/or

C. Take appropriate remedial or preventive action to prevent the violation from recurring. (Code 1965, § 34-26.)

13.24.260 Notice to clean.

A. Whenever an authorized enforcement officer finds any oil, earth, dirt, grass, weeds, dead trees, tin cans, rubbish, refuse, waste or any other material of any kind, in or upon the sidewalk abutting or adjoining any parcel of land, or upon any parcel of land or grounds, which may result in an increase in pollutants entering a city storm sewer system or natural watercourse, or a nonstorm sewer system or natural watercourse, or a nonstorm water discharge to a city storm sewer system or natural watercourse, he or she may give notice to remove such oil, earth, dirt, grass, weeds, dead trees, tin cans, rubbish, refuse, waste or other material, in any manner that he or she may reasonably provide. The recipient of such notice shall undertake the activities as described in the notice.

B. In the event the owner or operator of a facility fails to conduct the activities as described in the notice, the authorized enforcement officer may cause such required activities as described in the notice, and the cost thereof shall be invoiced to the owner of the property.

1. If the invoice is not paid within sixty days, a lien shall be placed upon and against the property.

2. If the lien is not satisfied by the owner of the property within three months after the completion of the required activities by the authorized enforcement officer the property may be sold in a satisfaction thereof in a like manner as other real property is sold under execution. (Code 1965, § 34-27.)

13.24.270 Nonexclusivity of remedies.

Remedies under this chapter are in addition to and do not supersede or limit any and all other remedies, civil or criminal. The remedies provided for herein shall be cumulative and not exclusive. (Code 1965, § 34-28.)

13.24.280 Appeal.

Any person, firm, corporation or organization required to perform monitoring, analyses, reporting and/or corrective activities by an authorized enforcement officer who is aggrieved by the decision of the authorized enforcement officer may appeal such decision to the director within ten days following the effective date of the decision by writing to the director. Upon receipt of such request, the director shall request a report and recommendation from the authorized enforcement officer and shall set the matter for hearing at the earliest practical date. At said hearing, the director may hear additional evidence, and may reject, affirm or modify the authorized enforcement officer's decision. Such decision shall be final unless appealed by the city council under the general appeal procedures of the city. (Code 1965, § 34-29.)

ORDINANCE NO. 1415

AN ORDINANCE OF THE CITY OF BANNING AMENDING THE CODE OF THE CITY OF BANNING, CALIFORNIA, 1965, TITLE 13, CHAPTER 13.24 NOW ENTITLED STORMWATER CODE

WHEREAS, the City of Banning (the "City") duly enacted on June 24, 1997 Ordinance 1212 which is entitled "An Ordinance Of The City Of Banning Adding Chapter 34 To The Banning Ordinance Code Establishing Storm Water Management And Discharge Controls"; and

WHEREAS, the City codified Chapter 34 of Ordinance 1212 in the Banning Municipal Code through Chapter 13.24 of Title 13, which shall be known as the "City of Banning Stormwater Management and Discharge Control Code" or, "Stormwater Code" for short; and

WHEREAS, the City seeks through this Ordinance to amend the Stormwater Code to ensure the future health, safety, and general welfare of the citizens, as well as compliance with existing and future National Pollutant Discharge Elimination System ("NPDES") Permits; and

WHEREAS, NPDES Permit Number CAS617002 (R7-2008-0001) is the existing NPDES Permit applicable to the City, a copy of which is attached hereto as Exhibit "A".

NOW, THEREFORE, THE CITY COUNCIL OF THE CITY OF BANNING DOES ORDAIN AS FOLLOWS:

Section 1. Section 13.24.010 (Title) of the Stormwater Code is hereby amended to read in its entirety as follows:

> "The ordinance codified in this chapter shall be known as the 'City of Banning Stormwater Management and Discharge Control Code', or the 'Stormwater Code' for short, and may be so cited."

Section 2. Section 13.24.030 (Definitions) of the Stormwater Code is hereby amended to read in its entirety as follows:

"The terms as used in this Chapter shall have the following meanings:

A. Best Management Practice (BMP). BMP or BMPs mean schedules of activities, prohibitions of practices, general good housekeeping practices, maintenance procedures, educational programs, and other management practices to prevent or reduce the discharge of pollutants directly or indirectly to waters of the United States. BMPs shall include treatment requirements, operating procedures, and practices to control plant site runoff, spillage or leaks, sludge or waste disposal, and drainage from raw materials storage. The California Stormwater Best Management Practice Handbooks for Municipal, Industrial/Commercial and Construction Activity provide a detailed discussion of BMPs.

B. Detention Basin refers to a basin type structure which permits large flows of stormwater to enter and remain, but limits and controls the outflow (i.e. discharge) by having a small opening at the lowest point of the structure.

C. Director means the Director of the Public Works Department of the City of Banning.

D. Enforcement Officer includes the City Manager, Public Works Director, City Engineer, Building and Safety Official, Code Enforcement Officer, and their designees.

E. Illicit Connection means any physical connection to a Storm Drain System which has not been permitted by the City of Banning, the Riverside County Flood Control and Water Conservation District, or other appropriate public agency.

F. Illegal Discharge means any discharge to the Storm Drain System that is not composed entirely of Stormwater Runoff except discharges made pursuant to a National Pollutant Discharge Elimination System (NPDES) permit or as otherwise authorized by the Santa Ana or Colorado River Basin Regional Water Quality Control Board.

G. Infiltration Basin refers to designs and/or practices for directing stormwater from a basin type of structure to the groundwater table through permeable soils.

H. Municipal NPDES Permit means an area-wide NPDES permit issued to a government agency or agencies for the discharge of stormwater from a stormwater system, and shall refer to NPDES Permit Number CAS617002 (R7-2008-0001) or its successor.

I. National Pollutant Discharge Elimination System (NPDES) Permit means a stormwater discharge permit issued by the Santa Ana or Colorado River Basin Regional Water Quality Control Board in compliance with the federal Clean Water Act.

J. Non-Stormwater Discharge means any discharge to the Storm Drain System that is not entirely composed of stormwater.

K. Person means any natural person, firm, association, club, organization, corporation, partnership, business trust, company or other entity which is recognized by law as the subject of rights or duties.

L. Pollutant means anything which causes the deterioration of water quality such that it impairs subsequent and/or competing uses of the water. Pollutants may include but are not limited to paints, oil and other automotive fluids, soil, rubbish, trash, garbage, debris, refuse, waste, fecal coliform, fecal streptococcus, enterococcus, heavy metals, hazardous

waste, chemicals, fresh concrete, yard waste from commercial landscaping operations, animal waste, materials that result from the process of constructing a building or structure, nauseous or offensive matter of any kind.

M. Premises means any building, lot, parcel of land, or portion of land whether improved or unimproved.

N. Retention Basin allows for relatively large flows of stormwater to enter in a basin type of structure during large storm events for which discharges are limited by outlet structures to a storm drain, the street, or other parts of the Storm Drain System. This type of basin notably has an outlet or discharge point so that stormwater does not accumulate in the basin for extended periods of time, when feasible, such that the stormwater permeates to a groundwater table.

O. Storm Drain System means any facility by which stormwater may be conveyed to waters of the United States. The Storm Drain System includes, but is not limited to, any roads with drainage systems, streets, curbs, gutters, catch basins, natural and artificial channels, ditches, aqueducts, storm drains, inlets, conduit or other drainage structures.

P. Stormwater Runoff means surface runoff and drainage associated with rainstorm events and snow melt."

Section 3. Section 13.24.070 (Discharge In Violation of Permit), subsection C., of the Stormwater Code is hereby amended to read in its entirety as follows:

"C. A copy of the current Municipal NPDES Permit will be filed in the City Clerk's Office."

Section 4. Section 13.24.080 (Illicit Connections) of the Stormwater Code is hereby amended to be entitled "Illicit Connections and Illegal Discharges" and to read in its entirety as follows:

"A. It is a violation of this Chapter to establish, use, maintain, or continue an Illicit Connection to the City's Storm Drain System, or to commence or continue any Illegal Discharge to the City's Storm Drain System. The prohibition against Illicit Connections is expressly retroactive and applies to past illicit connections when made.

B. Illegal Discharges include, without limitation, the following:
   1. Discharges of wash water resulting from the hosing or cleaning of gas stations, auto repair garages, or other types of automotive services facilities;
   2. Discharges resulting from the cleaning, repair, or maintenance of any type of equipment or machinery including motor vehicles, cement-related equipment, and port-a-potty service;

3. Discharges of wash water from mobile operations such as oily or greasy discharges from mobile automobile washing or similar mobile services, and/or discharges from steam cleaning, power washing, and carpet cleaning;

4. Discharges of runoff from material storage areas containing chemicals, fuels, grease, oil, or other Hazardous Materials as that term is defined by the federal Department of Transportation; and

5. Discharges of food-related wastes, including without limitation, grease, fish processing, and restaurant kitchen mat and trash bin wash water."

Section 5. Section 13.24.100 (Outdoor storage areas – Commercial and Industrial Facilities) of the Stormwater Code is hereby amended to read in its entirety as follows:

"A. It is a violation of this chapter for any person to improperly store grease, oil or other hazardous substances in outdoor areas such that any of these substances may leak or otherwise discharge from the container in which the substance is stored. In outdoor areas, no person shall improperly store motor vehicles, machine parts, or other objects in a manner that may leak grease, oil, or other hazardous substances.

B. To prevent the discharge of hazardous substances from the property, the City shall require the installation of a spill containment system. Spill containment systems may consist of a system of dikes, walls, barriers, berms, or other devices as required.

C. It is a violation of this Chapter for any person to operate a spill containment system such that it allows incompatible liquids to mix and thereby create a hazardous condition.

D. Any person or entity that owns or operates a commercial and/or industrial facility(s) shall comply with the provisions of this Chapter. All such facilities shall be subject to inspection as required by this Chapter, California Water Code §§ 13000 *et seq.* (Porter-Cologne Water Quality Control Act), Title 33 U.S.C. §§ 1251 *et seq.* (Clean Water Act), any applicable State or federal regulations promulgated thereto, and any related administrative orders or permits issued in connection therewith."

Section 6. Section 13.24.110 (Construction Sites) of the Stormwater Code is hereby amended to be entitled "Construction Sites and Onsite Storage and Infiltration of Stormwater" and to read in its entirety as follows:

"Any person performing construction work in the City shall comply with the provisions of this Chapter and the Uniform Building Code, latest edition, for erosion and sediment control, as well as City of Banning Ordinance 1388 which is incorporated by reference hereto. In addition, except as waived by or agreed to by the Director or the Director's designee consistent with NPDES permit provisions

and requirements, development of all land within the City must include provisions for the management of Stormwater Runoff from the property which is to be developed, including volumetric or flow based treatment control BMP design criteria, and/or exceptions to these requirements, and methodologies used to ensure proper management of Stormwater Runoff post-construction. This management shall consist of constructing storage and/or infiltration facilities, which includes basins. At a minimum, all development will make provisions to store runoff from rainfall events up to and including the one-hundred-year, three-hour duration event. Post-development peak urban runoff discharge rates shall not exceed pre-development peak urban runoff discharge rates.

The City Engineer shall be provided for review, comment and/or approval the drainage study, hydrologic analysis and design of drainage facilities prepared by a licensed professional engineer."

Section 7. Section 13.24.120 (New Development and Redevelopment) of the Stormwater Code is hereby amended to read in its entirety as follows:

"A. Existing development shall control Stormwater Runoff so as to prevent any deterioration of water quality that would impair subsequent or competing uses of the water. The Director shall identify the BMPs that may be implemented to prevent such deterioration and shall indentify the manner of implementation.

B. Any new development or redevelopment project shall control the volume and rate of Stormwater Runoff from the project so as to prevent any deterioration of water quality which would impair the subsequent or competing uses of the water. The Director shall establish written retention standards and guidelines and/or implement BMPs designed to control the rate and volume of Stormwater Runoff from new developments and redevelopments as may be appropriate to minimize the discharge and transport of pollutants. The standards, guidelines and BMPs shall include a provision permitting adjustments for specific projects where the Director finds that due to unique circumstances not generally applicable to other properties, such adjustments are required but in such circumstances the Director shall provide a written finding.

1. All new development and redevelopment projects that fall into one of the following categories are subject to the Water Quality Management Plan Design Standards for Best Management Practices as set forth in the NPDES Permit Number CAS617002 (Section F.1.c.), which is incorporated by reference hereto, a copy of which is available in the City Clerk's Office:

a. Singly-family hillside residences that create 10,000 square feet, or more, of impervious area where the natural slope is twenty-five percent (25%) or greater, including single-

family hillside residences that create 10,000 square feet of impervious area where the natural slope is ten percent (10%) or greater where erosive soil conditions are known;

b. 100,000 square foot commercial and industrial developments;

c. Automotive repair shops (with Standard Industrial Classification ("SIC") codes 5013, 7532, 7533, 7534, 7537, 7438, and 7539);

d. Retail gasoline outlets disturbing greater than 5,000 square feet;

e. Restaurants disturbing greater than 5,000 square feet;

f. Home subdivisions with 10 or more housing units; and

g. Parking lots 5,000 square feet or more or with 25 or more parking spaces and potentially exposed to non-stormwater discharges.

C. Acceptable methods and standards for controlling Stormwater Runoff volumes, rates, and pollutant load may include but are not limited to the following:

1. Increase Permeable Areas. Avoid placing impervious surfaces in highly porous soil areas; incorporate landscaping and open space into the project design; use porous materials for or near driveways and walkways; incorporate detention ponds and infiltration pits into the project's design; avoid placing pavement and other impervious surfaces in low lying areas.

2. Direct Runoff to Permeable Areas. Direct Stormwater Runoff away from impermeable areas to swales, berms, green strip filters, gravel beds, and french drains. Install rain gutters and orient them toward permeable areas. Modify the grade of the property to divert flow to permeable areas and minimize the amount of Stormwater Runoff leaving the property. When designing curbs, berms or other structures, avoid designs which isolate permeable or landscaped areas.

3. Maximize Stormwater Storage for Reuse. Use retention structures, subsurface areas, cisterns, or other structures to store Stormwater Runoff for reuse or slow release.

4. Any new development shall comply with the provisions of this Chapter, City of Banning Ordinance 1388 and the Municipal NPDES Permit, all of which are incorporated by reference hereto.

D. In the event the Municipal NPDES Permit is modified, the Director is authorized to apply the criteria of such successor permit.

E. In addition to the foregoing provisions, all existing and new development and redevelopment plans shall comply with Stormwater Code Section 13.24.110.

F. Any violation of this Section is punishable as provided in the Banning Municipal Code including this Chapter. In addition, fines may be imposed on a schedule agreed to between the City and any person or entity seeking to engage in a development or redevelopment project in the City."

Section 8. Section 13.24.125, "Issuance, Suspension and Revocation of Permits or Licenses," of the Stormwater Code is hereby added to read in its entirety as follows:

"A. No permit or license shall be issued unless it is in accordance with all the provisions of City ordinances as codified in the Banning Municipal Code, including Titles 5, 13 and 15, and any permit or license issued contrary to the provisions of the Banning Municipal Code shall be void and of no effect.

B. An Enforcement Officer, after compliance with the procedures hereunder, may revoke or suspend a permit or license issued by the City upon a finding that:

1. The permittee or licensee has violated any of the conditions or requirements of the permit or license, or provisions of the Banning Municipal Code and any ordinances, rules or regulations pertaining to the permit or license; or
2. The permit or license was issued in error; or
3. The permit or license was issued on the basis of incorrect information supplied by the permittee or licensee.

C. Revocation or suspension of a permit or license issued by the City is proper when written notice of the violation(s) has been sent to the permittee or licensee by first class mail and the permittee or licensee has failed or neglected to correct the violation within twenty (20) days from the date the written notice was mailed."

Section 9. Section 13.24.130 (Compliance with General Permits), subsection B., of the Stormwater Code is hereby amended to read in its entirety as follows:

"B. Proof of compliance with the Municipal NPDES Permit will be required in a form acceptable to the Director prior to issuance of any city grading, building, or occupancy permits. Due to requirements set forth in the NPDES Permit changing from time to time, said compliance with the Municipal NPDES Permit requires compliance with the most recent NPDES Permit on file in the City Clerk's Office."

Section 10. Section 13.24.150 (Authority to Inspect) of the Stormwater Code is hereby amended to read in its entirety as follows:

"A. Whenever necessary to make an inspection to enforce any of the provisions of this chapter or the Municipal NPDES Permit, or whenever an Enforcement Officer has reasonable cause to believe that there exists in any building or upon any premises any condition which constitutes a violation of the provisions of this Chapter, the Enforcement Officer may enter such building or premises at all reasonable times to inspect the same or perform any duty imposed upon the Enforcement Officer by this chapter.

B. Entry hereunder shall be subject to the following:

1. If such building or premises be occupied, an Enforcement Officer shall first present proper credentials and request entry; and
2. If such building or premises be unoccupied, an Enforcement Officer shall first make a reasonable effort to locate the owner or other persons having charge or control of the building or obtain a warrant to enter.

C. Any request for entry made hereunder shall state that the property owner or occupant has the right to refuse entry and that in the event such entry is refused, inspection may be made only upon issuance of a search warrant by a duly authorized magistrate. In the event the owner and/or occupant refuses entry after such request has been made, the official is empowered to seek assistance from any court of competent jurisdiction in obtaining such entry.

D. Routine or area inspections shall be based upon such reasonable selection processes as may be deemed necessary to carry out the objectives of this Chapter and the Municipal NPDES Permit, including but not limited to random sampling and/or sampling in areas with evidence of stormwater contamination, Illicit Connections, Illegal Discharges, Non-Stormwater Discharge to the Stormwater System, follow up inspections as required by the County of Riverside, the Compliance Assistance Program ("CAP") of the NPDES Permit, or the California State Water Quality Regional Control Board, or similar factors.

E. The property owner and/or occupant are liable for Inspection Fees as set forth in the City's adopted Fee Schedule through City Resolution 2006-114 duly adopted on September 12, 2006, which may be amended by the City Council from time to time."

Section 11. Section 13.24.180 (Requirement to Test or Monitor) of the Stormwater Code is hereby amended to read in its entirety as follows:

"A. An Enforcement officer may request that any person engaged in any activity and/or owning or operating any facility which may cause or contribute to Stormwater Runoff, Illicit Connections, Illegal Discharges, and/or discharge of Pollutants or Non-stormwater to the Stormwater System, undertake such monitoring activities and/or analyses and furnish such reports as the Enforcement Officer may specify. The burden, including costs, of these activities, analyses and reports shall bear a reasonable relationship to the need for the monitoring, analyses and reports and the benefits to be obtained. The recipient of such request shall undertake and provide the monitoring, analyses and/or reports requested within a reasonable time frame as set forth by the Enforcement Officer or as agreed to between the Enforcement Officer and the person.

B. In the event the owner or operator of a facility subject to a monitoring and/or analyses order fails to conduct required monitoring and/or analyses and furnish the required reports in the form required, an Enforcement Officer may cause such monitoring and/or analyses to be performed within thirty (30) days.

1. The costs, therefore, including the reasonable additional administrative costs incurred by the City, shall be the responsibility of the owner of the property and/or the person or entity in possession of the property.
2. The costs thereof shall be invoiced to the owner of the property and/or the person or entity in possession of the property.
3. If the invoice is not paid within sixty (60) days of the issuance thereof, the costs may be levied as a lien upon and against the property and continue in existence until the same shall be paid consistent with the Banning Municipal Code including Chapter 8.48.
4. If the lien is not satisfied by the owner of the property within three (3) months after the completion by an Enforcement Officer of the required monitoring and/or analyses and reports, the property may be sold in satisfaction thereof in a like manner as other real property is sold under execution."

Section 12. Section 13.24.220 (Violations Deemed a Public Nuisance), subsection A., of the Stormwater Code is hereby amended to read in its entirety as follows:

"A. In addition to the penalties hereinbefore provided, any condition caused or permitted to exist in violation of any of the provisions of this Chapter is a threat to the public health, safety and welfare, and may be declared and deemed a nuisance, and may be summarily abated and/or restored by an Enforcement Officer, and/or civil action to abate, enjoin or otherwise compel the cessation of such nuisance may be taken as authorized by the Banning Municipal Code including Chapter 8.48 or in any other manner provided by law."

Section 13. Section 13.24.225, "Payment of Abatement Costs, Penalties or Damages," of the Stormwater Code is hereby added to read in its entirety as follows:

> "If payment of an award of abatement costs, penalties or damages is not made within ten (10) days of an administrative or judicial determination of such costs, penalties or damages, the Enforcement Officer may file a Notice of Lien as provided for in the Banning Municipal Code, Chapter 8.48, describing the real property affected and the amount of the costs, penalties or damages claimed by the City with the Office of the County Recorder of Riverside County. The Enforcement Officer may transmit the judgment or award of abatement costs, penalties or damages of the City, which shall place the amount thereof on the Assessment Roll as a special assessment to be paid with County taxes, unless paid earlier. A judgment or award of such costs, penalties or damages may also be enforced in any other manner provided by law, including the property being sold under execution if the recorded lien remains unpaid for at least three (3) months."

Section 14. Section 13.24.240 (Civil Actions), subsection B., of the Stormwater Code is hereby amended to read in its entirety as follows:

> "B. Assessment of the violator for the costs of any investigation, inspection, or monitoring survey which led to the establishment of the violation, and for the reasonable costs and attorney's fees of preparing and bringing legal action under this subsection."

Section 15. Section 13.24.270 (Nonexclusivity of Remedies) of the Stormwater Code is hereby amended to read in its entirety as follows:

> "Remedies under this Chapter are in addition to and do not supersede or limit any and all other remedies, civil or criminal, as provided by federal, State and local law. The remedies provided for herein shall be cumulative and not exclusive."

Section 16. Section 13.24.280 (Appeal) of the Stormwater Code is hereby amended to read in its entirety as follows:

> "In addition to the provisions of Chapter 1.20 of the Banning Municipal Code, any person, firm, corporation or organization required by an Enforcement Officer to perform monitoring, analyses, reporting, or corrective activities, or for revocation or suspension of a permit or license, and who is aggrieved by the decision of an Enforcement Officer, may appeal such decision to the Director within fifteen (15) days following the effective date of the Enforcement Officer's decision by writing to the Director. Upon receipt of such request, the Director shall request a report and recommendation from the Enforcement Officer and shall set the matter for hearing at the earliest practical date not to exceed sixty (60) days from the date the request is filed. At said hearing, the Director may hear additional evidence, and may reject, affirm or modify the Enforcement Officer's decision. Such decision shall be written and final unless appealed to the

City Council, which is required pursuant to California Code of Civil Procedure § 1094.6 prior to commencing any civil action commencing."

Section 17. If any part of this Ordinance are held to be invalid or unconstitutional by decision of any court of competent jurisdiction, such decision shall not affect the validity of the remaining portions of this Ordinance, and the City hereby declares that it would have passed the remainder of this Ordinance if such invalid portion thereof had been declared invalid or unconstitutional.

Section 18. The City Clerk shall certify to the adoption of this Ordinance and shall cause a copy of the same to be published in a manner prescribed by law. This Ordinance shall take effect and be in force thirty (30) days after the adoption by the City Council for the City of Banning.

PASSED, APPROVED and ADOPTED this 12th day of January, 2010.

APPENDIX L

SGPWA ORDINANCE NO. 10 AND RESOLUTION NO. 2014-02

SGPWA ORDINANCE NO. 10

SAN GORGONIO PASS WATER AGENCY

ORDINANCE NO. 10

ORDINANCE ESTABLISHING WATER SHORTAGE PLAN

WHEREAS, the San Gorgonio Pass Water Agency ("Agency) is a State Water Project ("SWP") Contractor authorized to acquire waterworks, waters, and/or water rights, including but not limited to, water from the State of California from the SWP, and to provide, sell, and deliver that water under the control of the Agency to cities, agencies, districts, persons, corporations or private entities within the Agency ("Purchasers") for use within the service area of the Agency. The Agency is a wholesale water agency organized and operating under the Chapter 101 of the San Gorgonio Pass Water Agency Law set forth in the Water Code Appendix; and

WHEREAS, the Agency has a contract with the California Department of Water Resources for 17,300 acre-feet of SWP water which is designated as "Table A Water" and which is used to supplement local demands including eliminating groundwater overdraft; and

WHEREAS, the Agency is required to order SWP water from the California Department of Water Resources. The Board desires to adopt a policy regarding how the Agency will allocate deliveries of water to Purchasers during single and multiple dry years where the total amount of annual orders from Purchasers exceeds the amount of SWP water available in that calendar year or years. This policy shall pertain to the allocation of SWP water that is designated as Table A Water, Yuba Water, and other water not designated as "spot water," that is delivered at the request of a Purchaser. It shall not apply to Carryover Water, which shall be delivered to Purchasers at the discretion of the Board of Directors; and

WHEREAS, Water Code Section 375 et seq. provides that the Agency may, by a majority vote of the members of the Board after holding a public hearing upon notice, adopt and enforce a water shortage plan to allocate deliveries of water to Purchasers during single and multiple dry years; and

WHEREAS, the Board of Directors previously adopted Ordinance No. 8 which established the "Rules And Regulations For SGPWA Water Service." The Rules And Regulations may be revised from time to time. The Board desires to adopt this Ordinance No. 10 in order to establish procedures for allocating reduced deliveries of water to Purchasers in the event of single and multiple dry years and a shortage of water available to meet the demands of Purchasers.

BE IT ORDAINED BY THE BOARD OF DIRECTORS OF THE SAN GORGONIO PASS WATER AGENCY AS FOLLOWS:

Section 1 All of the foregoing Recitals are true and correct and the Board so finds and determines. The Recitals set forth above are incorporated herein and made an operative part of this Ordinance.

Section 2 The Board conducted a public hearing on July 7, 2014 at 1210 Beaumont Avenue, Beaumont, CA in order for members of the public to have the opportunity to be heard to protest against, and to present their respective needs to the Board regarding the proposed adoption of this Ordinance. Notice of the public hearing was published on July 11, 2014 in the Record Gazette, a newspaper of general circulation within the area in which the subject water supply is distributed. Said notice was published at least 7 days prior to the date of the hearing.

Section 3 ARTICLE IV, DELIVERY, **Section 4.11 Water Shortage Plan** is hereby added to the Rules And Regulations For SGPWA Water Service as follows:

1. Definitions

(a) Water Shortage Year(s) – a calendar year or years in which the total amount of SWP Orders from Purchasers, which are necessary to meet actual demands of Purchasers, plus water required by the Agency as defined below, exceeds the amount of SWP Water that is available for purchase by the Agency from the SWP in that applicable calendar year.

(b) First Priority Water Deliveries – Section 101-15.5 of the San Gorgonio Pass Water Agency Law provides that in allocating water received from the SWP under the Law, the highest priority shall be given to eliminating groundwater overdraft conditions within the Agency's boundaries. The Board hereby determines that five percent (5%) of the total amount of SWP Orders from Purchasers shall be allocated to direct delivery Purchasers, in a given Water Shortage Year, who take deliveries to the connection or other facilities of the Purchasers for domestic, industrial, and municipal purposes ("Direct Deliveries"). Said Direct Deliveries shall be for Purchasers who take Direct Deliveries in order to avoid the need for groundwater extractions, thereby helping to eliminate groundwater overdraft.

(c) Second Priority Water Deliveries - SWP Orders from Purchasers for Direct Deliveries in a given Water Shortage Year.

(d) Third Priority Water Deliveries – SWP water to be purchased by the Agency to be used in the Agency's discretion and which will be over and above the water needed to meet water demand projections for Direct Deliveries in the First and Second Priority Water Deliveries. Third Priority Water Deliveries shall not exceed 10% of the total amount of SWP Orders from Purchasers in a given Water Shortage Year. The Board of Directors shall have discretion to change this percentage in any given Water Shortage Year, based on Purchaser needs in that year.

(e) Fourth Priority Water Deliveries – SWP Orders from Purchasers for SWP water which would be utilized for groundwater replenishment by spreading or injecting in order to meet projected demands of Purchasers in a given Water Shortage Year.

(f) Fifth Priority Water Deliveries – If the amount of SWP water available for purchase by the Agency exceeds the total amount of SWP Orders necessary to meet all of the First, Second, Third and Fourth Priority Water Deliveries, then the water year shall not be classified as a Water Shortage Year and no water shortage year allocation shall be implemented by the Agency.

2. Allocations

(a) Water Shortage Year Allocation - If during any particular Water Shortage Year, the total amount of SWP Orders from Purchasers for First Priority Water Deliveries exceeds the amount of SWP water which is available for purchase by the Agency at any time during that Water Shortage Year, then the only deliveries of SWP water by the Agency for that Water Shortage Year shall be for Direct Deliveries under the First Priority Water Deliveries. First Priority Water Deliveries will be made in proportion to the ordered amount of SWP water by each Purchaser. Each Purchaser who orders water for Direct Deliveries under a First Priority Water Delivery shall receive an equal allocation of the available SWP water for said First Priority Water Deliveries in proportion to all other Purchasers who have made such orders. Said determination shall be made on a year-by-year basis for any such year which may be deemed to be a Water Shortage Year.

(b) SWP Water Exceeds First Priority Water Delivery Needs - If the amount of SWP water available for purchase by the Agency exceeds the total amount of SWP Orders necessary to meet all of the First Priority Water Deliveries, then Second Priority Water Deliveries will be made. Second Priority Water Deliveries will be made in proportion to the ordered amount of SWP water by each Purchaser. Each Purchaser who orders water under a Second Priority Water Delivery shall receive an equal allocation of the available SWP water for said Second Priority Water Deliveries in proportion to all other Purchasers who have made such orders. Said determination shall be made on a year-by-year basis for any such year which may be deemed to be a Water Shortage Year.

(c) SWP Water Exceeds First And Second Priority Water Delivery Needs – If the amount of SWP water available for purchase by the Agency exceeds the total amount of SWP Orders necessary to meet all of the First and Second Priority Water Deliveries, then Third Priority Water Deliveries will be made, if the Board determines that the water required by the Agency in that year is greater than zero.

(d) SWP Water Exceeds First, Second And Third Priority Water Delivery Needs - If the amount of SWP water available for purchase by the Agency exceeds the total amount of SWP Orders necessary to meet all of the First, Second and Third Priority Water Deliveries, then Fourth Priority Water Deliveries will be made. Fourth Priority Water Deliveries will be made in proportion to the ordered amount of SWP water by each Purchaser. Each Purchaser who orders replenishment

water under a Fourth Priority Water Delivery shall receive an equal allocation of the available SWP water for said Fourth Priority Water Deliveries in proportion to all other Purchasers who have made such orders. Said determination shall be made on a year-by-year basis for any such year which may be deemed to be a Water Shortage Year.

(e) SWP Water Exceeds First, Second, Third And Fourth Priority Water Delivery Needs - If the amount of SWP water available for purchase by the Agency exceeds the total amount of SWP Orders necessary to meet all of the First, Second, Third and Fourth Priority Water Deliveries, then the water year shall not be classified as a Water Shortage Year and no water shortage year allocation shall be implemented by the Agency.

3. Use Of Agency Purchase The Board of Directors shall have the discretion to determine how the Agency purchase for Third Priority Water Deliveries is utilized, as described below:

(a) Selling said water to a Purchaser for Direct Deliveries or groundwater replenishment based on a demonstrated need in a particular calendar year and pursuant to a written request and procedures as may be determined by the Board or the Agency's General Manager.

(b) Utilizing/storing said water for overdraft mitigation.

(c) Utilizing the water to meet the terms of a previous water exchange agreement with another State Water Contractor or other water agency, or to participate in a water exchange in order to obtain water for a future year.

(d) Designating said water as carry over water for use by the Agency in the next year or a future year.

4. Potential Availability Of Spot Water - In a Water Shortage Year, there may be "Spot Water" available for purchase by a Purchaser at an additional cost. "Spot Water" is commonly referred to as water that may be available for purchase from the SWP or from another source in any given year for that year only. In the event that Spot Water is available and a Purchaser desires to acquire said water, said Purchaser shall submit a written request pursuant to procedures as may be determined by the Board or the Agency's General Manager. All additional costs of purchasing and delivering said Spot Water shall be the sole responsibility of the requesting Purchaser. For example, the Agency would purchase such water specifically for delivery to one or more requesting Purchasers and the Agency would pass through all costs associated with said purchase and delivery to said Purchasers in in proportion to their requests.

Section 4 All ordinances, resolutions, minute orders, or administrative actions by the Board of Directors, or parts thereof, that are inconsistent with any provision of this Ordinance No. 10 are hereby superseded only to the extent of such inconsistency. Except as specifically set

forth in this Ordinance No. 10 in regard to the addition of **Section 4.11 Water Shortage Plan**, all other provisions of the Rules And Regulations For SGPWA Water Service shall remain in full force and effect.

Section 5 The Board finds that the addition of a water shortage plan constitutes general policy and procedure making and also constitutes organizational or administrative activities that will not result in direct or indirect physical changes in the environment. Based on this finding, the Board determines that the implementation of a water shortage plan, by way of adoption of this Ordinance No. 10, is exempt from the requirements of the California Environmental Quality Act pursuant to section 15378(b)(2) and (5) of the State CEQA Guidelines.

Section 6 The President of the Board of Directors shall sign this Ordinance No. 10 and the Secretary of the Board of Directors shall attest thereto, and this Ordinance No. 10 shall be in full force and effect immediately upon adoption. The Board of Directors shall review this Ordinance in each water shortage year, as defined herein. Within 10 days after adoption of this Ordinance No. 10, a copy of this Ordinance shall be published one time in a newspaper of general circulation with the names of the Directors voting for and against this Ordinance.

Section 7 If any section, subsection, clause or phrase in this Ordinance is for any reason held invalid, the validity of the remainder of this Ordinance shall not be affected thereby. The Board hereby declares that it would have passed this Ordinance and each section, subsection, sentence, clause, or phrase thereof, irrespective of the fact that one or more sections, subsections, sentences, clauses or phrases or the application thereof be held invalid.

ADOPTED this 21st day of July 2014, by the Board of Directors of the San Gorgonio Pass Water Agency.

Said Ordinance was adopted, on roll call, by the following vote:

AYES: Haring, Voigt, Melleby, Duncan, Dickson and Jeter
NOES: None
ABSTAIN: None
ABSENT: Morris

RESOLUTION NO. 2014-02

RESOLUTION NO. 2014-02

A RESOLUTION OF THE SAN GORGONIO PASS WATER AGENCY ESTABLISHING A POLICY FOR MEETING FUTURE WATER DEMANDS

WHEREAS, the San Gorgonio Pass Water Agency ("Agency") is a state water contractor that was formed with the purpose of importing water from the State Water Project ("SWP") into the San Gorgonio Pass area in 1961. The Agency's service area encompasses approximately 228 square miles and includes the Cities of Beaumont, Calimesa, and Banning, as well as the unincorporated areas of Cherry Valley, Cabazon, Poppet Flat, Banning Bench, and San Timoteo and Live Oak Canyons; and

WHEREAS, the mission of the Agency is to import water and to protect and enhance local water supplies for use by present and future water users and to sell imported water to local water agencies within the Agency's service area. The Agency is able to import water from sources that provide the highest quality and the most cost effective price, including the SWP and other potential sources. The Agency also works with local retail agencies to manage local and regional water resources in a sustainable manner designed to manage overdraft within the Agency's service area; and

WHEREAS, the Agency has a contract with the California Department of Water Resources for 17,300 acre-feet of SWP water which is used to supplement local demands including eliminating groundwater overdraft. Information and reports obtained by the Agency, including but not limited to, the Agency's 2010 Urban Water Management Plan, indicate that said amount of SWP water will likely not be sufficient to meet all future supplemental water demands within the Agency's service area. The Agency has the responsibility to manage the present and future water supply needs for all users within its jurisdiction. Increased demand from new growth and decreasing reliability will continue to present challenges to the Agency's ability to deliver wholesale water on a reliable basis. In addition, the Agency has made substantial investments in facilities and infrastructure to bring said supplies to the region and to store and deliver said supplies. Said facilities include pipelines, pump stations, turnouts, reservoirs and spreading grounds; and

WHEREAS, the Board of Directors of the Agency desires to adopt this Resolution in order to establish a policy which will work toward the goal of meeting future water demands in the region.

NOW, THEREFORE, BE IT RESOLVED BY THE BOARD OF DIRECTORS OF THE SAN GORGONIO PASS WATER AGENCY AS FOLLOWS:

1. Incorporation of Recitals All of the foregoing Recitals are true and correct and the Board so finds and determines. The Recitals set forth above are incorporated herein and made an operative part of this Resolution.

2, Definitions The types of water rights, supplies and resources which are subject to this Resolution and the policy set forth herein include, but are not limited to, the following:

(a) Carryover Water - Water belonging to a State Water Contractor that is not used in a given calendar year and thus is carried over to the next year for use in that year or in a future year.

(b) Dry Year Yield Water - Water made available in a dry year for that year only, typically from a farming interest, irrigation district or other type of agency providing service to farming interests.

(c) Exchange Water - Water obtained from another water agency in exchange for a promise of water at a subsequent time such as in a future month or future year. An exchange may be a one-to-one exchange or an exchange with a different ratio.

(d) Long-Term Water Rights - Water rights owned by another entity which is willing to sell the rights to the water and not just a water supply. Long-Term Water Rights are frequently defined as

lasting as long as the State Water Project.

(e) Short-Term Water - Water available under certain conditions in any given year or for a limited number of years for a defined period only.

(f) Spot Water - Water available in any given year for that year only.

(g) Transfer Water - Water transferred from one area of the state to another through the actions of public agencies.

3. Regional Water Management

(a) Meeting The Water Supply Needs Of The Region - The Agency is prepared to take the necessary actions to provide its service area with adequate supplies of water to meet expanding and increasing needs in the years ahead. As additional water resources are required to meet increasing needs, the Agency will be prepared to take the necessary actions to deliver such supplies.

(b) Funding And Construction Of Facilities - Taxpayers and water users residing within the Agency's service area already have obligated themselves for the construction of a supply and distribution system. This system has been designed and constructed, and future facilities will be designed and constructed, in a manner to deliver the Agency's full share of SWP water, as well as water from other sources as may be required in the years ahead.

(c) Acquiring Supplemental Water Supplies – The Agency is prepared to take the necessary actions to meet the water supply needs of the region. For example, and not by way of limitation, the Agency is authorized to pursue the acquisition of Short-Term Water, Spot Water, Dry Year Yield Water, and Long-Term Water Rights. The Board of Directors of the Agency has the discretion to reasonably determine the timing and other details of acquiring such supplies, and will also manage the Agency's current supplies to maximum effect, as determined in the Board's direction. In order to meet this commitment, the Agency has the discretion to reasonably determine which type of water source to pursue including, but not limited to, Carryover Water, one-year or multi-year Exchange Water, Transfers, or other purchases of water or water rights.

4. Consideration Of A Wheeling Request The Agency will consider "wheeling" water to the region subject to the terms of this Resolution, Agency wheeling policies, applicable law, and upon payment of the applicable charge. In the event of any such wheeling, the Agency's facilities, including its rights to use SWP facilities, may be used to transport water not owned or controlled by the Agency to a retail agency or other public or private entity within the Agency's service area.

5. Potential For Future Policies Regarding Water Supplies Nothing in this Resolution shall limit or otherwise impact the authority of the Board to adopt future policies regarding water supplies including, but not limited to, any potential water shortage plans that the Board may deem to be necessary in order to establish how the Agency will allocate deliveries of water to local retail agencies during single and multiple dry years where the total amount of annual orders from local retail agencies exceeds the amount of SWP water available in that calendar year or years.

6. Controlling Effect All ordinances, resolutions, minute orders, or administrative actions by the Board of Directors, or parts thereof, that are inconsistent with any provision of this Resolution are hereby superseded only to the extent of such inconsistency.

7. CEQA Compliance - The Board finds that the establishment of a policy for meeting future water demands constitutes general policy and procedure making and also constitutes organizational or administrative activities that will not result in direct or indirect physical changes in the environment. Based on this finding, the Board determines that the establishment of a policy for meeting future water demands, by way of adoption of this Resolution, is exempt from the requirements of the California Environmental Quality Act pursuant to section 15378(b)(2) and (5) of the State CEQA Guidelines.

8. Effective Date - The President of the Board shall sign this Resolution and the Secretary of the Board shall attest thereto, and this Resolution shall be in full force and effect immediately upon adoption.

9. Severability - If any section, subsection, clause or phrase in this Resolution is for any reason held invalid, the validity of the remainder of this Resolution shall not be affected thereby. The Board hereby declares that it would have passed this Resolution and each section, subsection, sentence, clause, or phrase thereof, irrespective of the fact that one or more sections, subsections, sentences, clauses or phrases or the application thereof be held invalid.

ADOPTED AND APPROVED this 18th day of February, 2014.

President, Board of Directors
San Gorgonio Pass Water Agency

ATTEST:

Secretary, Board of Directors
San Gorgonio Pass Water Agency

APPENDIX M

CHROMIUM-6 COMPLIANCE PLAN

CHROMIUM-6
COMPLIANCE PLAN

December, 2015

Background

The City of Banning ("City") owns and operates its water system and provides water to a population of approximately 30,325 and to businesses through 10,455 water connections.

100% of the City's water is extracted from local groundwater aquifers using 22 wells. A total of 7 wells (C2, C3, C4, C6, M3, M10, and M12), see Table A, are exceeding and in non-compliance with the new Chromium-6 Maximum Contaminant Level ("MCL") of 0.010 mg/L (10ppb).

	UCMR 1	UCMR 2	Date	Date	Date	Date	Annual Quarterly Average
	1/9/2013	7/23/2013	12/4/2014	3/30/2015	6/24/2015	9/29/2015	
Well C2	15.0	14.0	17.0	17.0	17.0	17.0	17.0
Well C3	16.0	15.0	16.0	15.0	16.0	14.0	15.3
Well C4	13.0	14.0	13.0	13.0	17.0	16.0	14.8
Well C6	10.0	Out of Service	14.0	12.0	14.0	13.0	13.3
Well M3	9.2	8.1	9.3	9.7	10.0	10.0	9.8
Well M10	9.9	10.0	10.0	11.0	12.0	12.0	11.3
Well M12	18.0	19.0	22.0	23.0	24.0	-	23.0

Table A: Wells and corresponding Chromium-6 concentrations (ppb).

A map showing the locations and their respective concentrations is attached as Exhibit A.

Historically, the 7 mentioned wells have been used to meet approximately 30% of the City's annual demand (2,710 acre-feet) and make up 6,950 gallons per minute ("gpm") of the City's total 22,500 gpm well capacity. Simply "turning off" the wells is not an option and at this time the City does not have the resources or treatment facilities to meet the new Chromium-6 standard.

Additionally, the City of Banning co-owns two wells with the Beaumont Cherry Valley Water District, which also have exceeded the Chromium-6 MCL. These two wells are currently not in use and will possibly be dedicated to non-potable uses. This makes for a total of 9 wells owned/co-owned by the City that are in non-compliance with the new Chromium-6 MCL.

Status

Since the adoption of the new Chromium-6 MCL, the City of Banning has been proactive in preparing to meet the standard. The following activities have taken place:

1. Well #M12
    a. Well #M12 has an average concentration of 23.0 ppb (highest of all 7 wells).

b. The well will be designated as a non-potable well.
c. The well has been taken off of the City's potable distribution system and connected to a 24 inch ductile iron pipe that makes up the first of three segments (and the only one currently installed) of the non-potable system. This section of the non-potable system extends from a connection point to the Sun Lakes Community ("SLC") at the corner of Highland Home Road and Sun Lakes Boulevard to the intersection of Lincoln Street and 22nd Street via Westward Avenue, Sunset Avenue and Lincoln Street.
d. The well is now solely providing SLC's Champions Golf Course with non-potable water.
e. The City is currently constructing a connection from the non-potable pipeline to SLC's Executive Golf Course. This work is scheduled to be completed by January 29, 2016 at a cost to the City equal to $45,000.00.

2. Treatment and Compliance Study
    a. On October 27, 2015 the City Council awarded a Professional Services Agreement to Hazen Sawyer for the development of a Treatment and Compliance Study.
    b. The scope of work, as listed in the attached RFP (see Exhibit B) includes:
        i. Evaluation of Treatment Alternatives including:
            1. Blending
            2. Well Head Treatments
                a. Ion Exchange (SBA and WBA)
                b. Reduction, Coagulation and Filtration (conventional and microfiltration)
                c. Reverse Osmosis
                d. Biological Reactor (fixed bed, fluidized bed and membrane)
            3. Brine treatment alternatives and hybrid treatment systems.
            4. Well Modification to reduce/eliminate intrusion of Chromium-6 into the well.
        ii. Evaluation infrastructure and site needs (right-of-way, property acquisition, etc.)
        iii. Cost analysis for each alternative.
    c. The Treatment and Compliance Study, which will be funded from Water Fund revenues, will cost the City $89,630.00.
    d. We expect the study will be completed by the end of June, 2016. This document will be used as a strategic planning tool for meeting the new standard. Once this document is completed the City will have a better understanding of the funding needs and timelines for constructing the necessary treatment facilities.

3. Dynamic Profiling
    a. On September 29, 2015 the City received a proposal to perform dynamic mass profiling seven City owned wells as listed in Table A. The cost to complete the project is $207,000.00.

b. At this point the City is looking into grant funding to fund the profiling as well as the construction of the modifications to the wells. The construction phase is anticipated to cost approximately $1,050,000.00.

Milestones

1. Treatment Study, Evaluation and Planning: December, 2015 to June, 2016

2. Financing Plan: April, 2016 to August, 2017

3. Environmental and PS&E: September, 2016 to August, 2017

4. Construction: September, 2017 to January, 2020.

*A Gantt Chart is attached as Exhibit C with more detail on the above milestones and shall be updated and submitted as needed.

Public Notice

Once approved, the City will provide written notice regarding its approved compliance plan to persons it serves, a minimum of two times per year. The notice will include:

1. That the public water system is implementing the compliance plan approved by the Division.
2. A summary of the compliance plan including the task/subtask milestones and scheduled completion dates.
3. A description of the work completed on each task/subtask identified in the compliance plan since the last report, the percentage of completion for each task/subtask, a description of any factors which could prevent the system from achieving compliance by the date specified in the approved compliance plan, and any requests for revision of the approved compliance plan found necessary to achieve compliance with the Chromium-6 MCL by the earliest feasible date.
4. Be printed in English, Spanish, and in the language spoken by any non-English-speaking group that exceeds 10 percent of the persons served by the public water system. It will contain a telephone number or address where residents may contact the public water system for assistance.
5. Information on where the persons served by the water system have access to alternative drinking water.
6. Basic information on Chromium-6, including the level found in drinking water provided by the public water system, the MCL for Chromium-6, and the possible effects of Chromium-6 on human health as specified in Appendix 64465-D of Section 64465 of Title 22 of the California Code of Regulations.

1.0 INTRODUCTION

1.1 PROJECT DESCRIPTION AND OBJECTIVES

The City of Banning is soliciting proposals from qualified consultants to provide professional engineering services for the development of a Chromium-6 Treatment and Compliance Study (Study) including preliminary design and cost estimates.

Effective July 1, 2015, the California Department of Public Health (CDPH) adopted the final drinking water Maximum Contaminant Level (MCL) for Chromium-6 at 10 parts per billion (ppb) as approved by the Office of Administrative Law on May 28, 2014. Up to seven (7) of the City of Banning's operating wells do not meet the final MCL.

The selected consultant shall analyze and report to the City the most efficient and effective method for complying with the final Chromium-6 MCL. The methods analyzed shall include blending, well head treatment (localized and regional treatment facilities), well modifications or a combination of these methods. The study shall also analyze the costs and benefits of removing co-occurring constituents, when found at levels of concern in local groundwater.

Proposals shall demonstrate the qualifications, competence, and capacity of the Consultant to perform the work and provide the engineering services described in this RFP.

The successful Consultant will be expected to execute the Professional Services Agreement included with this RFP.

1.2 BACKGROUND INFORMATION

The City of Banning, incorporated in 1913, covers approximately 23.2 square miles located in the San Gorgonio Pass area of Riverside County, approximately 30 miles east of the cities of San Bernardino and Riverside. The 2014 U.S. Census Bureau Community Survey recorded a population of 30,325 for the City of Banning. It is estimated that the population will increase by approximately 2% per year. The City of Banning owns and operates the water system which collects 100% of the water that it supplies from local groundwater aquifers. It currently operates 21 active ground water production wells and co-owns 3 production wells with the Beaumont Cherry Valley Water District (total of 24 active wells). The 24 wells have a design capacity of 24,300 gallons per minute (GPM). The City facilities also include 11 storage tanks with a total storage capacity of 18.4 million gallons (MG). In 2014 the City produced and provided approximately 8,500 acre-feet. Water service is provided to the entire City as well as unincorporated areas of the county that bound the south and north City limits.

Chromium-6 occurs naturally in the City of Banning groundwater due to erosion of sediments at levels above the final MCL of 10 ppb. Seven of the City's wells currently exceed the final MCL for Chromium-6 (see Exhibit "A" for concentrations and locations).

The study will require the Consultant to develop a strategy to comply with the final Chromium-6 MCL, including a time table and cost estimates for design and construction of the recommended treatment facilities. The study shall also analyze the costs and benefits of removing co-occurring constituents, when found at levels of concern in local groundwater.

2.0 SCOPE OF WORK

The scope of work that follows contains a general outline of the required tasks. Proposals submitted should include a detailed all-inclusive scope of work.

2.1 TASK 1: PROJECT MANAGEMENT, COMMUNICATION AND MEETINGS

A. Project Manager: Consultant shall assign a project manager that will be the point of contact and coordinate all communication with the City.

B. Project Kick-off Meeting and Review: Meet with the City staff to discuss study parameters, site-specific conditions, project goals, and latest developments. Obtain information as necessary to support the document preparation.

C. Project Schedule, Status report and Monthly Progress Meetings: Consultant shall submit an initial schedule with milestones using the latest version of MS Project. The schedule shall be updated monthly and shall be provided at monthly Progress Meetings attended by Consultant's Project manager. An Agenda shall be provided by Consultant a minimum of five (5) working days prior to the meeting date. Monthly Progress Meetings shall occur for the duration of the project unless noted otherwise by the City. Meeting minutes shall be prepared and submitted within five working days after the meeting(s).

2.2 TASK 2: DATA COLLECTION AND PRE-STUDY ANALYSIS

A. Site Survey and Site Visit: Conduct a site visit to identify potential locations for treatment facilities within the City of Banning.

B. Water Demand Analysis: Review and evaluate the City of Banning's latest Water Master Plans and provide recommended design analysis for Chromium-6 treatment under built-out conditions.

C. Water Quality Testing: Coordinate water quality testing with the City staff as required for study. All water quality samples shall be collected by the City; testing shall be performed by a certified laboratory, with lab costs paid separately by the City.

2.3 TASK 3: EVALUATE TREATMENT ALTERNATIVES

A. Treatment Analysis:

- **a.** *Blending Evaluation:*
  - **i.** Provide analysis for blending facilities.
  - **ii.** Identify required infrastructure.
- **b.** *Well Head Treatment Evaluation:*
  - **i.** Ion Exchange (SBA and WBA)
    1. Pre-treatment and post-treatment
    2. Constituent removal effectiveness
    3. Residual management
  - **ii.** Reduction Coagulation Filtration (conventional and microfiltration)
    1. Pre-treatment and post-treatment
    2. Constituent removal effectiveness
    3. Residual management
  - **iii.** Evaluate Reverse Osmosis
    1. Pre-treatment and post-treatment
    2. Constituent removal effectiveness
    3. Residuals management
  - **iv.** Evaluate Biological Reactor (fixed bed, fluidized bed, and membrane)
    1. Pre-treatment and post-treatment
    2. Constituent removal effectiveness
    3. Residual management
  - **v.** Evaluate Brine Treatment Alternative & Hybrid Treatment Systems (includes biological, catalytic and electrochemical brine treatment)
    1. Pre-treatment and post-treatment
    2. Constituent removal effectiveness
    3. Residual management
- ***c.*** *Well Modifications*
    1. Analyze the potential for performing dynamic well profiling to determine the potential for blanking off section of well screen in order to reduce intrusion of Chromium-6.

B. System Operation Evaluation: Provide analysis for headloss through treatment system, system capacity, waste disposal and frequency, chemical use, energy cost, filter run time, and equipment longevity.

C. Infrastructure Site Analysis: Evaluate public right-of-way and easements required to locate waterlines, conveyance facilities, and potential sites for all recommended Chromium-6 treatment facilities.

D. Cost Analysis: Provide a preliminary cost analysis and engineer's estimate to design, construct and operate the treatment facilities.

E. Facilities Schematic: Provide an 11" X 17" (or larger) conceptual layout depicting the location of all potential facilities including, but not limited to, connection location, conveyance facilities and treatment facilities for the recommended treatment option.

2.4 TASK 4: PREPARE CHROMIUM-6 TREATMENT AND COMPLIANCE STUDY

Chromium-6 Treatment and Compliance Study: Prepare the study to summarize the information from Tasks 1 through 3. The study will be used as a basis to consider the design and construction of the Chromium-6 treatment facilities. Meet with the City staff to discuss and review comments. Assume a minimum of one meeting to review the draft submittal, one meeting to review the final submittal, and two additional meetings to provide support at city council meetings.

3.0 CONSULTANT QUALIFICATIONS

3.1 QUALIFICATIONS AND UNDERSTANDING

Each Consultant must provide the following information about their company so the City can evaluate the Consultant's stability and ability to support the commitments set forth in response to the RFP. It is imperative the Consultant's proposal fully address all aspects of the RFP. The proposal must provide the City Staff with clearly expressed information concerning the Proposer's understanding of the City's specific requirements which would result in the conduct of this study in a thorough and efficient manner.

The Consultant shall outline their company's (or team's) background, including:

- How long the company has been in business, plus a brief description of the company history, size and organization.
- Consultant qualifications to complete the scope of services and a statement of understanding of the work involved to complete this assignment.

3.2 PROJECT TEAM

Each Consultant must provide the following information about their project team.

- Primary point of contact, person responsible for overall corporate commitment (must be a company principal or officer) and project manager. Describe the responsibilities of the individuals and extent of involvement with the project.
- Identify and list key individuals proposed for the project team. Describe the responsibilities of the individuals and extent of involvement with the project.
- All key personnel listed should have current names, titles and telephone numbers and be listed on at least one of the supplied client references who are familiar with work performed by the individual in a similar capacity. References will be contacted as part of the selection process.

- Clearly identify project sub consultants, how long the prime and sub have worked together and the reason why they were selected. Consultants are encouraged to support small businesses where ever possible.

3.3 REFERENCES

The Consultant shall supply a <u>minimum of 3 references</u> from agencies with projects of similar nature. Each reference shall contain:

- Client name and contact information
- Project description
- Role of key project team members.

Only references of the prime consultant shall be considered, or references from project teams that have completed at least 3 projects together. The Consultant shall also list projects completed for other agencies.

3.4 SCHEDULE

The consultant shall provide a project schedule indicating key project milestones and project activities. The schedule shall reflect a tentative start date of November 30, 2015.

3.5 WORKSHOPS AND MEETINGS

See Section 2.1, Task 1.

4.0 <u>PROPOSAL SUBMISSION</u>

4.1 RFP TIME SCHEDULE

• Request for Proposal Available	Tues, September 8, 2015
• Inquiry Deadline	Thurs., September 24,2015
• Proposals Due	Tues , September 29, 2015
• Final Selection	Thurs. October 15, 2015
• City Council Recommendation	Tues., October 27, 2015
• Notice to Proceed (Tentative)	Mon., November 30, 2015

4.2 NUMBER OF COPIES AND DELIVERY

Four (4) copies of the proposal shall be submitted to the following address:

City of Banning
City Clerk's Office
99 E. Ramsey Street
P.O. Box 998
Banning, CA 92220

The proposal title, consultants name and deadline information shall be clearly identified on the submission package and cover page. Submission deadline is Tuesday, September 29, 2015 at 5:00 p.m. Proposals submitted after that time shall not be considered. All questions regarding the scope of work shall be submitted to Holly Stuart, Management Analyst at the address above or via e-mail at hstuart@ci.banning.ca.us.

4.3 FORMAT AND CONTENT

Proposals shall be printed on 8 ½" X 11" paper, single sided in a 10 point Arial font and be limited to 25 pages excluding the cover letter, resumes and any appended information.

Proposals should address the following items in order of appearance:

Cover letter

The cover letter shall be provided which explains the firm's interest in the project. The letter shall contain name/address/phone number of the person who will serve as the firm's principal contact person.

Qualifications of Firm/Project Team

Provide names, titles and responsibilities of key personnel who will be responsible for the management of the project. Include qualifications, resumes, experience of each, and length of time with the company.

References

Give at least three (3) references for projects of similar size and scope, including at least three (3) references for projects completed during the past five years. Include the name and organization, a brief summary of the work, the cost of the project and the name and telephone number of a responsible contact person.

Strategy and Implementation Plan

Prepare a list of tasks to address the Scope of Work. Describe the firm's interpretation of the City's objectives with the regard to this RFP. Describe the proposed strategy and/or plan for achieving the objectives of the RFP. The narrative should include a description of the logical progression of tasks and efforts. Also include an explanation of the type of technology that will be used. This section shall also include a time schedule for the completion of the project and an estimate of time commitments from City staff.

Proposed quality assurance program (QA/QC)

Explain the firm's quality assurance program and the proposed approach for implementing the plan with this project.

Fee Proposal: One set in a separate sealed envelope

The Fee Schedule in a separate envelope shall be broken down on separate sheets as follows:

- A "Not to Exceed" fee for all services. Man-hours and billing rates per classification of personnel will be indicated for each task and/or subtask.
- Provide a complete list of costs per task and/or subtask and a total fee for the proposal, including expected reimbursable expenses (non-binding), for completion of the scope of services set forth in the proposal.
- A current hourly Fee Schedule for Fiscal Year 2015/2016 and classification of personnel for the firm, along with the type of work they and any sub consultants will perform, is also required.
- All printing and reproduction costs, research, meetings, mileage, telephone usage, general office supplies and overhead, etc., shall be included in the proposal and its "Not to Exceed" Fee schedule. Proposals should be prepared in a straight forward manner.

4.4 PROPOSAL EVALUATION

Proposals will be evaluated based on the following criteria:

- Responsiveness to the RFP.
- Consultant qualifications, project understanding, and overall experience.
- Technical Competency.
- Results of reference checks.
- Project Schedule.
- Proposed QA/QC plan.
- Proposal Fee.

4.5 NEGOTIATIONS

In an effort to manage the resources available for this project, the City may find it necessary to negotiate tasks, include contingencies for additional meetings or workshops, and address other factors identified by the Proposer not contemplated in this document or the City's standard agreement.

5.0 CONTRACT REQUIREMENTS AND SUBMITTALS

5.1 CITY OF BANNING REQUIREMENTS

The Contract will be presented to Council for approval. Please provide a copy of the attached City agreement to your legal team and insurance provider, if you are selected for Final Evaluation. This will expedite the process. A purchase order will not be granted until the contract is signed and all insurance requirements are satisfied.

CHROMIUM-6
COMPLIANCE PLAN
Amendment No. 1

March, 2016

Current Compliance Feasibility

Funding Sources: The City of Banning currently does not have treatment facilities in place that would allow for the treatment of pumped water in order to meet the new standard. Capital costs have been estimated in the range of $12,000,000.00 and $48,000,000.00 depending on the method of treatment. Annual operation and maintenance costs have been estimated in the range of $500,000.00 and $1,000,000.00. Additionally, lifecycle costs have been estimated between $1,100,000.00 and $3,000,000.00 annually.

For Fiscal Year 2015/2016, the City of Banning Water Division had an annual operating revenue budget of $8,017,650,00 and an expenditure budget of $8,017,650.00, a delta of <$813,338.00>. The delta in this case is due to reduced revenue projections related to conservation as mandated by Executive Order B-29-15. The loss in revenue was reduced by heavy budget cuts. The reduction in revenue will continue to become a challenge for the City and more so with future O&M costs related to Chromium-6 treatment facilities.

Additionally, the Water Operations Fund has a projected reserve balance of $7,873,060.00 at July 1, 2016. The City also has approximately $1,700,000.00 in two additional water capital funds.

The City plans to pursue all available funding sources including Prop 1 and State Revolving Funds. The City of Banning has both Severely Disadvantage and Disadvantage Community zones which may assist the city in obtaining funds for the expected capital expenditures.

The City is also in the process of completing a rate study, which will include the expected increase in operations costs due to the new treatment facilities.

It is clear that the City currently does not have the financial capacity to fund capital, O&M and lifecycle costs.

Operation of Wells: As previously mentioned, one obvious option that exists for the City of Banning includes removing the affected wells from the potable distribution system. The option is also not feasible; the City has a total of 16,300 gpm of well capacity. The eight affected wells make up 7,250 gpm of said capacity, 45% of the City's total capacity, see Table A. During dry seasons, these wells are relied upon even more due to the fact that the City's wells located in the Water Canyon have shallow aquifers and tend to "dry up" first.

Please note that the previous compliance plan submitted listed only seven well. This has now been increased to eight wells.

	UCMR 1	UCMR 2	Date	Date	Date	Date	Annual Quarterly Average	Well Capacity (gpm)
	1/9/13	7/23/13	12/4/14	3/30/15	6/24/15	9/29/15		
Well C2	15.0	14.0	17.0	17.0	17.0	17.0	17.0	1200
Well C3	16.0	15.0	16.0	15.0	16.0	14.0	15.3	1000
Well C4	13.0	14.0	13.0	13.0	17.0	16.0	14.8	1300
Well C6	10.0	Out of Service	14.0	12.0	14.0	13.0	13.3	950
Well M3	9.2	8.1	9.3	9.7	10.0	10.0	9.8	750
Well M10	9.9	10.0	10.0	11.0	12.0	12.0	11.3	650
Well M11	9.3	11.0	12.0	13.0	9.5	N/A	-	700
Well M12	18.0	19.0	22.0	23.0	24.0	-	23.0	700

Table A: Wells and corresponding Chromium-6 concentrations (ppb).

Update on Milestones

1. Treatment Study, Evaluation and Planning: December, 2015 to June, 2016

    a. Update (3/17/16): City staff has had several progress meetings with the consultant. During this process the team has reviewed different treatment scenarios including individual well head treatment and cluster treatment facilities; system hydraulics and cost estimates. Staff expects to have a draft memorandum of the results in April, 2016.

2. Financing Plan: April, 2016 to August, 2017

    a. Update (3/17/16): Staff has begun filling has attended various Prop 1 grant program workshop; most recently a Prop 1 groundwater program workshop held in Redlands, CA on March 14, 2016. Staff has begun the preparation of the pre-application for submittal. The City will submit its pre-application in April, 2016.

3. Environmental and PS&E: September, 2016 to August, 2017

4. Construction: September, 2017 to January, 2020.

Best Available Technology and Costs

As part of the Treatment Study, Evaluation and Planning process as described above, the City has analyzed the following options and costs:

Technology	Capital Cost	O&M	Life Cycle Costs
RCF (w/Recycle)	$19M - $37M	$1M	$1.75M - $2.5M
RCMF (w/Recycle)	$25M - $48M	$1M	$2M - $3M
Containerized SBA	$13M - $25M	$.5M	$1.3M - $2M
SBA (w/ CRRF)	$12M - $23M	$.5M	$1.1M - $1.65M
Conventional SBA	$15M - $28M	$.5M	$1.25M - $1.75M
WBA	$17M - $31M	$1M	$1.75M - $2.5M

Public Notice

the City will provide written notice regarding its approved compliance plan to persons it serves, a minimum of two times per year (July 1st and December 1st of each year).

APPENDIX N

DRAFT RESOLUTION DECLARING A WATER SHORTAGE EMERGENCY

RESOLUTION NO. _____

A RESOLUTION OF THE CITY COUNCIL OF THE CITY OF BANNING DECLARING A WATER SHORTAGE EMERGENCY (DRAFT)

The City Council for the City of Banning does hereby resolve as follows:

PURSUANT to California Water code Section 350 *et seq*, the City Council has conducted duly noticed public hearings to establish the criteria under which a water shortage emergency may be declared.

WHEREAS, the City Council finds, determines, and declares as follows:

(a) The City is the water purveyor for the property owners and inhabitants of the City of Banning in Riverside County and unincorporated areas of county adjacent to the City boundaries;

(b) The demand for water service is not expected to lessen;

(c) When the total combined quantities of water supply available to the City from all sources falls at or below the Stage 2 triggering levels described in the 2015 Urban Water Management Plan, the City will declare a water shortage emergency. The water supply would not be adequate to meet the ordinary demands and requirements of water consumers without depleting the City's water supply to the extent that there may be insufficient water for human consumption, sanitation, fire protection, and environmental requirements. This condition is likely to exist until precipitation and inflow dramatically increase or until water system damage resulting from a disaster are repaired and normal water service is restored.

NOW, THEREFORE, BE IT RESOLVED that the City Council of the City of Banning directs the Director of Public Works to find, determine, declare, and conclude that a water shortage emergency condition exists that threatens the adequacy of water supply, until the City's water supply is deemed adequate. After the declaration of a water shortage emergency, the

Director of Public Works is directed to determine the appropriate Rationing Stage and implement the City's Water Shortage Emergency Response.

FURTHERMORE, the City Council shall periodically conduct proceedings to determine additional restrictions and regulations which may be necessary to safeguard the adequacy of the water supply for domestic, sanitation, fire protection, and environmental requirements.

ORIGINAL

AGREEMENT

THIS AGREEMENT is by and between the City of Banning ("City") and the Beaumont-Cherry Valley Water District ("District"), sometimes jointly referred to as the "Parties."

RECITALS

WHEREAS, the Parties are the agencies serving the largest number of domestic water users in the San Gorgonio Pass area and collectively rely in substantial part on the Beaumont Basin ("Basin") as a source of water; and

WHEREAS, the Parties desire to promote conjunctive use of the Basin and desire to jointly address issues concerning the long-term reliability of the Basin as a source of potable water, including the use of water recycling and the treatment and use of imported water.

NOW, THEREFORE, THE PARTIES AGREE AS FOLLOWS:

I. PRODUCTION FACILITIES.

The Parties shall share the cost of constructing and operating three new production wells as follows:

A. Description.

The production wells shall be located west of Highland Springs Road at mutually agreed locations; shall be at least 1,500 feet deep' shall have minimum diameters of 18"; and each shall be capable of producing a minimum of 2,000 gallons per minute ("gpm").

B. Construction Costs.

The costs of constructing the production wells shall be shared equally between the Parties. The costs of constructing facilities to connect a Party's distribution system to any or all of said wells shall be borne by that Party.

C. Ownership.

The District and the City shall own and operate the wells jointly, on a 50-50 basis. District shall function as the lead operating agency with primary responsibility for the operation and maintenance of the joint facilities.

D. Operation, Maintenance, Repair and Replacement Costs.

(1). Operating and maintenance costs for each well shall be assessed to each Party on a per well basis. "Operating and maintenance costs" are defined as direct labor costs, electric costs, and costs of routine maintenance of the pumping facilities. "Repair and Replacement Cost: are defined as necessary costs of required repair or replacement of equipment and facilities. The District shall deliver the water to a tie-in point with City's water system at Highland Springs Avenue from the joint facilities at the Operating and maintenance costs of the water and without any wheeling cost.

(2). The cost shall be assessed based on the ratio of water supplied to that Party from a well/wells to the total water produced from that source.

(3). Each Party shall bear as its separate obligation those costs related to operation of facilities that it owns and that are used to deliver water to its distribution system.

(4). The District will submit the actual operation costs to operate the joint well/wells along with the necessary back up information on quarterly basis to the City. City will reimburse the District the said operation costs on quarterly basis subject to verification of such actual costs.

E. Production & Supply Pending Construction of Wells.

With respect to each production well, commencing on the date hereof and pending construction and development of the well to the point where total production from the well reaches 2,000 gpm, the District shall supply up to 1,000 gpm during Southern California Edison ("SCE")off peak hours to the City on an as-needed basis, at the District's cost of production. "Costs of production" are hereby defined as costs of electricity and direct labor costs required to bring the water to the surface and make it available to the City at the tie-in point.

F. Production & Supply Following Construction of Wells

(1). When the combined, total production from the three production wells reaches 6,000 gpm on a continuous basis, City shall be entitled to receive the greater of 3,000 gpm or 50% of the production at the District's Operating and Maintenance costs as defined above.

(2). The quantity of water delivered to City from the wells shall be charged to the City's total entitlement water from the Beaumont Basin set forth on Exhibit "Appropriators and Their Rights and Shares of Safe Yield and Operating Yield" of (Column number 6, "Operating Yield") the Stipulated Judgment in the Riverside County Superior Court case, San Timoteo Watershed Management Authority, etc. v. City of Banning, et al., Riverside County Superior Court case No. RIC 389197.

II. WATER TREATMENT PLANT.

A. Development of Joint Water Treatment Facilities.

The District has plans to build a water treatment facility for the treatment of state water project water on the District property located in Cherry Valley adjacent to District's Taylor reservoir. The Parties hereby express their intent to share the cost for design and construction of proposed treatment facilities. However, such agreement shall not prevent any party from unilaterally commencing the construction of the treatment plant. Should a Party elect to proceed with the design and construction of the treatment plant, it will not preclude the second party from constructing additions to the plant at a later date at the discretion of that Party. If construction on such water treatment plant has not commenced within 10 years of date hereof, Section II of this agreement "Water Treatment Plant" shall become void and of no further effect, unless otherwise mutually agreed by the Parties.

(1) Construction Costs.

Costs shall be shared based on percentage of participation in the total capacity of the plant: the City's percentage participation shall be determined by City, but shall not exceed 50% of rated plant capacity.

(2) Operation and Maintenance, Repair and Replacement Costs.

Operations and Maintenance shall be assessed on each Party according to its percentage of participation in the cost of operating and maintaining said water treatment facilities. "Repair and Replacement Cost" repair and replacement costs shall be assessed on each party according to its percentage of participation in the operation of the plant.

B. Treated Water Allocation.

Each party will be entitled to its prorata share of State Water Project water treated by the water treatment plant, based on its percentage of financial participation in the construction of the plant.

III. INTERCONNECTION OF SYSTEMS.

A. Connections.

City's and District's existing potable water distribution systems and recycled water systems (as the same are developed) shall be interconnected in order that each system will serve as a backup to the other. Connections will be at mutually agreed upon points between compatible pressure zones. Each connection shall be metered. Interconnection shall be established at such times and such places as are mutually agreed by the Parties in writing.

B. Cost Sharing.

(1) Construction Costs.

The costs of constructing/installing connections, meters and related facilities shall be borne equally by the Parties unless otherwise agreed in writing.

(2) Operation, Maintenance, Repair and Replacement

Each Party shall be responsible for operation, maintenance, repair and replacement of connections, meters, and related interconnection facilities assigned to it, as shown on Exhibit "A," attached hereto. Said exhibit may be amended from time to time. Each agency shall annually invoice the other for one-half of the total costs incurred for the operation and maintenance of said connections, etc.

C. Excess Deliveries Charges.

Water delivered to City by District shall be charged to City's entitlement to production from the wells as set forth in Paragraph 1(E) and 1(F) above. Deliveries by District to City in excess of said quantities shall be charged to City at District's lowest domestic water rate. Conversely, deliveries

by City to District shall be charged to District at City's lowest domestic water rate.

IV. RECYCLED WATER AND IN-LIEU WATER.

The District shall give the City first-take on any excess recycled water of the District. The decision to accept the water made available under this section shall be at the sole discretion of the City. The District and the City will work together to develop a system for deliveries to be made to the City under this subsection.

V. 1960, 1966 MEMORANDA OF UNDERSTANDING.

The 1960 and 1966 Memoranda of Understanding between the Parties are hereby modified to the extent necessary to allow for the construction and operation of the wells described in Paragraph 1 above, for the benefit of both parties. Consistent with those Memoranda of Understanding, either Party may, without consulting the other, develop additional water supplies within its boundaries, provided that it observes the one-half mile setback or buffer zone on each side of Highland Springs Road as created by said MOU's.

VI. Effective Date.

This MOU shall become effective when both Parties have executed this MOU and have executed the Stipulation for Judgment in the adjudication action, San Timoteo Watershed Management Authority v. City of Banning, et al., Riverside County Superior Court, Case No. RIC 389197.

VII. TERMINATION.

This Agreement may be terminated by written consent of both parties.

VIII. JOINT FUNDING EFFORT.

The Parties agree to work together to obtain Federal and State funding for projects that will jointly benefit both Parties, including the development of Supplemental Water Master Plans to include importation of State Water Project water, the capture and recharge of urban and storm runoff, recycled water systems, interconnection of domestic water systems, and State Water Project water treatment facilities. In addition, the Parties hereby agree to work with the California Department of Water Resources, the San Gorgonio Pass Water Agency ("Pass") and others, to develop supplemental water and recycled water supplies and will work closely with Pass to obtain access to and storage and distribution of State Water Project water.

IX. AMENDMENT.

This Agreement may be amended only by written amendment signed by the Parties.

X. SEVERABILITY.

In the event a portion of this Agreement is illegal or unenforceable, the remaining provisions will be given effect in order to preserve the original intent of the Parties.

XI. NOTICES.

Section 1

Introduction and Overview

Urban Water Management Planning and California Water Code

The California Water Code requires all urban water suppliers within the state to prepare urban water management plans and update them every five years. These plans satisfy the requirements of the Urban Water Management Planning Act of 1983 including amendments that have been made to the Act since then. Sections 10610 through 10656 of the Water Code detail the information that must be included in these plans, as well as who must file them. Appendix A of this Urban Water Management Plan (UWMP) contains the text of the Act. This report constitutes the 2015 update to the Beaumont-Cherry Valley Water District's 2013 Urban Water Management Plan (UWMP).

According to the Act, the Legislature finds and declares all of the following:

- The waters of the state are a limited and renewable resource subject to ever-increasing demands.
- The conservation and efficient use of urban water supplies are of statewide concern; however, the planning for that use and the implementation of those plans can best be accomplished at the local level.
- A long-term, reliable supply of water is essential to protect the productivity of California's businesses and economic climate.
- As part of its long-range planning activities, every urban water supplier should make every effort to ensure an appropriate level of reliability in its water supply sufficient to meet the needs of its various categories of customers during normal, dry, and multiple dry water years.
- Implementing effective water management strategies, including groundwater storage projects and recycled water projects, may require specific water quality and salinity targets for meeting groundwater basins water quality objectives and promoting beneficial use of recycled water.
- Public health issues have been raised over a number of contaminants that have been identified in certain local and imported water supplies. Water quality regulations are becoming an increasingly important factor in water agencies' selection of raw water sources, treatment alternatives, and modifications to existing treatment facilities. Changes in drinking water quality standards may also impact the usefulness of water supplies and may ultimately impact supply reliability.

- The quality of source supplies can have a significant impact on water management strategies and supply reliability.

The Legislature further finds and declares that it is the policy of the state as follows:

- The management of urban water demands and efficient use of water shall be actively pursued to protect the people of the state and their water resources.
- The management of urban water demands and efficient use of urban water supplies shall be a guiding criterion in public decisions.
- Urban water suppliers shall be required to develop water management plans to actively pursue the efficient use of available supplies.

The Act requires that each urban water supplier, providing water for municipal purposes, either directly or indirectly, to more than 3,000 customers or supplying more than 3,000 acre-feet of water annually, shall prepare, update and adopt its urban water management plan at least once every five years or before December 31, in years ending in five and zero, except as modified by the Legislature. (The Legislature required the 2015 UWMP Update to be submitted to DWR by July 1, 2016.) The Urban Water Supplier should periodically review the UWMP and any changes or amendments required as a result of that review shall be adopted (§10640).

BCVWD submitted its last UWMP Update in July 2013.

Changes in the Act Since 2010

There have been some changes to the Act since 2010. The changes are summarized in Table 1-1.

Water Conservation Act of 2009 (SB X7-7)

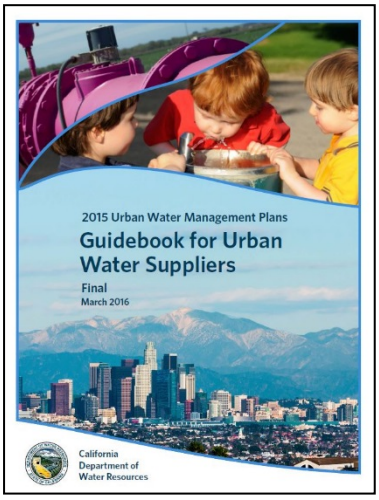
The Water Conservation Act of 2009 required retail urban water suppliers to report, in their UWMP's, their Base Daily per Capita Water Use (Baseline GPCD), 2015 Interim Urban Water Use Target, 2020 Urban Water Use Target, and Compliance Daily per Capita Water Use. This was included in BCVWD's 2013 UWMP Update.

Beginning in 2016, retail water suppliers are required to comply with the water conservation requirements in SB X7-7 in order to be eligible for State water grants or loans. Retail water agencies are required to set targets and track progress toward decreasing daily per capita urban water use in their service area, which will assist the State in meeting its 20 percent reduction goal by 2020.

Table 1-1
Changes to the UWMP Act since 2010

Topic	CWC Section	Legislative Bill	Summary
Demand Management Measures	10631 (f)(1) and (2)	AB 2067, 2014	Requires water suppliers to provide narratives describing their water demand management measures, as provided. Requires retail water suppliers to address the nature and extent of each water demand management measure implemented over the past 5 years and describe the water demand management measures that the supplier plans to implement to achieve its water use targets.
Submittal Date	10621 (d)	AB 2067, 2014	Requires each urban water supplier to submit its 2015 plan to the Department of Water Resources by July 1, 2016.
Electronic Submittal	10644 (a) (2)	SB 1420, 2014	Requires the plan, or amendments to the plan, to be submitted electronically to the department.
Standardized Forms	10644 (a) (2)	SB 1420, 2014	Requires the plan, or amendments to the plan, to include any standardized forms, tables, or displays specified by the department.
Water Loss	10631 (e) (1) (J) and (3)	SB 1420, 2014	Requires a plan to quantify and report on distribution system water loss.
Estimating Future Water Savings	10631 (e) (4)	SB 1420, 2014	Provides for water use projections to display and account for the water savings estimated to result from adopted codes, standards, ordinances, or transportation and land use plans, when that information is available and applicable to an urban water supplier.
Voluntary Reporting of Energy Intensity	10631.2 (a) and (b)	SB 1036, 2014	Provides for an urban water supplier to include certain energy-related information, including, but not limited to, an estimate of the amount of energy used to extract or divert water supplies.
Defining Water Features	10632	AB 2409, 2010	Requires urban water suppliers to analyze and define water features that are artificially supplied with water, including ponds, lakes, waterfalls, and fountains, separately from swimming pools and spas.

Urban Water Management Plans in Relationship to Other Planning Efforts



In the preparation of this UWMP Update, BCVWD used the following documents among others:

- 2015 BCVWD Potable Water Master Plan Update, (January, 2016)
- 2016 BCVWD Non-potable Water Master Plan, (in process)

- Recycled Water Facilities Planning Report for Recycled Water Pipeline and Pump Station, (June, 2014)
- City of Beaumont, General Plan, (March, 2007)
- Pass Area Land Use Plan, part of Riverside County General Plan, (October 7, 2003)
- San Gorgonio Pass Water Agency, Update of Demand Section of 2010 Urban Water Management Plan (UWMP) and Amendment of 2010 UWMP, (July 23, 2014)
- San Gorgonio Pass Water Agency, 2010 Urban Water Management Plan (UWMP), (December, 2010)
- San Gorgonio Pass Water Agency, Update Evaluation of Potential Water Transfer Opportunities, (July 23, 2013)
- Resolution 2015-05, Resolution of The Board of Directors of the San Gorgonio Pass Water Agency to Adopt Facility Capacity Fees for Facilities and Water, (July 27, 2015)

The City of Beaumont General Plan and the Pass Area Land Use Plans, listed above, are approaching or older than ten years; however, these are the latest land use and general plans available at this time.

UWMP Report Organization

The organization of the sections of this report follows as closely as possible the "Guidebook for Urban Water Suppliers, Final March 2016" developed by the California Department of Water Resources (DWR) to facilitate review by DWR. Although there is some flexibility in the organization and content, the "Guidelines" have specific required elements and table formats.
Throughout the various sections, the California Water Code (law) is cited and included to help the reader better understand why certain material is presented the way it is. Whenever the Water Code is cited it is presented in a boxed format as shown below:

CWC 10631

xxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx

UWMP and Grant or Loan Eligibility

For an urban water supplier to be eligible for any water management grant or loan administered by DWR, the agency must have a current UWMP on file that has been determined by DWR to address the requirements of the California Water Code (CWC). A current UWMP must also be maintained by the water supplier throughout the term of any grant or loan administered by

DWR. An UWMP may also be required in order to be eligible for other State funding, depending on the conditions that are specified in the funding guidelines.

Changes to California law require that, beginning in 2016, urban retail water suppliers must comply with water conservation requirements established by the Water Conservation Act of 2009 in order to be eligible for State water grants or loans. For 2015 UWMP's this means that a retail water agency must meet its 2015 Interim Urban Water Use Target and report compliance in the 2015 UWMP.

Suppliers may still be eligible for State water grants or loans if either of the following requirements are met.

1. The urban retail water supplier submits a schedule, financing plan, and budget, for achieving the per capita reductions; and/or
2. The urban retail water supplier submitted to DWR, for DWR's approval, documentation demonstrating that its entire service area qualifies as a disadvantaged community.

If an agency met its 2015 Interim Target, or met either of the exceptions above, and is participating in a multiagency water project or an Integrated Regional Water Management Plan, it shall continue to be eligible to receive grants or loans even though one or more of the other participating agencies is not in compliance with the SB X7-7 requirements.

Section 2

Plan Preparation

Basis for Preparing a Plan

CWC 10617

"Urban water supplier" means a supplier, either publicly or privately owned, providing water for municipal purposes either directly or indirectly to more than 3,000 customers or supplying more than 3,000 acre-feet of water annually. An urban water supplier includes a supplier or contractor for water, regardless of the basis of right, which distributes or sells for ultimate resale to customers. This part applies only to water supplied from public water systems…

CWC 10620

(b) Every person that becomes an urban water supplier shall adopt an urban water management plan within one year after it has become an urban water supplier.

CWC 10621

(a) Each urban water supplier shall update its plan at least once every five years on or before December 31, in years ending in five and zero, except as provided in subdivision (d).

(d) Each urban water supplier shall update and submit its 2015 plan to the department by July 1, 2016.

BCVWD is a retail, urban water supplier as the District has over 16,000 connections and delivers just over 9,000 acre-ft per year (AFY) of potable water.

Public Water System

CWC 10644

(a)(2) The plan, or amendments to the plan, submitted to the department … shall include any standardized forms, tables, or displays specified by the department.

CWC 10608.52

(a) The department, in consultation with the board, the California Bay-Delta Authority or its successor agency, the State Department of Public Health, and the Public Utilities Commission, shall develop a single standardized water use reporting form to meet the water use information needs of each agency, including the needs of urban water suppliers that elect to determine and report progress toward achieving targets on a regional basis as provided in subdivision of Section 10608.28.

(b) At a minimum, the form shall be developed to accommodate information sufficient to assess an urban water supplier's compliance with conservation targets pursuant to Section 10608.24… The form shall accommodate reporting by urban water suppliers on an individual or regional basis as provided in subdivision (a) of Section 10608.28.

> *California Health and Safety Code 116275*
>
> *(h) "Public Water System" means a system for the provision of water for human consumption through pipes or other constructed conveyances that has 15 or more service connections or regularly serves at least 25 individuals daily at least 60 days out of the year.*

BCVWD is a retail, public water system regulated by the State Water Resources Control Board (SWRCB) Division of Drinking Water (DDW).

Agencies Serving Multiple Service Areas/Public Water Systems

BCVWD has a single service area which includes the City of Beaumont and the unincorporated community of Cherry Valley in Riverside County and a portion of San Bernardino County. Table 2-1 presents information on BCVWD.

Table 2-1 Retail Only: Public Water Systems

Public Water System Number	Public Water System Name	Number of Municipal Connections 2015	Volume of Water Supplied 2015, AF
3310002	Beaumont Cherry Valley Water District	16,799	9,293
	TOTAL	16,799	9,293

NOTES:

Regional Planning

BCVWD is one of thirteen regional water providers and local governments that are a part of the San Gorgonio Pass Regional Water Alliance (SGPRWA or Alliance) formed through a memorandum of understanding (MOU) in March 2014. The Alliance is not preparing a separate regional UMWP Update. The goals of the Alliance are:

- To improve coordination, collaboration and communication among local, state and federal governments and water purveyors and other water resource stakeholders in the San Gorgonio Pass region to achieve greater efficiency and effectiveness in delivering water supplies.
- To develop and promote common water strategies that will, when implemented, fulfill the water demands of the regional area for the future

Individual or Regional Planning and Compliance

Table 2-2 shows BCVWD's 2015 UWMP is an individual UWMP.

Table 2-2: Plan Identification

☑	**Individual UWMP**		
	☐	Water Supplier is also a member of a RUWMP	
	☑	Water Supplier is also a member of a Regional Alliance	Other
☐	**Regional Urban Water Management Plan (RUWMP)**		
NOTES: BCVWD is a memer of, the San Gorgonio Pass Regional Water Alliance, which was formed in 2015; they did not prepare a 2015 UWMP			

Fiscal or Calendar Year and Units of Measurement

BCVWD is on a calendar year basis. Units of measure are acre-feet (AF) or acre-ft per year (AFY) unless clearly indicated otherwise. Individual customer meters read and customers are billed in terms of hundreds of cubic feet (HCF). Daily volumes are generally reporter in million gallons (MG) or million gallons per day (mgd). Data reported herein includes all of 2015. Units are clearly indicated on all tables.

Table 2-3 shows the Agency Identification information.

NOTES:	

Coordination and Outreach

Wholesale and Retail Agency Coordination

CWC 10631

(j) An urban water supplier that relies upon a wholesale agency for a source of water shall provide the wholesale agency with water use projections from that agency for that source of water in five-year increments to 20 years or as far as data is available. The wholesale agency shall provide information to the urban water supplier for inclusion in the urban water supplier's plan that identifies and quantifies, to the extent practicable, the existing and planned sources of water as required by subdivision (b), available from the wholesale agency to the urban water supplier over the same five-year increments, and during various water-year types in accordance with subdivision (c). An urban water supplier may rely upon water supply information provided by the wholesale agency in fulfilling the plan informational requirements of subdivisions (b) and (c).

The wholesale water provider in the San Gorgonio Pass area of Riverside County is the San Gorgonio Pass Water Agency (SGPWA). The Agency has been informed of BCVWD's projected imported water needs. BCVWD provided SGPWA with responses to their inquiries on the District's water demands, supplies and imported water needs.

Table 2-4 Retail: Water Supplier Information Exchange
The retail supplier has informed the following wholesale supplier(s) of projected water use in accordance with CWC 10631.
Wholesale Water Supplier Name *(Add additional rows as needed)*
San Gorgonio Pass Water Agency
NOTES:

Coordination with Other Agencies and the Community

CWC 10620

(d)(2) Each urban water supplier shall coordinate the preparation of its plan with other appropriate agencies in the area, including other water suppliers that share a common source, water management agencies, and relevant public agencies, to the extent practicable.

CWC 10642

Each urban water supplier shall encourage the active involvement of diverse social, cultural, and economic elements of the population within the service area prior to and during the preparation of the plan.

Table 2-5 presents a list of adjacent water agencies, communities and organizations that would have an interest in the BCVWD UWMP Update.

Table 2-5

HOAs			Beaumont Unified School District	■
Riverside County Planning Department			San Bernardino County Land Use Services	

The City of Beaumont has a direct interest since the city is served by BCVWD; BCVWD is also in discussions with the City about recycled water. The City of Banning has agreements with BCVWD to recharge imported water on their behalf, has an existing emergency potable water connection with BCVWD and stub outs across Highland Springs Avenue for potable and recycled water connections and has financially participated with BCVWD in the construction of several production wells. BCVWD has pipeline facilities within the City of Calimesa; however the District does not serve the city. The city is served by YVWD.

YVWD has been working with BCVWD to provide recycled (non-potable) water to BCVWD. BCVWD prepared a Facilities Planning Report in June 2014 for a Recycled Water Supply Pipeline and Pump Station; this report has been approved by the SWRCB.

The County of Riverside Planning Department is involved with land use planning and building permit approval in the unincorporated community of Cherry Valley; the County of San Bernardino Land Use Services controls land use planning in the unincorporated portion of the District's service in that county. The Riverside and San Bernardino County LAFCOs have an interest since they have requirements for water supply assessments whenever there is an annexation. Riverside County Flood Control and Water Conservation District are involved with BCVWD on the Beaumont MDP Line 16 project

and control the flood control channels within BCVWD's service area. Some of these channels play a role in basin recharge.

The Beaumont Basin Watermaster manages the groundwater basin which provides over 80% of the District's groundwater production.

The SGPWA is the State Water Contractor that imports water on behalf of the District and its other retail agencies through the East Branch Extension of the State Water Project. BCVWD has been purchasing water from SGPWA and percolating it in BCVWD's groundwater recharge facility since 2006. The SGPWA also has an agreement with BCVWD to use recharge facilities at the mouth of Little San Gorgonio Canyon on BCVWD-owned land for the recharge of State Project Water.

The Cherry Valley Acres and Neighbors (CVAN) is a local organization which is very active on land use and water issues.

The Riverside Building Industry Association is included since they are also very active in the area. There are a number of Home Owner Associations, (HOAs), which have in interest in as much as most of them are overseeing the non-potable water systems in their areas. The Beaumont Cherry Valley Parks and Recreation District and the Beaumont Unified School District are major current users of BCVWD's potable and non-potable water

The Santa Ana Watershed Planning Authority (SAWPA) is the major regional water resource planning organization in the Upper Santa Ana River and provides funding form projects in BCVWD's service area.

It should be pointed out that BCVWD does not serve any customers in San Bernardino County except its own residences.

Notice to Cities and Counties

> *CWC 10621 (b)*
>
> *Every urban water supplier required to prepare a plan pursuant to this part shall, at least 60 days before the public hearing on the plan required by Section 10642, notify any city or county within which the supplier provides water supplies that the urban water supplier will be reviewing the plan and considering amendments or changes to the plan.*

In early May, 2016, the 60-day notification was sent to the organizations indicated in Table 2-5 above. The notice stated that BCVWD was in the process of updating its UWMP. A formal notice of the date and time of the public hearing for adoption of the 2015 UWMP was sent to all of the Agencies in Table 2-5 on November 3 and 7, 2016 for a Public Hearing on December 14, 2016 in the Board Room, Beaumont Cherry Valley Water District, 560 Magnolia Avenue, Beaumont, CA 92223. The meeting was noticed, as required, in the *Record Gazette* newspaper.

The 2015 UWMP was posted on BCVWD's website on November 3, 2016.

Project Team and Acknowledgements

The 2015 Urban Water Management Plan Update was prepared by Joseph. C. Reichenberger P.E., BCEE, Staff Engineer, with assistance and review from Eric Fraser P.E, General Manager and Dan Jaggers P.E., Director of Engineering,

We acknowledge the help from the District's Board of Directors, other District Staff including Tony Lara, Director of Operations, Knute Dahlstrom, Sylvia Molina, Bruce Kincaid, Robert Rasha, and Bill Clayton.

Section 3

System Description

General Description of District

> *10631. A plan shall be adopted in accordance with this chapter and shall do all of the following:*
>
> *10631. (a) Describe the service area of the supplier, including current and projected population, climate, and other demographic factors affecting the supplier's water management planning. The projected population estimates shall be based upon data from the state, regional, or local service agency population projections within the service area of the urban water supplier and shall be in five-year increments to 20 years or as far as data is available.*

The Beaumont Cherry Valley Water District (BCVWD) provides potable and non-potable water service to about 16,799 active accounts, (16,985 connections), as of December 2015[1], in the City of Beaumont and the unincorporated community of Cherry Valley in Riverside and San Bernardino Counties in Southern California. The District's is approximately 75 miles east of Los Angeles along Interstate 10. BCVWD's average day demand in 2015 was 9.2 mgd; maximum day was 15.3 mgd. This was a decrease from 2013 when the average day and maximum day demands were 11.45 mgd and 20.2 mgd respectively -- primarily due to required landscape and outdoor water use conservation measures enacted by the State of California due to the 5-year drought.

The San Gorgonio Pass area started to develop in the late 1880s and in 1912 the community of Beaumont incorporated. BCVWD was formed in 1919 as the Beaumont Irrigation District under California Irrigation District Law, Water Code Section §20500 *et seq*. The name was changed to the Beaumont Cherry Valley Water District in 1973. Beaumont and Cherry Valley remained small until about the mid-1980s.

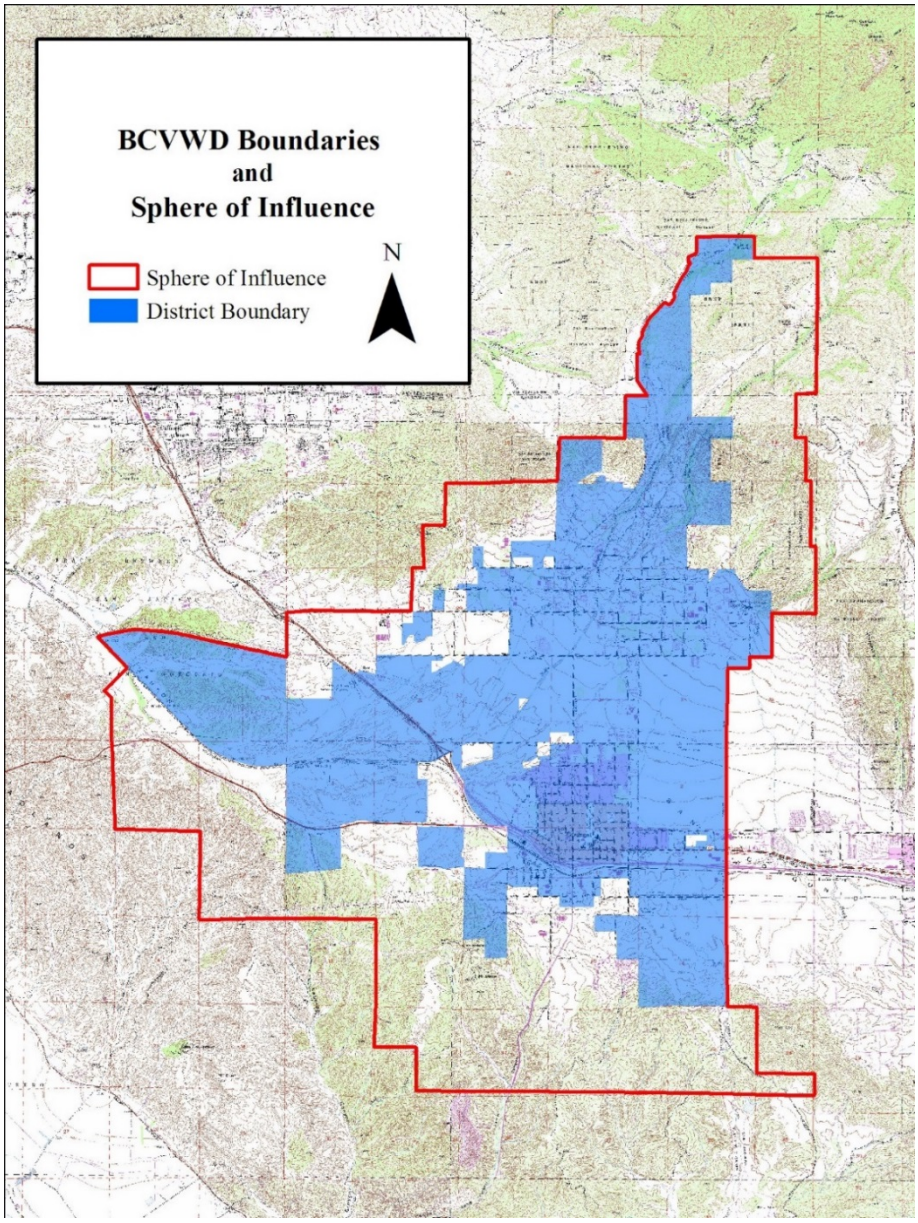
BCVWD Office since 2008

The populations of Beaumont and Cherry Valley in 1980 were 6,818 and 5,012 respectively. The boom of the early 2000s, saw Beaumont's population to skyrocket to 36,837 by 2010; Cherry Valley showed only limited growth to 6,279 during that same time period. Current (2015)

[1] BCWD (2015). Annual Financial Report for Fiscal Year Ended December 31, 2015.

population served by the District is approximately 48,400. Meeting the water demands for this rapid growth in Beaumont was challenging.

The population served by the District is expected to nearly double by 2040-45. The City of Beaumont's General Plan, adopted in 2007, had a projected build-out population of 87,200. The build out population within the District's Sphere of Influence (SOI) is estimated to be about 112,300 based on BCVWD estimates of land use.



Service Area

The District's present service area covers approximately 28 square miles, virtually all of which is in Riverside County, and includes the City of Beaumont and the community of Cherry Valley. The District owns 1,524 acres of watershed land in Edgar Canyon in San Bernardino County located just north of the Riverside-San Bernardino County line where the District operates a number of wells and several reservoirs.

The District's SOI, or ultimate service planning area, encompasses an area of approximately 37.5 square miles (14.3 sq. mi. are in the City of Beaumont). This SOI, shown in Figure 3-1, was established by the Riverside and San Bernardino County Local Agency Formation Commissions (LAFCOs). SOIs are established as a planning tool and help establish agency boundaries and avoid problems in service, unnecessary duplication of costs, and inefficiencies associated with overlapping service.

The District's SOI is bounded on the west and north by the Yucaipa Valley Water District (YVWD) and on the east by the City of Banning. The northerly boundary of Eastern Municipal Water District (EMWD) is one-mile south of the District's southerly SOI boundary. The area between EMWD and the District's SOI is not within any SOI and could be annexed to either the District or EMWD. The District's SOI in Little San Gorgonio Canyon follows Oak Glen Road. The area west of Oak Glen Road is within YVWD's SOI; east of Oak Glen Road is within the District's SOI.

In 1999, as part of an agreement to transfer the "Midway Area" to the City of Banning, the easterly limit of the District's SOI was set at Highland Springs Road. Areas east of Highland Springs Road are now served by the City of Banning. (Note, the "Midway Area" was along 6th St. east of Highland Springs Rd.)

NORTH

0 8000

Approximate Scale in Feet

Figure 3-1
District Boundary and Sphere of Influence

Beaumont Cherry Valley Water District
Beaumont, California

West of I-10, between Oak Valley Parkway (formerly San Timoteo Canyon Road) and I-10, the District's SOI matches that of the City of Beaumont and extends northerly and westerly to Southern California Edison Power Line Easement (Towers). This corresponds to the northerly boundary of the Fairway Canyon Project. North of the Power Line Easement there is an open space reserve that would limit any development westerly along Oak Valley Parkway (San Timoteo Canyon Rd.) This portion of the District's SOI boundary abuts the City of Calimesa and Yucaipa Valley Water District (YVWD).

About the year 2007, Riverside County LAFCO revised the District's SOI Boundaries east of I-10 in the vicinity of Calimesa. The area north of Cherry Valley Blvd from I-10 eastward to a point about 1,000 ft west of Hannon Rd is now in the City of Calimesa and in YVWD's SOI.

Though not in the District's service area boundary at the present time, a future development (Jack Rabbit Trail Project) southerly of Highway 60 is in the District's service area and ultimately would be served by the District.

The District's service area ranges in elevation from 2300 feet above mean sea level (MSL) in Fairway Canyon area of Beaumont on the western boundary, to 2900 feet in Cherry Valley, and over 4,000 feet in the upper reaches of the SOI. The area serves primarily as a "bedroom" community for the Riverside/San Bernardino Area and the communities east of Los Angeles County along the I-10 corridor.

The District is governed by a 5-member Board of Directors, each representing a division within the existing service area. Members of the Board of Directors are elected at large.

BCVWD's Water Supply System

BCVWD has a potable water supply system and a non-potable water system. The potable water system is supplied exclusively by groundwater wells; the non-potable water system is designed to convey non-potable groundwater, recycled water, untreated imported water and potable water, as make-up, or a blend of all. In addition to these systems the District owns and operates a groundwater recharge facility and imported water pipeline. BCVWD's 2015 average day and maximum day potable water demands were 9.2 mgd and 15.3 mgd, respectively. Average day non-potable water demand for 2015 was 1.15 mgd. These demands are lower than 2013 when the average day total potable and non-potable demand was 11.45 mgd; maximum day was 20.2 mgd. The impact of the Governor's mandated conservation is evident.

Potable Water System

BCVWD's potable water system is supplied by wells in Little San Gorgonio Creek (Edgar Canyon) and the Beaumont Basin (sometimes called the Beaumont Storage Unit or the Beaumont Management Zone). The District has a total of 24 wells (1 well is a standby). One of the wells, Well 26, can pump into either the potable water or the non-potable water system. Currently it is pumping into the non-potable water system. The Beaumont Basin is adjudicated and managed by the Beaumont Basin Watermaster. BCVWD augments its groundwater supply with imported State Project Water from the San Gorgonio Pass Water Agency (SGPWA) which is recharged at BCVWD's recharge facility at the intersection of Brookside Avenue and Beaumont Avenue.

Wells in Edgar Canyon have limited yield, particularly in dry years, and take water from shallow alluvial and bedrock aquifers; wells in the Beaumont Basin are large capacity and pump from deep aquifers – some as deep as 1500 ft below the ground surface. The Edgar Canyon wells are very inexpensive to operate and are the preferred source; however, those wells are not able to meet the current average day demand. The Edgar Canyon wells pump to a gravity transmission main that extends the full length of the District-owned properties in Edgar Canyon. The transmission main connects to the distribution system in Cherry Valley. Water from the Edgar Canyon Wells, which is not used in the developed areas adjacent to Edgar Canyon or Cherry Valley, is transferred to lower pressure zones serving the City of Beaumont. This happens regularly in the winter time. The Edgar Canyon Wells provide about 15 to 20 percent of the total annual supply; the rest is pumped from wells in the Beaumont Basin.

BCVWD has two active stream diversion locations within Little San Gorgonio Creek (Edgar Canyon) that are in the State Water Resources Control Board, Division of Water Rights database (S014351, S014352). The diversions have pre-1914 recorded water rights amounting to 3,000 miner's inch hours (MIH) or approximately 45,000 acre-feet per year (AFY) of right for diversion of water for domestic and irrigation uses. These date back to the early history of the District. However, the District has never had a demand that requires such large quantities of water supply; and the watersheds may not be capable of supplying such quantities during an average year. At the present time the District currently diverts streamflow in Edgar Canyon to a series of percolation ponds which recharge the shallow wells in Edgar Canyon. This water is then extracted for domestic purposes.

BCVWD's total well capacity (Edgar Canyon and Beaumont Basin) is about 27.5 million gallons per day (mgd) with the largest well out of service, which is much greater than the current 15.3 mgd maximum day demand (2015).

The District has 11 pressure zones and 14 reservoirs (tanks) ranging in size from 0.5 million gallons (MG) to 5 MG. Total storage is approximately 22 MG –almost 2.5 average days or 1.4 maximum days. The reservoirs provide gravity supply to their respective pressure zones. The BCVWD's system is constructed such that any higher zone reservoir can supply water on an emergency basis to any lower zone reservoir. There are booster pumps in the system to pump water up from a lower pressure zone to a higher pressure zone also.

The transmission system in the main pressure zones is 24-in diameter. (There are some 30-in diameter pipelines at some reservoirs.) The bulk of the pipe is ductile iron pipe with cement mortar lining and was installed in the last 10 to 15 years. There are a number of small distribution lines (4-in and smaller that are gradually being replaced over time with minimum 8-in diameter ductile iron pipe. All developments since the early 1980s have installed mortar lined, ductile iron pipe. The distribution system is capable of providing over 4,000 gallons per minute (gpm) fire flow in the industrial/commercial areas of the service area.

Imported Water and Recharge Facilities

Around 2001, BCVWD began investigating an 80-acre site on the east side of Beaumont Avenue between Brookside Ave. and Cherry Valley Blvd. as a location for a facility to recharge captured storm flow and imported water. After extensive hydrogeologic investigations including pilot testing, the District eventually purchased the site, (known as the Oda Property), and developed Phase 1 of the recharge facility on the westerly half of the site. The Phase 1 facilities were completed and went on line in late summer 2006. Phase 2 of the recharge facility was completed in 2014. This site has excellent recharge capabilities with long-term percolation rates around 7 to 10 acre-ft/acre/day with proper maintenance.

The District completed construction of a 24-in pipeline from the turnout on East Branch Extension (EBX) of the State Water Project to the groundwater recharge site in 2006. A metering station was installed at the turnout at Noble Creek and Vineland Avenue and BCVWD began taking imported water deliveries from SGPWA for recharge in September 2006. In conjunction with the recharge facility, the District developed a drought-tolerant landscape demonstration garden with walking trails and picnic areas for visitors to the site. Since its operation in 2006 through the end of 2015, nearly 48,500 acre-ft (about 15.8 billion gallons) of imported water have been recharged. As of the end of 2014, BCVWD has 28,930 acre-ft "banked" in the Beaumont Basin; this is more than a three year supply.

Non-potable (Recycled) Water System

Currently BCVWD has over 40 miles of non-potable water transmission and distribution pipelines, (6-in and larger), in place. This construction has occurred since about 2002. A 24-in diameter ductile iron pipeline forms a loop around the City of Beaumont. The system includes a 2 million gallon recycled (non-potable) water reservoir which provides gravity storage and pressurization for the system. The 2 MG non-potable water reservoir is configured to receive potable water or untreated State Project Water (SPW) through air gap connections. The non-potable water system can have a blend of recycled water, imported water, non-potable groundwater, and potable water. The 2 MG reservoir is located at the District's groundwater recharge facility at Beaumont Avenue between Brookside Ave. and Cherry Valley Blvd. There are about 300 existing landscape connections to the recycled water system receiving about 1,300 acre-ft of water based on 2015 meter records. (In 2014, the non-potable water use was 1,900 acre-ft.) The impacts of the Governor's conservation mandate impacted the non-potable system too.

A large part of the non-potable water system is currently supplied from Well 26, supplemented with potable water which is introduced into the 2 MG non-potable water tank through an air gap connection. The non-potable water system in the Tournament Hills and Fairway Canyon area is currently supplied with potable water through several interconnections between the potable and non-potable water system.

BCVWD was awarded a facilities planning grant from the SWRCB to develop a facilities plan for a recycled water connection with YVWD. This facilities plan was approved by the SWRCB in August 2014 and BCVWD could apply for grant/loan funding for the project. BCVWD is also in discussions with the City of Beaumont for recycled water.

BCVWD Authority Under the Irrigation District Law

As stated above, BCVWD was formed as an "irrigation district" under California Water Code §20500 *et seq*. defines the "powers" and authority of irrigation districts which are summarized below:

- Furnish water in the district for any beneficial use, including fire protection (§20500, 22077)

- Control, distribute, store, spread, treat, recapture and salvage any water (including but not limited to sewage waters for the beneficial use of the district or its residents (§22078)
- Provide for any and all drainage made necessary by the irrigation provided for by the District. (§22095)
- Acquire lease and operate plants for the generation, transmission, distribution and sale of electric power (§22115)
- Acquire, construct, maintain, and operate facilities for the collection and disposal of sewage subject to approval by a majority of the voters of the district (§22170, 22176)
- Fix and collect charges for any service provided by the district including the sale of water (with standby charges), connections to new pipelines or extensions of existing pipelines, use of water for groundwater recharge, use of water for power purposes and sale of electric power (§22280)
- Impose a special tax pursuant to Article 3.5 (commencing with Section 50075) of Chapter 1 of Part 1 of Division 1 of Title 5 of the Government Code. The special taxes shall be applied uniformly to all taxpayers or all real property within the district, except that unimproved property may be taxed at a lower rate than improved property (§22078.5)

Although these powers are permitted under statute, approval from LAFCO may be required before certain activities are undertaken.

Service Area Climate

Table 3-1 presents the monthly temperature, precipitation and evapotranspiration for the BCVWD service area.

Temperature

Table 3-1 presents temperature data for the City of Beaumont obtained from the Western Regional Climate Center. The climate in Cherry Valley is similar, but temperatures are cooler in the upper elevations of the District's SOI. Temperatures below freezing are common in winter in the upper elevations of the service area. Temperatures over 100^{o}F are also common in the summer.

Precipitation

As shown in Table 3-1, virtually all the precipitation occurs during the months of November through April; most of the precipitation is in the form of rain, but snow is common in higher elevations of the service area during the winter. Some rainfall occurs in summer from thunderstorms that are associated with monsoonal moisture. Annual precipitation in Beaumont (2680 MSL) averages approximately 17.8 inches, with increasing amounts of precipitation with

increasing elevation. Cherry Valley averaged 20.6 inches for the period 1911-2006; Oak Glen (4600 ft MSL) averaged 25.5 inches for the 61-year period 1946-2006.

Table 3-1
Climate in BCVWD Service Area[1]

	Jan	Feb	Mar	Apr	May	Jun	Jul	Aug	Sep	Oct	Nov	Dec	Annual
Average Max. Temperature (F)	60.5	63.6	66.2	72.5	78.8	88.0	95.6	95.5	90.6	80.7	69.4	62.0	77.0

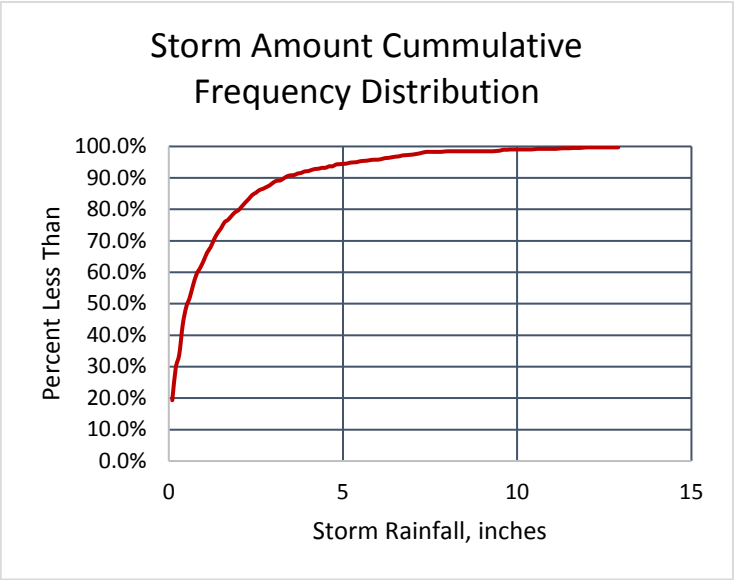
[1] Western Regional Climate Center, Beaumont 1E 7/1/1948 – 12/30/2004
[2] CIMIS website – Winchester, CA

Table 3-2 shows the percentage of occurrence of storms of various total rainfall amounts in Beaumont. Rarely does a total storm rainfall exceed 3 inches. A “storm,” in the Table 1-2 analysis, is defined as a continuous period of measurable daily rainfall interrupted by not more than 3 consecutive days of no measureable rainfall.

Evapotranspiration

Table 3-1, presented above, shows the monthly reference average ETo based on the California Irrigation Management Information System (CIMIS), Winchester, CA station. This station is located about 15 miles south of the BCVWD and is representative of the evapotranspiration in the District’s service area. The reference ETo represents the amount of water used and evaporated by a 4-in to 7-in tall stand of grass in an open field. Water use by other crops and landscape materials can be determined using the appropriate crop coefficient in conjunction with the ETo.



The service area is in Reference ETo Zone 9 – South Coast Marine to Desert Transition.[2] Outdoor water consumption for corrals, orchards and lawns during the hot, dry summer months is high. Data reported to the SWRCB, Conservation Reporting for 2015 showed per capita residential water use ranging from about 100 gpcd in the winter and spring months to about 200 gpcd in September. BCVWD was able to achieve a 23% reduction in water demand from 2013

[2] California Department of Water Resources and University of California Cooperative Extension, A Guide to Estimating Irrigation Water Needs of Landscape Plantings in California, The Landscape Coefficient Method and WUCOLS III, August 2000.

to the same period in 2015-16 in spite of a population growth of nearly 800 people. Attaining water conservation targets is a challenge.

Table 3-2
Total Storm Rainfall Frequency Beaumont (1918 – 2006)

Storm Total, in	Percent of Time
0.50 or less	49%
1.0 or less	63.9%
2.0 or less	79.8%
3.0 or less	88.5%
4.0 or less	92.2%
5.0 or less	94.5%
6.0 or less	95.8%
7.0 or less	97.4%
8.0 or less	98.5%
More than 8.0	1.5%

Climate Change

Climate change will result in reduced snowpack and more precipitation as rain. Although studies have shown that the average amount of precipitation may not change significantly under the different climate change (greenhouse gas scenarios) models, events will be more extreme. Wet periods will be wetter and drought periods drier. The timing of the runoff will be accelerated. For example, the peak runoff period in the Sierra Nevada Mountains will occur earlier in the year and will be at a higher rate due to the warmer temperatures and rainfall, on a limited snowpack. Much of this runoff may not be able to be captured by existing reservoirs designed under historic hydrology and operating under "old" storage/outflow management rules. Existing conveyance systems will not be adequate to move this water to off stream storage reservoirs or to groundwater recharge facilities. This will result in more water lost to the ocean and unavailable to meet demands.

DWR (2008) predicts that the Sierra snowpack water storage will be reduced 25% to 40% by 2050.[3] Chung, et al. (2009) estimated that climate change impacts will reduce Delta Exports

[3] DWR 2008. *Managing an Uncertain Future, Climate Change Adaptation Strategies for California's Water*, State of California, The Resources Agency, Department of Water Resources, October.

through the State Water Project (SWP) and the Central Valley Project (CVP) by 7% to 10% by 2050 and by 21% to 25% by the end of the 21st century. (Note that DWR's 2013 SWP Reliability Report, referenced later in this UWMP, included the effects of climate change.)

BCVWD conducted a climate change vulnerability assessment using the methodology in Appendix I of the UWMP Update Guidelines and the Climate Change Handbook for Regional Water Planning.[4] It should be pointed out that there is considerable speculation and variability between the various greenhouse gas/climate models. The approach in this UWMP is to consider climate change generically rather than specifically. The vulnerability assessment will address:

- Water Demand
- Water Supply
- Water Quality
- Flooding
- Ecosystem and Habitat Vulnerability

Vulnerability due to sea level rise and hydropower impacts do not directly impact BCVWD, but could indirectly impact BCVWD. For example, sea level rise will impact the Delta levee system which could impact SWP deliveries and SWP water quality should a levee failure occur. Although BCVWD does not have any hydropower facilities, reduced hydropower generation will affect the cost BCVWD pays SCE for electric power.

Water Demand

Since water use in BCVWD's service area varies by more than 50% during the year due to outdoor water use, increases in temperature due to climate change would be expected to increase summer time urban and agricultural water. However, this will be more than offset by the installation of water efficient and drought tolerant landscaping in new developments in response to tightening landscape ordinances. The City of Beaumont and Riverside County have been continually updating their landscape ordinances in response to directives from DWR. The most recent DWR Model Water Efficient Landscape Ordinance version was July 2015. Outdoor residential potable water consumption will also be reduced in the future with the implementation of graywater systems using laundry wastewater etc. Water use on orchards in the District will decrease as these areas are converted into urban uses. In summary, BCVWD believes climate change impacts on demand will be more than offset by more efficient outdoor

[4] USEPA Region 9 et al (2011*). Climate Change Handbook for Regional Water Planning,* prepared by CDM for US Environmental Protection Agency, Region 9, California Department of Water Resources, US Army Corps of Engineers South Pacific Division, and Resources Legacy Fund, November.

water use, reduced turf areas, implementation of graywater systems, and land use conversion from orchards to residential.

As an example, when BCVWD was under Stage 2 Water Conservation measures which limited outdoor water use and limited landscape sprinkling to two days per week, BCVWD was able to achieve a 23% reduction in water use from 2015-16 compared to the corresponding period in 2013.

Water Supply

Surface flow is not directly used for water supply. All streams in the area are ephemeral and dry up during the summer. Some only have flow during and shortly after rainfall events.

Other than imported SWP supply from the SGPWA which will make up an increasing fraction of the District's water supply over time, very little of the District's direct supply comes from local snowmelt; so the impact of climate change on the local supply will be minimal. The impact on the SWP and Delta exports was discussed above.

BCVWD is very fortunate in that the Beaumont Groundwater Basin has large storage capacity for banked water. BCVWD has an 80,000 acre-ft storage account in the Basin. During wet years, BCVWD can bank SPW for dry years, as was successfully done from 2006 through 2014 when over 46,000 acre-ft were recharged. The Beaumont Basin Watermaster keeps an accounting of stored water. As of the end of 2014, BCVWD had 28,930 acre-ft of water in storage for use during dry years.

Water Quality

Wildfires are always a threat in the area; fortunately CalFire and the local fire departments are very responsive. BCVWD, YVWD and the City of Banning have water distribution systems available for fire prevention which have been effective in controlling wild fires. Erosion from burned areas is always a problem. The District has been effective at mitigating the effects of wildfire erosion by diverting streamflow to desilting ponds constructed in and at the mouth of Little San Gorgonio Creek and percolating the desilted flow. The California Public Interest Energy Research (PIER) Program predicted a 30% increase in burned area by 2085 due to potential climate change impacts. BCVWD believes that erosion from the increased burned area can be managed with the existing infrastructure.

Flooding

BCVWD's has some well facilities that are probably with the 200-year flood plain in Little San Gorgonio Creek. During these events some damage may occur. But the District can still manage since there is adequate spare capacity in the Beaumont Basin wells. The Beaumont Basin wells are definitely outside of the 100-year flood plain and most likely outside of the 200-year flood plain though there are no 200-year flood plain maps to verify this. Riverside County

Flood Control and Water Conservation District has an improved channel for Noble Creek. It is relatively new and well-maintained.

There was significant flooding in 1969 which washed out pipelines in Little San Gorgonio Creek. Much of this pipeline has been replaced with new ductile iron pipe since 1983 and the remaining portion is master planned to be replaced in the next 5 to 10 years.

Sediment from erosion of burned areas is controlled by desilting basins in and at the mouth of Little San Gorgonio Creek.

Ecosystem and Habitat Vulnerability

Principal habitat areas are Noble Canyon and Little San Gorgonio Canyon and tributaries above Cherry Valley. Black bear, bobcats and mountain lions are frequently seen in Little San Gorgonio Creek canyon areas. These are under the ownership of BCVWD for the most part and will remain open space. San Timoteo Canyon and its tributaries between Beaumont and Redlands provides a corridor for habitat movement. There are some undeveloped lands south of BCVWD's SOI which are designated at open space. There may be some threatened and endangered species in all of these areas. These areas provide natural corridors for wildlife movement.

San Timoteo Creek and Cooper's Creek, a tributary of San Timoteo Creek immediately downstream of the YVWD's and the City of Beaumont's wastewater treatment effluent discharge respectively have some continuous flow at least for some distance downstream of the discharge. A portion of the effluent discharge will be required to be maintained by the Regional Board and US Fish and Wildlife for threated and endangered species habitat.

Service Area Population and Demographics

> ***CWC Section 10631***
>
> *Describe the service area of the supplier, including current and projected population …The projected population estimates shall be based upon data from the state, regional, or local service agency population projections within the service area of the urban water supplier and shall be in five-year increments to 20 years or as far as data is available .*

Historically the principal industry in the Beaumont-Cherry Valley area was agriculture and agriculture related services, particularly those associated with fruit production (cherries) and egg ranching. Over the years the agricultural areas and other vacant lands were converted to housing tracts as new home buyers seek more affordable homes, particularly within the City of Beaumont. A major egg ranch, Sunny Cal, is no longer in business and most of the facilities have been removed in anticipation of development. A Specific Plan has been developed for that project and street and infrastructure plans are nearing completion.

Several major commercial centers were constructed since year 2000, most notably the Wal-Mart and Kohl Center in Southeast Beaumont, the revitalized Stater Brothers-Walgreens center

on 14th and Oak Valley Parkway, and others. A number of major distribution centers have been constructed including Lowes Distribution Center, the Pro-Logis Developments and the Beaumont Business Center on the Dowling Orchard site in Southwest Beaumont.

Several large housing projects were started during the "boom" period around 2005 but many of these stopped due to the downturn in the economy around 2008. These developments have been approved for construction; some, in fact, have the grading completed and underground utilities installed. These projects include Seneca Springs, K-hov Four Seasons, Tournament Hills, Fairway Canyon, Sun Cal, Pardee Sundance, Aspen Creek, and Heartland. Several of these projects have re-started in 2014 and continue to develop. Home building reached a 14-year low of 169 single family homes in 2011; but in 2015 approached 500 single family homes. The average over the last three years was 449 single family homes per year in Beaumont – about 1,350 people per year.

A number of projects were approved by the City of Beaumont, but have not yet started construction due to the economy. These projects include Hidden Canyon, Kirkwood Ranch, Potrero Creek Estates, and Noble Creek Meadows (formerly Noble Creek Vistas). These projects are expected to be into construction in the not-to-distant future.

In addition, there are a number of projects are still in the City of Beaumont review stage e.g. Jack Rabbit Trail, Preserve/Legacy Highlands. Tournament Hills 3, Hidden Canyon II and others.

Growth in Cherry Valley has been much slower. The area is still rural residential.

Historical Population

Historic and current populations for the District's service area were extracted from the District's 2013 UWMP are presented in Table 3-3. There were some minor adjustments to account for the latest census data. The data in Table came from several sources:

- 1980 and 1990 populations and household information – U.S. Census Bureau, 2000 Census of Population and Housing, Population and Housing Unit Counts, PHC-3-6, California, Washington D.C., 2003. This data was used for the City of Beaumont. Data for Cherry Valley for this period was estimated.
- 2000 and 2010 population and household information – U.S. Census Bureau American Fact Finder for Beaumont, CA and Cherry Valley CDP[5], CA.

[5] CDP = Census-designated Place

Table 3-3
Historical Population and Housing

	1980	1990	2000	2010	2015
City of Beaumont					
Population	6,818	9,685	11,384	36,877	41,780

Occupied Housing Units			6,315	14,413	16,105

- 2015 population – Estimated for Cherry Valley based on historic growth from 2010. Estimated of City of Beaumont based on housing completions from City Planning Department, Major Project Status Reports for period 2010 through 2015.

It should be pointed out that the data in Table 3-3 are all of the people living in the District's service area. Except for a relatively few number of people that are on private wells or local water systems, all are served by the District. The District's Sphere of Influence (SOI) extends beyond its service area; but the existing population between the service area and the sphere of influence boundary is small at this time.

Figure 3-2 shows the population growth in the City of Beaumont and Cherry Valley from 1980 to 2015. The population after 2010 was estimated as described for Table 3-3.

The data in Table 3-3 and Figure 3-2 show very rapid growth for the City of Beaumont from the year 2000 to 2010. About 2/3 of this growth occurred between 2000 and 2007 based on building permits issued by the City of Beaumont. The high rate of growth continued until mid-2008 when development slowed markedly following the economic turndown in the US and California. The population in Cherry Valley remained relatively constant since 1990. During the

period from 2000 to 2008, the community of Cherry Valley did not experience the same growth spurt that occurred in the City of Beaumont and other areas in Western Riverside County.

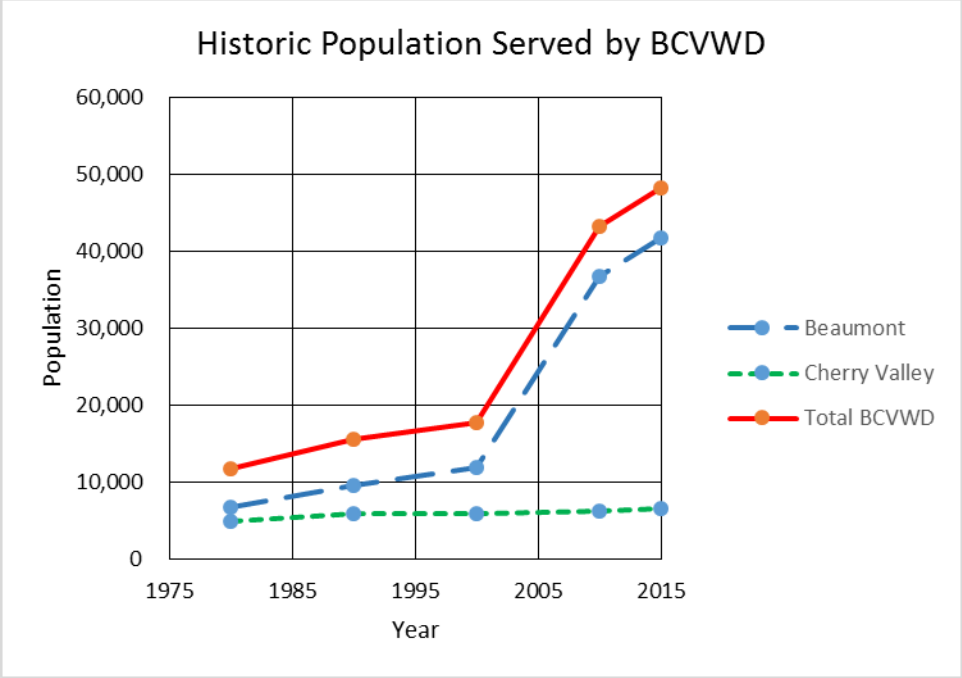

Figure 3-2
Historical Population Growth in District

The U.S. Census Bureau, American Fact Finder provided some information about the housing units in Beaumont and Cherry Valley. This information is presented in Table 3-4. Table 3-4 shows the housing stock in Beaumont is relatively new with over 60% constructed since 2000 and over 68% since 1990. This means most of the housing units have relatively water efficient plumbing systems. Chery Valley, on the other hand, has much older housing stock.

Figure 3-3 shows the number of single family home building permits issued in the City of Beaumont for the years 2002 through 2015. Although not shown in Figure 3-3, the permits started picking up in 1999-2000 and reached their peak in 2005 with 2,300 new home permits issued for that year. The number of permits for new homes declined to a low of 169 in 2011. Over the last 8 years, permits averaged 346 per year; over the last 3 years, permits averaged 449 per year. The 14-year average was 772 per year. **Future growth will likely be in the range of 400 to 600 permits per year, although some developers have projected slightly higher amounts in their build-out forecasts**.

BCVWD Historic Connection Growth

Figure 3-4 shows the growth in total connections (services) within BCVWD's service area. Most of these occurred in the City of Beaumont. Total connections at the end of 2015 was 16,985 as stated in the 2016 BCVWD Operating Budget. Total metered connections at the end of 2014 was 16,577 as stated in the 2015 BCVWD Annual Budget. Prior to the year 2000, the District

had about 5,600 total connections. The number of connections increased steadily until about 2008 when the annual increase began to slow down and level off.

Table 3-4
Housing Characteristics

Housing Type	Percent of Total Housing Units (2013 data)	
	Beaumont	Cherry Valley
Single Family	89.2%	73.1%
Multi-family	7.7%	0.3%
Mobile Home	3.1%	26.6%
Age of Housing	61.5% since 2000 68.4% since 1990	6.8% since 2000 86.4% since 1960

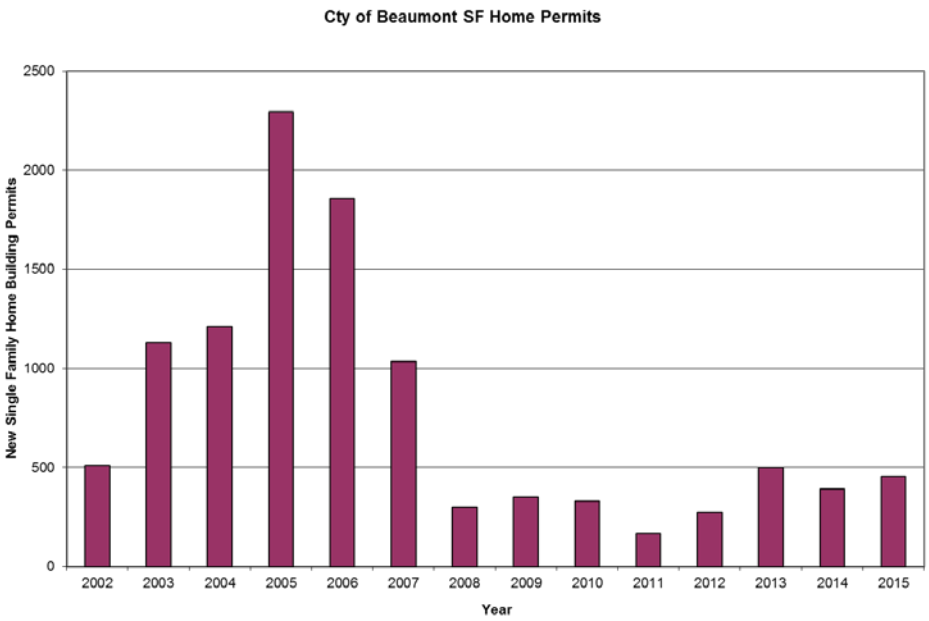

Figure 3-3
Growth in Beaumont as Shown by Single Family Home Building Permits

The peak year was 2005 when 2,433 connections were added. For 2009 and 2015 the increase was just under 350 connections per year. The average for the period 2001 through 2015 was 762 new connections per year. For 2014 and 2015, the District added 440 and 408 connections respectively. The number of connections dropped in 2011. This is more a function of the data collection which is taken from the total active accounts. The drop may be due to the high number of foreclosures in the service area. Many of these accounts were "closed." Based on an analysis of the total number of connections and the population in the service area, there are about 2.85 people per connection.

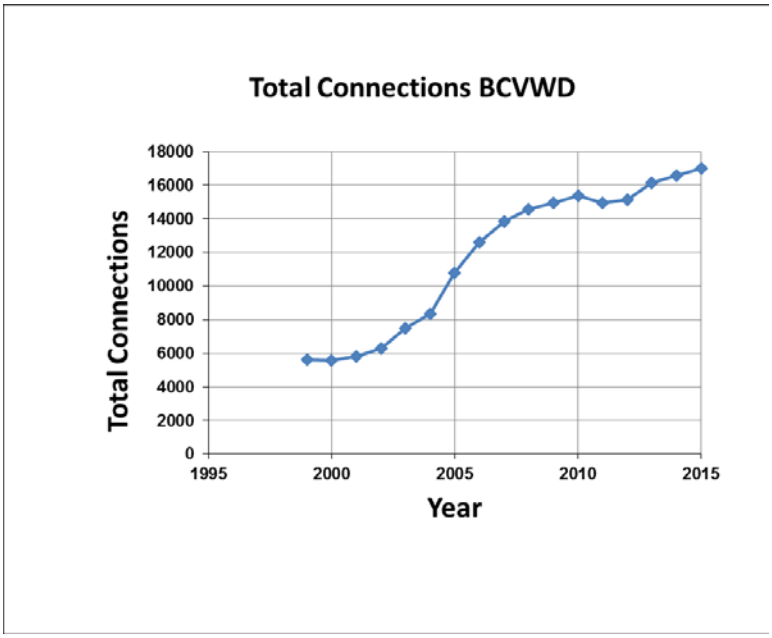

Figure 3-4
Connection Growth in BCVWD Since 1999

Build-out Population

The BCVWD service area build-out or "saturation" population was determined using the City of Beaumont's Zoning Map from the City's General Plan[6] and the District's Geographic Information System (GIS) to determine the total areas of the various zoning categories in the District's SOI. Actual GIS data was obtained from the City and integrated into the District's GIS system to determine the land use within the District's SOI. The zoning designation included a range of dwelling units/acre. An average value was used in the build-out analysis. The District's estimate of the City of Beaumont's build-out population is 90,600. (The City's General Plan, page 25, states the build-out population is 87,200; so the District's estimate is reasonable.)

The same approach was used for Cherry Valley, only this time data from Riverside County General Plan, Pass Area Land Use Plan was used[7]. Again the GIS data set was obtained from the County and integrated into the District's GIS system to determine the land use category areas within the District's SOI. Build-out population for Cherry Valley, within the BCVWD's SOI is 21,700 people.

Total estimated build-out population within the BCVWD's SOI is 112,300 or about 2.3 times the current population. BCVWD believes this population would not be reached until well beyond 2050 or 2060, if ever.

[6] City of Beaumont General Plan, Adopted March 2007.

[7] The Pass Area Land Use Plan, October 7, 2003. (Part of Riverside County General Plan)

The build-out population is a function of the local zoning; this could change at any time resulting in an increase or reduction in the build-out population. Changes in the SOI boundary by LAFCO would also affect the ultimate population served.

Projected Service Area Growth

The build-out population estimate was presented above, which will set the ultimate water demand. The increase in the water demand over time from current to build-out is discussed in the following subsections.

Review of the City of Beaumont's Major Project Status Report[8] listed six projects that were currently under development (on-going construction). These are listed in Table 3-5.

Table 3-5
Projects within BCVWD Service Area Under Construction

Development Name	Total Housing Units Approved	Estimated Housing Units Yet to be Constructed (Feb 2016)	Estimated Build-out Year
Sundance	4,716	1,730	2021[9]
Fairway Canyon SCPGA	3,566	2,085	2025
Heartland	981	981	2035
Four Seasons	2,041	400	2025

Rolling Hills Ranch Industrial/Winco/Prologis	Industrial	Some Industrial EDUs	2020
Totals	11,304	5,196	

BCVWD used the developers' plans for the projects in Table 3-5 in conjunction with Google Earth image dated 2/5/2016 to verify the construction progress and estimate the number of housing units (Equivalent Dwelling Units) remaining. It appears there are about 5,200 EDUs in the current on-going projects yet to be constructed as of February 2016.

Table 3-6 presents a list of other projects in various stages of approval the City of Beaumont. The total number EDUs is estimated to about 9,058.

[8] City of Beaumont, Major Project Status Report, February 16, 2016.

[9] Miyashiro to Jaggers (2014). Sundance Future Phasing., Personal Communication, email July 8.

The housing units yet to be constructed in Table 3-5 plus the EDUs in the other projects in Table 3-6 total 14,254 EDUs in the City of Beaumont. This would result in an increase in population of 40,000 people based on 2.8 people per EDU. This would bring the total Beaumont population to 81,780.

This population estimate approaches the build out population presented previously (90,600), which was based on average densities within the various land use categories. The 81,780 estimate is consistent with the City of Beaumont's General Plan build out population of 87,200.[10]

Cherry Valley Population Growth and BCVWD Served Population

As presented previously, the ultimate build-out population served by BCVWD for Cherry Valley based on the Pass Area Land Use Plan[11] densities is 21,700 people or about 7,750 EDUs. This is based on an increase to 2.8 persons per EDU projected at build-out.

There are 2,874 housing units in Cherry Valley in 2010 per the census data, but 26.6% of those are mobile homes. The 2,874 housing units are equivalent to about 2,485 EDUs. So build-out will result in about another 5,265 new EDUs. The Sunny Cal Egg Ranch Development (560 EDUs), included in the City of Beaumont, is actually within the current Cherry Valley census area and would have been included among the 5,265 EDU increase for Cherry Valley. So to avoid "double counting," the Sunny Cal Egg Ranch EDUs were deducted resulting in a net projected 4,655 EDU increase for Cherry Valley.

Except for the Sunny Cal Egg Ranch project, BCVWD believes the bulk of the 4,655 Cherry Valley EDUs will not be constructed until after 2030.

The City of Beaumont's population from the developments, (81,780 presented previously), combined with the Cherry Valley build-out population, (21,700 presented above), the total population served by BCVWD 103,480. This is consistent with the GIS land use based build-out estimate of 112,300 presented previously. The 112,300 estimate will be used as the District's build-out, served, population for planning purposes.

Existing EDUs and EDU Growth to Build-out

BCVWD uses Equivalent Dwelling Units (EDUs) to calculate and project potable water demand. BCVWD Rules and Regulation, Section 5, defines the water use as 580 gal/EDU/day. This is equivalent to 0.65 AFY/EDU. (An analysis developed for and presented in the 2015 Adopted Potable Water Master Plan supports this demand.)

BCVWD's 2015 Potable Water Master Plan projected EDU growth based on discussions with the developers having on-going projects. The "base year" for the analysis was 2013. The EDU growth is summarized in Table 3-7.

Table 3-7
Summary of New EDUs in BCVWD Service Area (base year 2013)
(Taken from BCVWD 2015 Potable Water Master Plan)

	Cumulative New EDUs							
	2015	**2020**	**2025**	**2030**	**2035**	**2040**	**2045**	**Build-out**
Beaumont	893	5,530	8,301	11,382	14,144	15,852	16,317	17,856
Cherry Valley	13	23	82	251	552	1,661	2,233	4,655
Totals	918	5,553	8,383	11,633	14,696	17,513	18,550	22,511
Average New EDUs/year		927	566	650	612	563	207	

Based on the past history of building permits in the City of Beaumont, presented previously in Figure 3-3, about 600 to 700 or so EDUs per year is believed to be a reasonable market assimilation rate for the area. This is somewhat below the "boom" years around 2005 to 2007, but similar "boom" years are not expected to occur in the future. In Table 3-7 the 927 EDUs per year average from 2015 to 2020 is greater than the 600 to 700 EDUs mentioned above; but this higher construction rate is due to the number of tracts that were approved and started

construction before the economic turndown brought a "halt" to these developments. A number of these tracts were fully graded with utilities already installed at the time the work was stopped. As a result they are "ready to go" and developers want to get these projects finished as soon as possible.

Table 3-8 shows the growth in population for Beaumont, Cherry Valley and BCVWD as a whole based on the EDU growth shown in Table 3-7. This growth rate is greater than that currently experienced by the City of Beaumont's Building Department which averaged 449 single family homes per year for the period 2013 through the end of 2015. The average for 2001 through 2015 was 772 single family homes per year

Table 3-8 also shows the population growth assuming a slower EDU growth of 500 EDUs/year in the City of Beaumont – more nearly matching the growth of the last few years. It shows that there would be a "lag" of about five years by 2040 – not much when considering water demand planning.

Table 3-8
Current and Projected Population in BCVWD Service Area

	Population						
	2015	**2020**	**2025**	**2030**	**2035**	**2040**	**Build-out**
Based on EDU Growth in Table 3-7							
Beaumont	41,780	54,764	62,522	71,149	78,883	83,665	92,806
Cherry Valley	6,597	6,622	6,784	7,244	8,066	11,139	19,494
Totals BCVWD	48,377	61,386	69,306	78,393	86,949	94,804	112,300
Based on 500 EDUs/year in Beaumont							
Cherry Valley	6,597	6,622	6,784	7,244	8,066	11,139	19,494
Beaumont	41,780	48,780	55,780	62,780	69,780	76,780	92,806
Totals BCVWD	48,377	55,402	62,564	70,024	77,846	87,919	112,300

The growth in EDUs in Table 3-7 will be the basis for projecting the water demand in this 2015 UWMP. But the reader should recognize that there could be a lag in reaching the 2040 demand.

Figure 3-5 shows the historic and projected population served by BCVWD taken from Tables 3-3 and 3-8 using the EDU growth in Table 3-7. Since the UWMPs are required to be updated every five years, adjustments in the water demands can be made as needed.

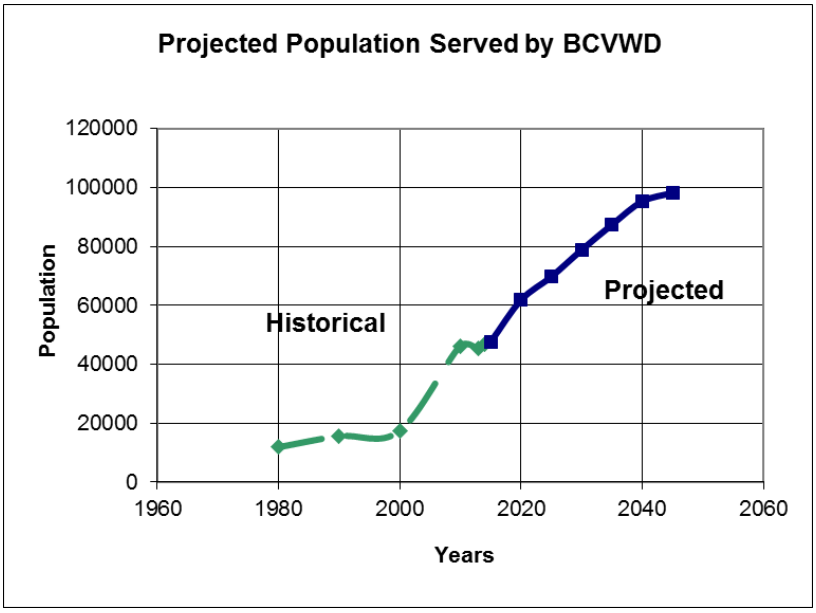

Figure 3-5
Historic and Projected Population Served by BCVWD
(based on EDU growth rate in Table 3-7)

Comparison with Department of Finance Projections

Table 3-9 shows a comparison between State of California Division of Finance (DoF) population growth rate for Riverside County and the population growth rate represented by the EDU growth rate in the BCVWD service area, shown in Table 3-7.

Table 3-9
DoF Riverside County vs. BCVWD 2015 UWMP
Population Growth Rates

	Population								
	2010	**2015**	**2020**	**2025**	**2030**	**2035**	**2040**	**2045**	**2050**
California DoF Riverside County, 000s	2,194	2,323	2,478	2,662	2,862,	3,053	3,215	3,353	3,481
Annual % Change		1.17%	1.33%	1.49%	1.51%	1.33%	1.06%	0.86%	0.76%
BCVWD	43,239	48,377	61,386	69,306	78,393	86,949	94,804	97,707	--
Annual % Change		2.4%	5.4%	2.6%	2.6%	2.2%	1.8%	0.6%	

The projected growth rate for BCVWD is higher than for Riverside County as a whole through the next 25 years or so. Table 3-10 shows BCVWD's retail population, current and projected to be consistent with the Department of Water Resources format.

Table 3-10
(DWR Table 3-1) BCVWD Population – Current and Projected

DWR Table 3-1 Retail: Population - Current and Projected						
Population Served	2015	2020	2025	2030	2035	2040
	48,377	61,386	69,306	78,393	86,949	94,804
NOTES: See Table 3-6 and text for description of methodology						

Impact of Potential Growth Limitation Initiative

In late 2015 there was discussion of a resident sponsored managed growth initiative that would limit the number of new housing units in the City of Beaumont to 350 units per year, 300 if in a planned community. There was discussion to try to get this on the November 2016 ballot. The impact this potential initiative would have on the District's EDU projections in this UWMP is best illustrated by Figure 3-6. First, it is not likely the initiative will affect those projects which have some form of entitlement; so the impacts will likely not be manifested for some time. But if implemented, it would likely cause some of the future projects, identified previously in this UWMP (e.g. Table 3-6), to be deferred, perhaps as much as 10 years or so.

Based on Figure 3-5, if the initiative were implemented, BCVWD's year 2045 potable demand would be reduced by about 20 percent.

During the last few years, several large projects in the City of Beaumont, previously planned residential, have been proposed to be commercial and industrial projects. Those areas include projects listed in Tables 3-5 and 3-6, such as the Heartland Development, the Hidden Canyon Development and possibly the Jack Rabbit Trail Development. This would result in a significant reduction in the water demand

Comparison to Previous UWMPs

To provide a perspective on population growth estimates, Figure 3-7 shows the historic population through the 2010 census along with the population projections in the 2002, 2005, 2013, and 2015 UWMP updates. Also included for reference is the Southern California Association of Government's (SCAG's) 2007 Regional Transportation Plan (RTP) Population forecast

The 2015 UWMP shows more aggressive growth than the previous (2013) version, but less than SCAG.

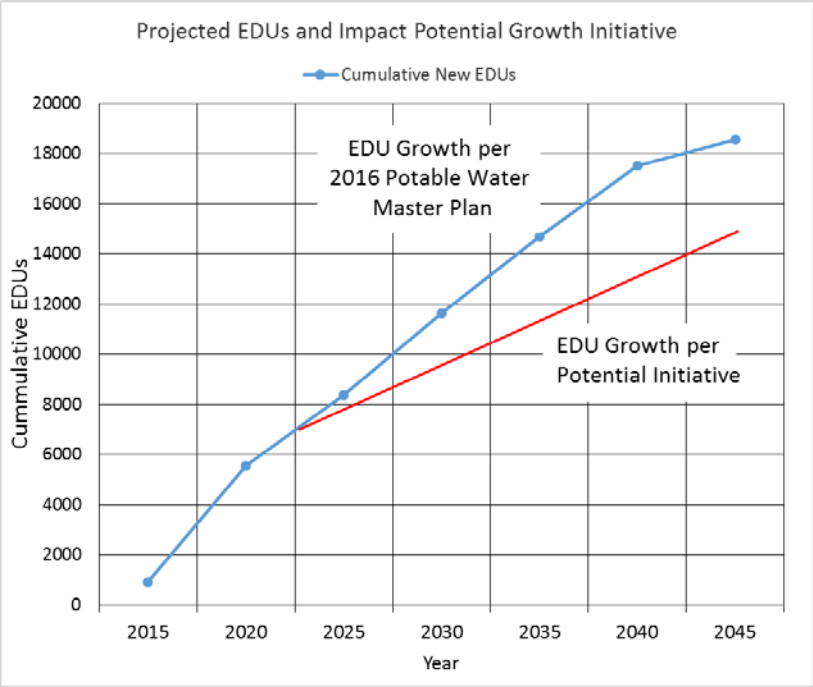

Figure 3-6
Possible Impact of Growth Initiative on BCVWD Planning

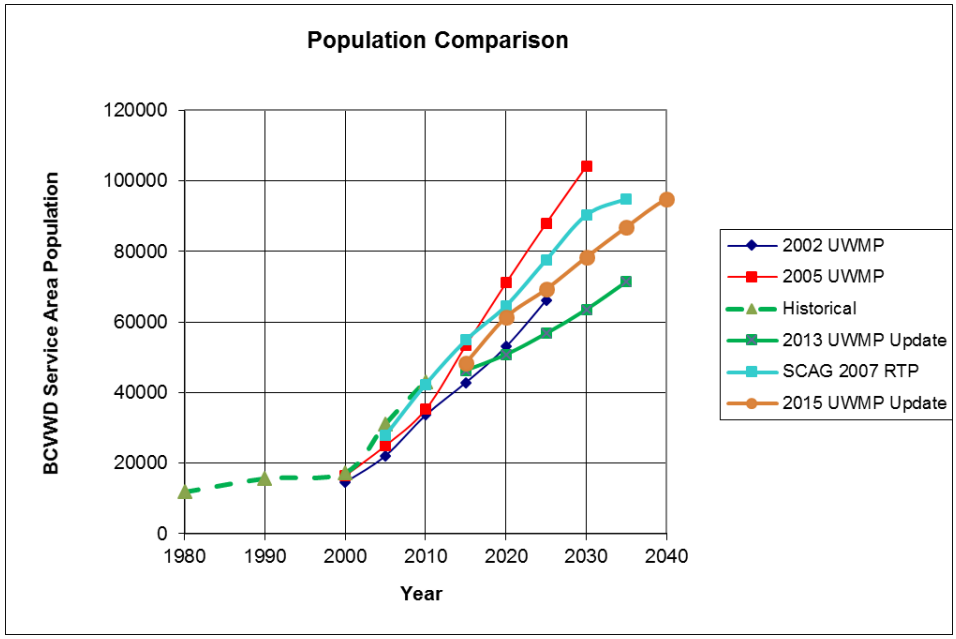

Figure 3-6
Historical Population and Previous UWMP Population Projections

Other Demographic Information

Income and Home Values

Table 3-11 presents data on the household income and median home values in the service area.

Table 3-11
Income and Housing Values for 2014[12]

Parameter	City of Beaumont	Cherry Valley	California
Median Household Income	$66,775	$58,080	$61,489
Per Capita Income	$26,627	$29,789	$29,906
Median Home or Condo Value	$216,300	$167,800	$371,400

Population Age and Diversity

The median age in Beaumont is 32.5 years; Cherry Valley is 52.9 years. The median age in California is 35.6 years, the U.S. as a whole, is 37.4 years. Beaumont is a young community, many first time home buyers; Cherry Valley is an older community.

The service area is ethnically diverse. Beaumont is primarily Caucasian and Hispanic with a small number of Asians; Cherry Valley is primarily Caucasian.

Employment

The latest data on employment in the service area is for the year 2014 from American Fact Finder census. This is summarized in Table 3-12.

Table 3-12
Employment from 2010 Census

Parameter	City of Beaumont	Cherry Valley	Total
Total Population 16 yrs and older	28,915	6,145	35,060
Total Population 16 yrs and older in labor force	18,400 (63.6%)	3,055 (49.7%)	21,455 (61.1%)

Principal industries for males in the City of Beaumont are construction, retail trade and manufacturing; for females, principal industries are retail sales, cashiers and office

[12] Source American Fact Finder

administration. In Cherry Valley the principal industries for males are construction and retail trade; for females, education and healthcare/social services.

Land Use

Figure 3-8 shows the distribution of land use within the District's SOI based on the City of Beaumont and Riverside County Zoning as presented in the latest General Plans. This does not necessarily represent the current land use distribution. Almost 50% of the land use is residential; 39% is open space, conservation or rural mountainous.

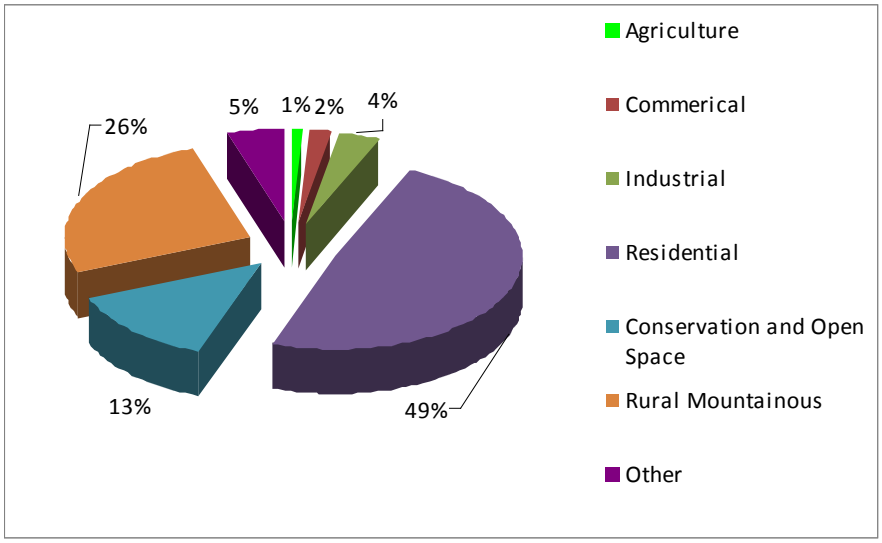

Figure 3-8
Land Use Distribution within BCVWD SOI based on Current Zoning

Section 5

SB X7-7 Baseline and Targets

In February 2008, the Governor introduced a seven-part comprehensive plan for improving the Sacramento-San Joaquin Delta. A key component of his plan was a goal to achieve a 20 percent reduction in per capita water use statewide by the year 2020 (called "20x2020").

In November 2009, SB X7-7, The Water Conservation Act of 2009, was signed into law as part of a comprehensive water legislation package. With the adoption of the Water Conservation Act of 2009, the Governor's 2008 water reduction plan was codified and the State is required to set a goal of reducing urban water use by 20 percent by the year 2020. Each retail urban water supplier must determine baseline water use during their baseline period and also establish target water use for the years 2015 and 2020 in order to help the State achieve the 20 percent reduction.

In this 2015 UWMP, water agencies, such as BCVWD, must demonstrate compliance with their pre-established water use target for the year 2015. This will also demonstrate whether or not BCVWD is currently on track to achieve its 2020 target.

Compliance is verified by DWR's review of the SB X7-7 Verification Form submitted with BCVWD's 2015 UWMP. The SB X7-7 Verification Form summarized in Tables 5-1 and 5-2 of this section.

Terminology

When determining water use in this UWMP, two terms are often used interchangeably:

- **Daily per Capita Water Use** - the amount of water used per person per day. In the UWMP calculations, this is total water use within a service area, divided by population and is measured in gallons.
- **Gallons per Capita per Day (GPCD**) – This is the "Daily per Capita Water Use" measured in gallons. Therefore, the term commonly used when referring to "Daily per Capita Water Use" is "Gallons Per Capita per Day" or "GPCD."

It is important to distinguish GPCD (as used in Urban Water Management Plans) from the R-GPCD that is used in drought reporting to the State Water Resources Control Board.

- **GPCD** is the total water use within a service area (residential, commercial, institutional, etc…) minus allowable exclusions, divided by the population. This is used in UWMPs for purposes of the Water Conservation Act of 2009.
- **R-GPCD** is solely the estimated residential water use in a service area divided by population. R-GPCD is used in drought reporting to SWRCB for purposes of

Section 4

System Water Use

This section provides data on the historic and projected water use within the BCVWD service area. For purposes of this UWMP the terms "**water use**" and "**water demand**" are **used interchangeably**.

Recycled versus Potable and Raw Water Demand

BCVWD's water supply mix for 2015 includes imported water (recharged and/or taken from banked storage), groundwater, and non-potable water. In the future, the non-potable water will included recycled water from YVWD and the City of Beaumont. Figure 4-1 shows the mix of water sources for BCVWD in year 2015.

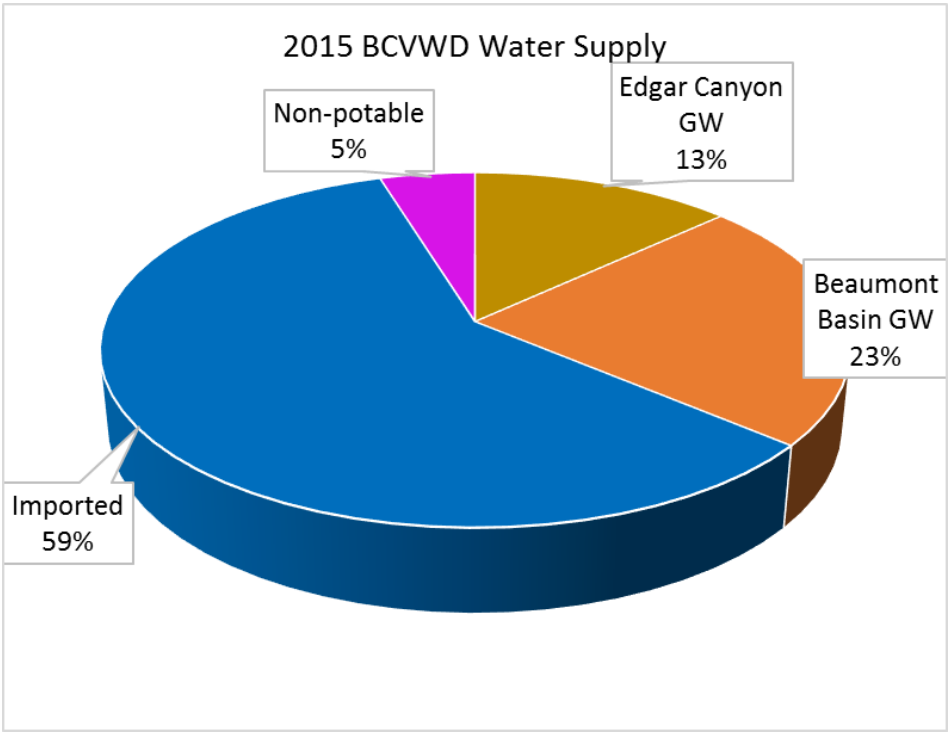

Figure 4-1
BVCWD Water Sources Year 2015

Beaumont Basin groundwater includes only "forbearance" water and "reallocation of overlier pumping rights" based on the Beaumont Basin Adjudication. Forbearance water is potable or non-potable water supplied to an overlier. This typically occurs when the overlier develops.

For 2015, BCVWD only recharged 2090 AF due to the reduced SGPWA SWP Allocation. The rest of the imported water (4270 AF) came from imported water banked in previous years in BCVWD's groundwater storage account.

In the future there will be greater use of non-potable water.

Water Uses by Sector

CWC 10631

(e)(1) Quantify, to the extent records are available, past and current water use, over the same five-year increments described in subdivision (a), and projected water use, identifying the uses among water use sectors, including, but not necessarily limited to, all of the following uses:

A) Single-family residential.

B) Multifamily.

C) Commercial.

D) Industrial.

E) Institutional and governmental.

F) Landscape.

G) Sales to other agencies.

H) Saline water intrusion barriers, groundwater recharge, or conjunctive use, or any combination thereof.

I) Agricultural…

(2) The water use projections shall be in the same five-year increments described in subdivision (a).

Definitions

For purposes of the 2015 UWMPs, the following definitions are used by DWR for each of the water sectors listed in the CWC. The order of the sectors follows the order found in the CWC. Each of these sectors are the only sectors that will be accepted by the WUE data online submittal tool..

Single-family Residential -- A single-family dwelling unit. A lot with a free-standing building containing one dwelling unit that may include a detached secondary dwelling.

Multi-family -- Multiple dwelling units contained within one building or several buildings within one complex.

Commercial – A water user that provides or distributes a product or service. CWC 10608.12 (d).

Industrial -- A water user that is primarily a manufacturer or processor of materials as defined by the North American Industry Classification System (NAICS) code sectors 31 to 33, inclusive, or an entity that is a water user primarily engaged in research and development. CWC 10608.12

(h). The following link is to the NAICS website: http://www.census.gov/cgi-bin/sssd/naics/naicsrch.

Institutional (and governmental) -- A water user dedicated to public service. This type of user includes, among other users, higher education institutions, schools, courts, churches, hospitals, government facilities, and nonprofit research institutions. CWC 10608.12 (i). Note that BCVWD account codes lump "Institutional" in with "Commercial." In the tables to follow, the instutional and commercial fractions were estimated.

Landscape -- Water connections supplying water solely for landscape irrigation. Such landscapes may be associated with multi-family, commercial, industrial, or institutional/governmental sites, but are considered a separate water use sector if the connection is solely for landscape irrigation. This is a retail demand.

Sales to Other Agencies – BCVWD has pumped water on behalf of the City of Banning in the past, but none was pumped for the City of Banning in 2015. The City of Banning has participated with BCVWD in funding several wells in the Beaumont Basin. When water is pumped by BCVWD for the City of Banning, it is considered City of Banning pumping and is not included in BCVWD's extractions.

Saline Water Intrusion – BCVWD does not supply any water to saline water intrusion barriers.

Groundwater Recharge -- The managed and intentional replenishment of natural groundwater supplies using man-made conveyances such as infiltration basins or injection wells. Water used for groundwater banking or storage may also be reported using this sector. If all, or a portion of, the groundwater recharge water is subsequently pumped out of the basin in the same year, that water will be reported by the pumping agency as a supply from groundwater (Tables 6-1 and/or 6-8 and 6-9). BCVWD is required to meet replacement water obligations of the Beaumont Basin water master by recharge or by taking water from BCVWD's groundwater storage account. Future years include a groundwater recharge component to build up BCVWD's storage account for dry years.

Conjunctive Use – BCVWD banks imported water in BCVWD's storage account in the Beaumont Basin when available from SGPWA and as funds permit. This water can be extracted in future years when imported water allocations are insufficient to meet demands.

Agricultural -- Water used for commercial agricultural irrigation through BCVWD's agricultural irrigation meters.

Distribution System Losses -- Reporting of system losses is required by the CWC in the 2015 UWMPs. See Section 4.3 and Appendix L for details on the required methodology for calculating system losses. The CWC requires reporting losses for the most recent 12 months for which data is available, which can be taken to mean the calendar year or fiscal year used for

data reporting throughout the rest of the UWMP. Report the losses for the most recent 12 months available in Table 4-1. If the reported water losses are for a 12 month period that is different from the calendar or fiscal year used for data reporting throughout the rest of the UWMP, the water supplier will state this in the UWMP.

Other Water Uses

There are several other water uses mentioned in the UWMP Guidelines:

Exchanges -- Water exchanges are typically water delivered by one water user to another water user, with the receiving water user returning the water at a specified time or when the conditions of the parties' agreement are met. BCVWD does not currently exchange water with any agency.

Surface Water Augmentation -- The planned placement of recycled water into a surface water reservoir that is used as a source of domestic drinking water supply. (Used in Chapter 6, Section 6.5 Recycled Water). BCVWD does not do "surface water augmentation."

Transfers -- The CWC defines a water transfer as a temporary or long-term change in the point of diversion, place of use, or purpose of use due to a transfer, sale, lease, or exchange of water or water rights. In the past, South Mesa Water Company has transferred water to BCVWD's groundwater storage account for payment. This was occurred between 2004 and 2014 when South Mesa has more than adequate groundwater supply to meet their needs at that time.

Wetlands or Wildlife Habitat -- Water used for a managed environmental use to improve an environmental condition. The City of Beaumont is required to maintain a flow of 1.8 mgd in Cooper's Creek a tributary of San Timoteo Creek from the City's wastewater treatment plant. Currently BCVWD is not receiving recycled water from the City of Beaumont, but this source is anticipated in the future. The requirement to maintain streamflow affects the amount of recycled water available to BCVWD.

Historical Water Uses

BCVWD's historical water use is summarized below:

Year	1980	1990	2000	2005	2010	2015
Potable Water Demand, AFY	5,074	5,572	6,308	9,306	11,023	9,792

The reduction in water use in 2015 was due to water conservation measures imposed during the drought.

Current (2015) Water Use by Sector

Table 4-1 shows BCVWD's water demand (water use) by sector for the year 2015.

Table 4-1 Retail: Demands for Potable and Raw Water - Actual			
Use Type *(Add additional rows as needed)*	2015 Actual		
	Additional Description *(as needed)*	Level of Treatment When Delivered	Volume, AF
Single Family		Drinking Water	6,612
Multi-Family		Drinking Water	287
Commercial	estimated	Drinking Water	118
Industrial		Drinking Water	169
Institutional/Governmental	estimated	Drinking Water	611
Landscape	potable water only	Drinking Water	772
Agricultural irrigation		Drinking Water	49
Other	Metered construction, street sweeping, etc.	Drinking Water	160
Losses	estimated	Drinking Water	500
Groundwater recharge	Imported Water Banked for future extractions during dry periods. During 2015, 2090 AF imported water recharged and extracted in 2015	Raw Water	0
Landscape	non-potable water	Raw Water	514
		TOTAL	9,792
NOTES:			

Future Water Use by Sector

Table 4-2 shows the future water use by sector. Included in Table 4-2 are planned quantities of groundwater recharge of imported water. The May 2016 Emergency Conservation Regulation requires a 3-year supply to avoid state-mandated water restrictions. BCVWD Board adopted Resolution 2014-05 that requires a 5-year supply. The groundwater recharge quantities are planned amounts achieve a minimum 5-year firm water supply to ensure water supply for new EDUs and meet new State Emergency Water Conservation Regulation, "stress test" requirements.

Table 4-2 Retail: Demands for Potable and Raw Water - Projected

Use Type *(Add additional rows as needed)* ***Drop down list*** *May select each use multiple times* *These are the only Use Types that will be recognized by the WUEdata online submittal tool*	Additional Description *(as needed)*	Projected Water Use *Report To the Extent that Records are Available*				
		2020	2025	2030	2035	2040
Single Family		12,702	14,191	16,084	17,878	19,533
Multi-Family		400	625	710	785	855
Commercial		126	135	145	155	165
Industrial		180	190	200	210	220
Institutional/Governmental		650	685	730	770	820
Landscape	recycled water	0	0	0	0	0
Agricultural irrigation		60	55	50	45	40
Other	Metered construction and street sweeping water etc.	300	315	325	340	350
Losses		335	380	430	473	500
Other	Raw water to supplement non-potable water system	163	280	455	449	398
Groundwater recharge	Imported raw water banked for future extractions during dry periods. Does NOT include imported water to meet Adjudication replacement obligations	1,000	1,500	2,000	2,500	2,500
	TOTAL	15,916	18,356	21,129	23,605	25,381

NOTES: Ground water recharge quantities are planned quantities to build 5-year supply per BCVWD Resolution 2014-05; landscape demand will be met with recycled water and supplemented with other non-potable water as needed.

The potable water demands, (i.e., all of the demands in Table 4-2 except “Landscape” and “Groundwater Recharge), are based on BCVWD’s 2015 Potable Water Master Plan. The potable water demands in the 2015 Master Plan Update were based on discussions with developers and projects in the construction, planning or proposal stage from the City of Beaumont’s Planning Department “Major Project Status Reports.” The projected growth to 2040 was discussed in Section 3. The rate of growth of the potable water demand is based on the growth of EDUs. With the economic turndown around 2007 or so, there were a number of large housing projects under construction, many had pads graded and utilities installed, when development stopped. These projects are ready to and developers have returned.

The growth in EDUs is assumed to be:

5-year Period	EDUs/year
2015 – 2020	927
2020 – 2025	566
2025 – 2030	650
2030 – 2035	612
2035 – 2040	563

This is a very aggressive EDU growth rate; Section 3 discusses the historical growth rate. Current growth rates in EDUs experience by the City of Beaumont is on the order of 450 EDUs/year. For planning purposes, it is better to be aggressive.

The water demand projections do not include any "water conservation" effects. There will likely be some lingering effect of the water restrictions mandated by the Governor's Office for 2015 as the population becomes more aware of the water situation in California. Also developers are constructing much more water efficient homes with limited turf landscaping and more efficient appliances. New landscape ordinances will be limiting turf areas in street medians and common areas which could bring down the demands projected in Table 4-2 by perhaps as much as 10% to 15%.

The water demand to the multi-family, commercial, industrial, institutional/governmental, and "other" categories were projected from the actual 2015 values through 2040 on the basis that the changes in demand would be proportional to the changes in single family demand. As single family residences increase there will be a proportionate increase in commercial, institutional, and industrial to support it. Multi-family units will grow also as land becomes more valuable.

The agricultural irrigation connections are declining as the land use is changing from orchards to residential land. Most of the irrigation customers are in Cherry Valley and would not likely be served by the recycled water system within the foreseeable future. They will continue to be served potable water. The agricultural irrigation accounts will decline throughout the planning period at a gradual rate particularly as the cost of water continues to increase.

The landscape demands are derived from BCVWD's 2015 Potable Water Master Plan Update and are associated with BCVWD's non-potable water system. The non-potable system could include recycled water from YVWD and the City of Beaumont, filter wash water from YVWD, non-potable groundwater, or imported SPW. The landscape demands **do not** include the irrigation demands from the two golf courses: Tukwet Canyon (1,250 AFY) and Oak Valley Greens (750 AFY). These golf courses are on their own wells and have Beaumont Groundwater Basin Overlier Rights. Irrigation of these golf courses from BCVWD's non-potable water system would depend on the amount of recycled water and filter wash water available.

BCVWD's operational plan is to supply the landscape demands first, then if there is recycled and filter wash water available, supply it to the golf courses. Any unused recycled water (typical of winter time operations) could be advance treated and recharged (planned indirect potable water reuse project).

The Groundwater Recharge quantities shown in Table 4-2 are for planned recharge to build-up or maintain BCVWD's Beaumont Basin groundwater storage account. They are not actual demands. The quantities shown are **over and above** that needed by BCVWD to meet their normal Beaumont Basin replacement water obligations. Banking water in the storage account is critical to meeting demands during dry years.

If imported SPW is not available in a given year, no groundwater recharge would occur. But when imported water is available, any deficiencies from previous years would be "carried over" and made up.

Table 4-3 shows the total water demands which summarizes the demands from Table 4-2.

Table 4-3 Retail: Total Water Demands

	2015	2020	2025	2030	2035	2040 *(opt)*
Potable and Raw Water *From Tables 4-1 and 4-2*	9,792	15,916	18,356	21,129	23,605	25,381
Recycled Water Demand* *From DWR Table 6-4*	0	2,196	2,525	2,892	3,238	3,579
TOTAL WATER DEMAND	9,792	18,112	20,881	24,021	26,843	28,960

**Recycled water demand fields will be blank until Table 6-4 is complete.*

NOTES: The recycled water demand includes the forecast amount used on landscaping irrigated by the non-potable water system, plus any recycled water supplied to golf courses when surplus recycled water is available. Sources of recycled water are YVWD and City of Beaumont.

The non-potable water demand in Table 4-3 is the landscape demand and does not include golf course demands. Tukwet Canyon and Oak Valley Golf Courses have their own well supply. BCVWD intends on serving the golf courses only when non-potable water is available.

Distribution System Water Losses

California Senate Bill No. 1420, (SB 1420), requires water utilities that submit Urban Water Management Plans to calculate annual system water losses using the water audit methodology developed by the American Water Works Association (AWWA). SB 1420 requires that utilities submit these audits every five years as part of their respective Urban Water Management Plans.

CWC 10631

(e)(1) Quantify, to the extent records are available, past and current water use over the same five-year increments described in subdivision (a), and projected water use, identifying the uses among water use sectors, including, but not necessarily limited to, all of the following uses:…

(J) Distribution system water loss

(3)(A) For the 2015 urban water management plan update, the distribution system water loss shall be quantified for the most recent 12-month period available. For all subsequent updates, the distribution system water loss shall be quantified for each of the five years preceding the plan update.

(B) The distribution system water loss quantification shall be reported in accordance with a worksheet approved or developed by the department through a public process. The water loss quantification worksheet shall be based on the water system balance methodology developed by the American Water Works Association.

To facilitate the process, AWWA has developed an Excel spreadsheet based on the principles in AWWA Manual M36 Water Audit methodology. Version 5.0 of the spreadsheet software was used in the analysis.

Table 4-4 summarizes the water loss volume from the AWWA spreadsheet.

Table 4-4 Retail: 12 Month Water Loss Audit Reporting

Reporting Period Start Date (mm/yyyy)	Volume of Water Loss*
01/2015	500
** Taken from the field "Water Losses" (a combination of apparent losses and real losses) from the AWWA worksheet.*	
NOTES: : BCVWD believes the amount calculated in the Water Audit Spreadsheet is not correct due to change in the this method of accounting for the 2 month lag between production (measured daily) and consumption (meter read time -- most bimonthly, but some monthly). TheDstrict believes the Water Loss Volume is really about 500 AF	

Estimating Future Water Savings

CWC 10631

(e)(4)(A) If available and applicable to an urban water supplier, water use projections may display and account for the water savings estimated to result from adopted codes, standards, ordinances, or transportation and land use plans identified by the urban water supplier, as applicable to the service area.

(B) To the extent that an urban water supplier reports the information described in subparagraph (A), an urban water supplier shall do both of the following: (i) Provide citations of the various codes, standards, ordinances, or transportation and land use plans utilized in making the projections.(ii) Indicate the extent that the water use projections consider savings from codes, standards, ordinances, or transportation and land use plans. Water use projections that do not account for these water savings shall be noted of that fact.

The water demand projections in Table 4-2 are based on BCVWD's 2015 Potable Water Master Plan and are conservative and do not include the passive savings from residual conservation or savings from new codes and ordinances. It is anticipated that future codes and restrictions will also have an effect at reducing consumption. Codes and ordinances which will reduce consumption, but are not considered in the demand projections include:

- Executive Order B-29-15 and California Code of Regulations Title 23, Division 2, Chapter 2.7. Model Water Efficient Landscape Ordinance – 2015. DWR estimates that a typical California landscape will use 12,000 gallons less water in a year or about 20% less than projected with the 2009 ordinance; commercial landscapes will cut water use by as much as 35%
- City of Beaumont Municipal Code 17.06 Landscaping.
- County of Riverside Ordinance No. 859 – Water Efficient Landscape Requirements
- BCVWD Resolution 2016-05 –Authorizing the Implementation of Water Use Restrictions and Rescinding Resolution 2015--05. This resolution rescinded the twice per week landscape watering restrictions but did maintain the other conservation measures in the May 18, 2016 Drought Emergency Water Conservation Regulations which was designed to prevent waste and unreasonable use of water and promote water conservation. (BCVWD was able to self-certify that it has adequate water supply for 3 years based on hydrologic conditions 2012 - 13, 2013 - 14, and 2014 - 15 water years and imported water from SGPWA identical to calendar years 2013 through 2015.)

Water Use for Lower Income Households

CWC 10631.1

(*a) The water use projections required by Section 10631 shall include projected water use for single-family and multifamily residential housing needed for lower income households, as defined in Section 50079.5 of the Health and Safety Code, as identified in the housing element of any city, county, or city and county in the service area of the supplier.*

California Health and Safety Code 50079.5

(*a) "Lower income households" means persons and families whose income does not exceed the qualifying limits for lower income families… In the event the federal standards are discontinued, the department shall, by regulation, establish income limits for lower income households for all geographic areas of the state at 80 percent of area median income, adjusted for family size and revised annually.*

Table 4-4A presents the long term low-income housing needs, per capita water demand and annual water demand per low-income housing unit for the City of Beaumont and Cherry Valley.

The number of low-income housing units for the City Beaumont was based on information in the City of Beaumont's General Plan, Housing Element dated October, 2010. The data in the Beaumont Housing Element originated in the Regional Housing Needs Assessment (RHNA)

prepared by SCAG. The RHNA new housing construction need was 2,732 dwelling units. More recent information was not available for this 2015 UWMP. For the purposes of this UWMP update, the 2,732 dwelling units was assumed to be the ultimate build-out need.

Table 4-4A
Current and Projected Low-income Housing Needs

	2015	2020	2025	2030	2035	2040
	Low Income Housing EDUs					
City of Beaumont

Low Income Multi-Family	200	298	395	492	589	692
Total Water Use	233	331	430	528	627	731

* Based on 3 people per residence

The number of units in 2010, (350 for Beaumont and 70 for Cherry Valley), was used as a starting point to project growth in low income housing. The came from the City's Housing

Element, Inventory of Government Assisted Housing Developments (rounded up). All of the low-income housing units are in multi-family units and that was assumed to continue through to the year 2035.

For the community of Cherry Valley, WRCOG developed a Low-income housing need for the entire WRCOG area (10,311 units). A separate projection for Cherry Valley was not provided. The low-income housing allocation for Cherry Valley was estimated based on the ratio of the current population of Cherry Valley to the total WRCOG population. The result was an estimated "need" of 175 low-income housing units in Cherry Valley. For Cherry Valley the low-income housing needs were assumed to be single family units with multi-family units only developed in the year 2035 and beyond.

The growth projections of low income housing parallels the population growth.

The single family, low-income unit water demand was estimated to be 75% of a typical Beaumont single family home. Multi-residential low income unit water demand was estimated to be 2/3 of a low-income single family unit.

The 2040 low-income water demand of 731 acre-ft/yr represents about 3.2% of BCVWD's water demand for 2040, i.e., not significant.

Table 4-5 certifies to the following:

- Future Water Savings from codes and ordinances is not included. The water demand projections in Table 4-2 are conservative. BCVWD does expect some reduction in the demand, on a per capita basis, over time.
- The water requirements for low income housing are included in the demand projections in Table 4-2

Table 4-5 Retail Only: Inclusion in Water Use Projections	
Are Future Water Savings Included in Projections? (Refer to Appendix K of UWMP Guidebook)	No
If "Yes" to above, state the section or page number, in the cell to the right, where citations of the codes, ordinances, etc… utilized in demand projections are found.	
Are Lower Income Residential Demands Included In Projections?	Yes
NOTES:	

Climate Change

Climate change will increase the landscape and outdoor water demand over time as evapotranspiration increases. However, new landscape ordinances which limit the amount of turf and encourage drought tolerant plantings will reduce the total water needs. In addition new

developments are reducing the turf areas on each lot and installing more drought-friendly landscaping. The drought-friendly landscaping is also extended to street medians and common areas. BCVWD believes the net impact of climate change on future water demand should be minimal.

complying with the Governor's drought declarations and executive orders in 2014 and 2015.

In the calculation of the "GPCD" above, there are four exclusions:

- Recycled water that is delivered within the service area of an urban retail water supplier or its urban wholesale water supplier
- The net volume of water that the urban retail water supplier places into long term storage
- The volume of water the urban retail water supplier conveys for use by another urban water supplier
- The volume of water delivered for agricultural use, except as otherwise provided in subdivision (f) of Section 10608.24. (In 2015, BCVWD delivered 49.43 AF for agricultural irrigation.)

Updating Calculations from 2013 UWMP

> *(g) An urban retail water supplier may update its 2020 urban water use target in its 2015 urban water management plan required pursuant to Part 2.6 (commencing with Section 10610).*
>
> *Methodologies DWR 2011, Methodology 2 Service Area Population*
>
> *Page 27 - Water suppliers may revise population estimates for baseline years between 2000 and 2010 when 2010 census information becomes available. DWR will examine discrepancy between the actual population estimate and DOF's projections for 2010; if significant discrepancies are discovered, DWR may require some or all suppliers to update their baseline population estimates.*

BCVWD last updated its UWMP in 2013. Since BCVWD used the 2010 Census in the preparation of its 2013 UWMP Update and the baselines and targets, there is no need to update the calculations.

Update of Target Method

BCVWD used Target Method 1 – Eighty percent of BCVWD's baseline per capita daily water use in its 2013 UWMP Update. It was compared to target method 4 – 95% of the applicable state hydrologic region target. Using the state hydrologic region target resulted in a very low, unattainable target; so, target method 1 was adopted and is used in this UWMP Update.

Required Use of 2010 U.S. Census Data

BCVWD submitted its UWMP Update in August 2013, which included the population data from the 2010 census.

SBX-X7 Verification Forms

The SB X7-7 Verification Forms, to demonstrate compliance with the Water Conservation Act of 2009, have been filled out and are included in the 2015 UWMP submittal to DWR. The results are summarized in this section.

Baseline Periods

> ***CWC 10608.20***
>
> *(e) An urban retail water supplier shall include in its urban water management plan due in 2010. . . the baseline daily per capita water use…along with the bases for determining those estimates, including references to supporting data.*
>
> *(g) An urban retail water supplier may update its 2020 urban water use target in its 2015 urban water management plan required pursuant to Part 2.6 (commencing with Section 10610).*

The Water Code specifies two different base periods for compliance with SB X7-7:

1. The first base period is a 10- to 15-year continuous period, and is used to calculate baseline per capita water use per §10608.20. The 15-year continuous period is used if the Agency used recycled water to supply more than 10% of its retail water demands. (BCVWD did not use recycled water during the baseline evaluation period.)
2. The second baseline period is a 5-year continuous period, and is used to calculate baseline per capita water use per §10608.22. Note that if the water agency's per capita demand is 100 GPCD or less, it is not necessary to determine this 5-year base period. Note that BCVWD's per capita demand is much higher than 100 GPCD, so the 5-year baseline period must be calculated and is described below.

Determination of the 10-15 Year Baseline Period (Baseline GPCD)

> ***CWC 10608.12***
>
> *"Base daily per capita water use" means any of the following:*
>
> *The urban retail water supplier's estimate of its average gross water use, reported in gallons per capita per day and calculated over a continuous 10-year period ending no earlier than December 31, 2004, and no later than December 31, 2010.*
>
> *For an urban retail water supplier that meets at least 10 percent of its 2008 measured retail water demand through recycled water that is delivered within the service area of an urban retail water supplier or its urban wholesale water supplier, the urban retail water supplier may extend the calculation described in paragraph (1) up to an additional five years to a maximum of a continuous 15-year period ending no earlier than December 31, 2004, and no later than December 31, 2010.*

In BCVWD's 2013 UWMP Update, the District performed a detailed analysis of 10-year baseline periods from 1995-2004 through 2001-2010. The period 1999-2008 was selected as the 10-year baseline period for calculation of targets. In as much as the 2010 census data was used in the 2013 UWMP Update, there is no need to update or change the 10-year baseline per capita.

Determination of the 5-Year Baseline Period (Target Confirmation)

> ***CWC 10608.12 (b)***
>
> *(3) For the purposes of Section 10608.22, the urban retail water supplier's estimate of its average gross water use, reported in gallons per capita per day and calculated over a continuous five-year period ending no earlier than December 31, 2007, and no later than December 31, 2010.*

In the 2013 UWMP Update BCVWD determined the 5-year, continuous baseline period was from 2004 through 2008. Again there is no need to revisit or change the 5-year baseline period.

Service Area Population

> ***CWC 10608.20***
>
> *An urban retail water supplier shall include in its urban water management plan due in 2010…the baseline per capita water use,…along with the bases for determining those estimates, including references to supporting data.*
>
> *When calculating per capita values for the purposes of this chapter, an urban retail water supplier shall determine population using federal, state, and local population reports and projections.*
>
> ***CWC10644***
>
> *(a)(2) The plan…shall include any standardized forms, tables or displays specified by the department.*

In the preparation of this 2015 UWMP, BCVWD used the U. S. Census data for the decade years 1990, 2000, and 2010. The City of Beaumont is entirely within BCVWD's service area and the census bureau data was used directly. For the unincorporated community of Cherry Valley the "Cherry Valley CDP" (census-designated place) population was used. To determine the population in the intervening years for calculation of baseline per capita water use, the growth in population between years 1990 and 2000 was estimated to be linear. This is reasonable considering the population growth within BCVWD during the decade was only 1,645 people (165 people per year). Refer to Table 3-1 and Figure 3-1 presented previously in Section 3. From 2000 to 2010, the population increase was estimated to follow the growth in connections; this was a period of high growth within BCVWD.

Gross Water Use

> *CWC 10608.12*
>
> *"Gross Water Use" means the total volume of water, whether treated or untreated, entering the distribution system of an urban retail water supplier, excluding all of the following:*
>
> *Recycled water that is delivered within the service area of an urban retail water supplier or its urban wholesale water supplier*
>
> *The net volume of water that the urban retail water supplier places into long term storage*
>
> *The volume of water the urban retail water supplier conveys for use by another urban water supplier*
>
> *The volume of water delivered for agricultural use, except as otherwise provided in subdivision (f) of Section 10608.24.*

California Code of Regulations Title 23 Division 2 Chapter 5.1 Article

Section 596 (a) An urban retail water supplier that has a substantial percentage of industrial water use in its service area is eligible to exclude the process water use of existing industrial water customers from the calculation of its gross water use to avoid a disproportionate burden on another customer sector.

Baseline Daily Per Capita Water Use

A detailed analysis of various baseline periods conforming to the Water Code was presented in BCVWD's 2013 UWMP Update as stated above. The analysis resulted in the 10-year baseline period being 1999-2008 and the 5-year baseline period being 2004-2008. Verification form SB 7X-7 Table 5 is presented below which summarizes the baseline period analyses for 1999-2008 and 2004-2008.

SB X7-7 Table 5: Gallons Per Capita Per Day (GPCD)

NOTES:				

2015 and 2020 Targets

> *CWC 10608.20*
>
> *(e) An urban retail water supplier shall include in its urban water management plan due in 2010. . . urban water use target, interim urban water use target,…along with the bases for determining those estimates, including references to supporting data (10608.20(e)).*
>
> *CWC 10608.20*
>
> *(g) An urban retail water supplier may update its 2020 urban water use target in its 2015 urban water management plan…*

The Water Code identified four methods which could be used to establish the target GPCD; BCVWD chose Target Method 1 – 80% of the 10-year Baseline GPCD.

Year 2020 Target (by Target Method 1) = 0.80 * 302 GPCD = 242 GPCD

5-year Target Confirmation

> *CWC 10608.22*
>
> *Notwithstanding the method adopted by an urban retail water supplier pursuant to Section 10608.20, an urban retail water supplier's per capita daily water use reduction shall be no less than 5 percent of base daily per capita water use as defined in paragraph (3) of subdivision (b) of Section 10608.12. This section does not apply to an urban retail water supplier with a base daily per capita water use at or below 100 gallons per capita per day.*

Year 2020 Target (by Target Confirmation) = 0.95 * 291 GPCD = 276 GPCD

In BCVWD's case, CWC §10608.22 controls, and the District's confirmed **year 2020 target is 242 GPCD.**

Calculate the 2015 Interim Urban Water Use Target

The year 2015 Interim Target GPCD is midway between the 10-year Baseline (302 GPCD) and the year 2020 Confirmed Target (276 GPCD). BCVWD's **year 2015 Interim Target is 272 GPCD.**

Baselines and Targets Summary

Table 5-1 presents a summary of results of the baseline per-capita and target analysis. Table 5-2 shows that BCVWD met the intermediate, year 2015 target and the year 2020 target by a considerable margin. It should be pointed out that Stage 2 Water Restrictions were in effect in the District during this period.

Table 5-1 Baselines and Targets Summary *Retail Agency or Regional Alliance Only*					
Baseline Period	Start Year	End Year	Average Baseline GPCD*	2015 Interim Target GPCD *	Confirmed 2020 Target GPCD*
10-15 year	*1999*	*2008*	*302*	*272*	*242*
5 Year	*2004*	*2008*	*291*		
*All values are in Gallons per Capita per Day (GPCD)					
NOTES:					

2015 Compliance Daily per Capita Water Use (GPCD)

CWC 10608.12

(e) "Compliance daily per-capita water use" means the gross water use during the final year of the reporting period…

CWC 10608.24

(a) Each urban retail water supplier shall meet its interim urban water use target by December 31, 2015.

CWC 10608.20

(e) An urban retail water supplier shall include in its urban water management plan due in 2010 . . . compliance daily per capita water use, along with the bases for determining those estimates, including references to supporting data.

BCVWD's actual per capita for 2015 was 180 GPCD, which is well below the interim Target of 272 GPCD in Table 5-1. See Table 5-2.

180	272	0	0	0	0	180	180	Yes
All values are in Gallons per Capita per Day (GPCD)								
NOTES: The persistent drought and Stage 2 Water Use Restrictions imposed by BCVWD resulted in a 24.3% water savings year 2015-16 vs comparable period in 2013. Without the water savings the year 2015 per capita would have been closer to 223 GPCD								

Table 5-2 provides for some adjustments to the 2015 GPCD for such reasons as defined in the Water Code. For BCVWD there were no adjustments needed. But is should be pointed out that the Stage II water restrictions and water conservation measures resulted in a 24.3% savings in potable water. Without the restrictions the 2015 GPCD would have been about 223 GPCD. Still well below the interim target.

Another factor that affected the District's per capita is the substantial new homes which have been constructed in the District. Since 2001 there have been 10,800 new single family houses constructed in Beaumont. This is almost 74% of all of the housing units in Beaumont having modern plumbing fixtures, high efficiency appliances and California friendly, drought tolerant landscaping with much reduced turf areas.

The drought conservation and the new housing stock were responsible for the reduction in per capita water consumption.

CWC 10608.24

(d)(1) When determining compliance daily per capita water use, an urban retail water supplier may consider the following factors:

Differences in evapotranspiration and rainfall in the baseline period compared to the compliance reporting period.

Substantial changes to commercial or industrial water use resulting from increased business output and economic development that have occurred during the reporting period.

Substantial changes to institutional water use resulting from fire suppression services or other extraordinary events, or from new or expanded operations, that have occurred during the reporting period.

(2) If the urban retail water supplier elects to adjust its estimate of compliance daily per capita water use due to one or more of the factors described in paragraph (1), it shall provide the basis for, and data supporting, the adjustment in the report required by Section 10608.40.

Methodologies for Calculating Baseline and Compliance Urban Per Capita Water Use, Methodology 4 This section discusses adjustments to compliance-year GPCD because of changes in distribution area caused by mergers, annexation, and other scenarios that occur between the baseline and compliance years.

BCVWD was in compliance with the 2015 Interim Target and no adjustment to the year 2015 per capita is required.

Section 6

System Supplies

Overview

In the early years of the District, before the middle of the 20th Century, diverted surface water from Edgar Canyon (Little San Gorgonio Creek) was used for domestic and agricultural supply. Remnants of some of the diversion boxes are still visible in Edgar Canyon. Since the early 1900's, wells in Edgar Canyon supplemented the surface diversions. Eventually the surface diversions were no longer used and the District relied solely on groundwater from both Edgar Canyon and, after 1936 or so, the Beaumont Storage Unit (BSU or the Beaumont Basin).

The Beaumont Groundwater Basin was adjudicated on February 4, 2004 and a Watermaster established for management of the basin (RIC389197). The Adjudication put the basin into a safe yield operation. The principal terms of the Adjudication are described later in this section; the full Adjudication is included in Appendix E.

In September 2006, BCVWD completed the Phase I of its storm water capture and groundwater recharge project located along Beaumont Ave. between Brookside Ave. and Cherry Valley Blvd. and began recharging imported State Project Water (SPW) purchased from the San Gorgonio Pass Water Agency (Pass Agency or SGPWA). The facility sits astride Noble Creek. The imported water percolates into the ground and comingles with the native groundwater in the Beaumont Basin. Groundwater and percolated imported water are BCVWD's only current water source. In 2015 BCVWD completed Phase II of the recharge facility which more than doubled the recharge capacity.

Future water sources will include recycled water and could include captured and recharged storm water from Edgar, Noble, Marshall and other canyons, urban runoff captured and recharged in detention and water quality basins, captured, nitrate-contaminated underflow from the Edgar Canyon, groundwater from the Singleton Groundwater Basin and perhaps the San Timoteo groundwater basins.

BCVWD is considering introducing SPW directly into the non-potable water distribution system. This will reduce the cost of water pumped into the non-potable system by about $100 per acre-ft and will reduce energy and the District's carbon footprint. (The $100 per acre-ft is the cost of energy to pump the water from the Beaumont Basin groundwater table into the non-potable water distribution system.) When recycled water having a TDS concentration greater than 330 mg/L is introduced into the non-potable water system, imported SPW will need to be blended in to meet the 330 mg/L, 10-year average Maximum Benefit TDS in the blended water in order to comply with the Regional Board's permit requirements for the Beaumont Groundwater Basin in Order R8-2015-0026, NPDES CA0105376.

Table 6-1 identifies the water sources which are currently used or planned to be used by the District to meet future demands. Each of these sources will be described in more detail in subsequent subsections.

The District's water supply plan is based on the following set of principles:

- The Plan must be sustainable in terms of water quality and quantity.
- Energy is a major consideration in the evaluation of alternative water supply strategies.
- Local water resources such as poor quality groundwater and recycled water should be maximized in the non-potable water system and used for irrigation.
- Surplus non-potable water should be supplied to golf courses whenever it is not needed to meet other landscape non-potable water demands. This will provide BCVWD with forbearance water, as described in the Adjudication, which can be extracted from the Beaumont Basin to meet potable water demands.
- Recycled Water not needed for landscaping or golf courses should be advance treated and percolated to augment the potable water supply in conformance with applicable rules and regulations.
- Urban runoff and storm runoff from Little San Gorgonio Creek, Marshall Creek, Noble Creek and other local watersheds should be captured and percolated to the extent practical to minimize the amount leaving the "basin."
- The Beaumont Basin Adjudication will be followed with return flow credits given for imported and recycled water.
- The SGPWA has committed to provide the needed imported water supply to meet BCVWD's needs through build-out.

Table 6-1
Current and Future Water Sources Available to BCVWD

Water Source	Current	Future
Groundwater, Edgar Canyon	●	●
Groundwater stored in the Beaumont Basin	●	●
Imported Water purchased through SGPWA	●	●
Recycled water for landscape irrigation		■
Recycled water for groundwater recharge		Potential
Storm Water Capture and Recharge from Edgar Canyon, Noble Creek and other local watershed		■
Urban Storm Runoff captured in detention and water quality basins		■
Captured, nitrate-contaminated shallow groundwater from Edgar Canyon to supplement non-potable water system		Potential
Singleton Basin groundwater		Potential
San Timoteo Basin groundwater to supplement non-potable water system		■
Joint Projects with Other Agencies with Exchanges		Potential

● Firm, existing source ■ Firm, future source

There are constraints on the use of some of these sources, e.g. recycled water to ensure the water quality of the groundwater is maintained over time. These constraints are established by the RWQCB and are described later in this section. The RWQCB and the DDW have constraints on the use recycled water for irrigation and groundwater recharge.

The water supply plan which is developed must be flexible. Conditions will change over time, regulations will change, more information and experience will be gained with the existing facilities, and other things will occur requiring periodic adjustments to the water supply plan.

Purchased or Imported Water

Imported Water is provided to BCVWD through the San Gorgonio Pass Water Agency (SGPWA), one of the 29 State Water Contractors that import water from Northern California through the State Water Project. The Agency has a service area of 225 sq. mi., exclusively in Riverside County. In addition to BCVWD, the major water retailers in the SGPWA service area include the City of Banning, YVWD, Banning Heights Mutual Water Company, High Valley Water District, South Mesa Mutual Water Company, and Cabazon Water District. Currently only

BCVWD, YVWD and the City of Banning have taken imported water. The SGPWA has used a small amount for their own use and recharged the Beaumont Groundwater Basin. Table 6-2 shows the historical deliveries from SGPWA and the amount delivered to BCVWD. As can be seen from the table, the majority of the deliveries were to BCVWD over the time period. This percentage of SGPWA's deliveries is expected to continue into the future at the rates following the end of the temporary surplus in February 2014, i.e., 80 to 85% or so.

The SGPWA or "Pass Agency" has a Table A amount of **17,300 acre-ft/year** based on their contract with the Department of Water Resources (DWR). Table A amounts are used in allocating the total State Water Project (SWP) water supply that is determined by DWR to be available for delivery each year among the State Water Contractors. The Table A amount is the maximum amount a contractor may request in any year from DWR. It is also the maximum amount that DWR agrees to deliver to a contractor, like the Pass Agency, during a year. The sum total of all of the Table A amounts for all of the 29 State Water Contractors under the Monterey Agreement (1994) shall not exceed 4.185 million acre-ft. (The DWR 2011 State Water Project Delivery Reliability Report[1] states 4.172 million acre-ft as the total combined maximum Table A amount – not significantly different.) The Pass Agency's Table A is shared with other agencies in the Pass' service area.

Under certain hydrologic and water supply conditions, DWR is not always able to deliver all of the water requested by the contractors. In these cases a smaller amount ("allocation") is set by DWR by prorating the total amount available in proportion to the contractor's Table A amount. Thus the Pass Agency's Table A amount of 17,300 acre-ft/year is subject to the reliability of State Water Project. See Table 6-2.

The State Water Project has been, and continues to be, subject to delivery reduction caused by the operational restrictions of several biological opinions issued in December 2008 and June 2009 by the U.S. Fish and Wildlife Service (USFWS) and National Marine Fisheries Service (NMFS). These federal court decisions have been remanded (returned back) to the agencies for further study. In March 2014, the US Circuit Court of Appeals, 9th District, reversed a lower court decision by US District Court Judge Oliver Wanger and upheld the US Fish and Wildlife Service's protection of the Delta Smelt. In December 2014, the protection was extended to salmon and steelhead.

The DWR 2011 delivery reliability report[2] uses the assumptions in the 2008/2009 biological opinions and there is essentially no change to the delivery reliability with the recent (2014) decisions.

Sources: (1) Report on Water Conditions, Reporting Period 2014, SGPWA, (2) 2014 Watermaster Annual Report, * 2016 SGPWA Total from J. Davis to E. Fraser email; BCVWD totals for Nov and Dec estimated

The delivery reliability was calculated by DWR using the Cal-Sim-II computer model which simulates current and future operations of the SWP. The analyses are based on 82 years (1922-2003) of rainfall and runoff adjusted to reflect current and future levels of development. The impact of climate change is factored into the calculations. Figure 6-1 presents a cumulative probability curve of deliveries as a percent of a Contractor's Table A amount. The results are summarized in Table 6-3. In reading Table 5-3, 90 percent of the time the SWP will be able to deliver 28 percent of a Contractor's Table A; 50 percent of the time, the SWP will be able to deliver 64 percent of Table A.

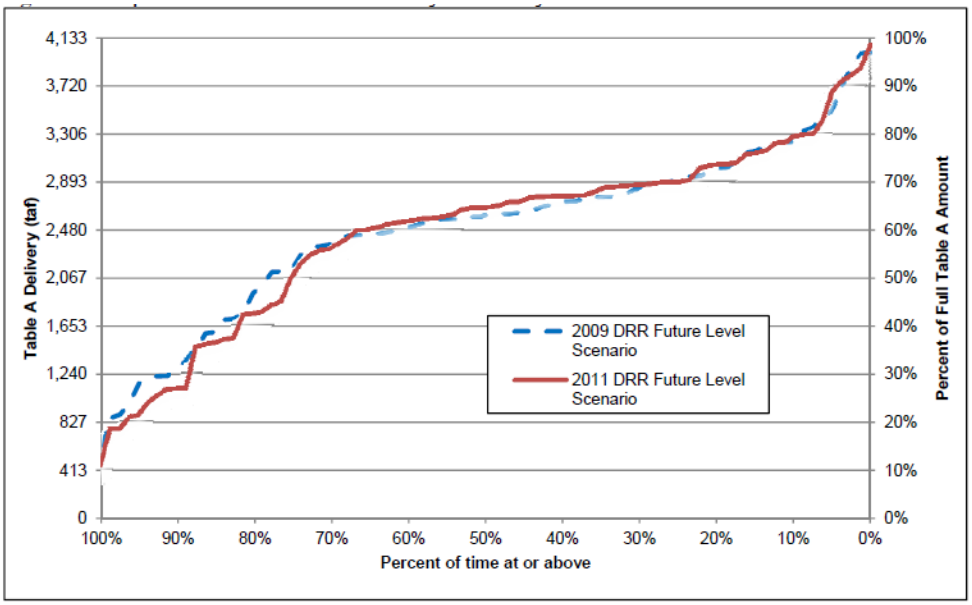

Figure 6-1
SWP Delivery Reliability (Future Conditions)

Source: 2011 Final Delivery Reliability Report, Technical Addendum

Figure 6-2 presents recent historical delivery percentages from 1992 – 2016. The average for the period is 66.0% or slightly above the 64% stated in the 2011 Delivery Reliability Report. This is not surprising since the Reliability Report percentages were based on future conditions. But the figure does lend credibility to the Reliability Report projections. This 64% reliability factor has been considered in the amount of water available on a consistent basis from the SWP.

Source: Extracted from 2011 Final Delivery Reliability Report Technical Addendum

Relating this to the Pass Agency, it means **on the average** (50% of the time), the SWP should be able to **deliver 11,100 acre-ft/yr to the Pass Agency**.

On July 27, 2015 the Pass Agency Board of Directors adopted a Facility Capacity Fee. The Capacity Fee is to be charged to new development on a "per EDU" basis for "new" water and for facility capacity increase to improve reliability and to be able to accommodate the larger volumes of water available during wet years including Article 21 Water. On February 18, 2014, the Board of Directors of the SGPWA adopted Resolution No. 2014-02, A Resolution of the San Gorgonio Pass Water Agency Establishing a Policy for Meeting Future Water Demands. Section 3(a) of this resolution states:

> *"The Agency is prepared to take the necessary actions to provide its service area with adequate supplies of water to meet expanding and increasing needs in the years ahead. As additional water resources are required to meet increasing needs, the Agency will be prepared to take the necessary actions to deliver such supplies."*

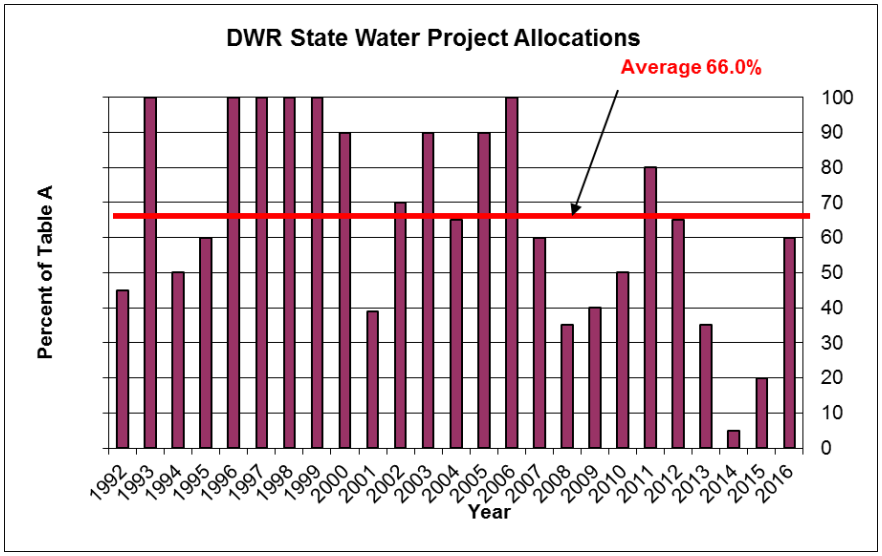

Figure 6-2
Historical SWP Delivery Percentages (1992 – 2016)

On July 27, 2015 the SGPWA adopted Resolution 2015-05, Resolution of the Board of Directors of The San Gorgonio Pass Water Agency to Adopt Facility Capacity Fees for Facilities and Water. The recitals of this resolution state:

> *"WHEREAS, the Board of Directors finds and determines that the present existing water importation, production, transportation, delivery facilities and water supplies are inadequate to meet anticipated demand;"*

Resolution 2015-05 was supported by a "nexus study" which supported the costs and charges along with a staff report. The Facility Capacity Fee as adopted by the SGPWA, has two components:

- A Facility Component
- A Water Supply Component

Both are imposed on new development, i.e., residential, commercial and industrial, effective July 27, 2015 as stated in the adopted resolution.

The Facility Component would fund the purchase of additional capacity in the Foothill Pipeline of the EBX and a storage facility in the Beaumont Basin known as the Brookside Avenue Recharge Facility (BARF). The Water Supply Component is used to "purchase new water and/or water rights and entitlements to meet future water demand" based on the expected water use of the new home or new commercial/industrial facility.

The component related to the construction of the Beaumont Avenue Recharge Facility (BARF) is considered by BCVWD to be a redundant facility for BCVWD customers since BCVWD's Development Community has funded adequate facilities to recharge more water than needed for current and all foreseeable future demands.

The new water supply component and increased capacity in the Foothill Pipeline are necessary to meet current and future demand. The nexus study further states:

"To maintain reliability for the benefit of future development SGPWA will need to purchase additional water rights and entitlements outside of its SWP contract.

The nexus study recognizes the reliability issues with the current Table A amount:

"The task of meeting the demands of new growth with scarce water sources is exacerbated by the significant reduction in reliability of imported water deliveries from the SWP due to periodic drought conditions, regulatory and court case cutbacks in allocations. SGPWA will need to purchase new water rights and entitlements to insure that additional water supplies will be available in the future as the SGPWA experiences new development. It has been estimated that the total water demand at build-out is expected to be in excess of local supplies and existing imported SWP water, with allowances for reduced reliability. This deficit will need to be balanced by the purchase of new water rights and entitlements. The water rights and entitlements, (authorized by SGPWA Act 101-27.1(b), (d), and (g)), that are needed to meet the demands of new development shall be purchased with funds provided by new development in the form of a Water Capacity Fee."

The Staff Report supporting the Resolution states:

"The Agency would ensure that future development within that entity's service area would be covered in the Agency's urban water management plan and that entity would have a right to expect future water supplies to be provided by the Agency for that development."

Resolution 2015-05 of the Board of Directors of the San Gorgonio Pass Water Agency to Adopt Facility Capacity Fees for Facilities and Water states:

> *"WHEREAS, pursuant to Section 101-27.1 of the SGPWA Act, SGPWA has prepared a Capacity Fee Study (Study) to support the need for additional water facilities and new water and/or water rights in that the existing facilities are not adequate to meet future increasing water needs in the SGPWA service area."*

Attachment 1 of Resolution 2015-05, Findings Supporting the Adoption of the Facility Capacity Fees states:

> *"The water capacity fee component will only be required of new development if the retail agency tasked with suppling water to that development determines that additional supplemental supply is needed."*

Based on these statements, the SGPWA has established an obligation to meet the water supply needs of the region and recognizes the current SGPWA Table A is fully subscribed to current users. If an agency, like BCVWD, determines that supplemental water is needed for a new development, the agency shall request SGPWA to obtain the supply, the water capacity fee component shall be paid, and the SGPWA will obtain the supplemental supply.

Based on the foregoing, BCVWD can rely on the SGPWA to secure and deliver the imported water needed to meet BCVWD's current and future demands as set forth in this 2015 UWMP and subsequent UWMP updates.

It is assumed the Pass Agency will consider the SWP reliability factor (64%) in the purchase of any additional Table A water from other State Water Contractors to ensure 100% reliability of Table A water.

In addition to the maximum annual Table A amount, there is a contractual limit of **32 cfs** on the instantaneous rate of delivery through the Aqueduct. (If operated continuously for the entire year, this would be 23,360 acre-ft. Since this exceeds the annual Table A amount, the maximum amount which could be delivered on an annual basis is still 17,300 acre-ft.) So California aqueduct conveyance is not a current limitation.

As stated above, and supported by SGPWA studies and Resolutions, the SGPWA considers the current allocation of the Agency's Table A amount of 17,300 AFY to be fully subscribed by the current users which are BCVWD, YVWD and the City of Banning (See Table 6-2). The respective allocation of the 17,300 AFY based on historical deliveries between 2013 and 2016 is: Banning 2,200 AFY, YVWD 1,218 AFY and BCVWD 13,882 AFY. This is the best representation of post-temporary surplus demands. Drought periods, such as 2013-2015 severely limit the availability of imported water.

BCVWD will need additional imported water to meet its long term needs, even when maximizing local water resources. As stated above, with the adoption of the Capacity Fee, the Pass Agency has committed to provide adequate water supply to meet the region's, (including BCVWD's), projected needs to at least year 2040.

BCVWD can reduce its need for supplemental water from the Pass Agency through:

- Water conservation
- Use of recycled water for landscape irrigation
- Increased storm water capture and recharge
- Use of local groundwater containing high nitrate and TDS in the non-potable water system
- Advanced wastewater treatment of YVWD and/or City of Beaumont recycled water for groundwater recharge

Importation Facilities and Capacity

Pass Agency imports SPW through the East Branch Extension (EBX). EBX Phase I was completed in 2003; the Environmental Impact Report for EBX Phase II (EBX II) was certified in 2008 and Phase II is currently nearing completion of construction and scheduled for completion in early 2016.

The EBX begins downstream of DWR's Devil Canyon Power Plant at the Devil Canyon Afterbay, north of the City of San Bernardino (Water Surface Elevation =1,931 ft MSL). From the Afterbay, the SPW flows through the Foothill Pipeline to the Greenspot Pump Station. From the Greenspot Pump Station, the water is pumped through the Greenspot Pipeline to the Crafton Hills Pump Station. The Crafton Hills Pump Station then pumps the SPW through the Crafton Hills Pipeline to Crafton Hills Reservoir. From the Crafton Hills Reservoir the water flows by gravity to the inlet of the Cherry Valley Pump Station. The Cherry Valley Pump Station then pumps the SPW through the Noble Creek Pipeline to the EBX terminus at Noble Creek in Cherry Valley (HGL Elevation ≈ 3,000 ft MSL). The EBX has a total length of about 33 miles; the water is lifted over 1,000 ft to get it to the Pass Agency. The EBX facilities up to the Garden Air Creek Metering Facilities are shared with San Bernardino Valley MWD (Valley District).

EBX II provides Valley District and the Pass Agency additional capacity to deliver water and at the same time provides some system redundancy. EBX II begins at Greenspot Rd and Cove Camp Rd and goes south in the Mentone Pipeline crossing under the Santa Ana River to the Citrus Reservoir and Pump Station at the intersection of Opal St and San Bernardino Ave. From

the Citrus Pump Station the SPW is pumped through the Mentone Pipeline East to the Crafton Hills Pump Station, constructed as part of the first phase of the EBX.

Table 6-4 presents a summary of the EBX Facilities and capacities; Table 6-5, the EBX II Facilities and their capacities.

Table 6-4
EBX Facilities, incl. EBX II Improvements

Facility	Description	Size	Capacity	SGPWA Capacity	Comment reference to SGPWA
Foothill Pipeline	From Devil Canyon to Santa Ana River Crossing	78”	220 cfs	32 cfs	Can use additional capacity with SBVMWD Board Approval
Santa Ana River Crossing (SARC)	Under Santa Ana River to Greenspot Pump Station	42”	108 cfs	16 cfs	Has 48 cfs capacity in parallel route (EBX II)
Greenspot Pump Station	Greenspot Pump Station		70 cfs total	16 cfs	Has 48 cfs capacity in parallel route (EBX II)
Greenspot Pipeline	Greenspot Pump Station to Crafton Hills Pump Station	48”	70 cfs	16 cfs	Has 48 cfs capacity in parallel route(EBX II)
Crafton Hills Pump Station			135 cfs total;110 cfs firm	64cfs	3 @25 cfs, 2 @ 20cfs, 2 @ 10 cfs
Crafton Hills Pipeline	Crafton Hills Pump Station to Crafton Hills Reservoir	54”		64 cfs	
Crafton Hills Reservoir			220 AF		Enlarged in EBX II from 85 AF
Bryant Street PIpeline	Crafton Hills Reservoir to Riverside San Bernardino County Line	54”	104 cfs	64 cfs	
Singleton Pipeline	Riverside San Bernardino County Line to Cherry Valley Pump Station	54”	64 cfs	64 cfs	
Cherry Valley Pump Station			52 cfs total; 32 cfs firm	52 cfs	Includes 20 cfs pump added in EBX II plus 1@16 cfs, 2@ 8 cfs
Noble Creek Pipeline	Cherry Valley Pump Station to Noble Creek Terminus	36”	32 cfs	32 cfs	Capacity could be as high as 52 cfs if velocity allowed to 7.4 ft/sec

Table 6-5
EBX II Improvements

Facility	Description	Size	Capacity	SGPWA Capacity	Comment reference to SGPWA
Mentone Pipeline South	Foothill Pipeline to Citrus Reservoir	66”	175 cfs	48 cfs	Has 16 cfs capacity in parallel route (EBX I)
Citrus Reservoir			400 AF		
Citrus Pump Station			160 cfs 150 cfs firm	48 cfs	Has 16 cfs capacity in parallel route (EBX I) 4@ 25 cfs, 4 @ 20 cfs, 2@ 10 cfs
Mentone Pipeline East	Citrus Pump Station to Crafton Hills Pump Station	60”	160 cfs	48 cfs	Has 16 cfs capacity in parallel route (EBX I)

BCVWD takes water from a 20-in diameter turnout and metering station at the current end of the EBX at Orchard Ave. and Noble Creek in Cherry Valley.

The EBX II project includes modification of the Crafton Hills and Cherry Valley Pump Stations, enlargement of Crafton Hills Reservoir, and a connector to the Yucaipa Pipeline.

From Tables 6-4 and 6-5, the Pass Agency has **64 cfs capacity in the East Branch Extension** except for:

- ***Foothill Pipeline*** – Pass Agency has 32 cfs in this pipeline but can use additional capacity if SBVMWD is not using the capacity. The 32 cfs is the maximum capacity Pass Agency currently has in the rest of the California Aqueduct.
- ***Cherry Valley Pump Station*** – Pass Agency has 52 cfs of total pumping capacity and 32 cfs of firm capacity (largest pump out of service). There is no space to add additional pumps in the building without major modifications.
- ***Noble Creek Pipeline*** – The velocity in this pipeline based on the total capacity of the Cherry Valley Pump Station of 52 cfs is 7.4 ft/sec. This is marginally acceptable with the headloss of 35 ft in the 10,000 ft length pipeline.

Facilities for Additional EBX Capacity

With completion of EBX II construction in 2016, the Pass Agency is still limited to 32 cfs or 17,300 acre-ft/yr in the EBX assuming a 75% operating time. This is based on the current SGPWA purchased capacity of 32 cfs in the Foothill Pipeline.

Pass Agency recognized the need to get additional capacity up to 64 cfs in the Foothill Pipeline and adopted a Capacity Fee in July 2015 to purchase an additional 32 cfs capacity in the Foothill Pipeline. This would double the current Pass Agency delivery capacity to 35,000 acre-ft/year assuming a 75% utilization factor.

BCVWD's Anticipated Need for Imported Water

BCVWD's 2017 Master Plan (Table 5-29 in the Master Plan) indicated BCVWD will need between 13,800 AFY and 16,300 AFY of imported water by the year 2040 depending on local water resource development, lingering water conservation, more restrictive landscaping ordinances, etc. This is the amount needed just to meet demand. Additional imported water will be needed to be banked to comply with the State's 2016 Emergency Conservation Measures which requires a 3-year supply to avoid imposing severe water use restrictions. BCVWD's Board of Directors, through Resolution 2014-05, established a requirement for a 5-year supply since drought periods have extended for more than 3 years. Table 6-26 herein (presented and discussed later) summarizes the imported water requirements and is consistent with the 2016 Master Plan. Build-out imported water requirement just to meet demand from the 2016 Potable Water Master Plan are in the range of 18,500 AFY to 23,000 AFY, again depending on local water resource development, water conservation, etc.

BCVWD Facilities for Imported Water

BCVWD takes water from a 20-in diameter turnout and metering station at the current end of the EBX I at Orchard Ave. and Noble Creek in Cherry Valley. Water from the turnout is metered by DWR and then enters a 3,500-ft long, 24-in diameter pipeline, constructed by BCVWD, which conveys the water to BCVWD's groundwater recharge site located east of Beaumont Ave. between Brookside Ave and Cherry Valley Blvd.

The 24-in diameter pipeline, designed for 30 cfs, was constructed in 2006. If operated continuously, the pipeline could convey 21,700 acre-ft per year. The capacity is based on maintaining the pipeline velocity below 10 ft/second. Higher velocities could be tolerated for short periods of time which would result in increased short-term delivery capacity. Based on imported water projections, the pipeline capacity should be adequate until well after year 2040 – maybe even build-out.

Phase I of the Recharge Facility, (West of Noble Creek), was completed in September 2006 and BCVWD began to take imported water at that time. Phase I consists of approximately 10.2 wetted acres based on the projected horizontal area at the normal water depth. Phase I has 3 "trains," or sets of percolation ponds (2.7 acres, 4.2 acres, and 3.32 acres (wetted area) respectively for "trains" 1, 2, and 3). Phase II was completed in 2015 and is operational. Phase II has an estimated horizontal wetted area of about 17 acres. It, too, is constructed in "trains" to allow wetting and drying.

Recharge of imported water has occurred almost continuously since September 2006. As of December, 2015, 48,530 acre-ft (15.8 billion gallons) of water have been recharged to BCVWD's account. Refer to Table 5-2 presented previously. Since 2006, annual recharge has averaged 4,853 AFY with a maximum of nearly 8,000 AFY.

Based on operational studies from 2006 through 2010, Geoscience Support Services, Inc., (Geoscience), determined the weighted average recharge rate for the Phase I facility is 10.3 acre-ft/wetted acre/day. This is a very high rate. Since there are a total of 10.2 wetted acres in Phase I, the existing recharge facility would be able to percolate over 100 acre-ft/day. Theoretically this is would be over 36,000 acre-ft per year (about twice the Pass Agency's Table A amount.) The 36,000 acre-ft per year, however should be reduced because of the need to "rest" and "restore" the basins and perform routine maintenance. If 2 of the 3 Phase I trains were operating at any one time, the theoretical capacity would be about 25,000 acre-ft/yr for Phase I.

Taking a conservative approach, using a percolation rate of 6 acre-ft/wetted acre/day and considering both Phase I and Phase II facilities, the percolation capacity would be 150 acre-ft/day. Using a 75% utilization factor, the percolation capacity on an annual basis would be over 40,000 acre-ft. However, achieving a capacity of 40,000 AFY would require frequent rest periods along and frequent pond bottom scouring. At this point, BCVWD does not have sufficient long-term operating experience with the Phase II ponds to justify more than a conservative 25,000 to 30,000 AFY total percolation capacity for Phases I and II combined. This capacity is adequate for BCVWD's long term needs to build-out.

Aquifer Response

BCVWD installed monitoring wells with the initial construction of the recharge facility to track and "trace" the recharged water. According to Geosciences, Inc, Feb 2010 report, BCVWD recharged over 15,000 acre-ft of water from September 2006 to December 20, 2009 in the Phase I facilities and water levels in the three shallow aquifer monitoring wells (perforated from 480 to 550 ft below ground surface) increased 94.4 ft, 86.1 ft, and 89.5 ft respectively. In the deeper aquifer (perforated 600 to 700 ft below ground surface), water levels increased in the fall and winter when BCVWD Well 23 was used less and decreased in summer when the well was used more. The water level in the two very deep monitoring wells (perforated 600 to 1000 ft below ground surface) increased 11.5 and 13.2 ft respectively since start of recharge in September 2006. In summary, it is clear the water is reaching the intended aquifers.

This data contradicts statements made in a USGS Report for the Pass Agency[3]. Specifically their report states that artificial recharge, including that from imported SPW in recharge ponds

[3] USGS (2006). Geology, Ground-Water Hydrology, Geochemistry, and Ground-Water Simulation of the Beaumont and Banning Storage Units, San Gorgonio Pass Area, Riverside County, California, D. L.

takes between 23 and 71 years to reach the water table depending on location. Spreading data from monitoring wells during Phase I operation of the recharge facility supports a much faster vertical travel time – more like 60 days under saturated conditions.

Imported Water Quality

State Project Water experiences some changes in water quality in response to wet and dry cycles in Northern California. Data from the Metropolitan Water District of Southern California, (Metropolitan), shown in Figure 6-3, shows the TDS in their imported water supplies from 1988 to 2014 – a 26-year period. Of particular interest is the Silverwood Reservoir source. The SGPWA also uses the same Silverwood Reservoir source. During high flow years, the TDS approached 100 mg/L; during the drought period of the early 1990s, TDS approached 400 mg/L. The last few years during the drought, the TDS has been in the 250 to 300 mg/L range. The nitrate concentration (as nitrate) in the imported water for 2014 was 1.9 mg/L, (0.43 mg/L as N).

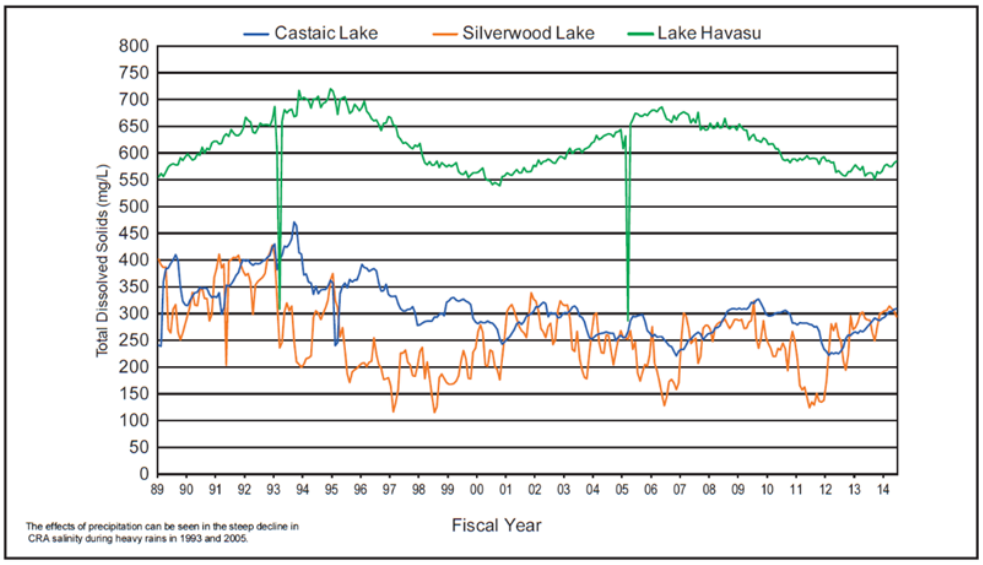

Figure 6-3
Quality of Metropolitan's Imported Water Supplies[4]

Article 19 of the Department of Water Resources' contract with SGPWA states that it is the objective of the State and the State shall take all reasonable measures to make available

Rewis, A. H. Christensen, J. C. Matti, J. A. Hevesi, T. Nishikawa, and P. Martin, Scientific Investigations Report 2006-5026.

[4] Metropolitan Water District of Southern California (Metropolitan 2012) Annual Report for the Fiscal Year July 1, 2011 to June 30, 2012. Chapter 4/

project water of such quality that the TDS concentration does not exceed 440 mg/L on a monthly average or 220 mg/L as an average during any 10-year period.[5]

The average TDS for the period January 2004 through January 2010 was 249 mg/L. This matches the TDS for the 25-year period from 1972-97[6]. For the 10-year period 1988-97 the TDS averaged 300 mg/L. This indicates that there could be some 10-year periods in the future where the SPW could exceed 250 mg/L and careful salinity management will be necessary. In their salinity management plan, Metropolitan used an average of 250 mg/L TDS for the East Branch.[7]

Implementation of the Bay Delta Conservation Plan should help maintain or improve the quality of the State Project Water; so a TDS concentration of 250 mg/L as a 10-year average should be is reasonable at this time.

Groundwater

CWC 10631

(b) If groundwater is identified as an existing or planned source of water available to the supplier, all of the following information shall be included in the plan:

(2) A description of any groundwater basin or basins from which the urban water supplier pumps groundwater.

The District currently owns and operates a total of 24 groundwater wells of which only 20 are used to any great degree. Three of the wells have their capacity shared with the City of Banning. (BCVWD constructed these wells under a cooperative agreement with Banning for shared capacity rights.) The 20 wells have a total production capability of approximately 27.3 million gallons per day (mgd) not including the capacity shared with Banning. Thirteen of the wells are in Edgar Canyon; eleven are in the Beaumont Basin.

Details on the District's wells and their current capacity can be found in the 2016 Potable Water Master Plan.

[7] Metropolitan Water District of Southern California (2012). Salinity in Metropolitan Supplies, Historical Perspective, Handout #2. Presented at Salinity Management Update Study Workshop, Southern California Salinity Coalition, June 1.

The greatest demand experienced by BCVWD occurred in 2009 when 22.1 mgd were used on one day (July 19); for 2015 the maximum day demand was 15.3 mgd. This is the lowest since 2005 and was likely due to the strict water conservation measures in effect for the drought. Historically the maximum day/average day ratio has been 1.87, but BCVWD uses a ratio of 2.0 for planning purposes. BCVWD can meet the maximum day demand with the largest well, (Well 29), out of service based on a 24-hour operation assuming short-term use of the shared Banning capacity (Total capacity is 21.5 mgd).

The District's wells are located in four areas:

- Upper Edgar Canyon (San Bernardino County)
- Middle Edgar Canyon (San Bernardino County)
- Lower Edgar Canyon (Riverside County)
- Beaumont Storage Unit (Beaumont Basin) (Riverside County)

Note that “Edgar Canyon” is synonymous with “Little San Gorgonio Creek”.

Edgar Canyon Wells

BCVWD has a total of 13 wells in Edgar Canyon; Well No. 13 is a standby for Well No. 12; Well No. 9A has limited use and Well RR-1 is in the process of being refurbished. Total capacity of the wells, not including RR-1, 9A and 12 is 1,510 gallons/minute (gpm) or 2.17 mgd. Individual well capacities range from 50 gpm to 300 gpm. Well capacities in Edgar Canyon vary from year to year, and throughout a given year, depending on hydrologic conditions, i.e., wet year vs dry year.

Groundwater in Edgar Canyon primarily occurs in the shallower, younger and older alluvial valleys and within the rock fractures beneath the alluvium. Numerous faults cross the canyon generally in a southeast-northwest direction. These act as barriers to groundwater movement and subdivide the canyon into several sub basins. Over the years BCVWD has drilled numerous wells, pilot holes and test wells in Edgar Canyon; but, because of the faulting, many of these wells have proven to be of limited use or value. Many “dry holes” are noted on some of the old BCVWD system maps.

The groundwater aquifer in Edgar Canyon is limited and storage is small. Groundwater levels vary from just few feet below ground surface to about 200 feet below ground surface. The groundwater levels and groundwater production respond quickly to stream flow. During wet years considerably more water can be pumped than during dry years.

BCVWD prefers to use the wells in Edgar Canyon since they are the least expensive to operate and the water can be conveyed to the District customers by gravity with no additional pumping.

The District has arbitrarily subdivided Edgar Canyon into three production areas:

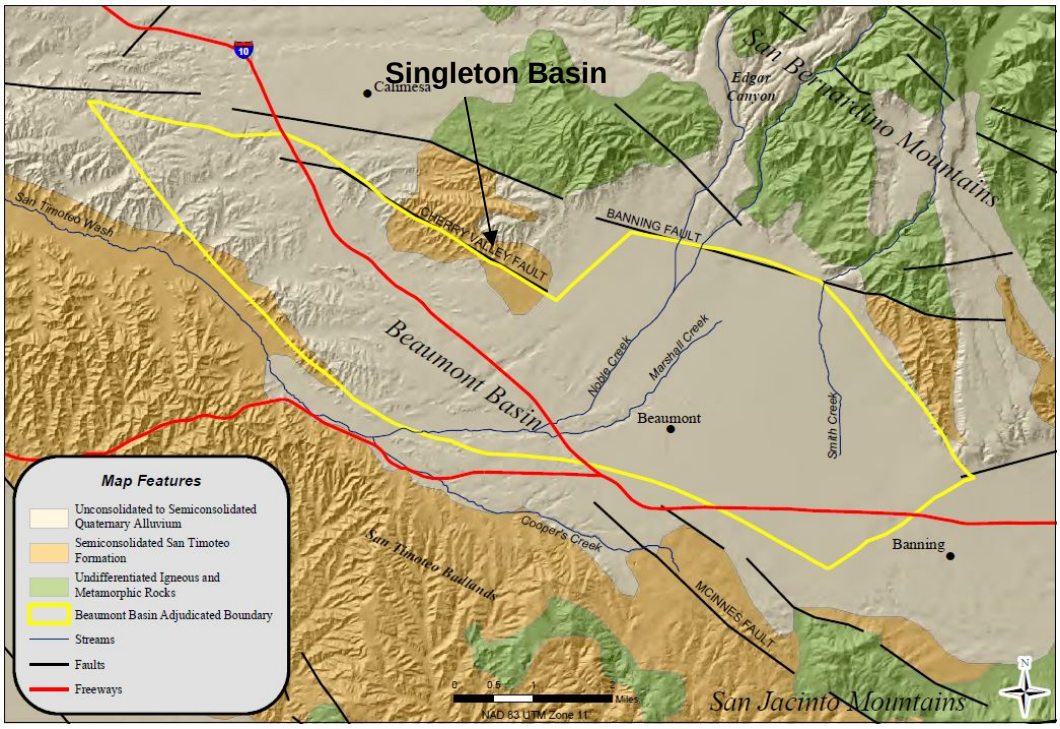
- **Upper Edgar Canyon** -- in San Bernardino County from the District's northern boundary, where Oak Glen Road crosses over Little San Gorgonio Creek, to a point about the center of Section 2, T1S/R1W approximately 1.5 miles north of the Riverside/San Bernardino County Line. The Upper Canyon wells include all wells except Wells 6, 4A, 5 and RR-1.
- **Middle Edgar Canyon** -- in San Bernardino County from the Riverside/San Bernardino County Line to a point about 0.5 mile north of the County line. Well 6 is in the Middle Canyon
- **Lower Edgar Canyon** in Riverside County from the mouth of the Canyon at Orchard St to about 1 mile north (upstream) where Well No. 5 is located. Well No. 4A is located about 1/4 mile below Well No. 5. Well RR-1 is about ½ mile north of Orchard St., downstream of Well 4A.

The Edgar Canyon wells are very inexpensive to operate and are the preferred source; however, those wells are not able to meet even the average day demand.

Locating water wells in Edgar Canyon has been a challenge due to the faults crossing the canyon. The faults form barriers to groundwater flow and create small, low production, low storage, aquifers. The successful wells are clustered into the 3 areas – Upper, Middle and Lower Edgar Canyon. In between the areas there is no groundwater production.

Beaumont Basin Wells

The Beaumont Basin, or Beaumont Storage Unit (BSU) as it is also known, is one of the largest groundwater units in the San Gorgonio Pass area covering an area of about 27 sq. mi. with at least 1.1 million acre-feet of water in storage and about 200,000 to 400,000 acre-feet of unused groundwater storage capacity. STMWA estimated the amount of water in the Beaumont Basin could be as much as 2.4 million acre-ft based on usable groundwater extending down to 1500 ft below ground surface.[8] This is 500 ft deeper than previously assumed and is based on several recent wells drilled by BCVWD and others.



The boundaries of the BSU are defined on all sides by postulated faults including the Banning and Cherry Valley Faults to the north and unnamed faults to the south, east, and west. The Cherry Valley Fault is the dividing line between the BSU and the Singleton storage unit. See Figure 6-4.

Groundwater within the BSU primarily occurs in the older alluvium and the San Timoteo Formation. Groundwater elevations in the BSU range from approximately 160 ft below ground

[8] "*Integrated Regional Water Management Program for the San Timoteo Watershed*," Final Draft, prepared for the San Timoteo Watershed Management Authority, Wildermuth Environmental, Inc., p 2-15, June 2005.

surface (bgs) to 600 ft bgs. Underlying the BSU are nearly impermeable granitic/metamorphic basement rocks.

It should be noted that the BSU has been drawn down from the steady state groundwater elevations computed in the Bloyd (1971) report[9]. The Bloyd report shows that the groundwater elevation is approximately 100 feet below steady-state (pre-development) conditions. According to STWMA, progressive drawdown of water levels in the Beaumont Basin occurred from the 1920s to about 1980. Since then, groundwater levels have stabilized. Current levels in the basin are about 75 to 120 ft below the 1920 levels and about 10 to 40 ft below the 1980 level.[10] Even though water levels have dropped, there has been no known adverse impact, e.g., water quality impacts, subsidence, etc. The only adverse impact is additional pumping cost. With the adjudication, the Basin is now under a long-term safe yield operation. Fluctuations in water levels will occur from wet years to dry years; but there should be no long-term decline.

Figure 6-4
Beaumont Groundwater Basin and Major Fault Boundaries

[9] Bloyd, R.M., 1971, Underground storage of imported water in the San Gorgonio Pass area, southern California: U.S. Geological Survey Water-Supply Paper 1999-D.

[10] "*Integrated Regional Water Management Program for the San Timoteo Watershed*," Final Draft, prepared for the San Timoteo Watershed Management Authority, Wildermuth Environmental, Inc., p 2-13, June 2005

Since startup of the BCVWD recharge facility and the recharge of SPW, groundwater in the BSU flows from the recharge site, (at Beaumont and Brookside Avenues), in a southeasterly direction toward Banning and a southwesterly direction to San Timoteo Creek.

During the field investigation work performed by BCVWD in anticipation of developing its recharge facility, multiple aquifers systems were identified by Geoscience Support Services Inc. (Geoscience)[11]. They designated the aquifer systems beneath the recharge site as:

- Perched -- 300 to 400 ft bgs
- Shallow -- 478 to 485 ft bgs
- Intermediate – 600 to 1000 ft bgs
- Deep –below 1000 ft bgs

Prior to drilling Well 23 at the recharge site, the base of useable groundwater water in the Beaumont Basin was thought to be 1,000 ft bgs. This was the primary production zone of most of the older municipal wells in the BSU, including the District's. (There are currently seven production wells in the Beaumont Basin having depths of 1,400 ft or more.) As part of the pilot recharge project, a well was drilled to 1,500 ft bgs and test pumped at 3,000 gpm. The water quality from this well is excellent, with total dissolved solids concentrations in the low 200 mg/L range. The finding of this deep aquifer greatly extends the amount of usable groundwater in the BSU.

Groundwater Quality

Overall, the water quality from BCVWD's wells is excellent. Table 6-6 presents a summary of the quality of water from the District's 2015 Consumer Confidence Report.

Edgar Canyon

In Edgar Canyon the TDS concentration is below 250 mg/L range; hardness is moderate; nitrate levels are low, except at the mouth of Edgar Canyon. At the mouth of Edgar Canyon, USGS has reported[12] that a monitoring well 2S/1W-22G4 had a nitrate-N concentration of 11.3 mg/L. This exceeds the drinking water MCL of 10 mg/L. Well 2S/1W-22G4 is a shallow monitoring well that is perforated from 138 to 158 below ground surface. USGS states that this well is likely affected by "an anthropogenic source of nitrogen that may include agricultural activity or septic

[11] Geoscience Support Services, Inc., (2002). *Geohydrologic Investigation Noble Creek Recharge Study*, July 1, 2002

[12] USGS (2006). *Geology, Ground-Water Hydrology, Geochemistry, and Ground-Water Simulation of the Beaumont and Banning Storage Units, San Gorgonio Pass Area, Riverside, California*, U.S. Department of the Interior, U.S. Geologic Report, in cooperation with the San Gorgonio Pass Water Agency, Scientific Investigations Report 2006-5026.

tank seepage." This well is not used for potable water supply; BCVWD has no production wells in the high nitrate area.

Table 6-6
Summary of BCVWD Groundwater Quality[13]

Constituent	Concentration, mg/L unless noted otherwise
	Average
Total Dissolved Solids, TDS	247
Specific Conductance, µmhos/cm	432
pH, pH units	7.5
Sodium	19
Calcium	51
Magnesium	17
Potassium	1.5
Bicarbonate	221
Chloride	9
Sulfate	24
Nitrate	7.6
Fluoride	0.4
Total Alkalinity, mg/L as $CaCO_3$	182
Total Hardness, mg/L as $CaCO_3$	200

Data from 1998 and 1999, showed the TDS in BCVWD's RR-1 well, in the floor of Edgar Canyon near the mouth, was 370 mg/L. Nitrate as nitrate was 24-27 mg/L. The TDS near the mouth of the canyon is much higher than farther up the canyon where BCVWD has its production wells.

Bonita Vista Water Company wells, on the ridge to the west of Edgar Canyon, showed high nitrate concentration; the Company has since been annexed into BCVWD and the wells were taken out of active operation. Based on this information, the ridges adjacent to the mouth of Edgar Canyon likely have elevated nitrate concentrations.

[13] BCVWD 2015 Consumer Confidence Report

The groundwater at the mouth of Edgar Canyon and beneath the ridges on the west side and possibly the east side, though there is no data to confirm this, has high nitrates and should not be used for potable water without further treatment. This groundwater could be introduced into the non-potable distribution system and beneficially used on landscaping, however. BCVWD has plans to do this.

Beaumont Basin

In the Beaumont Basin during the period 2002 – 2006, TDS concentrations in the groundwater ranged from 160 to 360 mg/L. Historical ambient TDS based on the period 1954 – 1973 was 230 mg/L; for the period 1984- 2003 the ambient TDS was 260 mg/L. Although there is a slight upward trend, the TDS is still very low.[14]

Average nitrate-N concentrations for the period 2002 – 2006 ranged from 0.26 to 7.9 mg/L with maximum concentrations ranging from 0.26 to 9.03 mg/L. During that same period about 70% of the wells sampled for nitrate-N had an average concentration less than 2.5 mg/L. None of the wells sampled had nitrate-N exceeding the MCL of 10 mg/L[15]. BCVWD's Well No. 16 in Cherry Valley experienced a "spike" in nitrate-N in 2005 reaching 9.0 mg/L; at the same time, Well No. 21 showed a concentration of 6.1 mg/L.[16] These concentrations have since decreased. This was investigated; but no conclusions could be drawn as to the exact cause. It is possible this could occur again.

The University of California Riverside (UCR), under contract with the SWRCB, conducted a water quality assessment of Beaumont Management Zone with the specific objective of looking at nitrate contamination from on-site wastewater disposal systems.[17]

Forty wells and eleven surface water sites were sampled and analyzed in the UCR study. In the central part of the BMZ, i.e., generally in Cherry Valley, several wells "showed clear signs of contamination by septic systems. The groundwater within the central part of Cherry Valley appeared to be more strongly affected by septic systems than groundwater on the periphery of

[15] Ibid

[16] Wildermuth Environmental, Inc. (2007). Water Quality Impacts from On-site Waste Disposal Systems in the Cherry Valley Community of Interest, Final Report, prepared for San Timoteo Watershed Management Authority, Project Committee No. 1, March.

[17] Univ. of California Riverside (2012). Final Report: Water Quality Assessment of the Beaumont Management Zone: Identifying Sources of Groundwater Contamination Using Chemical and Isotope Tracers. SWRCB Agreement No. R*-2010-0022, Department of Environmental Sciences, Riverside, CA 92521, Feb 3.

Cherry Valley. Several wells had measureable concentrations of pharmaceuticals and personal care products (PPCPs) and major anions and cations [associated with wastewater], suggesting septic waste was entering the groundwater system.[18]"

BCVWD has been able to deal with the nitrate concentrations by blending with other lower nitrate source waters when it has become an issue. Riverside County Ordinance 871 requires any new septic tanks within the Cherry Valley Community of Interest be able to remover 50% of the nitrogen. Usually this requires an "add on" process to the conventional septic tank. At some point in time it may be necessary to either install well-head treatment for nitrate removal (ion exchange or reverse osmosis) if blending alone cannot mitigate the problem. If the problem gets worse, sewers may need to be installed in the more densely developed portions of Cherry Valley.

One issue that has emerged is hexavalent chromium (Cr+6). Total chromium is regulated by the state of California, Division of Drinking Water, at an MCL of 50 µg/L (50 parts per billion). There are two forms of chromium that exist in natural waters – trivalent chromium (Cr+3) and hexavalent chromium (Cr+6). Trivalent chromium is a trace metal that the human body needs; hexavalent chromium is considered toxic based on laboratory animal studies. Trace amounts of hexavalent chromium are natural and found in rock and minerals. In some areas, high concentrations of hexavalent chromium are the result of industrial discharges. On July 1, 2014, a separate, State of California, MCL of 10 µg/L (10 parts per billion) for Cr+6 was established.

BCVWD sampled for hexavalent chromium as required by the State. Well 3, in the Beaumont Basin, had a concentration of 11 µg/L; wells 25 and 26, also in the Beaumont Basin, had concentrations of 11-12 µg/L and 14-15 µg/L respectively. This is all from natural causes; the concentrations are at or slightly above the MCL. Since these wells are above the MCL, quarterly monitoring will be required. Although BCVWD is concerned; there is no reason to be alarmed. The MCL was set low enough that health risk is extremely low. Well 26 is no longer pumping into the potable water distribution system; Well Nos. 3 and 25 have been placed on standby status and are not currently being used until Well Nos. 3 and 25 can be modified to reduce the Cr+6.

At the present time nitrates are not an immediate concern and hexavalent chromium concentrations in the wells continues to be monitored. At some point, it may be necessary to provide wellhead treatment.

As part of the preparation of this 2015 UWMP, a review of past industrial/commercial operations, particularly their waste disposal practices, was researched on the SWRCB's GeoTracker[19] to see if there could be any future water quality impact from these discharges.

[18] Ibid, pg. 27

[19] http://geotracker.waterboards.ca.gov/ Accessed 7/11/2016.

Lockheed Martin Corporation[20] used two remote sites near Beaumont, CA, to test solid rocket propellant and motors, weapons, and ballistics. Contamination related to these operations has been identified at both sites—Potrero Canyon and Laborde Canyon. Although the sites are owned or managed by entities other than Lockheed Martin today, Lockheed Martin has assumed responsibility for environmental cleanup at both locations. Both sites are still "open" and assessment and interim remedial action is going on.

The Potrero Canyon site is south of Beaumont and does not overlie any of the Beaumont Basin. BCVWD is not extracting any groundwater from this area. Laborde Canyon is located southwest of the City of Beaumont in the San Timoteo Badlands and also does not overly the Beaumont Groundwater Basin. BCVWD has no wells in this area either.

The SWRCB's GeoTracker list was reviewed for potentially contaminated sites in the BCVWD service area. There about 20 sites in the BCVWD SOI on the list; three are still "open." These include the Beaumont Landfill (inactive) at Fourth St. and Nicholas St., O'Reilly Auto Parts on Sixth and Maple, and SOCO on Fourth and Beaumont Ave. The O'Reilly site is in the assessment phase; SOCO is in the remediation phase, and the landfill is in the monitoring phase. These sites have not affected any BCVWD wells; BCVWD's nearest wells to these facilities are about 0.75 mile away.

Groundwater Management

CWC 10631

...If groundwater is identified as an existing or planned source of water available to the supplier, all of the following information shall be included in the plan:

A copy of any groundwater management plan adopted by the urban water supplier…or any other specific authorization for groundwater management.

…For basins that a court or the board has adjudicated the rights to pump groundwater, a copy of the order or decree adopted by the court or the board and a description of the amount of groundwater the urban water supplier has the legal right to pump under the order or decree.

The Beaumont Basin was adjudicated in February 2004, in Superior Court, Riverside County, Case RIC 389197, *San Timoteo Watershed Management Authority vs. City of Banning et al*. The Judgment established the Beaumont Basin Watermaster (Watermaster) to administer the judgment. It established the rights of the Overlying Parties and the Appropriator Parties, e.g., BCVWD and others. Some of the essential elements of the Judgment are as follows:

- The "Safe Yield" of the Basin was established at 8,650 AFY. This was to be re-evaluated every 10 years. §I 3.X and §VI 5.Y. It was re-evaluated in 2013 -2015 and on April 2015, through Resolution 2015-01, the safe yield was reduced to 6,700 AFY

[20] http://www.lockheedmartin.com/us/who-we-are/sustainability/remediation/beaumont.html Accessed 09052012

- A controlled overdraft of the basin was allowed for the first ten years to create more usable storage capacity in the Basin for Conjunctive Use. In the Judgment this was termed "Temporary Surplus." This was established at 160,000 acre-ft. After ten years (February, 2014), the controlled overdraft ceased. This provided a ten-year time frame for the appropriators to develop facilities to use or bank imported SPW and develop other water sources. § I3.BB and Exhibit C, Column (5).
- The Overlying Parties can extract, in total, a maximum of 8,650 acre-ft/yr. (All of the initial safe yield was dedicated to the Overlying Parties.) The Overlying Parties and their rights are shown in column (4) of Exhibit B. If an Overlying Party pumps more than five times its share of the operating safe yield (as shown in column (4) of Exhibit B) in any five consecutive year period, the overlying producer shall provide Watermaster with sufficient funds to replace the overproduction (typically with imported water). Exhibit B, Column (4) and §II 1.A
- During the first ten years after adoption of the Judgment (until 2014), the Appropriator Parties can extract, in total, a maximum of 16,000 AFY, i.e., the "temporary surplus" amount divided by ten years. Thereafter the Appropriating Parties can extract, as a maximum, only the amount each has in storage or otherwise credited to the Appropriator Party. If, after the first ten years, an Appropriator Party pumps more than each has in storage or otherwise credited, the Appropriator producer shall provide Watermaster with sufficient funds to replace the overproduction (typically with imported water). Watermaster uses a similar 5-consecutive year period for accounting as described above for the Overlying Parties. BCVWD is an Appropriator Party. BCVWD has a 42.51% share of the temporary surplus for the first ten years (until 2014) and can extract up to 6,802 acre-ft/yr without the need to replenish. Thereafter BCVWD can only extract what it has in storage or otherwise credited to BCVWD by Watermaster**.** §V 4 and Exhibit C, Column (5)
- An Overlying Party can request water service from an Appropriator Party. For example, an Overlying Party can subdivide its property and then request an Appropriator, such as BCVWD, to supply the new subdivision with water. When this happens, the Overlying must forgo extracting that volume of water provided by the Appropriating Party and the Appropriating Party shall have the right to produce the equivalent volume of water which the Overlying Party did not pump. §III 3. (This is sometimes called "forbearance" water.)
- If an Appropriating Party serves recycled water to an Overlying Party, the Overlying Party's water right is not diminished, but the Appropriator Party shall have the right to use that portion of the Overlying Water Right offset by the

recycled water. In other words, serving recycled water to an Overlying Party allows the Appropriator to pump the equivalent amount of groundwater. §III 3 E.

- There is a provision which requires the BCVWD to set aside 2,400 AFY of projected water demand in the 2005 Urban Water Management Plan update specifically for Oak Valley Partners, LP. For the 2010 UWMP update, the Judgment states this figure should be revised to reflect the projected water demands. Oak Valley Partners, LP has an overlying pumping right per column (4) of Exhibit B equal to 1,806 AFY. However it is unclear how this 1,806 AFY is to split between YVWD and BCVWD. BCVWD started to provide potable water service to Oak Valley Partners, LP land in 2005; in 2010, BCVWD provided a total of 1,307 acre-ft to them. BCVWD continues to provide potable water to the land from its potable and non-potable water distribution system §III.3.G.
- If any Overlying Party produces less than five times the share of the safe yield assigned to the Overlying Party during any 5 year period (per Column (4) of Exhibit B), the unused portion shall be apportioned to the Appropriator Parties per Column (2) of Exhibit C: BCVWD 42.51%, Yucaipa Valley Water District 13.58%, South Mesa Water Company 12.48%, and the City of Banning 31.43%. The availability and allocation of any such groundwater not produced by the overlying parties in accordance with their rights under the Judgment shall be first determined in fiscal year 2008/09 and every year thereafter according to a schedule. (Watermaster Rules and Regulations §7.8.)
- Any Appropriator may transfer all or any portion of its Appropriator's Production Right or Operating Yield that is surplus to its needs to another Appropriator. (Watermaster Rules and Regulations §7.3.)
- Watermaster has the authority to enter into Groundwater Storage Agreements with producers for the storage of supplemental water, wellhead protection and recharge, well abandonment, well construction, monitoring, replenishment, mitigation of overdraft, and collection of assessments. §VI.5.
- Supplemental replenishment water can be recycled water, State Project Water, or other imported water. Replenishment can be accomplished by spreading and percolation, injection, or directly using treated surface water or raw or treated imported water. §VI 7.
- A minimum 200,000 acre-ft of groundwater storage capacity shall be reserved for conjunctive use. Any person, party or not a party to the Judgment, can make reasonable beneficial use of the groundwater storage capacity for storage of supplemental water provided that it is in accordance with a storage agreement with Watermaster. §I.3.S and §V.5.B

- Minimal producers (10 or less acre-ft/yr) are exempt from the Adjudication. §III.4.and §I.3.K

Watermaster is responsible for providing the legal and practical means of ensuring the waters of the Beaumont Basin are put to maximum beneficial use and include:

- Administer the Judgement; approve Producer activities,
- Maintain and improve water supply; maintain and improve water quality; monitor and understand the Basin
- Develop and administer a well policy; develop contracts for beneficial programs and services; provide cooperative leadership

To simplify the Judgement, an appropriator, like BCVWD, after February 2014, can only extract water within the appropriator's storage account as determined by Watermaster. Water in the storage account can include:

- Imported water recharged by the Appropriator.
- Water transferred from one Appropriator's storage account to the Appropriator.
- Recycled water recharged to the Beaumont Basin which meets Regional Board and SWRCB Division of Drinking Water (DDW) groundwater water recharge regulations.
- "New" captured storm water or urban runoff recharged by the Appropriator.
- Unused Overlying Party pumping rights allocated back to the Appropriator.
- Return flows from imported water or recycled water applied to land overlying the Beaumont Basin by the Appropriator
- Forbearance water allocated to the Appropriator for providing potable or recycled water to the Overlying Party's land.

Watermaster performs an annual accounting of these sources and produces an annual report identifying the water in storage for each appropriator.

According to Watermaster, BCVWD had 28,930 acre-ft in storage in the Beaumont Basin at the end of 2014. Data from Watermaster's 2015 Annual Report, indicates that BCVWD's storage account balance at the end of 2015 is 25,568 AF.[21] BCVWD's storage account has a maximum capacity of 80,000 acre-ft.

The entire Judgment is contained in Appendix E.

[21] Beaumont Basin Watermaster (2016). 2015 Annual Report, Alda, Inc., Thomas Harder and Company, December

Overdraft Conditions

CWC 10631

(b)(2) For basins that have not been adjudicated, (provide) information as to whether the department has identified the basin or basins as overdrafted or has projected that the basin will become overdrafted if present management conditions continue, in the most current official departmental bulletin that characterizes the condition of the groundwater basin, and a detailed description of the efforts being undertaken by the urban water supplier to eliminate the long-term overdraft condition.

BCVWD has been extracting groundwater from Edgar Canyon for nearly 100 years. Data presented later in this section, (see Table 6-8), shows BCVWD's average Edgar Canyon groundwater pumped over the period 1983-2015 was 2,181 AFY. A study by STWMA indicated a safe yield of about 2,600 AFY; a SGPWA water balance study put the safe yield between 2,000 and 2,800 AFY. Based on these studies and BCVWD's long term records of pumping, Edgar Canyon is not in overdraft.

Prior to 2004, the year the Adjudication came into effect, the Beaumont Basin was in overdraft. Groundwater levels had declined from historical levels. It should be noted that the BSU has been drawn down from the steady state groundwater elevations computed in the Bloyd (1971) report[22]. The Bloyd report shows that the groundwater elevation is approximately 100 feet below steady-state (pre-development) conditions. According to STWMA, progressive drawdown of water levels in the Beaumont Basin occurred from the 1920s to about 1980. Since then, groundwater levels have stabilized. Current levels in the basin are about 75 to 120 ft below the 1920 levels and about 10 to 40 ft below the 1980 level.[23] However, in spite of the drop in water levels, there were no water quality impacts or known subsidence. At the present time, with the Adjudication, the Beaumont Basin is operated on a long-term safe yield basis.

The SGPWA monitors the overdraft in the Beaumont Basin and Figure 6-5 shows the accumulated overdraft, (AF), since 1997. As can be seen once imported water began to be imported the accumulated overdraft leveled off. The "overdraft" increased slightly after 2013 due to the drought when imported water supplies were reduced. Basins managed on a long-term safe yield basis are expected to have fluctuations in groundwater levels from year to year depending on hydrologic conditions and the availability of imported water. During dry years the water levels drop; during wet years the levels recover.

[22] Bloyd, R.M., 1971, Underground storage of imported water in the San Gorgonio Pass area, Southern California: U.S. Geological Survey Water-Supply Paper 1999-D.

[23] "*Integrated Regional Water Management Program for the San Timoteo Watershed*," Final Draft, prepared for the San Timoteo Watershed Management Authority, Wildermuth Environmental, Inc., p 2-13, June 2005

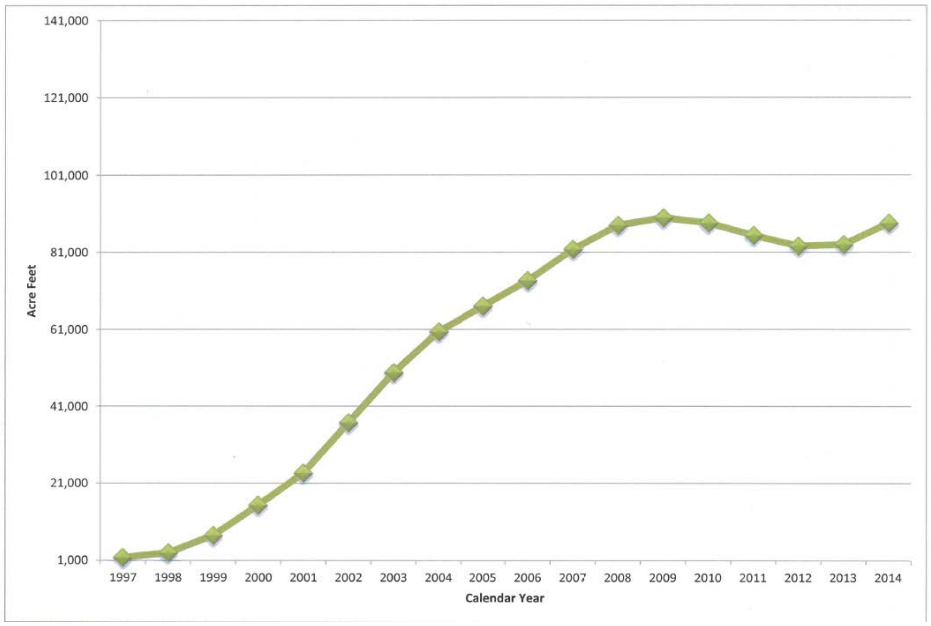

Figure 6-5
Accumulated Overdraft in Beaumont Basin since 1997 (by SGPWA)
(includes the impact of imported replenishment water)[24]

The accumulated overdraft is expected to remain nearly constant with the Adjudication; although there could be some fluctuations due to wet and dry periods causing variable amounts of recharge water to be available. To minimize outflow and loss of recharged imported water, Beaumont Basin water levels should be maintained at or near current conditions. During "wet" years when more imported water is available, the accumulated overdraft will be reduced. This is normal operation for a groundwater basin

The Beaumont Basin Watermaster has a calibrated groundwater model which is used to manage the basin. The model was used in the recent review of the safe yield value and resulted in a reduction to 6,700 AFY -- a value closer to some of the earlier hydrogeologic reports. In summary, although water levels are below historic levels, the Beaumont Basin, as a result of the Adjudication, is operating on a safe yield basis.

When the Adjudication was implemented, an extraction of 160,000 AF "temporary surplus" was planned to provide storage for conjunctive use and water banking. Watermaster was concerned about possible subsidence and implemented a basin-wide subsidence monitoring program. In 2006 Watermaster established a network of 72 benchmarks throughout the Basin and nearby basins and an initial level survey was conducted to establish a baseline. A second survey was conducted in 2007 which showed little vertical change. Whatever minimal change occurred was evenly distributed throughout the Basin. The program envisioned performing the survey every 3

[24] SGPWA, 2015, Annual Report of Water Conditions, Reporting Period 2014, November

years with the next round scheduled for spring 2009. The 2009 survey was not conducted since it was determined the level of subsidence was minimal. No additional surveys are scheduled at this time.[25] It can be concluded, the overdraft and the temporary surplus have not had any adverse effects.

Historical Groundwater Pumping

> *CWC 10631*
>
> *(b) ...If groundwater is identified as an existing or planned source of water available to the supplier, all of the following information shall be included in the plan:*
>
> *(3) A detailed description and analysis of the location, amount, and sufficiency of groundwater pumped by the urban water supplier for the past five years. The description and analysis shall be based on information that is reasonably available, including, but not limited to, historic use records.*

Table 6-7, (DWR Table 6-1) shows BCVWD's historical pumping from Edgar Canyon and the Beaumont Basin for the last five years (2011-2015). Figure 6-6 shows BCVWD's pumping from the 1970s.

Edgar Canyon

BCVWD has long-term records on pumping. From 1957 to 2015, a period of 58 years, the average production from the Edgar Canyon Wells was 1,926 AFY. However, prior to 1983, the ability to utilize the water pumped from Edgar Canyon was limited due to a lack of sufficient conveyance capacity to deliver water from Edgar Canyon to Cherry Valley and Beaumont. In 1983, the District installed the 14-in Edgar Canyon Transmission Main which enabled larger quantities of water to be conveyed from Edgar Canyon to Cherry Valley and Beaumont. Since 1983 to 2015, a period of 32 years, the average amount pumped was 2,181 AFY. This is far more indicative of Edgar Canyon's ability to produce water.

Statistical information on the Edgar Canyon production for the period 1983 to 2015 is presented in Table 6-8. As can be seen in Table 6-8, Edgar Canyon Wells produce about 15% of the District's annual need.

[25] Beaumont Basin Watermaster, 2014 Annual Report (Draft), June 2015.

Table 6-7
(DWR Table 6-1) BCVWD Groundwater Pumping (2011 – 2015)

DWR Table 6-1 Retail: Groundwater Volume Pumped						
☐	Supplier does not pump groundwater. The supplier will not complete the table below.					
Groundwater Type *Drop Down List* *May use each category multiple times*	Location or Basin Name	2011	2012	2013	2014 (1)	2015 (1)
Add additional rows as needed						
Alluvial Basin	Little San Gorgonio Creek	2158	1990	1732	1325	1418
Alluvial Basin	Beaumont Basin	9431	10162	11097	10806	8833
	TOTAL	11,589	12,152	12,829	12,131	10,251
NOTES: Little San Gorgonio Creek, also known as Edgar Canyon, is mix of shallow aluvial deposits and fractured rock aquifer. (1) 2014 and 2015 extractions were low, partially due to larger canyon wells (Well No. 6 and Well No. 14) being out of service.						

In Table 6-8, the term "10th Percentile" means that 90 percent of the time the production was greater than the value shown. In other words, there would be only one year in ten that the production would be less than 1,295 AFY. It is important to point out in Table 6-9 that annual production (far right column) will not be the total of the Upper, Middle and Lower Canyon values (second and third columns) because the maximums and minimums, etc. may not have occurred simultaneously, i.e., in the same year.

The San Timoteo Watershed Management Authority (STWMA)[26], estimated the safe yield from Edgar Canyon to be 2,600 AFY.[27] Is consistent with the average amount of extractions shown in Table 6-8 from Edgar Canyon for the period 1983 –2015.

A water budget analysis in a report prepared for the SGPWA indicated the yield from Edgar Canyon was between 2,000 and 2,800 AFY. The SGPWA report stated that based on the 20-year period 1988-2008, when water levels were reported rising in Edgar Canyon, pumping averaged 2,900 AFY and suggests that the yield of Edgar Canyon may be in the range of 2,300 to 2,800 AFY. This also is consistent with both the District's data and that of STWMA.[28]

[26] The San Timoteo Watershed Management Authority (STWMA), was dissolved around the year 2011.

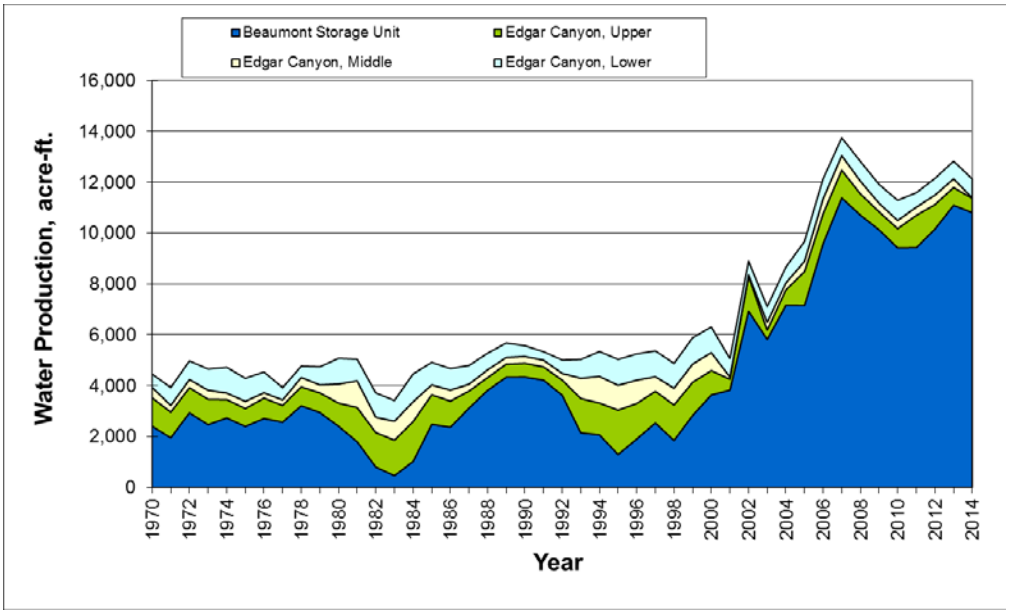

Figure 6-6
BCVWD Water Production History Since 1970

Based on production records for the 31-year period, 1983 – 2015, average and minimum production from Edgar Canyon was 2,181 AFY and 1,117 AFY respectively. Minimum yield is about 50% of the average. Refer to Table 6-8. **For planning purposes 2,200 and 1,110 AFY will be used for the average and minimum year respectively**.

Beaumont Basin Groundwater

Table 6-7, presented previously, showed BCVWD's pumping from the Beaumont Basin for 2011-2015. The water pumped includes imported water recharged and extracted the same year. (Some of imported water recharged was not extracted the same year and went into BCVWD's 80,000 acre-ft storage account monitored by Watermaster.)

In the Judgement, BCVWD and the other appropriators were not given any share of the safe yield; all of the safe yield was assigned to the Overlying Parties. However, during the 10 year period 2004 -2014, BCVWD and the appropriators were granted a portion of the "temporary surplus." The "temporary surplus" was designed to create a 160,000 acre-ft volume in the Beaumont Basin that could be used by the parties for conjunctive use and banking of imported water. This also gave time for the appropriators to construct facilities to use or recharge imported water to meet their needs after 2014.

Table 6-8
Groundwater Extraction Statistics from Edgar Canyon Wells
(1983 -2015)

Parameter	Annual Production Upper and Middle Canyon, acre-ft	Annual Production Lower Canyon, Acre-ft	Annual Production Acre-ft
Average	1,420	761	2,181
Maximum	2,720	1,095	3,738
Minimum	516	334	1,117
90th Percentile	2,268	1,017	3,230
10th percentile	704	541	1,295

Although the Basin safe yield was reserved for the overliers, if any overlier receives potable water or recycled water from any of the appropriators, according to the adjudication, the appropriator may pump the amount of water delivered to the overlier. Annually Watermaster makes an accounting of the unused overlier rights and distributes that amount to the appropriators in accordance with a predetermined share. (BCVWD's share is 42.51%.) In addition the Watermaster makes an accounting of the potable and recycled water supplied by an appropriator to an overlier. These two sources along with any imported water recharged go into the appropriator's storage account. Only stored water can be pumped. If an appropriator has insufficient stored water, Watermaster will assess the producer to pay for the purchase of imported water.

The safe yield of the Basin is subject to review every 10 years. It was reviewed in 2014 and a new safe yield of 6,700 AF was established by Watermaster in 2015.

BCVWD has 11 wells in the Beaumont Basin. The total pumping capacity is 17,425 gpm or 25.1 mgd, assuming the pumps operate 24 hours per day. Because of the large motors, these wells do not typically operate during the peak power periods. At 18-hr/day pumping, with all wells operating, the total pumping rate is 18.8 mgd. With the largest well out of service and 24 hr/day pumping the capacity is 13,425 gpm or 19.3 mgd; with 18 hours of pumping, the total pumping rate is 14.5 mgd.

The District's total well pumping capacity, Edgar Canyon plus Beaumont Basin Wells, with all wells operating 24 hr/day, is 27.3 mgd. With the largest well out of services (Well 29), the pumping capacity for 24-hr operation is 21.5 mgd

To put it in perspective, the year 2015 average and maximum day demands were 11.4 mgd and 15.3 mgd respectively. With all wells with standby power operating and assuming 24 hour/day pumping, (22.4 mgd capacity), the District can meet the maximum demand under extended

multi-day power outages even under maximum day demand. In fact, the District could withstand an extended multi-day power outage, with the largest well on standby power out of service under all but the highest demand conditions (16.6 mgd capacity) However as growth occurs in the service area, this ability will be impacted unless provisions are made to increase well capacity and standby power capacity.

With the Adjudication as described previously in this section, the amount of extractable groundwater, not including stored water, recharged imported SPW or captured stormwater, consists of:

- Reallocation of unused overlier pumping rights
- Credit for providing potable water or non-potable water delivered to an overlying party or an overlying party's land (termed "Forbearance Water")
- Return flow credits

A detailed analysis of the projected amounts available is presented in BCVWD's 2016 Potable Water Master Plan. The results of this analysis is summarized in Table 6-9.

Although the Adjudication is silent on this issue, Table 6-9 includes a proportionate reduction in the reallocation of unused Overlying Party pumping rights to account for the reduction in safe yield from 8,650 AFY to 6,700 AFY. This is a conservative approach.

The non-potable forbearance water in Table 6-9 does not include any non-potable (recycled) water supplied to Tukwet Canyon and Oak Valley Golf Courses. Based on month to month analysis, this would add 330 to 515 AFY forbearance water over time (year 2020 to year 2040).

Table 6-9
Summary of BCVWD Extractable Groundwater from Beaumont Basin
(without replacement and not including stored water)
(not including forbearance for non-potable water to Golf Course)

Item	2015	2020	2025	2030	2035	2040
Reallocated Unused Overlier Pumping Rights, AFY	1,490	1,040	920	800	750	750
Potable Forbearance Water, AFY	272	472	710	930	1,044	1,044
Non-Potable Forbearance Water, AFY	0	30	60	90	120	120
Return Flow Credits above Baseline, AFY	165	223	280	514	868	922
Total, AFY	1,927	1,765	1,970	2,334	2,782	2,836

Source: 2016 BCVWD Potable Water Master Plan Tables 5-4, 5-5, and 5-24

Surface Water

BCVWD does not use local surface water directly but does have two active surface water diversions in Edgar Canyon. These are on file with the State of California Division of Water Rights.

- Diversion Number S014351 located in the SE1/4 of NE1/4 of Section 2, T2S, R1W, SB&M and first used in 1907. This location is about 1,200 ft downstream of the USGS gauging station in Little San Gorgonio Creek, near the upper end of the District's property.
- Diversion Number S014352 located in the NW1/4 of SE1/4 or Section 22, T2S, R1W, SB&M and first used in 1894. This location is just upstream of the existing percolation ponds at the mouth of Edgar Canyon.

In the early years of the District, the upper diversion was used to provide domestic and irrigation supply. Water was diverted from Little San Gorgonio Creek and conveyed to sand and sediment removal structures and filter boxes in the Canyon and then piped down to consumers and orchards in Cherry Valley and Beaumont.

These diversions are used today to direct surface flows in Little San Gorgonio Creek into a series of percolation ponds in Edgar Canyon which then recharge the shallow aquifers to help supply the existing wells in Upper and Middle Edgar Canyon. BCVWD has been doing this since the late 1800s and has a pre-1914 water right to divert up to 3,000 miner's inch-hours (MIH) or approximately 43,440 AFY for domestic and irrigation uses[29]. However, BCVWD has never had a demand that requires such large quantities of water supply; and the watersheds may not be capable of supplying such quantities during an average year. The diversion right is not included in BCVWD's water supply calculations, but is needed to ensure adequate supply from the Edgar Canyon wells.

Storm Water

Storm water capture plays a significant role in BCVWD's local water resource supply development. Several projects are currently in operation:

- Diversions and percolation ponds in Upper and Middle Edgar Canyon described above. See Figure 6-7.
- Construction of desilting basins and percolation basins immediately upstream of the Lower San Gorgonio percolation ponds at the outlet of Edgar Canyon. See Figure 6-8.

[29] A miner's inch in Southern California is reported to be 0.02 cubic ft/second (cfs)

Figure 6-7
Percolation Ponds in Upper Edgar Canyon

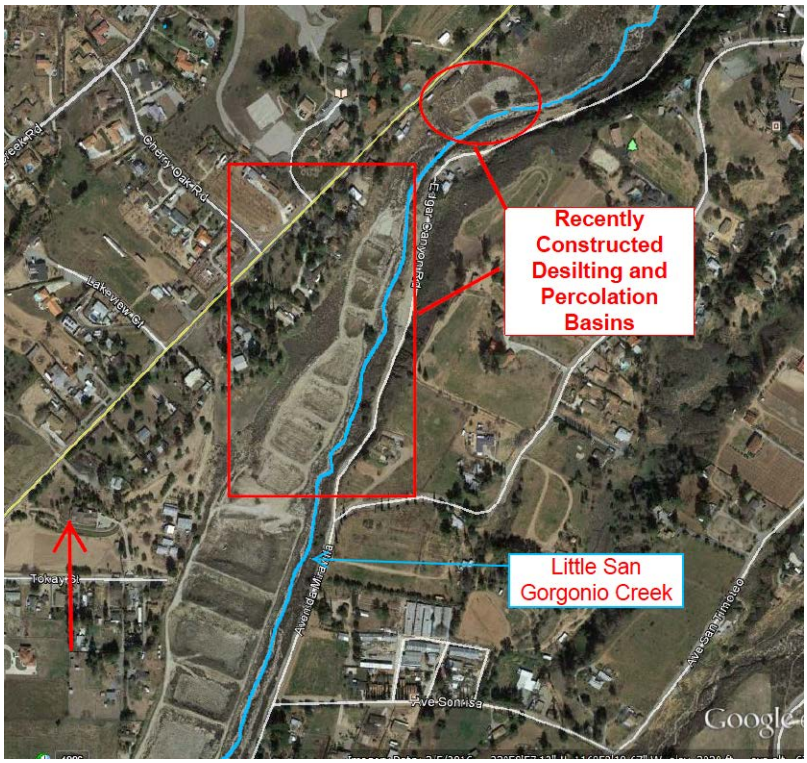

Figure 6-8
Recently Constructed Desilting and Recharge Basins
at the Mouth of Little San Gorgonio Creek (Edgar Canyon)

The diversions in Upper and Middle Edgar Canyon capture most of the storm flows and runoff that flows in the creek and diverts the flow to a series of percolation basins. The water is subsequently extracted by the adjacent wells.

On occasion there are very high flows which flow the entire length of Edgar Canyon. A portion of these flows can be captured in the new basins at the mouth of Edgar Canyon shown in Figure 6-10. In addition, BCVWD retains the right to use the older ponds, downstream of the new basins to capture flood water when they occur. During those times, the SGPWA would be precluded from percolating SPW.

Potential Storm Water Capture Projects

There were a number of projects which were explored in more detail in BCVWD's 2016 Potable Water Master Plan. These projects are listed in Table 6-11.

Edgar Canyon, Noble Creek and Marshall Creek

In BCVWD's 2013 UWMP Update, an estimate of the yield from the Edgar Canyon, Noble Creek and Marshall Creek Capture Projects was presented. No further work has been performed on these conceptual projects, so at this time the preliminary yield from the projects remains at 1,050 AFY.

Table 6-10
Potential Storm Water Capture Projects

Project	Brief Description
Soft plug in Noble Creek at BCVWD Groundwater Recharge Facility	Large flows which would bypass the spreading basins at the mouth of Edgar Canyon (Figure 6-10 above) could still be captured. Provide "soft plug" in lined portion of Noble Creek channel and divert flows into BCVWD's recharge facility. (Note that only extreme flows actually make it out of the canyon). Estimated Yield – 500 AFY.
Stormwater Capture Noble Creek	Noble Creek flows could be desilted on property owned by BCVWD (15.7 acres) along Noble Creek upstream of Noble St and west of Cherry Ave. Unfortunately this area is not over the Beaumont Basin, but the property could be used for desilting basins with the desilted water released back into Noble Cr. and recaptured at a soft plug in the lined channel and diverted into the District's recharge site. Estimated Yield = 400 AFY.
Marshall Creek s/o Elm to I-10	There is a significant amount of urban runoff from the developed area east of Beaumont Ave, between Oak Valley Parkway and Brookside Ave. which could be captured in the soft bottom of Marshall Creek using training dikes to prevent the water from going under the I-10 bridge. There is about 300 ac of urban drainage. Estimated Yield = 150 AFY.
Beaumont MDP Line 16	Approximately 517 acres of area could be intercepted by a storm drain along Grand Ave. and conveyed to the District's Recharge facility. This water is relatively free of sediments and runoff is generated with even the slightest amount of rainfall
Sundance Urban Runoff	Eighth St., Cherry Ave., and Starlight Ave. Basins capture runoff from the Sundance development. These basins capture runoff effectively, but percolation needs to be improved.

Grand Avenue and Sundance Urban Runoff Capture

The Sundance Development, a project with over 4,700 housing units, between Cherry Ave. and Highland Springs Rd and Brookside Ave. and Eighth Street has 3 detention/water quality basins to store and percolate runoff from the development. These include the Starlight, Eighth St., and Cherry Basins and are shown in Figure 6-9. Photos of captured runoff in the Sundance Basins are shown in Figure 6-10.

The location, drainage area and conceptual plan for the Beaumont MDP Line 16 Project is shown in Figure 6-11. This project will intercept runoff from this rural residential watershed in Cherry Valley and convey it to BCVWD's Groundwater Recharge facility. The Grand Avenue Storm Drain is a joint project with Riverside County Flood Control and Water Conservation District, the agency that is designing the project. The project is partially funded under 2015 Integrated Watershed Protection Program through the Santa Ana Watershed Project Authority. It should be operational before year 2018.

Figure 6-9
General Location of the Sundance Water Quality and Urban Runoff Capture Basins

Figure 6-10
Runoff Collected in Sundance Detention Basin

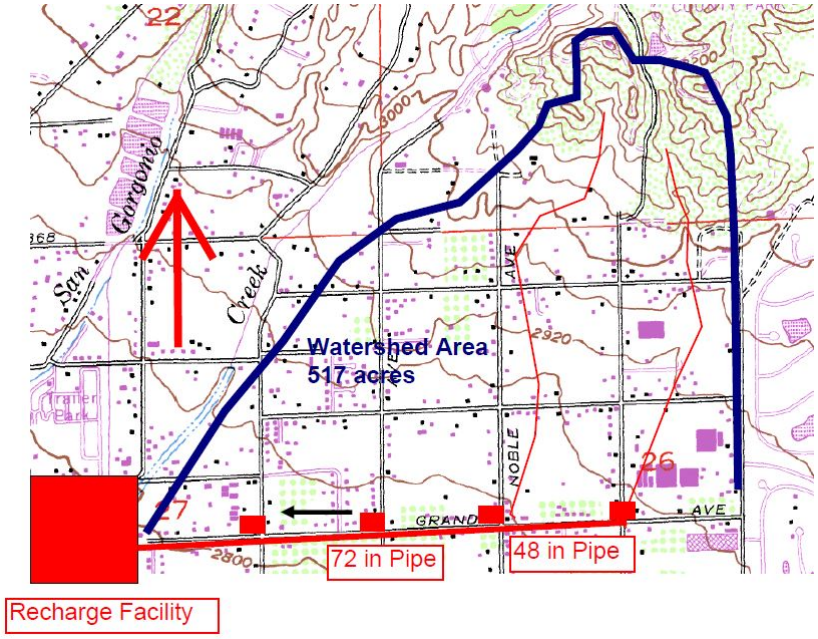

Figure 6-11
Beaumont MDP Line 16Watershed Area

Table 6-11 shows some information about the watershed and the detention basin volume.

A detailed analysis of the runoff potential from these projects was performed as part of the 2016 BCVWD Potable Water Master Plan. Daily Beaumont rainfall totals for the 77-year period January 1, 1929 through December 31, 2006 were used in the runoff analysis. Individual rainfall periods were identified and the runoff from each storm was determined using the Natural Resources Conservation Service (NRCS) Curve Number approach. Table 6-12 shows the amount of storm runoff that can actually be captured – close to 800 acre-ft annual average.

Table 6-11
Summary of the Urban Runoff Drainage Areas and Retention Basin Volumes

Facility	Drainage Area, acres	Basin Volume, acre-ft
Beaumont MDP Line 16	517	90[1]
Cherry Ave Basin	426	240
Eighth St. Basin	475	128
Starlight Basin	250	32

[1] Recharge during a multi-day storm even would add another 100 to 125 acre-ft

"Before and after" development calculations were made to determine "new water." From a water resources perspective, the Beaumont Basin Watermaster would likely not consider all of the captured storm water as "new water." "New water" is water which is developed over and above what would have occurred naturally, in an undeveloped condition.

Table 6-12
Urban Runoff Capture Summary

Facility	Estimated Captured Runoff, AFY	Percent of Storms Totally Captured	Total Average Annual Runoff, AFY, Based on 77 years of Record	Percent of All Possible Storm Water Captured
Beaumont MDP Line 16	200	98.5%	232	90.0%
Cherry Ave Basin	258	95.8%	276	93.4%
Eighth St Basin	237	94.6%	308	76.9%
Starlight Basin	89	89.2%	171	52%
Total	784			

Table 6-13 shows an estimate of "new water" from the projects – about 730 AFY.

Table 6-13
Estimate of "New Water" from Storm Water Capture

Facility	Estimated Captured Runoff, AFY	Runoff from Undeveloped Land		Estimated Amount of New Water, AFY
		3-in Total Storm Rainfall, AFY	4-in Total Storm Rainfall, AFY	
Beaumont MDP Line 16	200	41	75	172 to 192 (Use185)
Cherry Ave Basin	258	9	19	249 to 239 (Use 245
Eighth St Basin	237	10	21	226 to 216 (Use 220)
Starlight Basin	89	5	11	84 to 78 (use 80)
Total				730

Wastewater and Recycled Water

Recycled water use for non-potable purposes has a major role in BCVWD's water portfolio. BCVWD began planning the use of recycled water for landscape and golf course irrigation since the early 1990s with the development of a cooperative financing agreement to fund water supply infrastructure including recycled water. In November 1997, the City of Beaumont City Council adopted Ordinance 773 mandating the use of potable water for non-potable uses including cemeteries, golf courses, parks, street and highway landscaping, athletic fields, and other irrigation uses is a waste or an unreasonable use of water if recycled water is available. BCVWD's UWMPs dating to the 90s included plans and projections for the use of recycled water from the City of Beaumont. BCVWD continues in discussions with the City of Beaumont.

Recognizing that additional water may be needed than can be supplied by the City of Beaumont, BCVWD began discussions with YVWD around 2013. In June 2014, BCVWD prepared a Recycled Water Facilities Planning Report for a Recycled Water Supply Pipeline and Pump Station for a connection to YVWD's non-potable water system. The Facilities Planning report was approved by the SWRCB in August 2014. Since then discussions have move forward with YVWD

BCVWD's Existing Non-potable Water System

BCVWD has an extensive network of about 30 miles of non-potable transmission pipelines already constructed that can convey untreated SPW, groundwater, and recycled water. An extensive network of smaller distribution mains have been constructed by Tract developers to serve parks, medians, schools and common areas in their respective developments. The system includes a 2 million gallon non-potable water reservoir (2800 Zone Non-potable

Reservoir). There are about 300 existing landscape connections to the recycled water system receiving 1,650 acre-ft of water (year 2013 total). The existing recycled water system is currently pressurized with groundwater from Well 26 which has chromium levels above the CDPH levels. This is supplemented with potable water introduced into the non-potable water system through an air gap connection at the non-potable water storage tank (2800 Zone Non-potable Water Tank).

BCVWD's Non-potable Master Plan (under preparation) shows the system to have up to 5 pressures zones; 2370, 2520, 2600, 2800, and 3040. The 3040 Pressure Zone is not operational at the present time.

The Tournament Hills and Sun-Cal Fairway Canyon projects, south of I-10, have non-potable water distribution systems installed. This portion of the non-potable water system is isolated from and operates at a lower hydraulic grade line from the 2800 Non-potable Water Zone. This portion of non-potable water distribution system is currently supplied from the District's potable water system through interconnections having backflow prevention devices between the potable and non-potable water system. The non-potable water system was constructed from 2002 to the present using City of Beaumont Community Facilities District (CFD) bond funds, BCVWD funds derived from facilities (impact) fees collected from developers, BCVWD funding, and developer funding for the smaller distribution lines.

Recycled Water Coordination

> *CWC 10633*
>
> *The plan shall provide, to the extent available, information on recycled water and its potential for use as a water source in the service area of the urban water supplier. The preparation of the plan shall be coordinated with local water, wastewater, groundwater, and planning agencies that operate within the supplier's service area.*

Within BCVWD's service area, only the City of Beaumont provides wastewater collection, treatment and disposal. Except for the Highland Springs Village area of Cherry Valley, which is served by the City of Beaumont, the unincorporated community of Cherry Valley relies on on-site disposal systems.

YVWD to the west and the City of Banning to the east, provide wastewater collection, treatment and disposal of wastewater generated in their respective service areas. YVWD has a recently expanded and upgraded advanced wastewater treatment facility using UV disinfection and reverse osmosis. The City of Banning has plans prepared to upgrade their existing treatment plant using a membrane bioreactor. BCVWD has been in discussions with YVWD about obtaining supplemental non-potable water.

Wastewater Collection, Treatment, and Disposal

CWC 10633

(Describe) the wastewater collection and treatment systems in the supplier's service area, including a quantification of the amount of wastewater collected and treated and the methods of wastewater disposal.

CWC 10633

(Describe) the quantity of treated wastewater that meets recycled water standards, is being discharged, and is otherwise available for use in a recycled water project.

There are three existing wastewater reclamation plants in the San Gorgonio Pass Area. Only the City of Beaumont Treatment Plant No. 1 is within BCVWD's service area.

- City of Beaumont Treatment Plant No. 1
- YVWD Henry Wochholz Water Reclamation Plant
- City of Banning Wastewater Treatment Facility.

City of Beaumont

The City of Beaumont provides wastewater collection, treatment and disposal for wastewater generated within the City plus the Highland Springs area of Cherry Valley. Wastewater generally flows by gravity to the City's wastewater treatment plant; however, there are 9 wastewater lift and pumping stations in the southeastern and western portions of the City that pump wastewater collected in these areas and to the treatment plant or collection system leading to the treatment plant.

The City of Beaumont's Treatment Plant No. 1 (below) has a current permitted capacity of 4 million gallons/day (mgd). The treatment facility is located on Fourth St., ease of Viele Ave.

The treatment facility provides secondary treatment using the Biolac® activated sludge process, tertiary filtration and ultraviolet disinfection and operates under permit R8-2015-0026 NPDES CA 0105376. Waste biosolids from the secondary process is centrifuged and hauled offsite for disposal.

From January 2014 through March 2016, the plant flow monthly averages ranged from 2.98 to 3.22 mgd. A portion of the effluent is currently discharged to Cooper's Creek, (DP-001), a tributary of San Timoteo Creek which is a tributary of the Santa Ana River; a portion of the effluent is discharged into an unnamed creek at DP-007 located approximately 1,300 ft northwesterly along the railroad tracks from Veile Ave. As part of

the environmental permitting[30] for the recycled water system, the US Fish and Wildlife Service required that 1.8 mgd of effluent continue to be discharged to Cooper's Creek for maintenance of habitat[31]. The current operating permit allows for use of the effluent on the Tukwet Canyon and Oak Valley Golf Courses and landscape irrigation within the BCVWD service area.

In a 2007 letter from CDPH (now DDW) to the City of Beaumont, the City was directed to upgrade the facility to meet Title 22 requirements for unrestricted use and perform validation testing on the UV disinfection system. In July 2016, the City completed a Title 22 Engineering Report[32] which included the UV Validation Testing which was accepted by the State with conditions. Some upgrades to the tertiary system were identified.

BCVWD continues to work with the City relative to recycled water. The City of Beaumont's effluent has a TDS concentration of about 400 mg/L which is in excess of the Regional Board's Maximum Benefit Water Quality Objectives for the Beaumont Basin. The recycled water from the City will have to be treated and/or "blended" with imported water or other waters to achieve the Maximum Benefit Water Quality Objectives.

The discharge limits in the current operating permit in terms of Total Dissolved Solids (TDS) and Total Inorganic Nitrogen (TIN) are shown in Table 6-14.

Table 6-14
City of Beaumont Wastewater Discharge Requirement for TDS and TIN

Parameter	DP-001 Cooper's Creek		DP-007 Unnamed Creek	Recycled Water
	Discharge up to 1.8 mgd	Discharge over 1.8 mgd	All Discharges	All Discharges
TDS	400 mg/L	300 mg/L	230 mg/L	330 mg/L
TIN	6 mg/L	3.6 mg/L	2 mg/L	No Limit

As stated above the TDS of the City's effluent discharge is 400 mg/L. This is good quality recycled water; however, it does not meet the water quality requirements in the permit for

[30] Initial Study/Mitigated Negative Declaration Beaumont Cherry Valley Water District Recycled Water System Project, SCH 2007081127, June 2007.

[31] Letter dated February 29, 2008, Karen Goebel USFWS to Michelle Jones SWRCB, Informal Consultation for Beaumont Cherry Valley Water District Recycled Water System, SRF Loan C-06-5157-110.

[32] City of Beaumont Wastewater Treatment Plant (2016). Title 22 Engineering Report and Validation Testing, Aqua Engineering and Albert A. Webb and Associates, July.

specific discharge locations. As a result the City will need to provide desalination to at least a portion of the flow, (reverse osmosis treatment), to meet these requirements.

According to the current permit, the City must start construction of the desalination facilities by September 1, 2018 and be in compliance with the TDS and TIN limits by March 1, 2020; any discharges of TDS or TIN in excess of the limits above shall be completely offset by January 1, 2025. This is a very aggressive schedule.

Table 6-15 shows the amount of recycled water which is available from the City of Beaumont's wastewater treatment facility over time. The table shows the deduction of 1.8 mgd for environmental habitat mitigation, and roughly 10% reduction for water used on the plant site for washdown and irrigation and water contained in the dewatered biosolids hauled offsite.

The population for the City of Beaumont is based on a less aggressive population growth than that shown in Table 3-6 and Table 3-8 presented previously. Using a slower population growth will avoid over estimating the amount of recycled water available and will be conservative from a water supply standpoint.

Table 6-15
Recycled Water Available from City of Beaumont's WWTP

Year	2015	2020	2025	2030	2035	2040
City of Beaumont Population[1]	41,780	43,762	49,014	54,895	61,483	68,000
Wastewater Generation Flow Rate, gpcd	75	75	75	75	75	75
Wastewater Flow, mgd	3.0	3.28	3.68	4.12	4.61	5.10
Environmental Mitigation Flow, mgd	1.8	1.8	1.8	1.8	1.8	1.8
Wastewater Available for Recycling, mgd	1.2	1.48	1.88	2.32	2.81	3.3
Estimated amount which can be recycled, mgd	1.07	1.33	1.69	2.09	2.53	3.0
Estimated amount which can be recycled, AFY	1,194	1,494	1,892	2,336	2,835	3,360
Estimated amount which can be recycled, AF/month	100	125	158	195	235	280

[1] The City of Beaumont population growth is less aggressive than shown in Tables in Section 3 to be conservative in the amount of recycled water available.

YVWD

The YVWD provides wastewater collection, treatment, disposal and recycled water to the City of Yucaipa and City of Calimesa and surrounding areas. The YVWD also provides potable water service.

The YVWD Wochholz Regional Water Recycling Facility (WRWRF) (to the right) is a tertiary facility with a current flow of 4.5 mgd and a design and permitted capacity of 8 mgd. The facility provides screening, grit removal, primary sedimentation, flow equalization, nitrogen removal using the Modified Ludzack Ettinger (MLE) activated sludge process. The activated sludge process uses an integrated fixed film system (IFAS). Following activated sludge, the effluent passes through microfiltration membranes. A portion of the effluent from the microfiltration process passes through reverse osmosis. All of the effluent is disinfected with UV irradiation and flows to a reclaimed water storage reservoir on site. For there the recycled water is pumped to YVWD non-potable water system. Primary sludge and waste secondary sludge is anaerobically digested and dewatered using belt presses. The dewatered biosolids are taken by a local landscaper, composted, and recycled.

The plant is relatively new; a 2.5 mgd reverse osmosis treatment process started operation in 2014. YVWD constructed a 15-mile long brine line from the WRWRF to the terminus of the Inland Empire Brine Line (IEBL) near the I-215/I-10 Interchange in San Bernardino. The IEBL joins the Santa Ana River Interceptor (SARI) at the Orange County line below Prado Dam. YVWD will be discharging effluent with a TDS of 330 mg/L or less, which meets the Regional Board's Maximum Benefit Water Quality Objectives for the Beaumont Basin.

The WRWRF operates under permit R8-2015-0027 NPDES CA010569 and discharges into Reach 3 of San Timoteo Creek. The WRWRF is located west of I-10, between County Line Road and Live Oak Canyon Road in San Bernardino County.

BCVWD is in discussions with YVWD to acquire a recycled (non-potable) water supply. YVWD will be extending a recycled water pipeline about 5 miles to serve a new residential community in Calimesa called Summerwind. This is near the intersection of I-10 and Cherry Valley Blvd where it would connect into BCVWD's master planned 2600 Zone non-potable water pressure system. YVWD could serve BCVWD's 2600, 2520, and 2370 pressure zones directly. A new booster pump station would be constructed to boost the water from the 2600 Zone into BCVWD's 2800 Zone non-potable water system. A facilities plan has been prepared by BCVWD for the connection. The plan has been approved by the State Water Resources Control Board and the District could apply for funding under the Water Reclamation Bond Program/State Revolving Fund program.

In addition to providing recycled water from the WRWRF, YVWD has spent microfiltration/nanofiltration washwater from YVWD's surface water treatment facility available during the summer to supplement the recycled water. Table 6-16 shows the amount of recycled water and filter washwater available each month.

Table 6-16
Recycled Water Available from YVWD 2015

Month	Jan	Feb	Mar	Apr	May	June
Recycled Water, AF	126	83	15	9	77	0
Spent Filter Washwater, AF	0	0	0	0	0	93
Total, AF	126	83	15	9	77	93

Month	July	Aug	Sep	Oct	Nov	Dec	Totals
Recycled Water, AF	0	0	0	49	74	144	577
Spent Filter Washwater, AF	93	93	93	93	0	0	467
Total, AF	93	93	93	142	74	144	1044

Table 6-16 is based on information provided by YVWD.[33] For purposes of this UWMP Update, it is assumed this quantity will be available throughout the planning period to year 2040. This is believed to be very conservative since YWVD will likely be experiences increases in wastewater flow over time. YVWD will be providing recycled water at a TDS concentration of 330 mg/L or less to meet the Beaumont Management Zone's Maximum Benefit Objective.

City of Banning

The City of Banning provides wastewater collection, treatment and disposal of wastewater collected in the City of Banning. The City also provides potable water service and is in the process of constructing a non-potable water supply system.

The City of Banning has a secondary treatment facility that percolates effluent into the alluvium along Smith Creek southeast of the City under a permit from the Colorado River Regional Water Quality Control Board. The City has begun construction of a recycled (non-potable) water line from Sun Lakes Golf Course east to the wastewater treatment plant. The City may pump percolated wastewater, (groundwater), using a retrofitted well at the wastewater treatment plant, into the pipeline to serve the golf course in the future. The City has plans to upgrade the wastewater treatment plant to a modern membrane bioreactor facility to provide recycled water for the future. It is possible that some surplus recycled water from the City of Banning could be

[33] Email YVWD J. Ares to BCVWD D. Jaggers, 3/18/2016. Deemed conservative; constrained by need to maintain habitat in San Timoteo Creek.

introduced into the BCVWD recycled water system at some point in the distant future. It is not under consideration at this time however.

Community of Cherry Valley

The community of Cherry Valley relies exclusively on on-site systems for wastewater treatment except for the Highland Springs Village which connected to the City of Beaumont's sewerage system. Currently there is about 0.5 mgd of wastewater generated in Cherry Valley; this volume of wastewater will grow to about 0.8 mgd by 2040.

In July 2007 BCVWD prepared a Facilities Planning Study to provide wastewater collection and treatment to a portion of Cherry Valley known as the Cherry Valley Community of Interest CVCOI. The CVCOI was the area generally north of Brookside Avenue, between Bellflower St. and Nancy St. It included the Cherry Oaks and Bonita Vista Areas. Providing sewers would minimize the nitrate contribution to the Beaumont Groundwater Basin and provide a source of recycled water which could be beneficially used. BCVWD would be the agency operating the collection system and treating the wastewater in either a separate treatment plant or through a contract with the City of Beaumont or other agency for treatment.

Although BCVWD had the power to provide wastewater collection and treatment under the Irrigation District Act under which it was formed, this power was never exercised and LAFCO required a vote of the District residents to exercise the power. The ballot measure was defeated in September 2007 and as a result BCVWD does not currently have sewering authority.

It is unlikely that Cherry Valley will have a sewer collection system within the next 20 years and so should not be considered as being a source of recycled water.

Summary

Table 6-17 (DWR Table 6-2) shows a summary of the wastewater collected within BCVWD's service area in 2015. Table 6-18 (DWR Table 6-3) shows the wastewater treatment and discharge within BCVWD's service area in 2015.

Recycled Water System

CWC 10633

(c) (Describe) the recycled water currently being used in the supplier's service area, including, but not limited to, the type, place, and quantity of use.

BCVWD has an extensive network of about 40 miles of transmission and main line, non-potable (recycled water) pipelines already constructed. These are shown in solid "purple" in Figure 6-14, which also shows BCVWD's non-potable water service area. The system includes a 2 million gallon non-potable water reservoir. There are about 300 existing landscape connections to the recycled water system receiving 1,650 acre-ft of water (year 2013 total) It is believed that the current usage is slightly less due to the drought restriction in effect the last few years. The non-potable water system was constructed from 2002 to the present.

City of Beaumont	R-003	BCVWD RW	8 330101001	Other	No	Tertiary	0	0	0	0
						Total, mgd	3	3	0	0
NOTES: City of Beaumont claims that a portion of the effluent discharged at DP-001 and DP-007 incidently recharge the Beaumont Groundwater Basin. Watermaster is still awaiting proof. The effluent does not comply with planned groundwater recharge regulations.										

The non-potable water system consists of 5 pressure zones: 2370, 2520, 2600, 2800, and 3040. The 3040 Non-potable Zone will likely not be operational for a number of years yet as most of the current demand is in the other zones. The 2370, 2520 and 2600 Non-potable Zones are south of I-10. These pressure zones are supplied with potable water from the 2600 Potable Water Zone through a series of interconnections. These zones have a current non-potable water demand of about 286 AFY.

The 2800 Non-potable Zone is supplied from the 2 MG 2800 Zone Non-potable Water Tank located at BCVWD's groundwater recharge site. The 2800 Non-potable Zone has a current average demand of about 1,365 AFY. This is by far the highest demand zone. Since September 2015 the 2800 Non-potable Zone has been supplied with water (non-potable) from Well 26 supplemented with potable water through an air gap at the 2800 Zone Tank. The use of Well 26 is temporary until recycled water becomes available.

The non-potable water system is designed so that any surplus recycled/non-potable water could overflow into the percolation basins at BCVWD's groundwater recharge facility and recharge the BSU. However, additional treatment and monitoring would likely be required and recharge with recycled water is not planned for a number of years yet. The existing pipeline from the EBX brings State Project Water to the site to blend with and supplement the recycled water to meet the Regional Board's Maximum Benefit, 10-year average TDS requirement of 330 mg/L in the non-potable water system. Figure 6-14 shows the location of an anticipated connection to the YVWD non-potable system, described below, as well as the City of Beaumont Wastewater Treatment Plant. A pump station and reservoir would need to be constructed at the City of

Beaumont Wastewater Treatment Plant site to boost water into the 2800 Zone non-potable system.

Recycled Water Beneficial Uses

CWC 10633

(Describe and quantify) the potential uses of recycled water, including, but not limited to, agricultural irrigation, landscape irrigation, wildlife habitat enhancement, wetlands, industrial reuse, groundwater recharge, indirect potable reuse, and other appropriate uses, and a determination with regard to the technical and economic feasibility of serving those uses.

CWC 10633

. (Describe) the projected use of recycled water within the supplier's service area at the end of 5, 10, 15, and 20 years and a description of the actual use of recycled water in comparison to uses previously projected pursuant to this subdivision

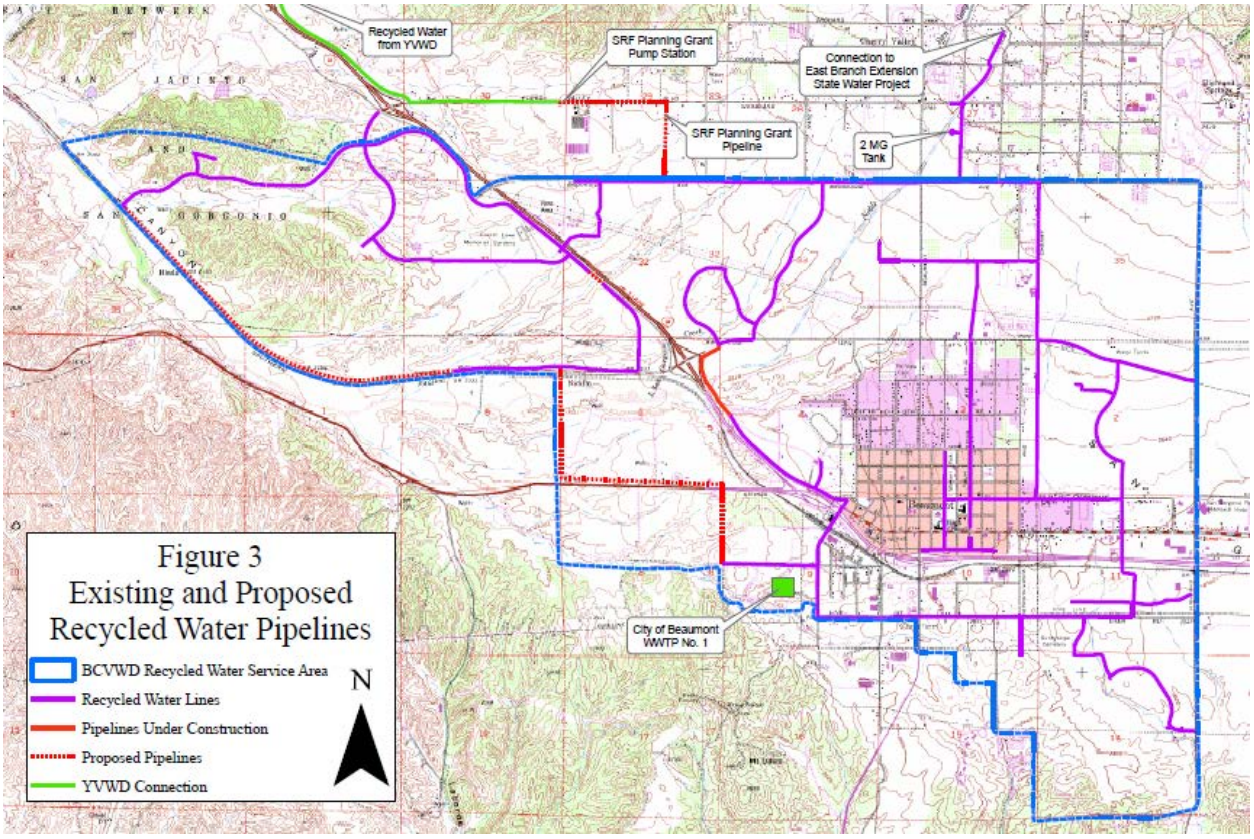

Figure 6-12
BCVWD Non-potable Water Transmission System

Source: Plan of Study, Pump Station and Recycled Water Pipeline to Use Recycled Water from YVWD within the BCVWD Service Area, May, 2010

BCVWD's non-potable (recycled) water system principal beneficial use is landscape irrigation of parks, playgrounds, common areas, street and highway medians and athletic complexes in residential, commercial and industrial areas. As new developments occurred, their landscape facilities were connected (separate metered connections) to the non-potable water system.

Once recycled water is available additional existing facilities (schools, parks, cemeteries, etc.) will be added to the system. There is one concrete ready mix supplier that is close to the non-potable water system. BCVWD has an agreement with the company to connect to the non-potable water system when recycled water is available.

Table 6-19 and Table 6-20 (DWR Tables 6-4A) for YVWD Recycled Water and City of Beaumont Recycled Water respectively show the projected quantities of recycled water for various beneficial uses from year 2015 to 2040. The quantities were determined from month-to-month analysis of recycled water supply and demand for each of the 5-year periods.

		Total AFY:	0	1,042	1,043	1,043	1,044	1,043
**IPR - Indirect Potable Reuse*								
NOTES: YVWD must provide some amount of effluent discharge to maintain habitat. Per DWR instructions this is not considered recycled water beneficial use. YVWD provides membrane treatment using reverse osmosis. Supply is based on correspondence from YVWD and is assume to not change over time to be conservative. Supply includes some filter washwater during summer months.								

Surplus recycled water is available during the winter and early spring months. Tukwet Canyon Golf Course is in the 2600 Zone and could be served recycled water as soon as the connection with YVWD is completed. The Tukwet Canyon golf course can be served directly from the YVWD connection through BCVWD's system. Oak Valley Golf Course is in the 2800 Non-potable Water Zone and recycled water from either YVWD or City of Beaumont would have to be boosted into the 2800 Zone to serve this golf course. Alternatively untreated SPW could be introduced into the 2800 Zone without boosting. Both Tukwet Canyon and Oak Valley Golf Courses are overlying parties in the Beaumont Basin Adjudication and have their own wells. BCVWD has existing piping and turnouts on the non-potable water system to supply both of the golf courses.

The golf courses could take recycled water during the winter and early spring and "rest" their wells. As their water demand increases during the late spring, summer and early fall, they would use their own wells for supply. The recycled water would then be used to supply

BCVWD's routine landscape demands. The benefit to BCVWD is Watermaster considers the recycled water provided to an overlying party as forbearance water and credit it to BCVWD's storage account.

Table 6-20
(DWR Table 6-4B) Current and Projected Recycled Water Direct Beneficial Uses within Service Area – City of Beaumont Recycled Water

Table 6-4 B Retail: Current and Projected Recycled Water Direct Beneficial Uses Within Service Area								
☐	Recycled water is not used and is not planned for use within the service area of the supplier. The supplier will not complete the table below.							
Name of Agency Producing (Treating) the Recycled Water:		City of Beaumont						
Name of Agency Operating the Recycled Water Distribution System:		Beaumont Cherry Valley Water District						
Supplemental Water Added in 2015		No recycled water used in 2015						
Source of 2015 Supplemental Water		No recycled water used in 2015

Other *(Provide General Description)*	none							
		Total:	0	1,154	1,482	1,849	2,194	2,536
*IPR - Indirect Potable Reuse								
NOTES: City of Beaumont is required to discharge 1.8 mgd (2,016 AFY) to maintain habitat in Cooper's Creek. Per DWR this is not considered a beneficial use. Recycled water for GW recharge (IPR) assumes 80% recovery. Total does not reflect advance treated recycled water recharged to Beaumont Basin since this is not a demand, but rather a water supply. (Year 2025 -- 418 AF, Year 2030 -- 491 AFY, Year 2035 -- 646 AF, Year 2040 -- 827 AF)								

BCVWD has determined there will be surplus non-potable water available even after supplying Tukwet Canyon and Oak Valley Golf Courses. This amounts to about 400 AFY initially and grows to about 800 AFY over time. This water could be advance treated and recharged in BCVWD's groundwater recharge facility as indirect potable water reuse. See Table 6-20. Watermaster would credit this recharged, advance treated water, to BCVWD.

Planned vs. Actual Use of Recycled Water

> *CWC 10633*
>
> *(e) (Provide) a description of the actual use of recycled water in comparison to uses previously projected pursuant to this subdivision.*

BCVWD last updated their UWMP in 2013. In 2013 it was envisioned the recycled water connection to the City of Yucaipa would be completed by sometime in 2015. See Table 6-21. This did not occur and so no recycled water could be delivered. However, in late 2015, BCVWD connected Well 26 to the non-potable water system and introduced 514 AF of non-potable well water into the non-potable system. This is continuing at least temporarily until recycled water can be secured from either YVWD or City of Beaumont or both.

Table 6-21
(DWR Table 6-5) 2013 UWMP Recycled Water Use Projection Compared to 2015 Actual

DWR Table 6-5 Retail: 2013 UWMP Recycled Water Use Projection Compared to 2015 Actual			
☐	Recycled water was not used in 2010 nor projected for use in 2015. The supplier will not complete the table below.		
Use Type		**2013 Projection for 2015, AFY**	**2015 Actual Use, AFY**
Agricultural irrigation

Groundwater recharge (IPR)			
Surface water augmentation (IPR)			
Direct potable reuse			
Other	*Type of Use*		
Total AFY		1,500	0
NOTES: City of Beaumont is rquired to discharge 1.8 mgd (2,000 AFY) to maintain habitat in Cooper's Creek. Per DWR instructions, this is not considered a beneficial use.			

Actions to Encourage and Optimize Future Recycled Water Use

CWC 10633

(Describe the) actions, including financial incentives, which may be taken to encourage the use of recycled water, and the projected results of these actions in terms of acre-feet of recycled water used per year.

CWC 10633

(Provide a) plan for optimizing the use of recycled water in the supplier's service area, including actions to facilitate the installation of dual distribution systems, to promote recirculating uses, to facilitate the increased use of treated wastewater that meets recycled water standards, and to overcome any obstacles to achieving that increased use.

Existing Requirements

BCVWD's Rules and Regulations §4-1.1 require each applicant for water service to prepare a written application including the legal description of the parcel, water use, e.g., domestic, irrigation, commercial, etc., and the meter size desired. Commercial and industrial applicants will need to submit the volumes of water needed. For commercial and industrial applicants, the District then determines the feasibility for recycled water. The District applies this to schools also.

BCVWD would prepare a “Plan of Service” to document the facilities that are needed to be constructed. The Plan of Service will state if connection to the recycled water system is required and what recycled water facilities are needed to be installed with the development. Generally recycled water facilities would be required if there were significant landscaped areas such as parks, schools or common areas and the project was in the recycled water service area. If annexation to the District is required, the Plan of Service is also submitted to LAFCO.

If the water service is approved by the Board of Directors, prior to construction, the developer and the District enter into a “Water Main Extension and Facilities Construction Agreement.” This is a very detailed description of the infrastructure needed and the costs, reimbursements and other conditions. If connection to the recycled water system is required, it is formalized in the Main Extension Agreement. It is through this process that the current system has been constructed and landscaped areas connected. This will continue for future development in the District.

The City of Beaumont has Ordinances requiring the use of recycled water when available:

- 772 -- Requiring Conservation of Water in Accordance with the Adopted Beaumont Cherry Valley Water District Urban Water Plan and Recycled Water Master Plan
- 773 -- Requiring use of Recycled or Reclaimed Water in Accordance with State Law
- 775 -- Establishing Service Charges and Fees for Recycled or Reclaimed Water in the City of Beaumont and the City Sphere of Influence

The City of Beaumont Municipal Code, Title 17, §17.06.030 D. b. 11 and §17.06.030 D. c. 5 , have specific requirements to use non-potable and recycled water for landscaping when available. Riverside County Ordinance 859.2 has similar requirements.

Methods to Expand Use of Recycled Water

BCVWD is fortunate to have a non-potable water system already installed with about 300 landscape connections, operating with non-potable well water supplemented with potable water. This system is ready to convert to recycled water when available. There is no need to “market” the use of recycled water. Future developments within the City of Beaumont will be connecting to the existing system based on the Plan of Study for the specific project. These will be new connections for new landscaped areas. Existing ordinances and Rules and Regulations already require this.

Table 6-22 contains a list of existing facilities which could potentially be connected to the BCVWD non-potable water system. Many of these are in close proximity to the existing non-potable water pipelines but BCVWD does not want to connect them until more non-potable (recycled) water is available. Currently the demand for non-potable water exceeds the supply and requires potable water make-up to the system.

Table 6-22
Potential Future Service Connections to Non-potable Water System

Facility	Estimated Amount of Recycled Water, AFY	Estimated Year of Connection
Beaumont High School (new)	99	2020
Beaumont Adult School & San Gorgonio Middle School	50	2025
Noble Creek Park	100	2025
Glenview High School	8	2025
Wellwood Elementary School	4	2025
Rangel Park	5	2025
Mountain View Cemetery	37	2025
Sunnyslope Cemetery	On private well	--
Eighth St & Elm Ave Triangle Park	2	2025
Rancho Ready Mix	20	2020
Total	325	

Tukwet Canyon and Oak Valley Golf Courses have not been included in Table 6-22. They are already included in the non-potable water demand forecast tables (Tables 6-19 and 6-20).

Table 6-23 (DWR Table 6-6) lists several projects to expand future recycled water use. Although the current non-potable water demand is about 1,600 AFY and will increase when the facilities in Table 6-22 are connected, additional non-potable water supply is needed to meet peak demands. Furthermore, non-potable water demand will increase as major developments continue to be constructed within BCVWD's service area. These developments are residential, for the most part, and will include park and school facilities, common areas, club houses, etc. which will be connected to the non-potable water system. These will occur and BCVWD will need to increase the supply of non-potable water.

The projects listed in Table 6-23 and will increase the supply by about 3,300 AFY initially. The amount from the City of Beaumont and YVWD connections will likely increase over time as more homes are connected to the wastewater system.

Desalinated Water Opportunities

CWC 10631

(h) Describe the opportunities for development of desalinated water, including, but not limited to, ocean water, brackish water, and groundwater, as a long-term supply.

As stated above there are opportunities to participate in desalting projects particularly for groundwater in other regions and exchange the water for State Project Water. However,

installing desalting facilities within the Beaumont Basin would not be very practical since the existing groundwater water quality is excellent. The TDS is only about 250-275 mg/L. Generally to make desalting practical, the TDS should be in the range of 1500 mg/L or greater. It is probable that desalting will be required on the recycled water available from the City of Beaumont to conform to the maximum benefit commitments. But this would only be partial demineralization to reduce the TDS to the maximum benefit objective of 330 mg/L.

Table 6-23
(DWR Table 6-6) Methods to Expand Future Recycled Water Use

DWR Table 6-6 Retail: Methods to Expand Future Recycled Water Use			
☐	Supplier does not plan to expand recycled water use in the future. Supplier will not complete the table below but will provide narrative explanation.		
	Provide page location of narrative in UWMP		
Name of Action	Description	Planned Implementation Year	Expected Increase in Recycled Water Use, AFY
Add additional rows as needed			
Const. YVWD Connection	Construct connection to YVWD non-potable water system including pumping station	2018	1,043
Const. City of Beaumont Connection	Construct storage and pumping station at City Treatment Plant	2020	1,154
Edgar Canyon Nitrate Wells	Install extraction wells at mouth of Edgar Canyon to extract high nitrate groundwater for non-potable water system	2030	300
San Timoteo Groundwater Capture	Install extraction wells in San Timoteo Canyon to extract wastewater which percolates from 1.8 mgd habitat mitigation flow.	2030	800
		Total AFY	3,297
NOTES: These projects will increase the non-potable water supply which allows BCVWD to serve more non-potable water.			

Exchanges or Transfers

CWC10631

(d) Describe the opportunities for exchanges or transfers of water on a short-term or long-term basis.

Transfers from South Mesa Water Company

BCVWD had an agreement with South Mesa Water Company (SMWC) to transfer unused rights from SMWC to BCVWD's groundwater storage account in the Beaumont Basin. The transfers

first began in 2007 and totaled 13,000 AF. During the period 1994 through 2014, the Beaumont Basin appropriators had access to a temporary surplus, established through the Adjudication to create storage space in the basin for conjunctive use and water banking. During this time, SMWC had excess water in storage and did not need that water to meet its normal demands. They transferred this water to BCVWD to allow BCVWD to build up its own storage account. After 2014, the temporary surplus is not available. As a result, SMWC will likely retain their stored water to meet future demands and will likely not make any further transfers.

Participation in Other Agency Water Supply Projects

BCVWD could participate in a joint project with another Southern California water agency. These projects could include groundwater treatment and desalination.

Many of the groundwater basins in Southern California are impacted by excessive nitrates, high total dissolved solids, and, in some cases volatile organic chemicals (VOCs) and perchlorate. There are a number of agencies constructing or planning to construct desalters and VOC, nitrate and perchlorate removal facilities in the area including the Santa Ana Watershed Project Authority, the Chino Basin Desalting Authority, Eastern Municipal Water District and others. BCVWD could participate in one or more of these projects in exchange for State Project Water. BCVWD understands that they will need to work with the Pass Agency and others to work out the arrangements to bring this exchange about. BCVWD understands there could be transportation (wheeling) charges imposed.

BCVWD sees transfers and exchanges as very viable solution to providing long term water supplies.

Emergency Interties

BCVWD already has a 12-in diameter emergency intertie with the City of Banning at Highland Springs Ave. and Sun Lakes Blvd. (First St.) since the 1990s. The City of Banning's water system pressure zones closely match BCVWD's and mutual exchanges are possible.

The City of Banning also has joint ownership, with BCVWD, in 3 large capacity wells in BCVWD's service area. There are also several large pipeline "stub outs" from BCVWD's potable water system across Highland Springs Ave, to the City of Banning. These "stub outs" will be extended through the Butterfield Ranch development to interconnect with Banning's potable water system. This will occur when Butterfield Ranch develops. These interconnections allow Banning to recharge imported SPW at BCVWD's ground water recharge facility and, using the joint wells and the interconnections, extract that water when needed, and convey it to Banning's water system for use.

Future Water Projects

> *CWC 10631*
>
> *(g) …The urban water supplier shall include a detailed description of expected future projects and programs…that the urban water supplier may implement to increase the amount of the water supply available to the urban water supplier in average, single-dry, and multiple-dry water years. The description shall identify specific projects and include a description of the increase in water supply that is expected to be available from each project. The description shall include an estimate with regard to the implementation timeline for each project or program.*

Table 6-24 (DWR Table 6-7) presents a list of potential future projects which BCVWD could construct to increase the available water supply.

The Beaumont MDP Line 16 Project is already in the preliminary design phase with work being done by the Riverside County Flood Control and Water Conservation District. This is funded under a DWR grant through SAWPA. BCVWD and YVWD are in discussions on the non-potable water connection with YVWD. BCVWD completed a Facilities Planning report in 2014 for the project which was approved by the SWRCB for potential funding.

These projects, when all are implemented, will yield about 3,900 AFY initially and about 6,100 AFY by year 2040. The large growth is due to increases in recycled water from the City of Beaumont as a result of development and population growth in the City of Beaumont.

Table 6-25, (DWR Table 6-8), summarizes BCVWD's water supply for the year 2015.

Summary of Existing and Planned Sources of Water

> *CWC 10631*
>
> *(b) Identify and quantify, to the extent practicable, the existing and planned sources of water available to the supplier over the same five-year increments described in subdivision 10631(a).*
>
> *(4) (Provide a) detailed description and analysis of the amount and location of groundwater that is projected to be pumped by the urban water supplier. The description and analysis shall be based on information that is reasonably available, including, but not limited to, historic use records.*

Table 6-26, (DWR Table 6-6), summarizes BCVWD's projected water supply for the years 2020, 2025, 2030, 2035 and 2040.

Table 6-24
(DWR Table 6-7) Expected Future Water Supply Projects or Programs

DWR Table 6-7 Retail: Expected Future Water Supply Projects or Programs						
☐	No expected future water supply projects or programs that provide a quantifiable increase to the agency's water supply. Supplier will not complete the table below.					
☐	Some or all of the supplier's future water supply projects or programs are not compatible with this table and are described in a narrative format.					
	Provide page location of narrative in the UWMP					
Name of Future Projects or Programs	Joint Project with other agencies?		Description (if needed)	Planned Implementation Year	Planned for Use in Year Type	Expected Increase in Water Supply to Agency, AFY
Beaumont MDP Line 16 (Line 16)	Yes	RCF&WCD	Const of SD to divert water into BCVWD Rehcharge Facility	2021	All Year Types	185
Misc Urban Runoff Capture	Yes	Beaumont	Various recharge basin enhancements	2025	All Year Types	200-545
Lower Edgar Canyon Non-potable Groundwater	No		Install extraction wells for high nitrate GW for non potable water system	2025	All Year Types	300
San Timoteo Canyon GW Extraction	Yes	Beaumont	Install series of wells to recapture percolated ww used for habitat mitigation	2030	All Year Types	400-800
Non-potable Water interconnection with YVWD	Yes	YVWD	Install interconnecting pipeline, and booster pumping station and pressure regulating stations	2018	All Year Types	1,043
Connection to City of Beaumont for recycled water	Yes	Beaumont	Install storage tank, booster pumping station and interconnecting piping	2020	All Year Types	1,154
Advance Treated Recycled Water	Yes	Beaumont	Construct Advanced Treatment Facility and Brine Line	2025	All Year Types	300-660
NOTES: Yield from City of Beaumont Recycled Water Connection will increae to 3,363 AFY by 2040 due to increases in wastewater flows over time. Expected increase in water supply for Advance Treated Wastewater is based on 80% recovery in the membrane treatment process						

Table 6-25
(DWR Table 6-8) BCVWD Water Supplies – Actual Year 2015

DWR Table 6-8 Retail: Water Supplies — Actual				
Water Supply	Additional Detail on Water Supply	2015		
		Actual Volume, AFY	Water Quality	Total Right or Safe Yield, *AFY*
Groundwater	Little San Gorgonio (Edgar Canyon)	1,418	Drinking Water	2,200
Groundwater	Beaumont Basin	2,300	Drinking Water	
Purchased or Imported Water	SGPWA	2,090	Raw Water	
Transfers	From Banked GW storage	3,984	Drinking Water	
	Total AFY	9,792		2,200
NOTES: BCVWD typically receives reallocated unused Overlying Party Rights, forbearance water for supplying potable or non-potable water to Overlying Parties, and return flow credits for importing SPW, groundwater, or recycled water per the Beumont Basin Watermaster. Thsi varies from year to year.				

Climate Change Impacts to Supply

Climate change, according the USEPA[34], refers to any significant changes in temperature, precipitation or other climate patterns lasting for extended periods of time. Throughout history, locations on the earth have experienced climate change – a notable example is the ice age which blanketed much of the Midwestern US with glaciers. These changes are continuing to occur whether impacted by mans' activities or purely a natural phenomenon. There is some evidence the earth's average temperature is rising ever so slowly and this is theorized by some experts to continue for several centuries. Places have experienced changes in rainfall, reduced snowfall, changes from snow to rain, warming of the oceans, melting of icecaps and resulting sea level rises. Even small changes in temperature can result in measureable changes in climate and weather. The cause is theorized to be due to increases in concentration of "greenhouse gases[35]" in the atmosphere.

[34] http://www.epa.gov/climatechange/basics/ accessed 4/2/2013

[35] Water vapor, carbon dioxide, methane, nitrous oxide and other gases which reflect light and infrared radiation back to the earth's surface.

A DWR White Paper published in 2008[36] on the climate change strategies for California water stated the following:

> *Climate change is already affecting California's water resources. Bold steps must be taken to reduce greenhouse gas emissions. However, even if emissions ended today, the accumulation of existing greenhouse gases will continue to impact climate for years to come. Warmer temperatures, altered patterns of precipitation and runoff, and rising sea levels are increasingly compromising the ability to effectively manage water supplies, floods and other natural resources. Adapting California's water management*

[36] State of California Department of Water Resources, (2008). Managing an Uncertain Future, Climate Change Adaptation Strategies for California Water, October.

systems in response to climate change presents one of the most significant challenges of this century.

While the exact conditions of future climate change remain uncertain, there is no doubt about the changes that have already happened. Analysis of paleoclimatic data (such as tree-ring reconstructions of stream flow and precipitation) indicates a history of naturally and widely varying hydrologic conditions in California and the west, including a pattern of recurring and extended droughts. The average early spring snowpack in the Sierra Nevada decreased by about 10 percent during the last century, a loss of 1.5 million acre-feet of snowpack storage (one acre-foot of water is enough for one to two families for one year). During the same period, sea level rose seven inches along California's coast. California's temperature has risen 10F, mostly at night and during the winter, with higher elevations experiencing the highest increase. A disturbing pattern has also emerged in flood patterns; peak natural flows have increased on many of the state's rivers during the last 50 years. At the other extreme, many Southern California cities have experienced their lowest recorded annual precipitation twice within the past decade. In a span of only two years, Los Angeles experienced both its driest and wettest years on record.

The Report further goes on to state:

What we know:

- *Historic hydrologic patterns can no longer be solely relied upon to forecast the water future;*
- *Precipitation and runoff patterns are changing, increasing the uncertainty for water supply and quality, flood management, and ecosystem functions;*
- *Significant and ongoing investments must be made in monitoring, researching, and understanding the connection between a changing climate, water resources and the environment;*
- *Extreme climatic events will become more frequent, necessitating improvements in flood protection, drought preparedness and emergency response;*

These changes will bring challenges to water supply agencies like BCVWD and impact BCVWD in both its imported water supply and it local supply – snow fall and rainfall runoff.

Climate Change Impacts on BCVWD Imported Water Supply

The DWR 2011 Reliability Report took climate change into consideration, but there are some specific issues that should be mentioned.

- Reduction in Sierra snow pack
- Rising sea levels on levee integrity

Reduction in Sierra Snowpack

The Sierra snowpack is California's best and least expensive reservoir. The precipitation falls as snow in the winter in the mountains through the winter, building up a large, "on the surface" water reservoir. During the spring and early summer this begins to melt gradually, trickling water into surface reservoirs. These reservoirs are able to capture the water and move it downstream to users maintaining flow releases that do not threaten levees or cause flooding. The peak of the runoff period is late spring or early summer.

In 1989 the USEPA issued a report on what would happen to global temperatures with a two-fold increase in the carbon dioxide concentration in the atmosphere. The report indicated a 1.5 to 4.5°C (2.7 to 8.1°F) increase over the next 100 years if fossil fuel usage continued at the rate at the time. DWR made some very approximate estimates of what that would do to the snowpack based on a rise of 1500 ft elevation in the historical winter snowline. Assuming no change in the amount of precipitation, DWR estimated that spring snowmelt runoff would decrease by 1/3, with more occurring in the northern Sierra versus the southern Sierra where the mountains are higher in elevation and capture more high elevation snow.[37] These are certainly dire predictions; whether this will actually occur is uncertain.

DWR did plot the April to July runoff in both the Sacramento River and San Joaquin River, reflecting the northern and southern Sierras respectively as a percent of the water year runoff. The April to July runoff would represent the snowmelt runoff. These are shown in Figure 6-13 and Figure 6-14.

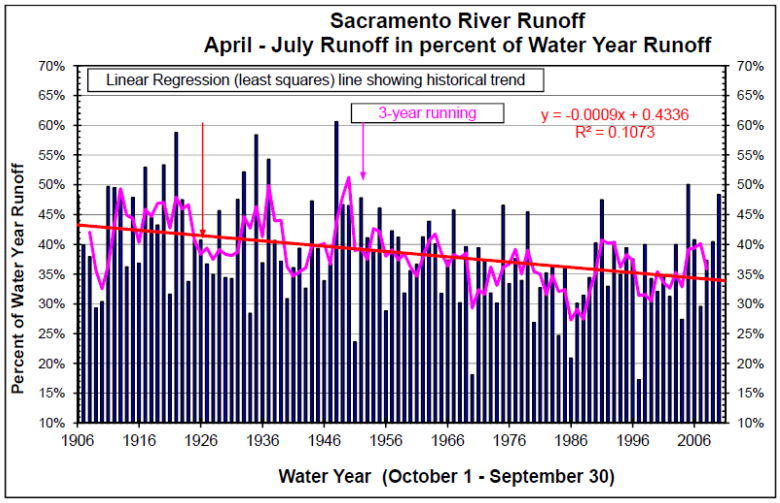

Figure 6-13
Sacramento River Runoff (1906-2010), April-July

[37] Department of Water Resources, State of California, Roos, Maury, Chief Hydrologist. (2012). Snowpack and Snowmelt Changes, January 3.

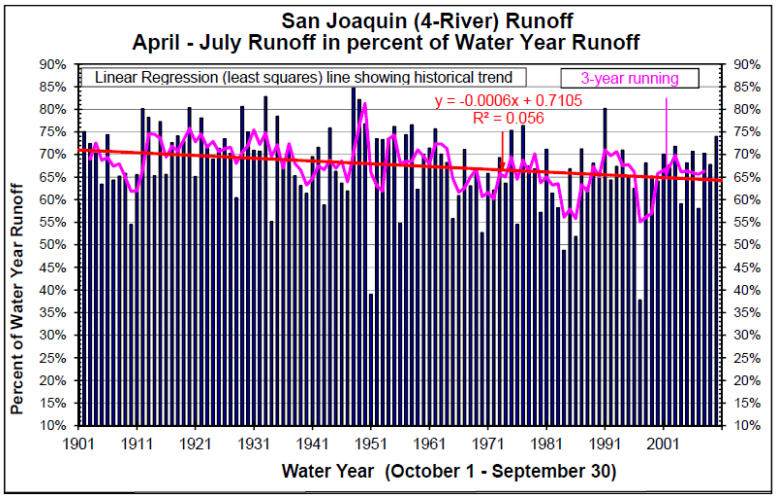

Figure 6-14
San Joaquin River Runoff (1901-2010), April-July

There is a downward trend evident with a steeper slope in the Sacramento River validating at least the general hypothesis determined in 1989.[38] From DWR's data, there appears to be solid evidence that at least some changes are occurring. Maybe these are cyclical; maybe more long term; maybe very long term.

With global warming things will be different. Precipitation will be principally in the form of rain. This will runoff rapidly, quickly filling the surface reservoirs the Department of Water Resources counts on to store water to supply users over the summer and fall till the next "season." The rainfall runoff occurs rapidly and in large quantities bringing with it significant sediment which will eventually silt up the storage reservoirs. The reservoirs will fill up and spill, releasing the high flows into the rivers leading to the Delta, straining levees which are already unstable. This water, which previously was captured as snowfall, will be lost to the ocean. The SWP does not have the storage or conveyance facility capacity to manage all of these high flows and put them to beneficial use or convey the flows to groundwater recharge facilities for storage.

There are many legislators and members of the public opposed to surface storage. This is unfortunate because without additional surface storage, the impacts of climate change will be felt by all of the water users in the State and the Delta ecosystem.

It is likely there will be less Table A water and more Article 21 water available as the reservoirs are quickly filled with rainfall runoff. If this Article 21 can be conveyed to the Pass Area, BCVWD is in a good position to recharge this water with the expanded recharge facility. Perhaps this is sufficient to overcome the reduction in Table A water.

[38] Ibid

Sea Level Impact on Levees

Climate change reportedly will result in sea level rise. The higher sea level will result in greater forces on the existing levees in the Delta. The islands that comprise the Delta are now well below sea level. Levees have broken in the past due to a wide variety of reasons. They are threatened by spring floods and seismic activity. Failure of a levee is akin to a dam break. Water from the Delta rivers will rush in to flood the island. This brings about a corresponding inflow of saline water from San Francisco Bay into the Delta contaminating the imported water flowing through the Delta with salt degrading its quality and making it potentially unusable for extended periods of time.

The levees in the Delta are weak. They were constructed over a century ago with the construction and compaction techniques of the time. They are certainly not up to today's standards and are vulnerable. Higher sea levels and higher spring flows due to the lack of snowpack will exacerbate the problems with the levees. Seismic activity during saturated condition could be devastating.

Because BCVWD can rely on the Beaumont Basin for groundwater, the District should be able to weather any short to medium term interruptions of imported water supply. But it will be important to make sure the storage account has adequate water.

Climate Change Impacts on BCVWD's Local Supply

Locally climate change will have similar effects.

- Reduced snow pack and higher runoff
- Increased wildfire risk
- Water demand increase

Warmer temperatures from climate change will reduce the local snow pack, but not to the degree described above for the Sierra Nevada mountains. The local snow pack is not a major supply source for BCVWD, though it does provide some gradual recharge, particularly the wells in Edgar Canyon. Higher rates of runoff can be expected with more intense storms. This will bring down substantial amounts of sediment. At this point BCVWD is in a good position to deal with the sediment having recently constructed additional desilting basins at the mouth of Edgar Canyon to supplement the numerous percolation ponds and basins along the length of Edgar Canyon. Construction of Phase 2 of the recharge facility is underway, which allows the District to capture any large storm flows which make it "out of the canyon." It is believed the number of larger storm flows will increase over time due to climate change.

Warmer temperatures will bring an increased risk of wildfires in the watershed. Although some may consider wildfires an ecological benefit, there are some devastating consequences to water suppliers such as BCVWD. A burned watershed will result in enormous amounts of sediment

moved down into the canyon streams, which could cause flooding in the canyon and flood out some of the District's well pumps. Wildfires have burned portions of the watershed in the recent past and BCWWD has been able to minimize the impacts. The District has installed a water tank at the 3900 foot elevation between Edgar and Wallace Canyons and a fire protection piping loop in the vicinity of the "middle houses" to respond to brush fires in the canyon.

Water demand is expected to increase due to hotter days and nights. Irrigation water needs will increase due to potential reduction in precipitation and warmer days.

Mitigation

One of the best ways of mitigating climate change is by reducing energy consumption, particularly energy produced by fossil fuels and becoming more energy efficient. Although consumers have no control over the use of energy and fossil fuels by BCVWD directly, consumers can assist BCVWD by reducing water consumption. Supplying water to customers in the District's service area takes energy to pump the water out of the ground and pressurize it for use. The bulk of the District's supply is from the Beaumont Basin where the groundwater table is 500 or more feet below the ground surface. To boost the pressure for consumers' use requires another 200 ft or so of pumping. A substantial amount of energy is expended pumping this water. Saving water at home means saving energy; saving energy reduces greenhouse gas emissions.

Section 7

Water Supply Reliability Assessment

Constraints on Water Sources

> *CWC 10631*
>
> *(c)(2) For any water source that may not be available at a consistent level of use, given specific legal, environmental, water quality, or climatic factors, describe plans to supplement or replace that source with alternative sources or water demand management measures, to the extent practicable.*
>
> *CWC 10634*
>
> *The plan shall include information, to the extent practicable, relating to the quality of existing sources of water available to the supplier over the same five-year increments as described in subdivision (a) of Section 10631, and the manner in which water quality affects water management strategies and supply reliability.*
>
> *10631(c)(2)*
>
> *For any water source that may not be available at a consistent level of use, given specific legal, environmental, water quality, or climatic factors, describe plans to supplement or replace that source with alternative sources or water demand management measures, to the extent practicable.*

Table 7-1 shows a summary of BCVWD's current and future water sources and identifies the factor(s) that affect the specific source's consistency of supply. Climate affects the amount of water available from most of the sources; there are some legal constraints on the Beaumont Groundwater Basin Source due to the Adjudication and contractual and environmental constraints on the imported SPW. BCVWD's sources are not affected by water quality per se, although a case could be made for the imported SPW supply and Delta water quality impacts on pumping.

The following subsections quantify the variability in BCVWD's water sources.

Reliability by Type of Year

> *CWC 10631*
>
> *(c)(1) Describe the reliability of the water supply and vulnerability to seasonal or climatic shortage, to the extent practicable, and provide data for each of the following:*
>
> *A. an average water year,*
>
> *B. a single dry water year,*
>
> *C. multiple dry water years.*

The water supply quantities from BCVWD's sources for the average year were presented in Section 6. This Section 7 will quantify the availability during various drought scenarios over the planning period:

- Single dry year -- the lowest water supply available to BCVWD, a worst case condition

- Two consecutive dry years -- the lowest average available water supply over a 2-year period
- Three consecutive dry years -- the lowest average available water supply over a 3-year period
- Six Consecutive dry years -- the lowest average available water supply over a 3-year period

Table 7-1
Factors Resulting in Inconsistency of Supply

Water Supply Source	Cause of Inconsistent Supply				Additional Information
	Legal	Environmental	Water Quality	Climate	
Edgar Canyon Groundwater				X	
Beaumont Basin Groundwater Appropriator Rights	X				Note 1
Beaumont Basin Groundwater Unused Overlier Rights	X			X	Note 2
Imported State Project Water	X	X		X	Note 3
Recycled Water				X	Note 4
Stormwater Capture and Percolation				X	
Urban Runoff Capture and Percolation				X	
Nitrate-contaminated Groundwater from mouth of Edgar Canyon				X	

Notes to Table 7-1:

1 After 2014 the Appropriator production rights are zero per Adjudication

2 Reallocation of Overlier pumping rights are variable. Estimated to drop to 1000 AFY by 2035

3 SWP reliability discussed in text. 10% of Table A is available 100% of the time; adjusted per draft allocation agreement.

4 Recycled water is not subject to any significant variations; but some drought period reductions in flow are experienced – maybe 10%. Domestic water restrictions typically have the greatest impact on outdoor water use.

In DWR's Guidebook for Urban Water Suppliers Preparing 2015 UWMP Updates, there are a number of standard tables that are to be completed. BCVWD believes these standard tables, if presented in the text of this Section, will be very confusing to the readers. It would be difficult for the reader to follow how the information on water supplies for various durations of dry years was developed. In lieu of the standard tables, BCVWD presents its methodology using similar tables, but not identical tables, which better explain the water source reliability and demonstrate the assessment of impacts of single dry year and multiple dry year on BCVWD's water supply. DWR's standard tables were completed using the information from BCVWD's tables in this section and are presented along with the other DWR standard tables in Appendix C.

As background for the discussion on water supply reliability, BCVWD enjoys the benefits of a groundwater basin, (Beaumont Basin), with very large storage capacity. BCVWD and its neighboring agencies in the San Gorgonio Pass Area can take advantage of this by banking imported water during wet years for use during extended droughts. Complementing the large storage capacity is the fact that percolation and recharge occur at relatively high rates. It is very easy to "bank" water in the Beaumont Basin. It is retained in the Basin due to well-managed groundwater levels, and the ample storage capacity. Figure 7-1 shows the amount of water BCVWD has accumulated in its storage account since 2003. Imported water began to be spread in 2006.

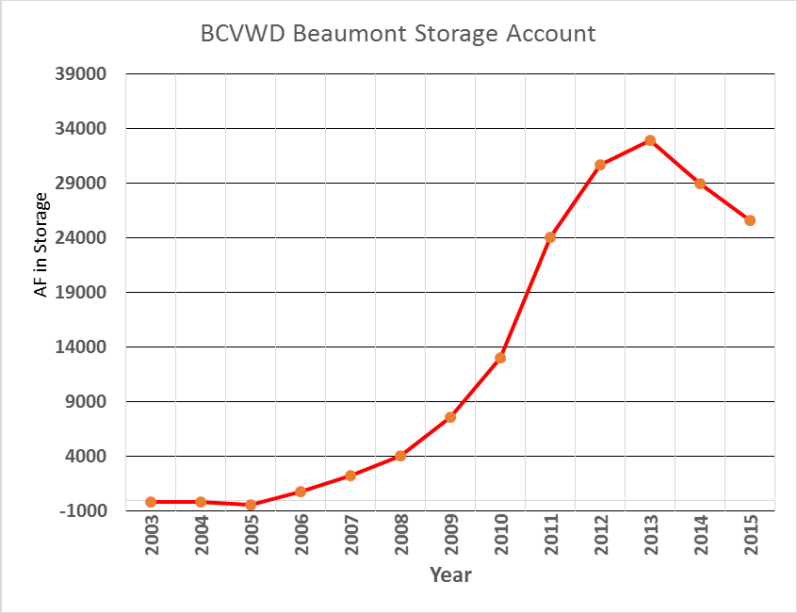

Figure 7-1
BCVWD's Beaumont Basin Storage Account

With the ability to bank water and the large "underground" reservoir, BCVWD and its neighboring agencies can withstand extended periods of drought without severe restrictions.

At the end of 2015, for example, BCVWD had 25,568 AF in storage. This dropped from a maximum in 2013 of nearly 34,000 AF due to the drought and the reduced SWP. BCVWD can store up to 80,000 AF in the Beaumont Basin managed by the Watermaster.

In Section 6, Table 6-25 (DWR Table 6-9), a quantity of BCVWD-purchased imported water was identified as "SGPWA for Banking." This varied from 1,000 AFY to 2,500 AFY and is over and above the amount of imported water needed to meet demands. The purpose of this "banking water" is to build up BCVWD's Beaumont Basin Groundwater Storage Account to be used as reserve for drought periods when adequate, (as projected in Table 6-25), SPW is not available.

SGPWA is to supply the imported water requested in Table 6-25 (DWR Table 6-9) to meet BCVWD's needs plus the anticipated SPW for banking. If in any year(s), either of these quantities cannot be supplied, for any reason, the accumulated shortfall is expected to be delivered to BCVWD by SGPWA as soon as possible once imported water is available. In this way, BCVWD will be able to keep adequate water in storage for current (2015) needs and accommodate growth in BCVWD's service area. Looking at the quantities in Table 6-26, BCVWD anticipates banking 35,000 AF of water over the next 20 years, which would bring BCVWD's storage account to about 60,560 AF. This is over 3 years of SPW requirements to meet demand. In other words, BCVWD would be able to meet year 2040 demands with no SPW for over 3 years.

Groundwater

Beaumont Basin

The Beaumont Basin is managed by the Beaumont Basin Watermaster. A discussion of the principles of the Adjudication was presented previously in Section 6.

In any given year, BCVWD can pump out its stored (banked) water. The storage is replenished, at least partially, every year by forbearance water, reallocated unused Overlying Party pumping rights, return flows, and imported water when available. The amount of imported water that can be recharged in any year depends on DWR's SWP allocation. This varies from year to year. See Figure 6-2 presented previously.

Table 6-9, presented previously, showed the amount the Watermaster credits to BCVWD's Beaumont Basin Storage Account annually. The amount of unused Overlying Party rights is based on a 5-year moving average and could decrease slightly during drought periods as the Overlying Parties use more well water to compensate for the lack of rainfall. The forbearance water and return flows will decrease during dry periods as users reduce water consumption.

Table 7-2 shows the estimated amount of water credited to BCVWD by Watermaster for a single or multiple dry year analysis. For the dry year analysis, it was estimated that there would be a 15% conservation effect; in other words, for dry year analysis, only 85% of average annual forbearance, reallocated Overlying Party rights, etc. would be available. In Table 7-2, the 15% reduction factor is also applied to the recycled forbearance water to account for a potential

reduction in treated wastewater due to water conservation effects. No irrigation of golf courses is assumed to occur during these drought periods since there may not be enough recycled water available with conservation to permit this to occur. This is believed to be conservative.

Table 7-2
Summary of BCVWD's Beaumont Basin Storage Credits

Item	2015	2020	2025	2030	2035	2040
Total Return Flow Credits, Allocated Overlying Party Rights, and Forbearance Water (No Golf Courses), from Table 6-9, AFY	1,927	1,765	1,970	2,334	2,782	2,836
Expected to be Available for Single and Multiple Dry Year Analysis, AFY	1,640	1,500	1,675	1,985	2,330	2,410

Edgar Canyon

Groundwater from Edgar Canyon is affected to some degree by climate as can be seen from the statistics in Table 6-8 presented previously. The average annual extraction from Edgar Canyon is 2,181 AFY based on records from 1983-2015. During that period of time the minimum extracted was 1,117 AFY, which occurred in 1991. This can be considered the "Single Dry Year Water Available." The 2-year, 3-year, and 6-year moving averages for the extractions from 1983 -2015 were determined and are presented in Table 7-3 along with the Base Period for moving averages.

Table 7-3
Groundwater Available from Edgar Canyon for
Single and Multiple Dry Year Analysis

Drought Condition (Base Years)	Average Available over the Drought Period, AFY
Single Dry Year (1991)	1,117
2 Consecutive Dry Years (1990 – 91)	1,173
3 Consecutive Dry Years (1989 – 91)	1,230
6 Consecutive Dry Years (1987 – 92)	1,367

Imported Water

The amount of imported water available from the SGPWA via the State Water Project is very climate dependent. A spreadsheet was developed using the 2015 DWR Delivery Capability Report simulation data (1922 to 2003) for SGPWA to develop an estimate of the delivery capability for the single dry year and multiple dry year reliability analysis. The 2-, 3-, and 6-year moving averages of annual estimated delivery allocations were determined for the period 1922-2003. A summary of the Table A delivery percentages is shown in Table 7-4.

Table 7-4
SGPWA SWP Delivery Capability as Percent of Table A
(Based on 2015 DWR SWP Delivery Capability Report)

Dry Year(s)	Single	2-year	3-year	6-year
Table A Annual Delivery Average Over the Drought Period, %	8	19	22	28

The percentages in Table 7-4 were compared to actual SWP delivery allocations for the period 1992 to 2016, a 24-year period:

Minimum year	5% (2015)
Minimum 2 consecutive years	12.5% (2014-15)
Minimum 3 consecutive years	20% (2013 – 15)
Minimum 6 consecutive years	42.5% (2010 – 15)

As can be seen, the actual minimum year and minimum 2 and 3 consecutive years are less than those from the 2015 DWR SWP Delivery Capability Report. So, for the reliability analysis in this 2015 UWMP, the allocation percentages in Table 7-5 will be used.

Table 7-5
SGPWA SWP Delivery Capability as Percent of Table A
(Used for Reliability Analysis)

Dry Year(s)	Single	2-year	3-year	6-year
Table A Annual Delivery Average Over the Drought Period, %	5	12.5	20	28

For the reliability analysis, the percentages in Table 7-5 will be applied to BCVWD's imported water demand for the particular year. The results are shown in Table 7-6. The additional SPW to provide a 5-year emergency supply for droughts per BCVWD Board of Directors Resolution

2014-05 is not included in the SPW Needed in Table 7-6. See Table 6-25, presented previously. (Note that the State's 2016 Emergency Conservation Regulation requires a 3-year supply in order to avoid restrictive water conservation mandates.)

Section 6 described the role of the SGPWA in supplying SWP to BCVWD. The SGPWA has initiated a capacity fee for all new connections. By Resolution 2015-05, the SGPWA Board of Directors established an obligation to meet the future water supply needs of the region, including BCVWD, and recognizes the current allotment of Table A capacity is fully subscribed to current users. BCVWD can rely on the SGPWA to secure and deliver the imported water needed to meet BCVWD's current and future demands as set forth in this 2015 UWMP and subsequent UWMP updates in concert with DWR's Delivery Capability Reports.

Table 7-6
Estimated SWP Deliveries to BCVWD from SGPWA During Extended Dry Periods

	% Table A	Year				
		2020	2025	2030	2035	2040
SPW Needed, AFY		10,313	11,407	12,503	13,893	15,367
Single Dry Year	5%	520	570	630	690	770
2-years	12.5%	1,290	1,430	1,560	1,740	1,920
3-years	20%	2,060	2,280	2,500	2,780	3,070
6-years	28%	2,890	3,190	3,500	3,890	4,300

Recycled Water

Recycled water is consistently available; although during droughts, consumers are more aware of water conservation and reduce their indoor water consumption somewhat. They are more aware of the need to do only full loads of laundry, full loads for the dishwasher etc. Agencies, including the City of Beaumont, have observed a reduction in wastewater flows during the current drought.

BCVWD is counting on two separate sources of recycled water: YVWD and the City of Beaumont. For a single dry year, an estimate of 90% of the normal, average recycled water will be available. As the drought becomes more pervasive, the amount of recycled water is estimated to reduce further to 85% of normal. Table 7-7 provides an estimate of the available recycled water during extended dry periods. The amount of recycled water under normal conditions is derived from Tables 6-18 and 6-19, presented previously.

Storm Water and Urban Runoff Reliability (Potential Projects)

Storm water and Urban Runoff quantities are very dependent on rainfall. Review of the rainfall record at Beaumont for the period 1888 – 2006 resulted in the data shown in Table 7-8. To determine the multiple dry year rainfall as a percent of the average rainfall, the 2-, 3-, and 6-year moving averages of the annual rainfall was determined. Table 7-8 also lists the storm water

capture projects and their estimated annual "new water" captured from Table 6-13 presented previously.

Table 7-7
Estimated Recycled Water Available During Extended Dry Periods

		Year				
		2020	2025	2030	2035	2040
YVWD Recycled Water Used on Landscaping, AFY	% Available	921	977	1,018	1,028	1,032

Total Storm Water, AFY	255	325	325	470

The data from Tables 7-2 through 7-8 will be used in the water supply reliability assessment to follow.

Water Supply Reliability Assessment

CWC 10635

(a) Every urban water supplier shall include, as part of its urban water management plan, an assessment of the reliability of its water service to its customers during normal, dry, and multiple dry water years. This water supply and demand assessment shall compare the total water supply sources available to the water supplier with the total projected water use over the next 20 years, in five-year increments, for a normal water year, a single dry water year, and multiple dry water years. The water service reliability assessment shall be based upon the information compiled pursuant to Section 10631, including available data from state, regional or local agency population projections within the service area of the urban water supplier.

Section 6 presented the Water Supply Assessment for an average or "normal" year (Table 6-25). For the normal year, there is more than enough supply to meet the demand and BCVWD can bank water in the Beaumont Basin which will be needed during dry periods.

Tables 7-9 through 7-12 present the water supply reliability assessment for:

- Single Dry Year (Table 7-9)
- 2 Consecutive Dry Years (Table 7-10)
- 3 Consecutive Dry Years (Table 7-11)
- 6 Consecutive Dry Years (Table 7-12)

Imported SPW,AFY	2,890	3,190	3,500	3,890	4,300
Subtotal Supply, AFY	7,707	8,842	9,852	10,967	11,837
From Banked Beaumont Basin Storage, AF	6,838	7,632	8,866	9,725	10,654
Total Withdrawn from Storage Over Dry Period, AF	41,029	45,791	53,195	58,347	63,924

For the Single Dry Year and the 2 and 3 Consecutive Years Dry Periods, the potable and non-potable water demands did not reflect any conservation. The 6 Consecutive Years Dry Period assumes that water restrictions will be in place that will result in a 15% reduction in normal water demands. This is a reasonable assumption since there is adequate time to implement water use restrictions. In all of the assessments, water must be extracted from BCVWD's Beaumont Basin Storage Account. BCVWD has an 80,000 AF storage account managed by Watermaster. This volume is adequate to meet the needs of this reliability analysis but should be increased to allow the District to bank 5 years of water to meet future needs as desired by the District's Board of Directors. Tables 7-9 through 7-12 clearly indicate the importance of maintaining substantial amounts of water in the storage account. Based on the assessment, BCVWD should keep 65,000 AF in the account. This will require building up from the year-end 2015 Balance of 25,568 AF.

Regional Supply Reliability

CWC 10620

(f) An urban water supplier shall describe in the plan water management tools and options used by that entity that will maximize resources and minimize the need to import water from other regions.

BCVWD has a very diverse water portfolio that allows it to maintain a reliable water supply to its current and future customers. The existing sources include:

- Unadjudicated groundwater from Little San Gorgonio Creek (Edgar Canyon)

- Adjudicated groundwater from the Beaumont Basin
- Stormwater capture in Edgar Canyon (Little San Gorgonio Creek) and recharge in percolation ponds in Upper and Middle Canyon and at the Canyon mouth in recently added desilting and recharge basins
- Non-potable groundwater supplying the existing non-potable water system
- Imported State Project Water from SGPWA

Potential Future Sources described in this 2015 UWMP include:

- Recycled water from the City of Beaumont and YVWD for landscape irrigation and with advanced treatment for indirect potable reuse (groundwater recharge)
- Improved recharge of captured urban runoff from Sundance development
- Non-potable groundwater from the mouth of Edgar Canyon
- Non-potable groundwater from San Timoteo Creek
- Storwater capture and recharge via the Grand Avenue Storm Drain (funded by RCFCWCD, SAWPA grant and currently under design)
- Stormwater capture from Noble and Marshall Creek
- Additional urban runoff capture and recharge from developing areas

These potential sources have been described in Section 6 of this 2015 UWMP.

BCVWD's water management strategy since its formation has always been to maximize local water resources including local groundwater and capture and percolate surface flows in Little San Gorgonio Creek for subsequent extraction in the District's Edgar Canyon wells. With the development that occurred starting about year 2000, BCVWD began installation of a non-potable water system with the intent of using recycled water from the City of Beaumont and YVWD. Currently (2015) the water demand in the non-potable system is about 12% of the total water demand. This demand is being partially met by non-potable groundwater. Recycled water could meet the remainder of the demand.

As discussed above BCVWD has an 80,000 AF storage account in the Beaumont Basin to purchase and store imported water when available in ample supply during wet years. In addition to SGPWA's Table A amount, there are two other sources of imported water over and that are available:

- Article 21 Water
- Turn-back Pool Water

SWP Article 21 Water

Article 21 Water refers to a provision in each State Water Contractor's Contract with DWR that allows each Contractor, like SGPWA, to take advantage of excess water flowing through the Delta. The individual Contractor must take the water on short notice and store it within the Contractor's facilities and the delivery of the water cannot interfere with the delivery of Table A

allocations, SWP deliveries or operations. DWR has estimated that 82% of the time, the maximum amount of Article 21 Water available will be 20,000 AF. For the period 2001 through 2014, average amount of Article 21 Water available was 176,456 AF with a median amount of 45,630 AF.

There is significant "competition" for Article 21 Water. Generally there are greater demands from the Contractors than there is Article 21 Water available. When this happens, the available Article 21 Water is proportioned according to the Table A allocations of the interested Contractors. Based on the Contractors who typically took delivery of Article 21 Water from 2001 through 2014, the SGPWA would only get about 0.5% of the available Article 21 Water, i.e., about 230 AF of the median amount. During very wet years, it could be over 3,000 AF; 75% of the time the SGPWA would receive less than 1,900 AFY of Article 21 Water based on a statistical analysis performed by BCVWD. Nevertheless, whenever Article 21 Water is available, SGPWA should request as much as can be accommodated in the EBX conveyance system (64 cfs or 3,800 AF/month).

Turn-back Pool Water

Turn-back Pool Water is Table A water that other Contractors requested that they are unable to take delivery of. This is offered for sale at a set price.

For the period 2001 through 2014, the median and average Turn-back Pool amounts were 17,740 and 25,280 AF respectively. This source could yield 500 AF assuming the same competition as for Article 21 Water. SGPWA should be looking at purchasing Turn-back Pool water whenever it is available.

Other Sources

SGPWA should be purchasing water from San Bernardino Valley Municipal Water District (Valley District) on a year-by-year or longer basis. Valley District does not currently need all of their Table A and it is believed that some of this is available for purchase. BCVWD is interested in purchasing some of this for BCVWD's storage account; SGPWA should purchase any that is available. This water would be purchased by BCVWD, YVWD or the City of Banning for storage in their respective Beaumont Basin storage accounts.

Financing of Water Resource Needs

BCVWD has the financing in place and is collecting fees from each new residential unit or "equivalent dwelling unit" for commercial/industrial/institutional facility for new infrastructure, (transmission mains, wells, storage, treatment, local water resource development, and non-potable water facilities). BCVWD's commodity rate structure includes funding for purchase of imported SPW.

BCVWD's 2015 Potable Water Master Plan Update identified the infrastructure needs and funding requirements to replace existing facilities which have reached the end of their useful life and construct new facilities to meet anticipated growth in the service area.

Section 8

Water Shortage Contingency Planning

CWC 10632

The plan shall provide an urban water shortage contingency analysis that includes each of the following elements that are within the authority of the urban water supplier.

- *Stages of Action*
- *Prohibitions on End Uses*
- *Penalties, Charges, Other Enforcement of Prohibitions*
- *Consumption Reduction Methods*
- *Determining Water Shortage Reductions*
- *Revenue and Expenditure Impacts*
- *Resolution or Ordinance*
- *Catastrophic Supply Interruption*
- *Minimum Supply Next Three Years*

Water shortage contingency planning is a strategic planning process to prepare for and respond to water shortages. Good planning and preparation can help maintain reliable supplies and reduce the impacts of supply interruptions.

This section describes BCVWD's water shortage contingency planning. The planning includes staged responses to a water shortage, such as a drought, that occurs over a period of time, as well catastrophic supply interruptions which occur suddenly.

The water shortage contingency plan (WSCP) can be created separately from the UWMP and amended as needed without amending the corresponding UWMP. However, the most current version of the WSCP must be included as part of the UWMP when the UWMP is submitted to DWR.

Stages of Action

10632(a) Stages of action to be undertaken by the urban water supplier in response to water supply shortages, including up to a 50 percent reduction in water supply, and an outline of specific water supply conditions which are applicable to each stage.

The District proposes a five-stage plan of action in the event of an extended drought condition or loss of supply. The action levels for each stage are presented in the subsections that follow, and the water supply reduction stages are provided in Table 8-1. These stages could be implemented as a result of BCVWD water shortages, including reduction in imported water allocation, or mandatory water conservation targets by the Governor's office.

Table 8-1 Retail Stages of Water Shortage Contingency Plan		
Stage	Complete Both	
	Percent Supply Reduction[1] *Numerical value as a percent*	Water Supply Condition (*Narrative description*)
Add additional rows as needed		
1	10%	Up to a 10% reduction in normal, "long term" water supply; imported water supply allocation averages approximately 50% over a 2-year (or longer) period
2	20%	Up to 20% reduction in normal, "long term" water supply; imported water supply allocation between 49.9% and 25% over a 3-year (or longer) period
3	25%	Up to 25% reduction in normal, "long term" water supply; imported water supply allocation between 24.9% and 10% over a 3-year (or longer) period
4	30%	Up to 30% reduction in normal, "long term" water supply; imported water supply allocation between 9.9% and 5% over a 3-year (or longer) period
5	50%	Up to 50% reduction in normal, "long term" water supply; imported water supply allocation averages less than 5% over a 4-year (or longer)period
[1] *One stage in the Water Shortage Contingency Plan must address a water shortage of 50%.*		
NOTES:		

These stages and the percent reductions in demand are based on BCVWD's experience during the state mandated water conservation program targets comparing 2015 with a similar period in 2013. BCVWD was able to reduce consumption by 24.3% for the period May 2015 through April 2016. This was done through the restrictions in Board of Directors Resolution 2015-05 which limited watering to two days per week.

In establishing the "Stages," BCVWD has the advantage of the Beaumont Basin, its large storage capacity for banked water, and BCVWD's 80,000 AF storage account. BCVWD currently has 25,568 AF in storage, despite an average SWP allocation of only 43% for the period 2012 through 2015. BCVWD's plan is to purchase additional imported water over that needed to meet demands to add to the storage account balance each year including making up for any shortfall that may occur during dry years. The District's goal is to fill the storage account by 2040 or before.

Stage 1

Stage 1 occurs when:

- A 10% water use reduction from the established base year is required, or

- Imported water supply allocation averages approximately 50% over a two year(or longer) period

The District declares a water shortage and imposes voluntary water conservation. In this stage the District shall notify all its customers that water deliveries may be reduced. The District will recommend a voluntary 10% water use reduction based on an established base year to be determined by the District at the time Stage 1 is implemented. At the same time the District shall implement its own public awareness program to encourage the efficient use of water. This will be accomplished by bill stuffers, web site information, and articles in the local newspaper.

Stage 2

Stage 2 occurs when:

- A 20% water use reduction from the established base year is required, or
- The SWP allocation averages between 49.9% and 25% over a three year (or longer) period, or
- Stage 1 voluntary conservation efforts do not yield the 10% reduction in demand.

At this point the District will initiate water restrictions similar to Resolution 2015-05 and require a 20% reduction in demand from an established base year.

Stage 3

Stage 3 occurs when:

- A 25% water use reduction from the established base year is required, or
- The SWP allocation averages between 24.9% and 10% over a three year (or longer) period, or
- The Stage 2 conservation efforts do not result in the required 20 percent reduction

In this stage the District will impose restrictions similar to Resolution 2015-05, but limit lawn watering to one day per week and no filling of swimming pools. Topping off of swimming pools is permitted. No new construction meters will be approved. Use of recycled or non-potable water for construction activities will be encouraged. The District will adopt financial incentives to encourage efficient water use. Public awareness programs will expand to schools.

Stage 4

Stage 4 occurs when:

- A 30 % water use reduction from the established base year is required, or
- The SPW allocation averages between 9.9% and 5%, over a three year (or longer) period, or
- The Stage 3 conservation efforts do not result in the required 25 percent reduction

In this stage the District will impose restrictions similar to Resolution 2015-05, but make more stringent including prohibit lawn watering except for lawns and turf irrigated with recycled or non-potable water. No filling of swimming pools; topping off of swimming pools may be permitted. Hand watering of plantings is permitted two days per week if using a hose with a shut-off nozzle. Use of potable water for construction activities will be prohibited; only recycled or non-potable water, if available, can be used for construction activities. Trucking recycled water may be necessary. The District will adopt financial incentives to encourage efficient water use. Stricter enforcement penalties will be developed. At this Stage, the District will appoint a water conservation advisory committee. This committee will comprise of officials from the District, the City of Beaumont, and the Cherry Valley community. Public awareness in schools will continue. District staff will work with high water using commercial/retail and industrial facilities to develop programs to reduce water use.

Stage 5

Stage 5 occurs when:

- A 50% water use reduction from the established base year is required, or
- The SWP allocation averages less than 5% for four consecutive years

In this stage the District will impose restrictions similar to Resolution 2015-05, but prohibit lawn watering except for lawns and turf irrigated with recycled or non-potable water. No filling of swimming pools; topping off only permitted on covered pools. Hand watering of plantings is permitted one day per week if using a hose with a shut-off nozzle. Use of potable water for construction will be prohibited; only recycled or non-potable water may be used for construction activities, as determined by the Board of Directors. Trucking recycled water may be necessary. “Will serve” letters or annexations will not be approved by the Board of Directors. The District will adopt financial incentives to encourage efficient water use. Stricter enforcement penalties will be developed. The water conservation advisory committee will continue to function. This committee will comprise of officials from the District, the City of Beaumont, and the Cherry Valley community. Public awareness in schools will continue. District staff will work with high water using commercial/retail and industrial facilities to develop programs to reduce water use.

Implementation

Implementation of any of the above stages will require action by the Board of Directors and should only be considered after a public hearing wherein the conditions that bring about the reduction in supply and current consumption are discussed, options considered, and impacts on the revenue stream and public are presented. The public will generally be provided an opportunity to provide public input on implementation of water shortage contingency stages.

Prohibitions on End Users

> ***CWC 10632***
>
> *(a)(4) Additional, mandatory prohibitions against specific water use practices during water shortages, including, but not limited to, prohibiting the use of potable water for street cleaning.*
>
> *(5) Consumption reduction methods in the most restrictive stages. Each urban water supplier may use any type of consumption reduction methods in its water shortage contingency analysis that would reduce water use, are appropriate for its area, and have the ability to achieve a water use reduction consistent with up to a 50 percent reduction in water supply.*

Table 8-2 provides a list of water use prohibitions and the various stages when they would be implemented. The list is "fixed" by DWR; other prohibitions may be considered by the Board. Note that if a prohibition is listed for a given stage, it would be applicable to all higher numbered stages. For example, a prohibition in Stage 2 would be prohibited in Stages 3, 4, and 5 also.

Except in extreme sudden emergencies, the Board of Directors would normally hold a public hearing to discuss the conditions requiring prohibitions in water use. Comments from the public will be taken and considered before making a decision. Some of the restrictions could include one or more of the above depending on the water shortage and its duration. A resolution would be adopted identifying the course of action and mandatory restrictions.

It is possible that the initial recommended prohibitions may not result in the desired reduction and more restrictive measures need to be taken. The Board would then call for another public hearing, present the facts and the results to-date of the implementation of the water restrictions and the need for further reductions. Further reductions could then be implemented through a resolution.

The list presented in Table 8-2 is not intended to include all possible restrictions; other measures may be identified during the public hearing and implemented.

Customers would be notified in writing of any prohibitions set by the Board and notices would be posted on the District's website, and the local newspapers and cable TV (English and Spanish versions.

Water Features and Swimming Pools

> ***CWC 10632***
>
> *(b) Commencing with the urban water management plan update due July 1, 2016, for purposes of developing the water shortage contingency analysis pursuant to subdivision (a), the urban water supplier shall analyze and define water features that are artificially supplied with water, including ponds, lakes, waterfalls, and fountains, separately from swimming pools and spas, as defined in subdivision (a) of Section 115921 of the Health and Safety Code.*

Health and Safety Code Section 115921

As used in this article the following terms have the following meanings:

(a) "Swimming pool" or "pool" means any structure intended for swimming or recreational bathing that contains water over 18 inches deep. "Swimming pool" includes in-ground and aboveground structures and includes, but is not limited to, hot tubs, spas, portable spas, and non-portable wading pools.

In Table 8-2, swimming pools are separate and distinct from "water features." Water features include decorative ponds, water hazards on golf courses, artificial waterfalls and fountains. Golf course water hazard ponds that serve as irrigation reservoirs or balancing ponds, supplied with private wells are not covered by BCVWD's water restrictions. BCVWD water restrictions do not apply to water features supplied by private wells.

Stock ponds for animal watering are not covered under the swimming pool or water feature restrictions. Recycled and non-potable water may be used without restriction in water features and ponds if approved for use.

Penalties, Charges, and Enforcement of Provisions

10632(f) Penalties or charges for excessive use, where applicable.

BCVWD has provisions within its Rules and Regulations to establish charges for excessive water use. Currently there is 2-tiered rate structure in effect which increases the unit cost (per one hundred cubic feet (HCF) for water use in a billing period over 44 HCF. BCVWD could increase these charges, initiate consumption surcharges for excessive use to cover the additional cost of imported replacement water, and/or provide for additional tiers upon proper notification and following the procedures established by Proposition 218. This is not something that can be done on short notice however.

BCVWD has "water waster" provisions in Part 15 of its Rules and Regulations.

> "15-1 PROHIBITION OF WATER WASTER – No person, firm, or corporation shall use, deliver, or apply waters received from this District in any manner that causes the loss, waste, or the applications of water for unbeneficial purposes. Within the meaning of this Regulation, any waters that are allowed to escape, flow, and run into areas which do not make reasonable beneficial use of such water, including but not limited to streets, gutters, drains, channels, and uncultivated lands, shall be presumed to be wasted contrary to the prohibitions of these Rules and Regulations.
>
> 1) Upon the first failure of any person, firm, or corporation to comply, this District shall serve or mail a warning notice upon any person determined to be in violation of these Rules and Regulations.

Table 8-2 Retail Only: Restrictions and Prohibitions on End Uses			
Stage	Restrictions and Prohibitions on End Users ***Drop down list*** *These are the only categories that will be accepted by the WUEdata online submittal tool*	Additional Explanation or Reference *(optional)*	Penalty, Charge, or Other Enforcement? *Drop Down List*
Add additional rows as needed			
All	Landscape - Restrict or prohibit runoff from landscape irrigation	Part of BCVWD's Water Waste Provisions	Yes
2	Landscape - Limit landscape irrigation to specific times		Yes
2	Landscape - Limit landscape irrigation to specific days	2 days per week	Yes
2	CII - Lodging establishment must offer opt out of linen service		Yes
2	CII - Restaurants may only serve water upon request		Yes
2	Landscape - Prohibit all landscape irrigation	Prohibit irrigation of street median turf only	Yes
2	Water Features - Restrict water use for decorative water features, such as fountains		Yes
2	Other - Prohibit use of potable water for washing hard surfaces		Yes
3	Other - Require automatic shut of hoses		Yes
3	Landscape - Limit landscape irrigation to specific days	1 day per week	Yes
3	Other - Customers must repair leaks, breaks, and malfunctions in a timely manner		Yes
4	Landscape - Prohibit certain types of landscape irrigation	Hand watering only with auto nozzle	Yes
5	Pools and Spas - Require covers for pools and spas		Yes
5	Pools - Allow filling of swimming pools only when an appropriate cover is in place.		Yes
5	Other - Prohibit use of potable water for construction and dust control		Yes
5	Other - Prohibit vehicle washing except at facilities using recycled or recirculating water		Yes
NOTES:			

2) Upon the second failure of any person, firm or corporation to so comply, the water charges of any such consumer shall be doubled until full compliance with these Rules or Regulations has been established to the satisfaction of the Board of Directors of the District.

3) Upon the third failure of any person, firm, or corporation to so comply, the District shall terminate water service to any connection through which waters delivered by the District are wasted in violation of these Rules and Regulations."

In Resolution 2016-05, there was a list of financial penalties for violation of the water restrictions in the Resolution.

- Upon the first failure of any person, firm, or corporation to comply, the District shall serve or mail a warning notice upon any person determined to be in violation of the District's Rules and Regulations
- Upon the second failure of any person, firm, or corporation to so comply, the water charges of any such customer shall be doubled until full compliance with the District's Rules and Regulations has been established to the satisfaction of the Board of Directors of the District.
- Upon the second failure of any person, firm, or corporation to so comply, the District shall terminate water service to any connection through which waters delivered by the District are wasted in violation of the District's Rules and Regulations.

Consumption Reduction Methods

CWC 10632

(a)(5) Consumption reduction methods in the most restrictive stages. Each urban water supplier may use any type of consumption reduction methods in its water shortage contingency analysis that would reduce water use, are appropriate for its area, and have the ability to achieve a water use reduction consistent with up to a 50 percent reduction in water supply.

Table 8-4 presents some consumption reduction methods, separate from the restrictions and prohibitions presented previously. The list in Table 8-5 is limited by DWR and so does not include all possible methods.

- **Expand Public Information** – BCVWD should work with SGPWA and the other retailers in the San Gorgonio Pass to develop a consistent, region-wide message that could include regular articles in the local newspapers, displays at major events, low water using garden workshops, etc. Expand into the schools and service clubs. Work with the high volume water users in the commercial/retail/industrial area to determine if there are water reduction opportunities.

- **Improved Customer Billing** – Provide customers with their historic usage for the past year in graphical format (bar charts) with target levels for water conservation. Provide data on other typical customers in the District's service area.

Table 8-3 Retail Only: Stages of Water Shortage Contingency Plan - Consumption Reduction Methods		
Stage	Consumption Reduction Methods by Water Supplier *These are the only categories that will be accepted by the WUEdata online submittal tool*	Additional Explanation or Reference *(optional)*
Add additional rows as needed		
2	Expand Public Information Campaign	
3	Improve Customer Billing	Provide Historic Record and comparison of use on similar properties. Show targets and actual reductions
4	Provide Rebates for Landscape Irrigation Efficiency	Consider rebates on smart controllers with SGPWA
3	Provide Rebates for Turf Replacement	Work with SGPWA to develop replacement programs
NOTES:		

- **Rebates for Irrigation Efficiency Improvements** – BCVWD should work with SGPWA to provide rebates to improve irrigation efficiency including drip systems and smart controllers. Replacement of spray nozzles with rotating nozzles reduces water consumption significantly and prevents overspray.
- **Rebates for Turf Replacement** -- BCVWD should work with SGPWA to provide rebates to convert turf areas to low water using drought tolerant plantings.
- **Other Methods Not on DWR's List:**
    - Work with the City of Beaumont and developers to install drought tolerant, low water using plantings in common areas and street medians. Reduce turf and planted areas in new home construction.
    - Convert existing street median and common area turf areas to drought tolerant, low water using plantings.
    - Begin using recycled water for landscape irrigation. This method has the greatest potential for reducing potable water use in the BCVWD service area.
    - Restrict construction water use to non-potable water

- Implement more tiers in the rate structure to reflect the cost for purchase of imported water as a result of higher use.

BCVWD does not perform extensive main flushing or any hydrant flow testing. All water taken from fire hydrants is metered and billed.

Determining Water Shortage Reductions

10632(i) A mechanism for determining actual reductions in water use pursuant to the urban water shortage contingency analysis.

The District keeps historic and current pumping records on all of its wells. The imported water delivered by the Pass Agency is metered both by the Pass Agency/DWR Meter and BCVWD's own meter. All of the District's customers are metered. BCVWD's customer billing system retains customer water usage by billing period. Except for water used from hydrants to fight fires or water lost due to accidents breaking fire hydrants, all water taken from hydrants for construction, street sweeping, vactor trucks, etc. is metered. These records are used to determine seasonal and annual fluctuations in water use.

BCVWD can compare pumping records from one year to the next to determine actual reductions in water use. The District, through its billing system, is able to track historic and current use by service account and therefore track customer usage during a drought and evaluate the effectiveness of each conservation measure implemented under this plan.

Revenue and Expenditure Impacts

10632(g) An analysis of the impacts of each of the actions and conditions described in subdivisions (a) to (f), inclusive, on the revenues and expenditures of the urban water supplier, and proposed measures to overcome those impacts, such as the development of reserves and rate adjustments.

Drought Rate Structures and Surcharges

BCVWD does not have a drought rate structure or surcharge in place at this time.

Use of Financial Reserves

Rather than identify the financial impacts of each prohibition on BCVWD's financial position, the impacts will be assessed on a "percent reduction in water demand" basis.

The District's current water rate structure includes a service (meter) charge (bimonthly, regardless of how much water is used), and a 2-tiered commodity charge per 100 cu ft of water used. In addition there is a power surcharge and an imported water surcharge per 100 cu ft of water used.

During times of drought, the revenue from the commodity charge and the power and imported water surcharges would be reduced by an amount equal to the water conservation effort. The meter charge would not be affected. But the reduction in water consumption will also reduce the power consumption needed to pump and produce water and reduce the need for imported water, essentially balancing out the reduction in surcharge revenue.

For 2016, the proposed budget estimated $2.6 million in fixed meter (service) charges and $3.79 million in water sales revenue including agricultural water sales and construction water sales (commodity charge). Water importation surcharges were budgeted at $1.75 million and SCE power surcharge at $1.55 million. So total "variable" revenue would be $7.09 million. The expenses budgeted for chemicals and treatment, electricity and imported water was $2.33 million. The fixed meter (service) charges would not be affected by a reduction in water sales. All of the other revenues and expenses would be.

It is important to note the 2016 budget was based on 8,700 AFY of water sales, which is about 10% less than year 2015 projected ending. So this already represents a conservative position.

Assuming a water reduction of 25% is required for a 2-month long-term interruption, the annual reduction would be (2/12) * 25% or 4.2%. The resultant loss in water sales revenue would be $298,000, i. e, 0.042 *$7.09 million; the reduction in chemicals, electricity and imported water purchase would be $98,000. The net would be an annual loss of revenue of $200,000.

A 50% reduction in water demand for a period of 1 month would result in a similar net annual revenue loss of $200,000.

The costs above do not include additional staff overtime that may be required providing notifications, production, publication, and mailing of notices; updates, water conservation messages, inspection and enforcement. An estimate of $25,000 for each "event" is reasonable to cover these costs. So the total annual impact could be in the $225,000 to $250,000 range.

If water reduction of another 10% on an annual basis were required, i.e., water sales at 7,900 AFY versus the 8,700 AFY budgeted, the impact would be a net loss of $476,000.

The BCVWD audited Financial Report for 2014 showed BCVWD with over $131.6 million in net assets of which $13.5 million was in unrestricted funds. The impact of a net $175,000 loss due to a water reduction of 25% over a 2 month period (or 50% for a 1 month period), or even another 10% reduction on an annual basis will not affect BCVWD's operation. The $476,000 is less than 4% of the District's unrestricted cash assets. As a result, no special action is needed.

Other Measures

BCVWD will be looking a performing a rate review in 2017. The last rate review was in 2010, and the Board of Directors established rates from 2010 through 2015. The 2015 rates are currently in effect. The financial analysis presented above was based on reduced consumption and the 2015 rates.

Resolution or Ordinance

10632(h) A draft water shortage contingency resolution or ordinance.

A draft water shortage contingency resolution is included at the end of this Section.

Catastrophic Supply Interruption

Water Shortage Contingency Planning

10632(c) Actions to be undertaken by the urban water supplier to prepare for, and implement during, a catastrophic interruption of water supplies including, but not limited to, a regional power outage, an earthquake, or other disaster.

Water supplies may be interrupted or reduced significantly in a number of ways –regional and local power outage, an earthquake that damages water delivery or storage facilities, or a contaminated well or water source. This section describes how BCVWD will meet the maximum day demands of their customers and their plans to respond to such emergencies so that emergency needs are met promptly and equitably. Table 8-4 presents the average day and maximum day demands for the period 2005 through 2035 based on BCVWD's maximum day/average day ratio of 2.0. The data was taken from BCVWD's 2015 Potable Water Master Plan and represents a very conservative approach to growth and does not consider any lingering water conservation effect. This provides the backdrop for the sub-sections to follow.

Table 8-4
Historic and Projected Average and Maximum Day Potable Water Demands
(source: 2015 Potable Water Master Plan)--(no conservation effect)

Year	Average Day Demand, AFY	Average Day Demand, mgd	Maximum Day Demand, mgd
2005	9,306[1]	7.4	17.0 actual
2010	11,023[1]	8.3	19.7 actual
2015	10,252[2]	9.2	15.3 actual
2020	14,753	13.17	26.34
2025	16,576	14.80	29.59
2030	18,674	16.67	33.34
2035	20,658	18.44	36.88
2040	22,483	20.07	40.14

[1] Total water demand since potable water used in non-potable system

[2] Total potable water demand and potable water into non-potable system

Regional and Local Power Outage

To meet emergency water needs BCVWD has both gravity storage and wells. Storage can provide for short term power outages; wells, equipped with standby generators or emergency power connections can meet longer term power outages.

Storage

The storage can provide short term water supply for regional or local power outage, i.e., a few hours to one day depending on the time of year and water demand. Approximately 24 MG (72.5 acre-feet) of gravity storage is available as listed in Table 8-5.

The reservoir storage capacity in Table 8-5 does not include the Twelfth and Palm Reservoir (0.4 MG). This serves as an equalization tank for the Twelfth and Palm Boosters. The almost 23.45 MG of gravity storage is more than 2.5 x maximum day based on 2015 conditions. Considering the vast amount of water storage in the Beaumont Basin aquifer, the need for large amounts of above-ground gravity storage is not warranted– provided, of course, there is adequate well capacity to meet the maximum day demands. BCVWD has such well capacity on standby power or capable of being connected to portable standby generators.

Table 8-5
Gravity Storage Reservoirs in BCVWD System

Available Reservoirs	Total Aboveground Storage (MG)	Total Aboveground Storage (AF)
Upper Edgar	0.75	1.5
Lower Edgar	1.0	3.1
Noble & Highland Springs	3.0	9.2
Vineland I, II & III	5.5	18.5
Cherry I,II, and III	4.1	12.3
Taylor	3.9	12.0
Hannon (2650 Zone)	5.0	15.3
3900 Zone (not yet operational)	0.2	0.6
TOTAL	23.45	72.5

Wells

Wells equipped with emergency power or emergency power connections can supply up to a maximum of 14,880 gpm, or 65.7 acre-feet per day (AF/day) or 21.4 mgd and assumes all wells in service. See Table 8-6. This capacity only includes BCVWD's share of the joint wells with the City of Banning. (If there was a regional power outage, the City of Banning would likely need water too, and would rely on their share of the well capacity.)

The District has three portable generators. The portable units have the capability of running up to 50, 350 and 550 horsepower (hp) motors respectively.

BCVWD's wells with standby power or standby power connections can provide water to meet the maximum day demand to the year 2018 assuming all wells with standby power or standby power connections are in service and growth occurs as projected. With conservation, the wells should have capacity to beyond 2020. So a local or regional power outage should have little or no impact. If, however, Well 29, BCVWD's largest well, is out of service for any reason due to mechanical failure, BCVWD will only be able to supply 15.4 mgd and will not be able to meet the maximum day demand during a regional power outage of extended duration. During such an event, water use, e.g., irrigation, will have to be restricted. It should be noted that 15.4 mgd **will** be able to supply an average day to well beyond the year 2035; so the impacts of a regional power outage will depend on the time of year.

BCVWD has plans for the rehabilitation/replacement of Well 2 which should boost capacity by 1,500 gpm (2.2 mgd) or more. This well should be equipped with a generator or standby power connection. As other wells are constructed, they should have standby power to provide back-up and reliability.

Pressure Zone Transfers and Boosting

BCVWD is able to move water between pressure zones through pressure regulators and booster pumping stations. Except for the Cherry Yard Boosters (21A, 21B and 21C), which are used regularly, the other boosters are usually used only for emergency transfers when gravity transfer from higher pressure zones cannot be made.

Boosters 21A and 21B which pump from the Cherry Reservoir (2750 Zone) to Noble Reservoir (3040 Zone) have transfer switches so a portable generator can be connected. Booster 21C has a natural gas driven pump that has a capability of pumping 1,500 gpm from the Cherry reservoir (2750 Zone) to the Noble reservoir (3040 Zone).

Table 8-6
BCVWD Wells with Standby Power or Connections for Standby Power

Well No.	Location	Total Capacity		Remarks
		GPM	AF/Day	
12	Upper Edgar Canyon	130	0..6	Auxiliary engine drive
14	Upper Edgar Canyon	200	0.9	Portable generator connection
6	Middle Edgar Canyon	250	1.1	Portable generator connection
4A	Lower Edgar Canyon	300	1.3	Portable generator connection
16	BSU (Vineland)	800	3.5	Portable generator connection
21	BSU (Cherry Ave)	2,100	9.3	Portable generator connection
22	BSU (Michigan Ave)	1,700	7.5	Portable generator connection
23	BSU (Recharge Site)	2,700	11.9	Standby Generator
24	BSU (Brookside)	1,250	5.5	Standby Generator (only BCVWD's Share of Capacity Shown – total = 2500 gpm)
25	BSU (Starlight)	1,250	5.5	Standby Generator (only BCVWD's Share of Capacity Shown – total = 2900 gpm)
26	BSU (Snapdraggon)	825	3.6	Standby Generator (only BCVWD's Share of Capacity Shown – total = 1650 gpm) Pumps to Potable and Non-potable System
29	BSU (Sunny Cal Egg)	4,000	17.7	Standby Generator
Total Wells with Standby Power or Standby Power Connections		15,505	68.4	22.3 mgd capacity
Total Wells with Standby Power or Standby Power Connections with Well 29 out of service and 26 to Non-potable System		10,680	47.2	15.4 mgd capacity
Total All Wells incl. Edgar Canyon		18,935	83.7	27.3 mgd capacity

There is an emergency booster at the Well 4A site with a 100 hp motor; which is rated at 500 gpm and can boost water from the 3040 Zone to the Upper Edgar Tank (3620 Zone), BCVWD's

highest active pressure zone. In addition, the 50 hp Noble Tank Booster, which has a rated capacity of 500 gpm, can boost water from the 3040 Zone to the 3330 Mesa Pressure Zone.

Stationary backup generators with automatic transfer switches were installed at the headquarters building and at Highland Springs Hydropneumatic system.

Summary

BCVWD is well positioned with a combination of ground storage, wells with standby power or standby power connections and pressure zone boosters to weather extended local or regional power outages. If BCVWD's largest well is out of service for mechanical reasons and demands are high due to climatic conditions, there will be a need to initiate water restrictions to reduce the demands.

As population increases as projected, additional well capacity will be needed to keep pace with the maximum day demand. New wells will be equipped with standby power generators.

Earthquake or Other Natural Disasters

BCVWD Facilities

The San Andreas Fault passes through the San Gorgonio Pass area about 8 to 10 miles north of the center of BCVWD's service area. If a major earthquake were to occur along the San Andreas Fault in the Pass area many of the BCVWD's facilities could be affected.

The Cherry Tanks, Upper Edgar Tank, Taylor Tank, the Vineland Tanks and the Hannon Tank are all equipped with flexible connectors (EBBA Iron Flex-tends) for movement during an earthquake. Upper Edgar, Cherry Tank III, Vineland II and III, and Taylor Tank are all anchored to their ring wall foundation and have been designed to resist seismic shaking. These are all relatively new tanks constructed since year 2000 and designed and constructed to recent AWWA standards. These tanks should be capable of resisting significant earthquake shaking. BCVWD's other tanks were designed according to AWWA standards in effect at the time they were constructed; but over time the design standards have improved and become more stringent. The greatest vulnerability will be with the older steel tanks.

Experience with other earthquakes, e.g., Landers, magnitude 7.3 (1992), has shown steel water tanks survive but do suffer some minor structural damage. Observations of some of the water tanks showed the inlet/outlet piping sheared off and some "elephant footing" of the side wall occurred but the tanks remained intact. This is what would be expected with BCVWD's older tanks. The newer tanks should survive with little or no damage. The older tanks should be able to be put back into service within a week, if not sooner.

Wells and well pumps could be damaged during a very severe earthquake but they should be able to be returned to service within a month depending on the availability of replacement parts and equipment to repair the pumps.

Piping breaks could be expected to occur, but these can be repaired fairly quickly. BCVWD has an inventory of repair clamps, fittings and pipe as well as staff and equipment to make these repairs.

BCVWD has also constructed emergency "interties" at various locations along Highland Springs Road so that water can be supplied in either direction between the City of Banning and BCVWD.

Another threat is fire in the watershed which could cause damage to wells in Little San Gorgonio Canyon (Edgar Canyon). A severe fire could damage and make inoperable some or all of the eleven active wells in the canyon. Damage could occur to power and telemetry poles, electrical panels, pump house roofs etc. If all of the wells in Edgar Canyon were put out of service, BCVWD would lose about 2.2 mgd (or about 8 percent) of its well capacity. This can be made up by the Beaumont Basin wells; so the impact from a water supply standpoint would be minimal. In this case there would be a financial impact since the replacement water from the Beaumont Basin would be more costly to pump.

Each well is in a concrete masonry block building, but the roof and electrical power lines/poles are vulnerable to fires. A severely burned watershed could present a problem if heavy rains cause mud and debris flows that make access into the canyon difficult. One of the largest fires in the District was the Repplier Fire 11/2/1993 to 11/4/1993 which burned 8,000 acres and caused 2,000 people to be evacuated from Cherry Valley[1]. The cause was determined to be arcing power lines. No District facilities were impacted though the fire did surround the District's "middle houses." No water supply outages occurred. In fact the fire fighters relied on BCVWD water supply facilities to fight the fires.

The bulk of the watershed where the wells are located is owned by BCVWD. BCVWD rigorously controls entry which minimizes the fire danger; but the threat is always there. BCVWD has established procedures for fires in the watershed with a number of the staff actually experiencing them in the past.

Imported Water Interruptions

The SWP California Aqueduct could be interrupted for a number of reasons including:

- Earthquake or extremely high floods destroying levees in the Sacramento-San Joaquin Delta
- Earthquake damage to the aqueduct or any of its major pumping stations
- Subsidence/slippage/flooding of the aqueduct

[1] The Southland Firestorm: Week 2: Latest Southland Fires (1993). Los Angeles Times, Cecilia Rasmussen, researcher, Nov. 3.

Levee Destruction

The U.S. Geological Survey indicated a 63 percent chance of a magnitude 6.7 quake in the next 30 years in the Bay/Delta Area. A 6.7 quake could create a collapse of the 100-year-old levees that channel Delta water, causing saltwater to flood in (dam break in reverse) and contaminate the supply [2] A seismic event creating levee breeches could create an outage of 1 to 2 years[3] A report by the U.S. Department of the Interior, indicated a large earthquake with significant levee breaches could cause disruption in the water supply for 28 months.[4] Based on this, it is not unreasonable to assume the SWP would not be delivering water for at least 2.3 years or say 2.5 years minimum.

Land subsidence in the Delta has been on-going since the 1800s as the peat soil dries and oxidizes. The land subsidence creates increased water level differences and increased water pressures on the levees which increases the risk of breach from causes other than seismic events.

Since 1900 there have been 163 levee breaches which flooded 114 islands. Fifty-one of the breaches have occurred since 1970 about the time the SWP began operation and Oroville Dam was constructed. One levee break occurred in 2004 at the Jones Tract. The cause of the failure was unknown. It happened in June and took about 1 month to "seal" the breach and almost six months to pump out the flooded island.[5] These breaches have not caused significant disruption in the SWP delivery up until now.

Climate is always changing which will bring its own stresses on the Delta levees. Sea level rise will exacerbate the water level differential over time, increasing hydrostatic pressures on the levees. Climate changes will affect the hydrologic response of the Sacramento-San Joaquin River watersheds resulting in higher peak flows and less snowmelt. This will mean higher peak

flows earlier in the season than the levees have historically experienced. This in combination with sea level rise will cause increased water pressure on the levees.[6]

In summary, climate change, subsidence, and aging levees will increase the risk of levee breach and the "Jones Tract" experiences can be expected to become more frequent and more severe. However, these should be less catastrophic than a significant seismic event causing an outage of supply due to numerous levee breaches and salt water intrusion shutting down deliveries for as much as 2.5 years or perhaps longer.

Aqueduct or Pump Station Damage

The California Aqueduct could be ruptured by displacement on the San Andreas Fault, and supply may not be restored for a three to six week period or perhaps even longer. The situation would be further complicated by physical damage to the pumping equipment of the electrical switchgear. These repairs could take a number of months depending on the severity.

One of the SWP's important design engineering features is the ability to isolate parts of the system. The Aqueduct is divided into "pools." Thus, if one reservoir or portion of the California Aqueduct is damaged in some way, other portions of the system can still remain in operation and supply water. For example, if the Banks Pumping Plant in Tracy were to be out of service or the aqueduct out of service between Banks Pumping Plant and San Luis Reservoir, water could be delivered into the East Branch from water stored in San Luis Reservoir or Silverwood Reservoir. Similarly if the Edmonston Pumping Plant or the aqueduct either upstream or downstream of Edmonston Pumping Plant were out of service, water to the East Branch could be delivered from water stored in Silverwood Reservoir.

If however, there was damage to the Devil Canyon Power Generating Station or the penstocks leading to it, the East Branch Extension bringing water to the Pass Water Agency would be out of service. The length of service outage could be 6 months or more depending on the severity.

Aqueduct Subsidence, Slippage and Flooding

The Aqueduct is subject to damage from a wide variety of causes. Past examples include slippage of aqueduct side panels into the California Aqueduct near Patterson in the mid-1990s, the Arroyo Pasajero flood event in 1995 (which also destroyed part of Interstate 5 near Los Banos), and various subsidence repairs needed along the East Branch of the Aqueduct since the 1980s. All these outages were short-term in nature (on the order of weeks), and DWR's Operations and Maintenance Division worked diligently to devise methods to keep the Aqueduct in operation while repairs were made. Thus, the SWP contractors experienced no significant

[6] Lund, J. et. al. (2007). Envisioning Futures for the Sacramento-San Joaquin Delta, Public Policy Institute of California.

interruption in deliveries.[7] These events would not have a significant impact on water deliveries to the Pass Agency assuming there is adequate storage in Silverwood Reservoir.

Summary

In the event of a major catastrophe which caused an outage of the State Water Project for an extended period of time, e.g., a year or more, BCVWD would be relying on its own Beaumont Basin storage account to make up the difference. In the event the outage is long enough to deplete the District's storage account, BCVWD could request Watermaster to temporarily waive the need for immediate replenishment and give permission to draw on the Basin. There is over 2 million acre-ft of water in storage in the basin, and short term "mining" will have little impact on the overall water levels in the basin. In this event, BCVWD would begin to implement some water use restrictions. BCVWD is in a unique position that interruptions in supply can easily be accommodated.

Water Supply Contamination

Contamination of BCVWD's water supply could occur as a result of past or current industrial/commercial operations, old dumps and landfills, on-site wastewater disposal systems, cross-connections, vandalism or terrorism. A cross-connection or bacteriological contamination would be the most serious and require immediate action once detected. The actions that are to be taken and the required notification procedures are in the BCVWD's Emergency Response Plan (ERP). The ERP was developed in 2004 and most recently updated in 2011. It is currently (2016) being reviewed and adjustments are made as needed.

Past Industrial/Commercial Operations etc.

Lockheed Martin Corporation[8`]

Lockheed Martin Corporation used two remote sites near Beaumont, Calif., to test solid rocket propellant and motors, weapons, and ballistics. Contamination related to these operations has been identified at both sites—Potrero Canyon and Laborde Canyon. Although the sites are owned or managed by entities other than Lockheed Martin today, Lockheed Martin has assumed responsibility for environmental cleanup at both locations.

The Potrero Canyon site is south of Beaumont and not overlying any of the Beaumont Basin. BCVWD is not extracting any groundwater from this area. Laborde Canyon is located

[7] Kern County Water Agency (2010). Urban Water Management Plan Update.

[8] http://www.lockheedmartin.com/us/who-we-are/sustainability/remediation/beaumont.html Accessed 09052012

southwest of the City of Beaumont in the San Timoteo Badlands and also does not overly the Beaumont Groundwater Basin.

Other Contaminated Sites

The Regional Board's Geographic Environmental Information Management System (GEIMS/GeoTracker) was reviewed for contaminated sites in the BCVWD service area. There are 3 "open" sites in Beaumont; two are in the remediation phase; one is in the site assessment phase. There are 8 "closed" sites which means the Regional Board has approved the remediation or the site was not considered to need remediation. There were 4 sites identified in Cherry Valley; all have been closed.

On-site Wastewater Disposal Systems

BCVWD has been monitoring the nitrate concentration in its wells over the years and has noticed a gradual increase in some wells. At this point in time, no wells are shut down because of nitrate contamination.

The University of California Riverside (UCR), under contract with the SWRCB, conducted a water quality assessment of Beaumont Management Zone with the specific objective of looking at nitrate contamination from on-site wastewater disposal systems.[9]

Forty wells and 11 surface water sites were sampled and analyzed in the UCR study. In the central part of the BMZ, i.e., generally in Cherry Valley, several wells "showed clear signs of contamination by septic systems. The groundwater within the central part of Cherry Valley appeared to be more strongly affected by septic systems than groundwater on the periphery of Cherry Valley. Several wells had measureable concentrations of pharmaceuticals and personal care products (PPCPs) and major anions and cations suggesting septic waste was entering the groundwater system.[10]"

Figure 8-1 shows historical trends in the nitrate concentrations in the BCVWD's wells; wells 1, 16 and 21 are in the Beaumont Basin; wells 4 and 5 are in lower Edgar Canyon.

[9] Univ. of California Riverside (2012). Final Report: Water Quality Assessment of the Beaumont Management Zone: Identifying Sources of Groundwater Contamination Using Chemical and Isotope Tracers. SWRCB Agreement No. R*-2010-0022, Department of Environmental Sciences, Riverside, CA 92521, Feb 3.

[10] Ibid, pg 27

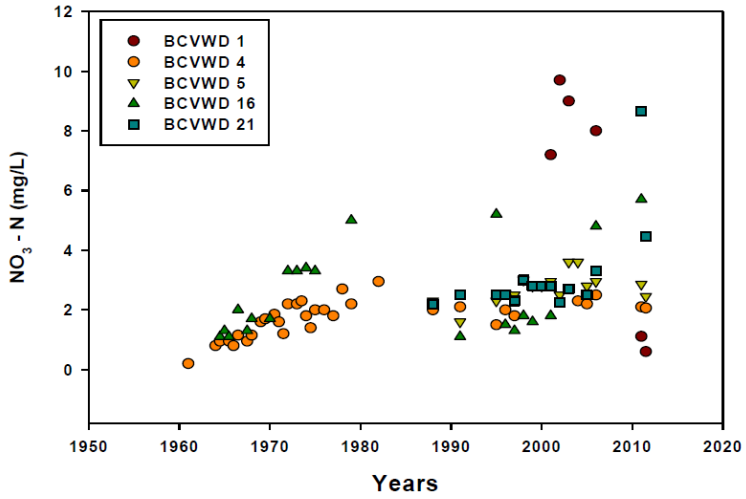

Figure 8-1
Historical Trends in Nitrate-N Concentration in Selected BCVWD Wells11
(MCL for NO3-N = 10 mg/L)

BCVWD has been able to deal with the nitrate concentrations by blending with other lower nitrate source waters when it has become an issue. The last time was in 2006-07 when the District was required by CDDW to monitor nitrate concentration in Well 16 and the 2850 zone reservoir on a regular basis. It is believed that the nitrate incidents may occur again. At some point in time it may be necessary to either install well-head treatment for nitrate removal (ion exchange or reverse osmosis) if blending alone cannot mitigate the problem. If the problem gets worse, sewers may need to be installed in the more densely developed portions of Cherry Valley.

Vandalism and Terrorism

Vandalism and terrorism-related contamination are remote possibilities; nevertheless they could occur. BCVWD has installed intrusion alarms on its new well pump buildings and reservoirs and other critical facilities. Cameras have been installed at the District headquarters and elsewhere. Vandalism has not been a cause for concern in the past; terrorism can be cause for concern; however, BCVWD did have a Vulnerability Assessment and Emergency Response Plan prepared as required by the US EPA after 9/11/2001 attacks. The Vulnerability Assessment is a sensitive document and is kept confidential on file with BCVWD's Director of Operations. The document outlines steps and procedures to be implemented to prevent or minimize terror incidents.

[11] Ibid

BCVWD Actions Needed During Water Supply Interruption

BCVWD has a water system Emergency Response Plan which is reviewed annually. It was last updated in May 2011 and is currently under review. This ERP identifies the actions to be taken, emergency reporting stations, notification and alert process, and procedures for various emergencies. These actions will not be repeated here.

Impact of Local Interruptions of Supply, Vandalism and Terrorism

BCVWD has its own field crews, equipment and materials to respond promptly and make emergency repairs to the water system should vandalism occur. Several of BCVWD's operations staff live on District property in Little San Gorgonio Canyon and so are able to respond to emergencies quickly. There is always an on-call staff person. Operations staff can "poll" the telemetry system remotely with laptop computers to make adjustments and identify problems. When an interruption occurs, such as a pipeline main break, BCVWD staff will immediately respond and isolate the main and stop the leak. That is their first duty. They then assess the situation and determine what needs to be done next. Time permitting they will notify the affected customers of the outage and its expected duration.

BCVWD's Emergency Response Plan contains the procedures to be followed and the required notification process when cross-connections, bacteriological contamination, or other emergency action is required by the CDDW.

The ERP provides specific details on dealing with terror attacks on the water system. This is confidential.

Impact of Longer Term Aqueduct Interruptions

As stated previously, BCVWD is fortunate to have the Beaumont Groundwater Basin available to meet demands even during extended periods of imported water supply outages. BCVWD has an 80,000 AF authorized storage account. As of December 31, 2015, BCVWD's storage account had a balance of 25,568 AF[12]. At the current demand (2015) of about 6,100 AFY for imported water, the amount of water presently in storage is sufficient to meet BCVWD's imported water demands for about four years even if no imported water is available. (Note this does not include the District's additional demand for imported water banking.)

Outage Due to Contamination

Well outage due to contamination, not terrorism-related and not bacteriological, typically occurs gradually. Because of regulatory testing, these problems are identified quickly and appropriate action is taken in accordance with the District's Emergency Response Plan.

[12] 2015 Annual Report (2016). Beaumont Basin Watermaster, Draft, August.

The most serious incident in the past occurred at Wells 1, 16 and 21 where nitrate spiking occurred. Well 1 pumps into a small reservoir at 12th and Palm Avenue which receives water from another well (Well 3 and ultimately Well 2 when it is put back into service). Both Wells 2 and 3 are low in nitrate, so the nitrate spike can easily be blended down to meet the MCL before it is introduced into the distribution system by the 12th and Palm Boosters. Well 16 and 21 pump into a reservoir (Vineland and Cherry respectively). These reservoirs receive water indirectly from a number of other low nitrate wells. Blending is carefully monitored to ensure there is ample low-nitrate water in the reservoir to meet the MCL. So far this has not been an issue and the system blending has complied with CDDW requirements. If these wells increase in nitrates, blending may not be a solution and treatment will be required.

On July 1, 2014 the SWRCB DDW established an MCL for hexavalent chromium (Cr+6) at 0.010 mg/L (10 µg/L). The first step in the implementation was sampling of the District's wells. Amounts just over the MCL were detected in several wells. This hexavalent chromium is due to natural causes. In response to state-mandated hexavalent chromium testing, Well 25 was rehabilitated and Well 26 was modified to pump to the non-potable water system in lieu of providing wellhead treatment at this time. In the future, well head treatment may be installed.

Actions taken during outages due to cross-connection or bacteriological contamination are in the Emergency Response Plan and were discussed above.

Advisory Reductions for Short-term Interruptions

A short-term interruption could result in district-wide water shortage, e.g., several major production wells out of service for maintenance, bacteriological contamination etc., or a localized water shortage, e.g., transmission main break, reservoir out of service, etc. In the latter case, reduction in demand would only be required in a small (localized) portion of the service area.

Localized Interruption

If the interruption is localized, BCVWD staff would typically go "door to door" in the affected area notifying the affected customers of the interruption and the estimated time to get the water supply "back to normal." The purpose is to request the customers to voluntarily reduce their water use until the situation can be remedied. Staff will suggest that they do the following:

1. Avoid watering lawns, washing cars (except at commercial car washes), and filling or adding make-up water to swimming pools
2. Minimize use of water using appliances, e.g., automatic washing machines and dishwashers, i.e., full loads only.
3. Use water wisely within the house, shorten showers, minimize faucet running time, etc.
4. Stop using water from hydrants for construction and dust control

5. Reduce park, school and street median landscape watering to the minimum needed to sustain plant life.

Once the short term emergency is over, BCVWD staff will again notify the customers that the water supply is "back to normal," thank them for using water wisely and encourage them to continue to do so.

District-wide Interruption

If the interruption is District-wide, individual customer notification is not practical. A more extensive outreach program is needed.

BCVWD management will notify the District's Board of Directors, City of Beaumont elected officials and management, and the Riverside County Supervisor whose district covers the service area of the District-wide interruption, as appropriate. In addition BCVWD will notify the newspapers, e.g., Riverside Press-Enterprise, Banning Record Gazette, etc., cable TV provider (Time Warner), and local radio stations in Riverside, San Bernardino, and the Coachella Valley, including the Spanish language stations In addition a notice will be posted on the BCVWD website.

Consumers will be urged to conserve water by taking the steps listed above for a localized interruption. Once the short term emergency is over, BCVWD staff will again notify all of the local elected officials, newspapers and cable TV and radio stations that the water supply is "back to normal," thank them for their conservation efforts and encourage customers to continue to use water wisely.

Minimum supply Next Three Years

§10632(b) An estimate of the minimum water supply available during each of the next three water years based on the driest three-year historic sequence for the agency's water supply.

Table 8-7 (DWR Table 8-4) presents a summary of the water supply available over the next 3 years (2016, 2017, and 2018). Table 8-8 provides the back-up for Table 8-7.

Table 8-7
(DWR Table 8-4) Minimum Water Supply Next Three Years (2016 – 2018)

DWR Table 8-4 Retail: Minimum Supply Next Three Years			
	2016	2017	2018
Available Water Supply	13,826	9,650	4,508
NOTE: 2016 based on BCVWD receiving 9,870 AF per SGPWA email. Year 2017 and 2018 assumes 35% and 5% SWP Allocation as used in Stress Test. SPW amounts per SGPWA for Stess Test Analysis.			

Table 8-8
Minimum Water Supply Available Next 3 Years

	YEAR		
	2016	**2017**	**2018**
DEMAND			
Potable Water Demand, AFY	11,110	12,020	12,930
Non-Potable Water Demand, AFY	1,410	1,530	1,660
Recycled Water Into Non-potable System, AFY	-	-	775
Total Water Demand Supplied from Groundwater, AFY	12,520	13,550	15,365
SUPPLY			
Groundwater			
Edgar Canyon, AFY	1,117	1,117	1,117
Beaumont Basin, AFY	2,839	2,791	2,826
Imported SPW,AFY	9,870	5,742	565
Subtotal Supply, AFY	13,826	9,650	4,508
From (to) Banked Beaumont Basin Storage, AF	(1,306)	3,900	10,857
BCVWD Beaumont Basin Storage Account Balance, AF	26,874	22,974	12,117

The assumptions in Table 8-8 are:

- The non-potable water system is supplied by non-potable water from the Beaumont Basin. Non-potable water extractions from the Beaumont Basin are assumed to be considered as extractions from BCVWD's storage account.
- The Edgar Canyon extractions represent the smallest 3-year moving average of pumping from 1983 through 2015.
- For the SPW supply for 2016, the allocation to each Contractor is 60%; so the Pass Agency will receive 60% of 17,300 AFY, their Table A amount, or 10,380 AF. Communication from SGPWA indicated BCVWD would receive 9,870 AF for 2016[13]. For the succeeding years, the allocation will follow the period 2013 (35%) and 2014 (5%) as assumed in BCVWD's Self-certification provided to DWR in response to the Drought Emergency Water Conservation directive. These amounts, (5,742 AFY and 565 AFY), were provided to BCVWD by SGPWA.
- Recycled water delivery is assumed to start in 2018.

[13] Email. J. Davis GM SGPWA to E. Fraser, GM BCVWD, April 26, 2016.

- Banked storage in BCVWD's account at the end of 2015 was 25,568 AF.[14]
- An increase in demand of 22.7% from 2016 to 2020.
- Beaumont Basin available groundwater is determined by Watermaster based on a projection of reallocation of unused overlier rights.[15]

The result shows that BCVWD will still have over 12,000 AF in storage at the end of 2018. Even if recycled water has not started, there will still be over 11,300 AF in storage. With some conservation, there will be even more water remaining in storage. This is close to a 1-year supply.

Reconciliation with Self-certification Report

BCVWD submitted a Self-certification Report to DWR in response to the Drought Emergency Water Conservation directive. The Self-certification Report covered the 3-year period 2017 through 2019. The assumptions in the Self-certification Report were slightly different that in Table 8-8. In the Self-certification Report:

- The water was the average of 2013 and 2014 demands demand and remained constant for the 3-year period rather than increasing as in Table 8-8.
- Edgar Canyon supply was the average of years 2013 through 2015 as opposed to the minimum 3-year moving average used in Table 8-8.
- BCVWD did not include any recycled water.
- The reallocated unused overlier rights were based on the 2014 Watermaster Annual Report vs. the 2015 Watermaster Annual Report in Table 8-8.
- The amount of water in banked storage in January 2017, the start of the Self-certification Report evaluation, was estimated to be 27,576 AF.
- The amount of groundwater in banked storage at the end of the 3-year Self-certification period was 16,831 AF

The analysis presented in Table 8-8 represents a more severe drought analysis although in either case, BCVWD has water, in storage, even after the extension of the drought.

DRAFT

RESOLUTION _____

**RESOLUTION OF THE BOARD OF DIRECTORS
OF THE BEAUMONT CHERRY VALLEY WATER DISTRICT
WATER SHORTAGE CONTINGENCY REGULATIONS**

The Board of Directors of the Beaumont Cherry Valley Water District (District) does hereby resolve:

WHEREAS, the Urban Water Management Plan (UWMP), 2015 Update, adopted by the Board contains provisions relating to water shortages and contingencies due to catastrophic outage of state, regional and District supply facilities, hydrologic conditions resulting in lower than normal water supply or other factors which prevent the District from providing as much water as is customary; and

WHEREAS, the District endeavors to supply water in sufficient quantities to protect public health; and

WHEREAS, the District has established four stages of action in the UWMP 2015 Update which impose both voluntary and mandatory reductions in water use depending on the severity of the shortage,

NOW, THEREFORE, BE IT RESOLVED, by the Board of Directors of the District as follows:

1. The General Manager is hereby authorized to declare a Water Shortage according to the Water Shortage Contingency Plan in the UWMP 2015 Update
2. The General Manager is hereby authorized and directed to implement the various stages identified in the UWMP 2015 Update
3. The General Manager shall monitor water use and recommend to the Board of Directors additional measures as may be required to conserve water resources and ensure public health.

ADOPTED this _____

BEAUMONT CHERRY VALLEY WATER DISTRICT

_____

President of the Board of Directors of the
Beaumont Cherry Valley Water District

Section 9

Demand Management Measures

The goal of this Demand Management Measures (DMM) section is to provide a comprehensive description of the water conservation programs that BCVWD has implemented, is currently implementing, or plans to implement in order to ensure its customers use water wisely and the District meets its urban water use targets. During the period May 2015 through April 2016, BCVWD was able to reduce water consumption by 24% from the same period in 2013; but this was still below the target value of 32%. This was accomplished with two days per week landscape irrigation and Stage 2 water restrictions.

The section on the California Water Code (CWC) addressing DMMs was significantly modified in 2014 to simplify, clarify and update the DMM reporting requirements. This was done by reducing the 14 specific measures in previous UWMPs to 6 more general requirements plus an "other" category.

Demand Management Measures for Retail Agencies

CWC 10631

(f) Provide a description of the supplier's water demand management measures. This description shall include all of the following:

(1)(A) … a narrative description that addresses the nature and extent of each water demand management measure implemented over the past five years.

CWC 10631

(f)(A)…The narrative shall describe the water demand management measure that the supplier plans to implement to achieve its water use targets pursuant to Section 10608.20.

The narrative pursuant to this paragraph shall include descriptions of the following water demand management measures:

Water waste prevention ordinances.

Metering.

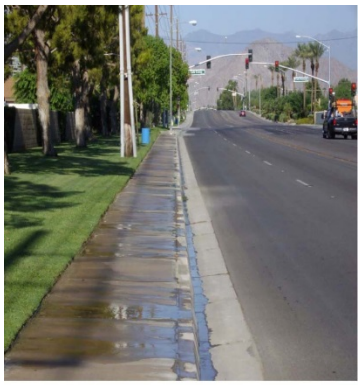
Conservation pricing.

Public education and outreach.

Programs to assess and manage distribution system real loss.

Water conservation program coordination and staffing support.

Other demand management measures that have a significant impact on water use as measured in gallons per capita per day, including innovative measures, if implemented.



Water Waste Prevention Ordinances

Section 9.6 of the District's Rules Governing Water Service states the following:

> *It is a violation of these Regulations:*
>
> *3) To cause or permit the waste of water from the water system or to maintain or cause or permit to be maintained any leaky outlets, apparatus or plumbing fixtures through which water is permitted to waste;*
>
> *4) To use water for washing sidewalks and driveways in a manner that prevents the usual and customary use of public streets and sidewalks by others;*
>
> *5) To permit water sprinklers to spray onto sidewalks and streets or to permit water to run from the consumer's property onto public sidewalks and streets to cause risk and/or damage to the public or to public and private property;*

Section 15 of the District's Rules Governing Water Service states the following:

> *No person, firm or corporation shall use, deliver, or apply waters received from this District in any manner that causes the loss, waste, or the application of water for unbeneficial purposes. Within the meaning of this Regulation, any waters that are allowed to escape, flow, and run into areas which do not make reasonable beneficial use of such waters, including but not limited to streets, gutters, drains, channels, and uncultivated lands, shall be presumed to be wasted contrary to the prohibitions of these Rules and Regulations.*

The Regulations for Water Service have a series of warnings/penalties. The first notice is a written warning; the second offense results in a doubling of the water charges until full compliance is attained. After the third offense, the District can terminate water service to the customer.

BCVWD Board of Directors adopted Resolution No. 2016-05 implementing new water use restrictions. The new resolution prohibited, among others:

- Use of potable water on driveways and sidewalks
- No washing of cars unless the hose had an shutoff valve
- Serving of water to restaurant guests unless specifically requested
- No irrigation within a rain event or 48 hours afterwards
- Giving hotel/motel guests the option of reusing their own towels
- No fountain use except recirculating type

In addition the District set up a "water waster hotline" which would accept anonymous calls. Customer Service Representatives would respond to these calls and request one of the District's operations staff to investigate. Calls were taken for leaks, water running in gutters, etc.

Implementation: The District already has the ordinance in place. Also, recycled water shall be used wherever available.

Metering

> ***CWC 526***
>
> *Notwithstanding any other provisions of law, an urban water supplier that, on or after January 1, 2004, receives water from the federal Central Valley Project under a water service contract or subcontract... shall do both of the following:*
>
> *On or before January 1, 2013, install water meters on all service connections to residential and nonagricultural commercial buildings... located within its service area.*
>
> ***CWC 527***
>
> *An urban water supplier that is not subject to Section 526 shall do both the following:*
>
> *Install water meters on all municipal and industrial service connections located within its service area on or before January 1, 2025.*

All of BCVWD's services are metered. This includes all residential, commercial/retail, industrial, institutional and landscape irrigation connections. In addition BCVWD meters construction water taken from hydrants and street sweeping and vactor truck water. On-site fire services are metered to prevent theft. BCVWD has a regular program of replacing meters. Meters are read every other month; landscape and other high volume users are read monthly.

BCVWD had some Automatic Meter Reading (AMR) systems installed when they first came available. These are now in the process of being replaced on a gradual basis with newer, more effective AMR devices. These can be very effective at identifying leaks at the customer service side and reduce meter reading time.

Implementation: This is already in place with AMR starting to be installed.

Conservation Pricing

BCVWD has rate schedule (effective 1/1/2013) that includes a:

- Service (meter) charge which depends on the size of the meter. The larger the meter, the larger the bi-monthly service charge
- Commodity charge which is two tiered. For single family residences from 0 – 44 HCF and greater than 45 HCF. The unit price for water use over 45 HCF is a little over 9% more than the unit price from 0 to 44 HCF. For multi-family residential, the first block rate is from 0 – 35 HCF; the second is over 36 HCF. The unit price for the second block rate is about 2% more than the first block rate. This accounts for the generally lower family incomes in multi-family residences.
- SCE Power Charge per HCF to cover a portion of the cost of pumping power. This is applied to all water sold.
- State Project Water Charge per HCF to cover the cost of importing SPW.

Implementation: BCVWD will be evaluating its rate structure late in 2016 or earl 2017 to eliminate non-conserving pricing structures and consider including additional tiers for more incentives.

Public Education and Outreach

BCVWD provides water conservation literature in the lobby where customers pay their bills or enter for District Board Meetings. The District's web site http://www.bcvwd.org/tips.html has over one hundred water conservation tips. In addition the District constructed its own demonstration water conservation garden that is open 24/7 at the District's groundwater recharge facilities. Many of the plants are identified. There are marked trails and pathways through the garden and picnic tables and barbecue pits. The public is free to enjoy the gardens anytime. An annual fishing derby is held at the site in cooperation with the Parks and Recreation District.

All new customers requesting water service are told about water conservation and water restrictions by the customer service representatives.

The District presently does not make a special effort to promote water conservation at local schools. District staff are available on an "as requested" basis to explain the benefits of water conservation and its importance on the community.

Implementation: The public information programs are ongoing and information is provided as needed. District staff may consider coordinating with School District staff, events where information packets on water conservation and water savings techniques can be distributed to students. Once recycled water is provided to the schools, BCVWD will be much more active with the schools as part of the on-site inspections and working with the school's on-site recycled water site supervisor. This could evolve into a regular presentation to all entering freshmen and transfer students to educate them in the recycled water system and the need for water conservation programs.

Programs to Assess and Manage Distribution System Real Loss

Much of the BCVWD water system is new having been installed within the last 15 years or so with the housing boom. Older leak-prone lines are replaced; BCVWD has developed and funded a Capital Improvement Program to replace aging and leaking pipes over the next 5 to 19 years. Water distribution lines are routinely checked and/or tested for leaks; when leaks are found they are promptly repaired.

BCVWD annually performs a distribution system water audit comparing the amount of water produced from wells to the amount of water used by consumers (as reported by metering readings). The District meters construction water and private fire systems. Very little water is unmetered. After allowing for authorized unmetered uses such as fire fighting, main flushing, and public use, it can be assumed that the remaining unmetered water is explained by inaccurate meter readings, malfunctioning valves and leakage, and theft. The District has very little unaccounted-for or non-revenue water.

To save water, the District does not perform hydrant flow testing. Fire flow verification is performed on the District's calibrated computer model.

Implementation: The District has an ongoing schedule to inspect facilities and periodically calibrate master water meters. The District has already implemented leak detection measures. Water system audits are generally done at least once a year

Water Conservation Program Coordination and Staffing Support

The District presently does not have a designated conservation coordinator. All conservation and water use restriction information is provided by the District's Customer Service Representatives. BCVWD has been operating at reduced staff levels to keep expenditures to a minimum so that water rates do not have to be raised. During these economic times, it is very difficult to justify such a position when BCVWD staff has been reduced to a minimum.

Implementation: The District is a small agency and funding a full time water conservation coordinator would have significant financial impacts – perhaps as much as $5 per household per year for just salary and benefits. The District will investigate opportunities regionally through the Pass Agency.

Both Beaumont and Cherry Valley have been classified by the Santa Ana Watershed Project Authority (SAWPA) as disadvantaged or partially disadvantaged communities so it is important to keep rates as low as possible.

Other Demand Management Measures

Conversion to Recycled Water. Currently there are about 300 landscape irrigation connections connected to a non-potable (untreated and recycled) water system. The District has installed over 30 miles of recycled water transmission mains and a 2 MG reservoir for recycled water. The system is separated such that one part (larger part) is currently served by non-potable water Well No. 26, supplemented as needed by potable water discharged through an air gap into the 2 MG reservoir.

The portion of the system with is south of I-10 is pressurized with potable water from the Hannon (2650 Zone Potable Water Tank).

A facilities planning grant application to bring in recycled water from YVWD has been approved by the SWRCB. Discussions are on-going with YVWD for non-potable water from the Henry Wochholz Water Reclamation Facility. Negotiations are on-going with the City of Beaumont for recycled water from their treatment plant. Any recycled water which is introduced into the system will offset the existing potable water demand on a gallon for gallon basis. Currently about 1700 acre-ft/yr (measured through the irrigation meters) is supplied to the landscape irrigation services. The potable demand will be reduced once recycled water is available.

Implementation or Scheduled Implementation

Recycled water will most likely be introduced into the non-potable water system by 2018 to 2020.

Planned Implementation to Achieve Water Use Targets

To achieve the SB7x7 water use targets in Section 5, BCVWD intends to continue and expand implementation of the DMMS presented above. In the future the District may look to partnering and possibly cost sharing with SGPWA for rebate programs. Large and small wholesalers have provided and managed rebate programs on behalf of their member retailers. Both parties benefit.

Within BCVWD's service area, 68 percent of the housing units have been built since 1990; so they have reduced water use plumbing fixtures. In Cherry Valley, the residences have on-site wastewater disposal systems; those homeowners tend to be very frugal with indoor water use anyway. Consequently, low flush toilet rebate programs would not be effective.

With over 60 percent of the housing stock in Beaumont constructed since 2000, there is likely not much opportunity for replacement of dishwashers or washing machines with more water efficient machines. Most of the developers are very conscious of water use and are installing these high efficient devices in their new models.

There may be opportunity for replacement of dishwashers and washing machines in Cherry Valley where the housing stock is older and the residences are on septic tanks.

The implementation of new landscape ordinances at the state and local level will help reduce outdoor water use. Requirements for smart irrigation controllers on new housing will go a long way to reduce outdoor water use. BCVWD believes the greatest opportunity for water savings is conversion of street medians and common area turf areas to more drought tolerant planting materials and converting these irrigated areas to recycled water. The use of recycled water for landscape irrigation is key to BCVWD meeting the water use target.

Section 10
Plan Adoption, Submittal and Implementation

This section describes the public notification, plan adoption, submittal and implementation of BCVWD's 2015 UWMP.

The draft 2015 UWMP was completed on November 2, 2016 and was available for a 10-day public review prior to the public hearing. Copies of the draft 2015 UWMP were available at the BCVWD District Office, 560 Magnolia Avenue, Beaumont, CA 92223 during regular business hours and was posted on BCVWD's website http://www.bcvwd.org/.

A public hearing was held on December 14, 2016 at BCVWD's Board Room, 560 Magnolia Avenue, Beaumont, CA 92223. Board member and public comments and testimony were taken and staff considered all comments and revised the 2015 UWMP as necessary. The final UWMP was adopted by the Board of Directors through a resolution at a meeting at the BCVWD office held on January 11, 2017. The final 2015 UWMP was submitted to DWR within 30 days of Board approval. The final adopted 2015 UWMP was available to the public and was posted on the District's website within 60 days of submission to DWR.

The 2015 UWMP is intended to serve as a general, flexible, open-ended document that periodically can be updated to reflect changes in service area growth and demands, available water supply and conservation policies and practices. The plan will guide the Board and staff through the year 2020 when the UWMP is required to be updated again.

Inclusion of All 2015 Data

BCVWD's 2015 UMWP includes all water use and planning data from calendar year 2015

Notice of Public Hearing

BCVWD held a public hearing on December 14, 2016 prior to having the Board of Directors adopt the Plan. The public hearing provided an opportunity for the public to provide input to the plan before it is adopted. The Board of Directors considered all public input. The hearing was noticed to the nearby cities, the County of Riverside, the County of San Bernardino, and public. Copies of the notification letters are in Appendix C.

Notice of Cities and Counties

CWC 10621

(b) Every urban water supplier required to prepare a plan shall… at least 60 days prior to the public hearing on the plan … notify any city or county within which the supplier provides waters supplies that the urban water supplier will be reviewing the plan and considering amendments or changes to the plan.

CWC 10642

…The urban water supplier shall provide notice of the time and place of hearing to any city or county within which the supplier provides water supplies. A privately owned water supplier shall provide an equivalent notice within its service area…

Table 10-1 is a checklist for the notification of cities and counties required by DWR; Table 10-2 is a summary of agencies and notifications.

Table 10-1 Retail: Notification to Cities and Counties

City Name	60 Day Notice	Notice of Public Hearing
Add additional rows as needed

Notice to the Public

> ***CWC 10642***
>
> *…Prior to adopting a plan, the urban water supplier shall make the plan available for public inspection…Prior to the hearing, notice of the time and place of hearing shall be published within the jurisdiction of the publicly owned water supplier pursuant to Section 6066 of the Government Code…*
>
> ***Government Code 6066***
>
> *Publication of notice pursuant to this section shall be once a week for two successive weeks. Two publications in a newspaper published once a week or oftener, with at least five days intervening between the respective publication dates not counting such publication dates, are sufficient. The period of notice commences upon the first day of publication and terminates at the end of the fourteenth day, including therein the first day.*

Copies of the Public Hearing Notice and dates of publication are included in Appendix F. The Public Hearing was held on December 14, 2016 at the BCVWD District Office, Board Room, 560 Magnolia Avenue, Beaumont CA 92223. Copies of the 2015 UWMP were available at the office during regular business hours. It was also published on BCVWD's websitehttp://www.bcvwd.org/ .

Public Hearing and Adoption

> ***CWC 10642***
>
> *…Prior to adopting a plan, the urban water supplier shall hold a public hearing thereon.*
>
> ***CWC 10608.26***
>
> *In complying with this part, an urban retail water supplier shall conduct at least one public hearing to accomplish all of the following:*
>
> *Allow community input regarding the urban retail water supplier's implementation plan for complying with this part.*
>
> *Consider the economic impacts of the urban retail water supplier's implementation plan for complying with this part.*
>
> *Adopt a method, pursuant to subdivision (b) of Section 10608.20 for determining its urban water use target.*

BCVWD provided information on their baseline water use targets and implementation plan required in the Urban Water Conservation Act of 2009.

The public hearing was held on December 14, 2016. In attendance were Mayor Lloyd White, City of Beaumont, David Fenn, Director, SGPWA, Michael Tidus, Attorney and Jeff Chambers for Pardee Homes, and other members of the public.

Both oral and written comments were taken; Joseph C. Reichenberger PE, senior engineer with BCVWD presented the findings of the 2015 UWMP. A copy of the presentation is in Appendix C. When the public hearing was closed, the Board gave direction to staff to consider all comments and make revisions to the 2015 UWMP Update as required.

The 2015 UWMP was revised by staff to incorporate comments from the public hearing. The revised UWMP was made available at the District Office and posted on the District's website

prior to the date of adoption. On January 11, 2017 at a regular meeting of the Board of Directors, the 2015 UWMP was adopted. The meeting was duly noticed per Government Code.

Plan Submittal

> ***CWC 10621***
>
> *(d) An urban water supplier shall update and submit its 2015 plan to the department by July 1, 2016.*
>
> ***CWC 10644***
>
> *(a)(1) An urban water supplier shall submit to the department, the California State Library, and any city or county within which the supplier provides water supplies a copy of its plan no later than 30 days after adoption.*
>
> ***CWC 10635***
>
> *(b) The urban water supplier shall provide that portion of its urban water management plan prepared pursuant to this article to any city or county within which it provides water supplies no later than 60 days after the submission of its urban water management plan.*

BCVWD's 2015 UWMP will be submitted to DWR within 30 days of adoption and as close to July 1, 2016 as practical. The submittal will be electronic using DWR's WUEdata submittal tool.

A hard copy or CD will be submitted to the California State Library within 30 days of adoption. The addresses are:

California State Library Government Publications Section
P.O. Box 942837 Sacramento, CA 94237-0001
Attention: Coordinator, Urban Water Management Plans

Or if hand carried --

California State Library Government Publications Section
914 Capitol Mall
Sacramento, CA 95814

Public Availability

> *§10645 Not later than 30 days after filing a copy of its plan with the department, the urban water supplier and the department shall make the plan available for public review during normal business hours.*

BCVWD will, within 30 days of filing with DWR, make the plan available to the public at the District's office at 560 Magnolia St., Beaumont, CA 92223 during normal business hours. It will also be posted on the District's website in pdf form for reading/downloading by the public.

Amending an Adopted UWMP

> ***CWC 10621***
>
> *(c) The amendments to, or changes in, the plan shall be adopted and filed in the manner set forth in Article 3 (commencing with Section 10640).*
>
> ***CWC 10644***
>
> *(a)(1) Copies of amendments or changes to the plans shall be submitted to the department, the California State Library, and any city or county within which the supplier provides water supplies within 30 days after adoption.*

If the 2015 UWMP needs to be amended, any amendments or changes will be adopted and filed as described above.

Chapter 4. Miscellaneous Provisions §10650-10656

Chapter 1. General Declaration and Policy

SECTION 10610-10610.4

10610. This part shall be known and may be cited as the "Urban Water Management Planning Act."

10610.2. (a) The Legislature finds and declares all of the following:

(1) The waters of the state are a limited and renewable resource subject to ever-increasing demands.

(2) The conservation and efficient use of urban water supplies are of statewide concern; however, the planning for that use and the implementation of those plans can best be accomplished at the local level.

(3) A long-term, reliable supply of water is essential to protect the productivity of California's businesses and economic climate.

(4) As part of its long-range planning activities, every urban water supplier should make every effort to ensure the appropriate level of reliability in its water service sufficient to meet the needs of its various categories of customers during normal, dry, and multiple dry water years.

(5) Public health issues have been raised over a number of contaminants that have been identified in certain local and imported water supplies.

(6) Implementing effective water management strategies, including groundwater storage projects and recycled water projects, may require specific water quality and salinity targets for meeting groundwater basins water quality objectives and promoting beneficial use of recycled water.

(7) Water quality regulations are becoming an increasingly important factor in water agencies' selection of raw water sources, treatment alternatives, and modifications to existing treatment facilities.

(8) Changes in drinking water quality standards may also impact the usefulness of water supplies and may ultimately impact supply reliability.

(9) The quality of source supplies can have a significant impact on water management strategies and supply reliability.

(b) This part is intended to provide assistance to water agencies in carrying out their long-term resource planning responsibilities to ensure adequate water supplies to meet existing and future demands for water.

10610.4. The Legislature finds and declares that it is the policy of the state as follows:

(a) The management of urban water demands and efficient use of water shall be actively pursued to protect both the people of the state and their water resources.

(b) The management of urban water demands and efficient use of urban water supplies shall be a guiding criterion in public decisions.

(c) Urban water suppliers shall be required to develop water management plans to actively pursue the efficient use of available supplies.

Chapter 2. Definitions

SECTION 10611-10617

10611. Unless the context otherwise requires, the definitions of this chapter govern the construction of this part.

10611.5. “Demand management" means those water conservation measures, programs, and incentives that prevent the waste of water and promote the reasonable and efficient use and reuse of available supplies.

10612. "Customer" means a purchaser of water from a water supplier who uses the water for municipal purposes, including residential, commercial, governmental, and industrial uses.

10613. "Efficient use" means those management measures that result in the most effective use of water so as to prevent its waste or unreasonable use or unreasonable method of use.

10614. "Person" means any individual, firm, association, organization, partnership, business, trust, corporation, company, public agency, or any agency of such an entity.

10615. "Plan" means an urban water management plan prepared pursuant to this part. A plan shall describe and evaluate sources of supply, reasonable and practical efficient uses,

reclamation and demand management activities. The components of the plan may vary according to an individual community or area's characteristics and its capabilities to efficiently use and conserve water. The plan shall address measures for residential, commercial, governmental, and industrial water demand management as set forth in Article 2 (commencing with Section 10630) of Chapter 3. In addition, a strategy and time schedule for implementation shall be included in the plan.

10616. "Public agency" means any board, commission, county, city and county, city, regional agency, district, or other public entity.

10616.5. "Recycled water" means the reclamation and reuse of wastewater for beneficial use.

10617. "Urban water supplier" means a supplier, either publicly or privately owned, providing water for municipal purposes either directly or indirectly to more than 3,000 customers or supplying more than 3,000 acre-feet of water annually. An urban water supplier includes a supplier or contractor for water, regardless of the basis of right, which distributes or sells for ultimate resale to customers. This part applies only to water supplied from public water systems subject to Chapter 4 (commencing with Section 116275) of Part 12 of Division 104 of the Health and Safety Code.

Chapter 3. Urban Water Management Plans

Article 1. General Provisions

SECTION 10620-10621

10620. (a) Every urban water supplier shall prepare and adopt an urban water management plan in the manner set forth in Article 3 (commencing with Section 10640).

(b) Every person that becomes an urban water supplier shall adopt an urban water management plan within one year after it has become an urban water supplier.

(c) An urban water supplier indirectly providing water shall not include planning elements in its water management plan as provided in Article 2 (commencing with Section 10630) that would be applicable to urban water suppliers or public agencies directly providing water, or to their customers, without the consent of those suppliers or public agencies.

(d) (1) An urban water supplier may satisfy the requirements of this part by participation in areawide, regional, watershed, or basinwide urban water management planning where those plans will reduce preparation costs and contribute to the achievement of conservation and efficient water use.

(2) Each urban water supplier shall coordinate the preparation of its plan with other appropriate agencies in the area, including other water suppliers that

share a common source, water management agencies, and relevant public agencies, to the extent practicable.

(e) The urban water supplier may prepare the plan with its own staff, by contract, or in cooperation with other governmental agencies.

(f) An urban water supplier shall describe in the plan water management tools and options used by that entity that will maximize resources and minimize the need to import water from other regions.

10621. (a) Each urban water supplier shall update its plan at least once every five years on or before December 31, in years ending in five and zero, except as provided in subdivision (d).

(b) Every urban water supplier required to prepare a plan pursuant to this part shall, at least 60 days before the public hearing on the plan required by Section 10642, notify any city or county within which the supplier provides water supplies that the urban water supplier will be reviewing the plan and considering amendments or changes to the plan. The urban water supplier may consult with, and obtain comments from, any city or county that receives notice pursuant to this subdivision.

(c) The amendments to, or changes in, the plan shall be adopted and filed in the manner set forth in Article 3 (commencing with Section 10640).

(d) Each urban water supplier shall update and submit its 2015 plan to the department by July 1, 2016.

Article 2. Contents of Plan

SECTION 10630-10634

10630. It is the intention of the Legislature, in enacting this part, to permit levels of water management planning commensurate with the numbers of customers served and the volume of water supplied.

10631. A plan shall be adopted in accordance with this chapter that shall do all of the following:

(a) Describe the service area of the supplier, including current and projected population, climate, and other demographic factors affecting the supplier's water management planning. The projected population estimates shall be based upon data from the state, regional, or local service agency population projections within the service area of the urban water supplier and shall be in five-year increments to 20 years or as far as data is available.

(b) Identify and quantify, to the extent practicable, the existing and planned sources of water available to the supplier over the same five-year increments described in subdivision (a). If groundwater is identified as an existing or planned source of

water available to the supplier, all of the following information shall be included in the plan:

(1) A copy of any groundwater management plan adopted by the urban water supplier, including plans adopted pursuant to Part 2.75 (commencing with Section 10750), or any other specific authorization for groundwater management.

(2) A description of any groundwater basin or basins from which the urban water supplier pumps groundwater. For basins that a court or the board has adjudicated the rights to pump groundwater, a copy of the order or decree adopted by the court or the board and a description of the amount of groundwater the urban water supplier has the legal right to pump under the order or decree. For basins that have not been adjudicated, information as to whether the department has identified the basin or basins as overdrafted or has projected that the basin will become overdrafted if present management conditions continue, in the most current official departmental bulletin that characterizes the condition of the groundwater basin, and a detailed description of the efforts being undertaken by the urban water supplier to eliminate the long-term overdraft condition.

(3) A detailed description and analysis of the location, amount, and sufficiency of groundwater pumped by the urban water supplier for the past five years. The description and analysis shall be based on information that is reasonably available, including, but not limited to, historic use records.

(4) A detailed description and analysis of the amount and location of groundwater that is projected to be pumped by the urban water supplier. The description and analysis shall be based on information that is reasonably available, including, but not limited to, historic use records.

(c) (1) Describe the reliability of the water supply and vulnerability to seasonal or climatic shortage, to the extent practicable, and provide data for each of the following:

(A) An average water year.

(B) A single-dry water year.

(C) Multiple-dry water years.

(2) For any water source that may not be available at a consistent level of use, given specific legal, environmental, water quality, or climatic factors, describe plans to supplement or replace that source with alternative sources or water demand management measures, to the extent practicable.

(d) Describe the opportunities for exchanges or transfers of water on a short-term or long-term basis.

(e) (1) Quantify, to the extent records are available, past and current water use, over the same five-year increments described in subdivision (a), and projected water use, identifying the uses among water use sectors, including, but not necessarily limited to, all of the following uses:

(A) Single-family residential.

(B) Multifamily.

(C) Commercial.

(D) Industrial.

(E) Institutional and governmental.

(F) Landscape.

(G) Sales to other agencies.

(H) Saline water intrusion barriers, groundwater recharge, or conjunctive use, or any combination thereof.

(I) Agricultural.

(J) Distribution system water loss.

(2) The water use projections shall be in the same five-year increments described in subdivision (a).

(3) (A) For the 2015 urban water management plan update, the distribution system water loss shall be quantified for the most recent 12-month period available. For all subsequent updates, the distribution system water loss shall be quantified for each of the five years preceding the plan update.

(B) The distribution system water loss quantification shall be reported in accordance with a worksheet approved or developed by the department through a public process. The water loss quantification worksheet shall be based on the water system balance methodology developed by the American Water Works Association.

(4) (A) If available and applicable to an urban water supplier, water use projections may display and account for the water savings estimated to result from adopted codes, standards, ordinances, or transportation and land use plans identified by the urban water supplier, as applicable to the service area.

(B) To the extent that an urban water supplier reports the information described in subparagraph (A), an urban water supplier shall do both of the following:

(i) Provide citations of the various codes, standards, ordinances, or transportation and land use plans utilized in making the projections.

(ii) Indicate the extent that the water use projections consider savings from codes, standards, ordinances, or transportation and land use plans. Water use projections that do not account for these water savings shall be noted of that fact.

(f) Provide a description of the supplier's water demand management measures. This description shall include all of the following:

(1) (A) For an urban retail water supplier, as defined in Section 10608.12, a narrative description that addresses the nature and extent of each water demand management measure implemented over the past five years. The narrative shall describe the water demand management measures that the supplier plans to implement to achieve its water use targets pursuant to Section 10608.20.

(B) The narrative pursuant to this paragraph shall include descriptions of the following water demand management measures:

(i) Water waste prevention ordinances.

(ii) Metering.

(iii) Conservation pricing.

(iv) Public education and outreach.

(v) Programs to assess and manage distribution system real loss.

(vi) Water conservation program coordination and staffing support.

(vii) Other demand management measures that have a significant impact on water use as measured in gallons per capita per day, including innovative measures, if implemented.

(2) For an urban wholesale water supplier, as defined in Section 10608.12, a narrative description of the items in clauses (ii), (iv), (vi), and (vii) of subparagraph (B) of paragraph (1), and a narrative description of its distribution system asset management and wholesale supplier assistance programs.

(g) Include a description of all water supply projects and water supply programs that may be undertaken by the urban water supplier to meet the total projected water

use, as established pursuant to subdivision (a) of Section 10635. The urban water supplier shall include a detailed description of expected future projects and programs that the urban water supplier may implement to increase the amount of the water supply available to the urban water supplier in average, single-dry, and multiple-dry water years. The description shall identify specific projects and include a description of the increase in water supply that is expected to be available from each project. The description shall include an estimate with regard to the implementation timeline for each project or program.

(h) Describe the opportunities for development of desalinated water, including, but not limited to, ocean water, brackish water, and groundwater, as a long-term supply.

(i) For purposes of this part, urban water suppliers that are members of the California Urban Water Conservation Council shall be deemed in compliance with the requirements of subdivision (f) by complying with all the provisions of the "Memorandum of Understanding Regarding Urban Water Conservation in California," dated December 10, 2008, as it may be amended, and by submitting the annual reports required by Section 6.2 of that memorandum.

(j) An urban water supplier that relies upon a wholesale agency for a source of water shall provide the wholesale agency with water use projections from that agency for that source of water in five-year increments to 20 years or as far as data is available. The wholesale agency shall provide information to the urban water supplier for inclusion in the urban water supplier's plan that identifies and quantifies, to the extent practicable, the existing and planned sources of water as required by subdivision (b), available from the wholesale agency to the urban water supplier over the same five-year increments, and during various water-year types in accordance with subdivision (c). An urban water supplier may rely upon water supply information provided by the wholesale agency in fulfilling the plan informational requirements of subdivisions (b) and (c).

10631.1. (a) The water use projections required by Section 10631 shall include projected water use for single-family and multifamily residential housing needed for lower income households, as defined in Section 50079.5 of the Health and Safety Code, as identified in the housing element of any city, county, or city and county in the service area of the supplier.

(b) It is the intent of the Legislature that the identification of projected water use for single-family and multifamily residential housing for lower income households will assist a supplier in complying with the requirement under Section 65589.7 of the Government Code to grant a priority for the provision of service to housing units affordable to lower income households.

10631.2. (a) In addition to the requirements of Section 10631, an urban water management plan may, but is not required to, include any of the following information:

(1) An estimate of the amount of energy used to extract or divert water supplies.

(2) An estimate of the amount of energy used to convey water supplies to the water treatment plants or distribution systems.

(3) An estimate of the amount of energy used to treat water supplies.

(4) An estimate of the amount of energy used to distribute water supplies through its distribution systems.

(5) An estimate of the amount of energy used for treated water supplies in comparison to the amount used for nontreated water supplies.

(6) An estimate of the amount of energy used to place water into or withdraw from storage.

(7) Any other energy-related information the urban water supplier deems appropriate.

(b) The department shall include in its guidance for the preparation of urban water management plans a methodology for the voluntary calculation or estimation of the energy intensity of urban water systems. The department may consider studies and calculations conducted by the Public Utilities Commission in developing the methodology.

10631.5. (a) (1) Beginning January 1, 2009, the terms of, and eligibility for, a water management grant or loan made to an urban water supplier and awarded or administered by the department, state board, or California Bay-Delta Authority or its successor agency shall be conditioned on the implementation of the water demand management measures described in Section 10631, as determined by the department pursuant to subdivision (b).

(2) For the purposes of this section, water management grants and loans include funding for programs and projects for surface water or groundwater storage, recycling, desalination, water conservation, water supply reliability, and water supply augmentation. This section does not apply to water management projects funded by the federal American Recovery and Reinvestment Act of 2009 (Public Law 111-5).

(3) Notwithstanding paragraph (1), the department shall determine that an urban water supplier is eligible for a water management grant or loan even though the supplier is not implementing all of the water demand management measures described in Section 10631, if the urban water supplier has

submitted to the department for approval a schedule, financing plan, and budget, to be included in the grant or loan agreement, for implementation of the water demand management measures. The supplier may request grant or loan funds to implement the water demand management measures to the extent the request is consistent with the eligibility requirements applicable to the water management funds.

(4) (A) Notwithstanding paragraph (1), the department shall determine that an urban water supplier is eligible for a water management grant or loan even though the supplier is not implementing all of the water demand management measures described in Section 10631, if an urban water supplier submits to the department for approval documentation demonstrating that a water demand management measure is not locally cost effective. If the department determines that the documentation submitted by the urban water supplier fails to demonstrate that a water demand management measure is not locally cost effective, the department shall notify the urban water supplier and the agency administering the grant or loan program within 120 days that the documentation does not satisfy the requirements for an exemption, and include in that notification a detailed statement to support the determination.

(B) For purposes of this paragraph, "not locally cost effective" means that the present value of the local benefits of implementing a water demand management measure is less than the present value of the local costs of implementing that measure.

(b) (1) The department, in consultation with the state board and the California Bay-Delta Authority or its successor agency, and after soliciting public comment regarding eligibility requirements, shall develop eligibility requirements to implement the requirement of paragraph (1) of subdivision (a). In establishing these eligibility requirements, the department shall do both of the following:

(A) Consider the conservation measures described in the Memorandum of Understanding Regarding Urban Water Conservation in California, and alternative conservation approaches that provide equal or greater water savings.

(B) Recognize the different legal, technical, fiscal, and practical roles and responsibilities of wholesale water suppliers and retail water suppliers.

(2) (A) For the purposes of this section, the department shall determine whether an urban water supplier is implementing all of the water demand management measures described in Section 10631 based on either, or a combination, of the following:

(i) Compliance on an individual basis.

(ii) Compliance on a regional basis. Regional compliance shall require participation in a regional conservation program consisting of two or more urban water suppliers that achieves the level of conservation or water efficiency savings equivalent to the amount of conservation or savings achieved if each of the participating urban water suppliers implemented the water demand management measures. The urban water supplier administering the regional program shall provide participating urban water suppliers and the department with data to demonstrate that the regional program is consistent with this clause. The department shall review the data to determine whether the urban water suppliers in the regional program are meeting the eligibility requirements.

(B) The department may require additional information for any determination pursuant to this section.

(3) The department shall not deny eligibility to an urban water supplier in compliance with the requirements of this section that is participating in a multiagency water project, or an integrated regional water management plan, developed pursuant to Section 75026 of the Public Resources Code, solely on the basis that one or more of the agencies participating in the project or plan is not implementing all of the water demand management measures described in Section 10631.

(c) In establishing guidelines pursuant to the specific funding authorization for any water management grant or loan program subject to this section, the agency administering the grant or loan program shall include in the guidelines the eligibility requirements developed by the department pursuant to subdivision (b).

(d) Upon receipt of a water management grant or loan application by an agency administering a grant and loan program subject to this section, the agency shall request an eligibility determination from the department with respect to the requirements of this section. The department shall respond to the request within 60 days of the request.

(e) The urban water supplier may submit to the department copies of its annual reports and other relevant documents to assist the department in determining whether the urban water supplier is implementing or scheduling the implementation of water demand management activities. In addition, for urban water suppliers that are signatories to the Memorandum of Understanding Regarding Urban Water Conservation in California and submit biennial reports to the California Urban Water Conservation Council in accordance with the memorandum, the department may use these reports to assist in tracking the implementation of water demand management measures.

(f) This section shall remain in effect only until July 1, 2016, and as of that date is repealed, unless a later enacted statute, that is enacted before July 1, 2016, deletes or extends that date.

10631.7. The department, in consultation with the California Urban Water Conservation Council, shall convene an independent technical panel to provide information and recommendations to the department and the Legislature on new demand management measures, technologies, and approaches. The panel shall consist of no more than seven members, who shall be selected by the department to reflect a balanced representation of experts. The panel shall have at least one, but no more than two, representatives from each of the following: retail water suppliers, environmental organizations, the business community, wholesale water suppliers, and academia. The panel shall be convened by January 1, 2009, and shall report to the Legislature no later than January 1, 2010, and every five years thereafter. The department shall review the panel report and include in the final report to the Legislature the department's recommendations and comments regarding the panel process and the panel's recommendations.

10632. (a) The plan shall provide an urban water shortage contingency analysis that includes each of the following elements that are within the authority of the urban water supplier:

(1) Stages of action to be undertaken by the urban water supplier in response to water supply shortages, including up to a 50 percent reduction in water supply, and an outline of specific water supply conditions that are applicable to each stage.

(2) An estimate of the minimum water supply available during each of the next three water years based on the driest three-year historic sequence for the agency's water supply.

(3) Actions to be undertaken by the urban water supplier to prepare for, and implement during, a catastrophic interruption of water supplies including, but not limited to, a regional power outage, an earthquake, or other disaster.

(4) Additional, mandatory prohibitions against specific water use practices during water shortages, including, but not limited to, prohibiting the use of potable water for street cleaning.

(5) Consumption reduction methods in the most restrictive stages. Each urban water supplier may use any type of consumption reduction methods in its water shortage contingency analysis that would reduce water use, are

appropriate for its area, and have the ability to achieve a water use reduction consistent with up to a 50 percent reduction in water supply.

(6) Penalties or charges for excessive use, where applicable.

(7) An analysis of the impacts of each of the actions and conditions described in paragraphs (1) to (6), inclusive, on the revenues and expenditures of the urban water supplier, and proposed measures to overcome those impacts, such as the development of reserves and rate adjustments.

(8) A draft water shortage contingency resolution or ordinance.

(9) A mechanism for determining actual reductions in water use pursuant to the urban water shortage contingency analysis.

(b) Commencing with the urban water management plan update due July 1, 2016, for purposes of developing the water shortage contingency analysis pursuant to subdivision (a), the urban water supplier shall analyze and define water features that are artificially supplied with water, including ponds, lakes, waterfalls, and fountains, separately from swimming pools and spas, as defined in subdivision (a) of Section 115921 of the Health and Safety Code.

10633. The plan shall provide, to the extent available, information on recycled water and its potential for use as a water source in the service area of the urban water supplier. The preparation of the plan shall be coordinated with local water, wastewater, groundwater, and planning agencies that operate within the supplier's service area, and shall include all of the following:

(a) A description of the wastewater collection and treatment systems in the supplier's service area, including a quantification of the amount of wastewater collected and treated and the methods of wastewater disposal.

(b) A description of the quantity of treated wastewater that meets recycled water standards, is being discharged, and is otherwise available for use in a recycled water project.

(c) A description of the recycled water currently being used in the supplier's service area, including, but not limited to, the type, place, and quantity of use.

(d) A description and quantification of the potential uses of recycled water, including, but not limited to, agricultural irrigation, landscape irrigation, wildlife habitat enhancement, wetlands, industrial reuse, groundwater recharge, indirect potable reuse, and other appropriate uses, and a determination with regard to the technical and economic feasibility of serving those uses.

(e) The projected use of recycled water within the supplier's service area at the end of 5, 10, 15, and 20 years, and a description of the actual use of recycled water in comparison to uses previously projected pursuant to this subdivision.

(f) A description of actions, including financial incentives, which may be taken to encourage the use of recycled water, and the projected results of these actions in terms of acre-feet of recycled water used per year.

(g) A plan for optimizing the use of recycled water in the supplier's service area, including actions to facilitate the installation of dual distribution systems, to promote recirculating uses, to facilitate the increased use of treated wastewater that meets recycled water standards, and to overcome any obstacles to achieving that increased use.

10634. The plan shall include information, to the extent practicable, relating to the quality of existing sources of water available to the supplier over the same five-year increments as described in subdivision (a) of Section 10631, and the manner in which water quality affects water management strategies and supply reliability.

Article 2.5. Water Service Reliability

SECTION 10635

10635. (a) Every urban water supplier shall include, as part of its urban water management plan, an assessment of the reliability of its water service to its customers during normal, dry, and multiple dry water years. This water supply and demand assessment shall compare the total water supply sources available to the water supplier with the total projected water use over the next 20 years, in five-year increments, for a normal water year, a single dry water year, and multiple dry water years. The water service reliability assessment shall be based upon the information compiled pursuant to Section 10631, including available data from state, regional, or local agency population projections within the service area of the urban water supplier.

(b) The urban water supplier shall provide that portion of its urban water management plan prepared pursuant to this article to any city or county within which it provides water supplies no later than 60 days after the submission of its urban water management plan.

(c) Nothing in this article is intended to create a right or entitlement to water service or any specific level of water service.

(d) Nothing in this article is intended to change existing law concerning an urban water supplier's obligation to provide water service to its existing customers or to any potential future customers.

Article 3. Adoption and Implementation of Plans

SECTION 10640-10645

10640. Every urban water supplier required to prepare a plan pursuant to this part shall prepare its plan pursuant to Article 2 (commencing with Section 10630). The supplier shall likewise periodically review the plan as required by Section 10621, and any amendments or changes required as a result of that review shall be adopted pursuant to this article.

10641. An urban water supplier required to prepare a plan may consult with, and obtain comments from, any public agency or state agency or any person who has special expertise with respect to water demand management methods and techniques.

10642. Each urban water supplier shall encourage the active involvement of diverse social, cultural, and economic elements of the population within the service area prior to and during the preparation of the plan. Prior to adopting a plan, the urban water supplier shall make the plan available for public inspection and shall hold a public hearing thereon. Prior to the hearing, notice of the time and place of hearing shall be published within the jurisdiction of the publicly owned water supplier pursuant to Section 6066 of the Government Code. The urban water supplier shall provide notice of the time and place of hearing to any city or county within which the supplier provides water supplies. A privately owned water supplier shall provide an equivalent notice within its service area.

After the hearing, the plan shall be adopted as prepared or as modified after the hearing.

10643. An urban water supplier shall implement its plan adopted pursuant to this chapter in accordance with the schedule set forth in its plan.

10644. (a) (1) An urban water supplier shall submit to the department, the California State Library, and any city or county within which the supplier provides water supplies a copy of its plan no later than 30 days after adoption. Copies of amendments or changes to the plans shall be submitted to the department, the California State Library, and any city or county within which the supplier provides water supplies within 30 days after adoption.

(2) The plan, or amendments to the plan, submitted to the department pursuant to paragraph (1) shall be submitted electronically and shall include any standardized forms, tables, or displays specified by the department.

(b) (1) Notwithstanding Section 10231.5 of the Government Code, the department shall prepare and submit to the Legislature, on or before December 31, in the years ending in six and one, a report summarizing the status of the plans adopted pursuant to this part.

The report prepared by the department shall identify the exemplary elements of the individual plans. The department shall provide a copy of the report to each urban water supplier that has submitted its plan to the department. The department shall also prepare reports and provide data for any legislative hearings designed to consider the effectiveness of plans submitted pursuant to this part.

(2) A report to be submitted pursuant to paragraph (1) shall be submitted in compliance with Section 9795 of the Government Code.

(c) (1) For the purpose of identifying the exemplary elements of the individual plans, the department shall identify in the report water demand management measures adopted and implemented by specific urban water suppliers, and identified pursuant to Section 10631, that achieve water savings significantly above the levels established by the department to meet the requirements of Section 10631.5.

(2) The department shall distribute to the panel convened pursuant to Section 10631.7 the results achieved by the implementation of those water demand management measures described in paragraph (1).

(3) The department shall make available to the public the standard the department will use to identify exemplary water demand management measures.

10645. Not later than 30 days after filing a copy of its plan with the department, the urban water supplier and the department shall make the plan available for public review during normal business hours.

Chapter 4. Miscellaneous Provisions

SECTION 10650-10656

10650. Any actions or proceedings to attack, review, set aside, void, or annul the acts or decisions of an urban water supplier on the grounds of noncompliance with this part shall be commenced as follows:

(a) An action or proceeding alleging failure to adopt a plan shall be commenced within 18 months after that adoption is required by this part.

(b) Any action or proceeding alleging that a plan, or action taken pursuant to the plan, does not comply with this part shall be commenced within 90 days after filing of the plan or amendment thereto pursuant to Section 10644 or the taking of that action.

10651. In any action or proceeding to attack, review, set aside, void, or annul a plan, or an action taken pursuant to the plan by an urban water supplier on the grounds of noncompliance with this part, the inquiry shall extend only to whether there was a prejudicial abuse of discretion. Abuse of discretion is established if the supplier has not proceeded in a manner required by law or if the action by the water supplier is not supported by substantial evidence.

10652. The California Environmental Quality Act (Division 13 (commencing with Section 21000) of the Public Resources Code) does not apply to the preparation and adoption of plans pursuant to this part or to the implementation of actions taken pursuant to Section 10632. Nothing in this part shall be interpreted as exempting from the California Environmental Quality Act any project that would significantly affect water supplies for fish and wildlife, or any project for implementation of the plan, other than projects implementing Section 10632, or any project for expanded or additional water supplies.

10653. The adoption of a plan shall satisfy any requirements of state law, regulation, or order, including those of the State Water Resources Control Board and the Public Utilities Commission, for the preparation of water management plans or conservation plans; provided, that if the State Water Resources Control Board or the Public Utilities Commission requires additional information concerning water conservation to implement its existing authority, nothing in this part shall be deemed to limit the board or the commission in obtaining that information. The requirements of this part shall be satisfied by any urban water demand management plan prepared to meet federal laws or regulations after the effective date of this part, and which substantially meets the requirements of this part, or by any existing urban water management plan which includes the contents of a plan required under this part.

10654. An urban water supplier may recover in its rates the costs incurred in preparing its plan and implementing the reasonable water conservation measures included in the plan. Any best water management practice that is included in the plan that is identified in the "Memorandum of Understanding Regarding Urban Water Conservation in California" is deemed to be reasonable for the purposes of this section.

10655. If any provision of this part or the application thereof to any person or circumstances is held invalid, that invalidity shall not affect other provisions or applications of this part which can be given effect without the invalid provision or application thereof, and to this end the provisions of this part are severable.

10656. An urban water supplier that does not prepare, adopt, and submit its urban water management plan to the department in accordance with this part, is ineligible to receive funding pursuant to Division 24 (commencing with Section 78500) or Division 26

(commencing with Section 79000), or receive drought assistance from the state until the urban water management plan is submitted pursuant to this article.

Appendix B
California Water Code
Sustainable Water Use and Demand Reduction (SB X7-7)

California Water Code Division 6, Part 2.55.

Chapter 1. General Declarations and Policy §10608-10608.8
Chapter 2. Definitions §10608.12
Chapter 3. Urban Retail Water Suppliers §10608.16-10608.44
Chapter 4. Agricultural Water Suppliers §10608.48
Chapter 5. Sustainable Water Management §10608.50
Chapter 6 Standardized Data Collection §10608.52
Chapter 7 Funding Provisions §10608.56-10608.60
Chapter 8 Quantifying Agricultural Water Use Efficiency §10608.64

Chapter 1. General Declarations and Policy

SECTION 10608-10608.8

10608. The Legislature finds and declares all of the following:

(a) Water is a public resource that the California Constitution protects against waste and unreasonable use.

(b) Growing population, climate change, and the need to protect and grow California's economy while protecting and restoring our fish and wildlife habitats make it essential that the state manage its water resources as efficiently as possible.

(c) Diverse regional water supply portfolios will increase water supply reliability and reduce dependence on the Delta.

(d) Reduced water use through conservation provides significant energy and environmental benefits, and can help protect water quality, improve streamflows, and reduce greenhouse gas emissions.

(e) The success of state and local water conservation programs to increase efficiency of water use is best determined on the basis of measurable outcomes related to water use or efficiency.

(f) Improvements in technology and management practices offer the potential for increasing water efficiency in California over time, providing an essential water management tool to meet the need for water for urban, agricultural, and environmental uses.

(g) The Governor has called for a 20 percent per capita reduction in urban water use statewide by 2020.

(h) The factors used to formulate water use efficiency targets can vary significantly from location to location based on factors including weather, patterns of urban and suburban development, and past efforts to enhance water use efficiency.

(i) Per capita water use is a valid measure of a water provider's efforts to reduce urban water use within its service area. However, per capita water use is less useful for measuring relative water use efficiency between different water providers. Differences in weather, historical patterns of urban and suburban development, and density of housing in a particular location need to be considered when assessing per capita water use as a measure of efficiency.

10608.4. It is the intent of the Legislature, by the enactment of this part, to do all of the following:

(a) Require all water suppliers to increase the efficiency of use of this essential resource.

(b) Establish a framework to meet the state targets for urban water conservation identified in this part and called for by the Governor.

(c) Measure increased efficiency of urban water use on a per capita basis.

(d) Establish a method or methods for urban retail water suppliers to determine targets for achieving increased water use efficiency by the year 2020, in accordance with the Governor's goal of a 20-percent reduction.

(e) Establish consistent water use efficiency planning and implementation standards for urban water suppliers and agricultural water suppliers.

(f) Promote urban water conservation standards that are consistent with the California Urban Water Conservation Council's adopted best management practices and the requirements for demand management in Section 10631.

(g) Establish standards that recognize and provide credit to water suppliers that made substantial capital investments in urban water conservation since the drought of the early 1990s.

(h) Recognize and account for the investment of urban retail water suppliers in providing recycled water for beneficial uses.

(i) Require implementation of specified efficient water management practices for agricultural water suppliers.

(j) Support the economic productivity of California's agricultural, commercial, and industrial sectors.

(k) Advance regional water resources management.

10608.8. (a) (1) Water use efficiency measures adopted and implemented pursuant to this part or Part 2.8 (commencing with Section 10800) are water conservation measures subject to the protections provided under Section 1011.

(2) Because an urban agency is not required to meet its urban water use target until 2020 pursuant to subdivision (b) of Section 10608.24, an urban retail water supplier's failure to meet those targets shall not establish a violation of law for purposes of any state administrative or judicial proceeding prior to

January 1, 2021. Nothing in this paragraph limits the use of data reported to the department or the board in litigation or an administrative proceeding. This paragraph shall become inoperative on January 1, 2021.

(3) To the extent feasible, the department and the board shall provide for the use of water conservation reports required under this part to meet the requirements of Section 1011 for water conservation reporting.

(b) This part does not limit or otherwise affect the application of Chapter 3.5 (commencing with Section 11340), Chapter 4 (commencing with Section 11370), Chapter 4.5 (commencing with Section 11400), and Chapter 5 (commencing with Section 11500) of Part 1 of Division 3 of Title 2 of the Government Code.

(c) This part does not require a reduction in the total water used in the agricultural or urban sectors, because other factors, including, but not limited to, changes in agricultural economics or population growth may have greater effects on water use. This part does not limit the economic productivity of California's agricultural, commercial, or industrial sectors.

(d) The requirements of this part do not apply to an agricultural water supplier that is a party to the Quantification Settlement Agreement, as defined in subdivision (a) of Section 1 of Chapter 617 of the Statutes of 2002, during the period within which the Quantification Settlement Agreement remains in effect. After the expiration of the Quantification Settlement Agreement, to the extent conservation water projects implemented as part of the Quantification Settlement Agreement remain in effect, the conserved water created as part of those projects shall be credited against the obligations of the agricultural water supplier pursuant to this part.

Chapter 2 Definitions

SECTION 10608.12

10608.12. Unless the context otherwise requires, the following definitions govern the construction of this part:

(a) "Agricultural water supplier" means a water supplier, either publicly or privately owned, providing water to 10,000 or more irrigated acres, excluding recycled water. "Agricultural water supplier" includes a supplier or contractor for water, regardless of the basis of right, that distributes or sells water for ultimate resale to customers. "Agricultural water supplier" does not include the department.

(b) "Base daily per capita water use" means any of the following:

(1) The urban retail water supplier's estimate of its average gross water use, reported in gallons per capita per day and calculated over a continuous 10-year period ending no earlier than December 31, 2004, and no later than December 31, 2010.

(2) For an urban retail water supplier that meets at least 10 percent of its 2008 measured retail water demand through recycled water that is delivered within the service area of an urban retail water supplier or its urban wholesale water supplier, the urban retail water supplier may extend the calculation described in paragraph (1) up to an additional five years to a maximum of a continuous 15-year period ending no earlier than December 31, 2004, and no later than December 31, 2010.

(3) For the purposes of Section 10608.22, the urban retail water supplier's estimate of its average gross water use, reported in gallons per capita per day and calculated over a continuous five-year period ending no earlier than December 31, 2007, and no later than December 31, 2010.

(c) "Baseline commercial, industrial, and institutional water use" means an urban retail water supplier's base daily per capita water use for commercial, industrial, and institutional users.

(d) "Commercial water user" means a water user that provides or distributes a product or service.

(e) "Compliance daily per capita water use" means the gross water use during the final year of the reporting period, reported in gallons per capita per day.

(f) "Disadvantaged community" means a community with an annual median household income that is less than 80 percent of the statewide annual median household income.

(g) "Gross water use" means the total volume of water, whether treated or untreated, entering the distribution system of an urban retail water supplier, excluding all of the following:

(1) Recycled water that is delivered within the service area of an urban retail water supplier or its urban wholesale water supplier.

(2) The net volume of water that the urban retail water supplier places into long-term storage.

(3) The volume of water the urban retail water supplier conveys for use by another urban water supplier.

(4) The volume of water delivered for agricultural use, except as otherwise provided in subdivision (f) of Section 10608.24.

(h) "Industrial water user" means a water user that is primarily a manufacturer or processor of materials as defined by the North American Industry Classification System code sectors 31 to 33, inclusive, or an entity that is a water user primarily engaged in research and development.

(i) "Institutional water user" means a water user dedicated to public service. This type of user includes, among other users, higher education institutions, schools, courts, churches, hospitals, government facilities, and nonprofit research institutions.

(j) "Interim urban water use target" means the midpoint between the urban retail water supplier's base daily per capita water use and the urban retail water supplier's urban water use target for 2020.

(k) "Locally cost effective" means that the present value of the local benefits of implementing an agricultural efficiency water management practice is greater than or equal to the present value of the local cost of implementing that measure.

(l) "Process water" means water used for producing a product or product content or water used for research and development, including, but not limited to, continuous manufacturing processes, water used for testing and maintaining equipment used in producing a product or product content, and water used in combined heat and power facilities used in producing a product or product content. Process water does not mean incidental water uses not related to the production of a product or product content, including, but not limited to, water used for restrooms, landscaping, air conditioning, heating, kitchens, and laundry.

(m) "Recycled water" means recycled water, as defined in subdivision (n) of Section 13050, that is used to offset potable demand, including recycled water supplied for direct use and indirect potable reuse, that meets the following requirements, where applicable:

(1) For groundwater recharge, including recharge through spreading basins, water supplies that are all of the following:

(A) Metered.

(B) Developed through planned investment by the urban water supplier or a wastewater treatment agency.

(C) Treated to a minimum tertiary level.

(D) Delivered within the service area of an urban retail water supplier or its urban wholesale water supplier that helps an urban retail water supplier meet its urban water use target.

(2) For reservoir augmentation, water supplies that meet the criteria of paragraph (1) and are conveyed through a distribution system constructed specifically for recycled water.

(n) "Regional water resources management" means sources of supply resulting from watershed-based planning for sustainable local water reliability or any of the following alternative sources of water:

(1) The capture and reuse of stormwater or rainwater.

(2) The use of recycled water.

(3) The desalination of brackish groundwater.

(4) The conjunctive use of surface water and groundwater in a manner that is consistent with the safe yield of the groundwater basin.

(o) "Reporting period" means the years for which an urban retail water supplier reports compliance with the urban water use targets.

(p) "Urban retail water supplier" means a water supplier, either publicly or privately owned, that directly provides potable municipal water to more than 3,000 end users or that supplies more than 3,000 acre-feet of potable water annually at retail for municipal purposes.

(q) "Urban water use target" means the urban retail water supplier's targeted future daily per capita water use.

(r) "Urban wholesale water supplier," means a water supplier, either publicly or privately owned, that provides more than 3,000 acre-feet of water annually at wholesale for potable municipal purposes.

Chapter 3 Urban Retail Water Suppliers

SECTION 10608.16-10608.44

10608.16.(a) The state shall achieve a 20-percent reduction in urban per capita water use in California on or before December 31, 2020.

(b) The state shall make incremental progress towards the state target specified in subdivision (a) by reducing urban per capita water use by at least 10 percent on or before December 31, 2015.

10608.20.(a) (1) Each urban retail water supplier shall develop urban water use targets and an interim urban water use target by July 1, 2011. Urban retail water suppliers may elect to determine and report progress toward achieving these targets on an individual or regional basis, as provided in subdivision (a) of Section 10608.28, and may determine the targets on a fiscal year or calendar year basis.

(2) It is the intent of the Legislature that the urban water use targets described in paragraph (1) cumulatively result in a 20-percent reduction from the baseline daily per capita water use by December 31, 2020.

(b) An urban retail water supplier shall adopt one of the following methods for determining its urban water use target pursuant to subdivision (a):

(1) Eighty percent of the urban retail water supplier's baseline per capita daily water use.

(2) The per capita daily water use that is estimated using the sum of the following performance standards:

(A) For indoor residential water use, 55 gallons per capita daily water use as a provisional standard. Upon completion of the department's 2016 report to the Legislature pursuant to Section 10608.42, this standard may be adjusted by the Legislature by statute.

(B) For landscape irrigated through dedicated or residential meters or connections, water efficiency equivalent to the standards of the Model Water Efficient Landscape Ordinance set forth in Chapter 2.7 (commencing with Section 490) of Division 2 of Title 23 of the California Code of Regulations, as in effect the later of the year of the landscape's installation or 1992. An urban retail water supplier using the approach specified in this subparagraph shall use satellite imagery, site visits, or other best available technology to develop an accurate estimate of landscaped areas.

(C) For commercial, industrial, and institutional uses, a 10-percent reduction in water use from the baseline commercial, industrial, and institutional water use by 2020.

(3) Ninety-five percent of the applicable state hydrologic region target, as set forth in the state's draft 20x2020 Water Conservation Plan (dated April 30, 2009). If the service area of an urban water supplier includes more than one hydrologic region, the supplier shall apportion its service area to each region based on population or area.

(4) A method that shall be identified and developed by the department, through a public process, and reported to the Legislature no later than December 31, 2010. The method developed by the department shall identify per capita targets that cumulatively result in a statewide 20-percent reduction in urban daily per capita water use by December 31, 2020. In developing urban daily per capita water use targets, the department shall do all of the following:

(A) Consider climatic differences within the state.

(B) Consider population density differences within the state.

(C) Provide flexibility to communities and regions in meeting the targets.

(D) Consider different levels of per capita water use according to plant water needs in different regions.

(E) Consider different levels of commercial, industrial, and institutional water use in different regions of the state.

(F) Avoid placing an undue hardship on communities that have implemented conservation measures or taken actions to keep per capita water use low.

(c) If the department adopts a regulation pursuant to paragraph (4) of subdivision (b) that results in a requirement that an urban retail water supplier achieve a reduction in daily per capita water use that is greater than 20 percent by December 31, 2020, an urban retail water supplier that adopted the method

described in paragraph (4) of subdivision (b) may limit its urban water use target to a reduction of not more than 20 percent by December 31, 2020, by adopting the method described in paragraph (1) of subdivision (b).

(d) The department shall update the method described in paragraph (4) of subdivision (b) and report to the Legislature by December 31, 2014. An urban retail water supplier that adopted the method described in paragraph (4) of subdivision (b) may adopt a new urban daily per capita water use target pursuant to this updated method.

(e) An urban retail water supplier shall include in its urban water management plan due in 2010 pursuant to Part 2.6 (commencing with Section 10610) the baseline daily per capita water use, urban water use target, interim urban water use target, and compliance daily per capita water use, along with the bases for determining those estimates, including references to supporting data.

(f) When calculating per capita values for the purposes of this chapter, an urban retail water supplier shall determine population using federal, state, and local population reports and projections.

(g) An urban retail water supplier may update its 2020 urban water use target in its 2015 urban water management plan required pursuant to Part 2.6 (commencing with Section 10610).

(h) (1) The department, through a public process and in consultation with the California Urban Water Conservation Council, shall develop technical methodologies and criteria for the consistent implementation of this part, including, but not limited to, both of the following:

(A) Methodologies for calculating base daily per capita water use, baseline commercial, industrial, and institutional water use, compliance daily per capita water use, gross water use, service area population, indoor residential water use, and landscaped area water use.

(B) Criteria for adjustments pursuant to subdivisions (d) and (e) of Section 10608.24.

(2) The department shall post the methodologies and criteria developed pursuant to this subdivision on its Internet Web site, and make written copies available, by October 1, 2010. An urban retail water supplier shall use the methods developed by the department in compliance with this part.

(i) (1) The department shall adopt regulations for implementation of the provisions relating to process water in accordance with subdivision (l) of Section 10608.12, subdivision (e) of Section 10608.24, and subdivision (d) of Section 10608.26.

(2) The initial adoption of a regulation authorized by this subdivision is deemed to address an emergency, for purposes of Sections 11346.1 and 11349.6 of the Government Code, and the department is hereby exempted for that purpose from the requirements of subdivision (b) of Section 11346.1 of the

Government Code. After the initial adoption of an emergency regulation pursuant to this subdivision, the department shall not request approval from the Office of Administrative Law to readopt the regulation as an emergency regulation pursuant to Section 11346.1 of the Government Code.

(j) (1) An urban retail water supplier is granted an extension to July 1, 2011, for adoption of an urban water management plan pursuant to Part 2.6 (commencing with Section 10610) due in 2010 to allow the use of technical methodologies developed by the department pursuant to paragraph (4) of subdivision (b) and subdivision (h). An urban retail water supplier that adopts an urban water management plan due in 2010 that does not use the methodologies developed by the department pursuant to subdivision (h) shall amend the plan by July 1, 2011, to comply with this part.

(2) An urban wholesale water supplier whose urban water management plan prepared pursuant to Part 2.6 (commencing with Section 10610) was due and not submitted in 2010 is granted an extension to July 1, 2011, to permit coordination between an urban wholesale water supplier and urban retail water suppliers.

10608.22. Notwithstanding the method adopted by an urban retail water supplier pursuant to Section 10608.20, an urban retail water supplier's per capita daily water use reduction shall be no less than 5 percent of base daily per capita water use as defined in paragraph(3) of subdivision (b) of Section 10608.12. This section does not apply to an urban retail water supplier with a base daily per capita water use at or below 100 gallons per capita per day.

10608.24.(a) Each urban retail water supplier shall meet its interim urban water use target by December 31, 2015.

(b) Each urban retail water supplier shall meet its urban water use target by December 31, 2020.

(c) An urban retail water supplier's compliance daily per capita water use shall be the measure of progress toward achievement of its urban water use target.

(d) (1) When determining compliance daily per capita water use, an urban retail water supplier may consider the following factors:

(A) Differences in evapotranspiration and rainfall in the baseline period compared to the compliance reporting period.
(B) Substantial changes to commercial or industrial water use resulting from increased business output and economic development that have occurred during the reporting period.

(C) Substantial changes to institutional water use resulting from fire suppression services or other extraordinary events, or from new or expanded operations, that have occurred during the reporting period.

(2) If the urban retail water supplier elects to adjust its estimate of compliance daily per capita water use due to one or more of the factors described in

paragraph (1), it shall provide the basis for, and data supporting, the adjustment in the report required by Section 10608.40.

(e) When developing the urban water use target pursuant to Section 10608.20, an urban retail water supplier that has a substantial percentage of industrial water use in its service area may exclude process water from the calculation of gross water use to avoid a disproportionate burden on another customer sector.

(f) (1) An urban retail water supplier that includes agricultural water use in an urban water management plan pursuant to Part 2.6 (commencing with Section 10610) may include the agricultural water use in determining gross water use. An urban retail water supplier that includes agricultural water use in determining gross water use and develops its urban water use target pursuant to paragraph (2) of subdivision (b) of Section 10608.20 shall use a water efficient standard for agricultural irrigation of 100 percent of reference evapotranspiration multiplied by the crop coefficient for irrigated acres.

(2) An urban retail water supplier, that is also an agricultural water supplier, is not subject to the requirements of Chapter 4 (commencing with Section 10608.48), if the agricultural water use is incorporated into its urban water use target pursuant to paragraph (1).

10608.26.(a) In complying with this part, an urban retail water supplier shall conduct at least one public hearing to accomplish all of the following:

(1) Allow community input regarding the urban retail water supplier's implementation plan for complying with this part.

(2) Consider the economic impacts of the urban retail water supplier's implementation plan for complying with this part.

(3) Adopt a method, pursuant to subdivision (b) of Section 10608.20, for determining its urban water use target.

(b) In complying with this part, an urban retail water supplier may meet its urban water use target through efficiency improvements in any combination among its customer sectors. An urban retail water supplier shall avoid placing a disproportionate burden on any customer sector.

(c) For an urban retail water supplier that supplies water to a United States Department of Defense military installation, the urban retail water supplier's implementation plan for complying with this part shall consider the conservation of that military installation under federal Executive Order 13514.

(d) (1) Any ordinance or resolution adopted by an urban retail water supplier after the effective date of this section shall not require existing customers as of the effective date of this section, to undertake changes in product formulation, operations, or equipment that would reduce process water use, but may provide technical assistance and financial incentives to those customers to implement efficiency measures for process water. This section shall not limit

an ordinance or resolution adopted pursuant to a declaration of drought emergency by an urban retail water supplier.

(2) This part shall not be construed or enforced so as to interfere with the requirements of Chapter 4 (commencing with Section 113980) to Chapter 13 (commencing with Section 114380), inclusive, of Part 7 of Division 104 of the Health and Safety Code, or any requirement or standard for the protection of public health, public safety, or worker safety established by federal, state, or local government or recommended by recognized standard setting organizations or trade associations.

10608.28.(a) An urban retail water supplier may meet its urban water use target within its retail service area, or through mutual agreement, by any of the following:

(1) Through an urban wholesale water supplier.

(2) Through a regional agency authorized to plan and implement water conservation, including, but not limited to, an agency established under the Bay Area Water Supply and Conservation Agency Act (Division 31 (commencing with Section 81300)).

(3) Through a regional water management group as defined in Section 10537.

(4) By an integrated regional water management funding area.

(5) By hydrologic region.

(6) Through other appropriate geographic scales for which computation methods have been developed by the department.

(b) A regional water management group, with the written consent of its member agencies, may undertake any or all planning, reporting, and implementation functions under this chapter for the member agencies that consent to those activities. Any data or reports shall provide information both for the regional water management group and separately for each consenting urban retail water supplier and urban wholesale water supplier.

10608.32. All costs incurred pursuant to this part by a water utility regulated by the Public Utilities Commission may be recoverable in rates subject to review and approval by the Public Utilities Commission, and may be recorded in a memorandum account and reviewed for reasonableness by the Public Utilities Commission.

10608.36. Urban wholesale water suppliers shall include in the urban water management plans required pursuant to Part 2.6 (commencing with Section 10610) an assessment of their present and proposed future measures, programs, and policies to help achieve the water use reductions required by this part.

10608.40. Urban water retail suppliers shall report to the department on their progress in meeting their urban water use targets as part of their urban water management plans

submitted pursuant to Section 10631. The data shall be reported using a standardized form developed pursuant to Section 10608.52.

10608.42.(a) The department shall review the 2015 urban water management plans and report to the Legislature by July 1, 2017, on progress towards achieving a 20-percent reduction in urban water use by December 31, 2020. The report shall include recommendations on changes to water efficiency standards or urban water use targets to achieve the 20-percent reduction and to reflect updated efficiency information and technology changes.

(b) A report to be submitted pursuant to subdivision (a) shall be submitted in compliance with Section 9795 of the Government Code.

10608.43. The department, in conjunction with the California Urban Water Conservation Council, by April 1, 2010, shall convene a representative task force consisting of academic experts, urban retail water suppliers, environmental organizations, commercial water users, industrial water users, and institutional water users to develop alternative best management practices for commercial, industrial, and institutional users and an assessment of the potential statewide water use efficiency improvement in the commercial, industrial, and institutional sectors that would result from implementation of these best management practices. The taskforce, in conjunction with the department, shall submit a report to the Legislature by April 1, 2012, that shall include a review of multiple sectors within commercial, industrial, and institutional users and that shall recommend water use efficiency standards for commercial, industrial, and institutional users among various sectors of water use. The report shall include, but not be limited to, the following:

(a) Appropriate metrics for evaluating commercial, industrial, and institutional water use.

(b) Evaluation of water demands for manufacturing processes, goods, and cooling.

(c) Evaluation of public infrastructure necessary for delivery of recycled water to the commercial, industrial, and institutional sectors.

(d) Evaluation of institutional and economic barriers to increased recycled water use within the commercial, industrial, and institutional sectors.

(e) Identification of technical feasibility and cost of the best management practices to achieve more efficient water use statewide in the commercial, industrial, and institutional sectors that is consistent with the public interest and reflects past investments in water use efficiency.

10608.44. Each state agency shall reduce water use at facilities it operates to support urban retail water suppliers in meeting the target identified in Section 10608.16.

Chapter 4 Agricultural Water Suppliers

SECTION 10608.48

10608.48.(a) On or before July 31, 2012, an agricultural water supplier shall implement efficient water management practices pursuant to subdivisions (b) and (c).

(b) Agricultural water suppliers shall implement all of the following critical efficient management practices:

(1) Measure the volume of water delivered to customers with sufficient accuracy to comply with subdivision (a) of Section 531.10 and to implement paragraph (2).

(2) Adopt a pricing structure for water customers based at least in part on quantity delivered.

(c) Agricultural water suppliers shall implement additional efficient management practices, including, but not limited to, practices to accomplish all of the following, if the measures are locally cost effective and technically feasible:

(1) Facilitate alternative land use for lands with exceptionally high water duties or whose irrigation contributes to significant problems, including drainage.

(2) Facilitate use of available recycled water that otherwise would not be used beneficially, meets all health and safety criteria, and does not harm crops or soils.

(3) Facilitate the financing of capital improvements for on-farm irrigation systems.

(4) Implement an incentive pricing structure that promotes one or more of the following goals:

(A) More efficient water use at the farm level.

(B) Conjunctive use of groundwater.

(C) Appropriate increase of groundwater recharge.

(D) Reduction in problem drainage.

(E) Improved management of environmental resources.

(F) Effective management of all water sources throughout the year by adjusting seasonal pricing structures based on current conditions.

(5) Expand line or pipe distribution systems, and construct regulatory reservoirs to increase distribution system flexibility and capacity, decrease maintenance, and reduce seepage.

(6) Increase flexibility in water ordering by, and delivery to, water customers within operational limits.

(7) Construct and operate supplier spill and tailwater recovery systems.

(8) Increase planned conjunctive use of surface water and groundwater within the supplier service area.

(9) Automate canal control structures.

(10) Facilitate or promote customer pump testing and evaluation.

(11) Designate a water conservation coordinator who will develop and implement the water management plan and prepare progress reports.

(12) Provide for the availability of water management services to water users. These services may include, but are not limited to, all of the following:

(A) On-farm irrigation and drainage system evaluations.

(B) Normal year and real-time irrigation scheduling and crop evapotranspiration information.

(C) Surface water, groundwater, and drainage water quantity and quality data.

(D) Agricultural water management educational programs and materials for farmers, staff, and the public.

(13) Evaluate the policies of agencies that provide the supplier with water to identify the potential for institutional changes to allow more flexible water deliveries and storage.

(14) Evaluate and improve the efficiencies of the supplier's pumps.

(d) Agricultural water suppliers shall include in the agricultural water management plans required pursuant to Part 2.8 (commencing with Section 10800) a report on which efficient water management practices have been implemented and are planned to be implemented, an estimate of the water use efficiency improvements that have occurred since the last report, and an estimate of the water use efficiency improvements estimated to occur five and 10 years in the future. If an agricultural water supplier determines that an efficient water management practice is not locally cost effective or technically feasible, the supplier shall submit information documenting that determination.

(e) The data shall be reported using a standardized form developed pursuant to Section 10608.52.

(f) An agricultural water supplier may meet the requirements of subdivisions (d) and (e) by submitting to the department a water conservation plan submitted to the United States Bureau of Reclamation that meets the requirements described in Section 10828.

(g) On or before December 31, 2013, December 31, 2016, and December 31, 2021, the department, in consultation with the board, shall submit to the Legislature a report on the agricultural efficient water management practices that have been implemented and are planned to be implemented and an assessment of the manner in which the implementation of those efficient water management practices has affected and will affect agricultural operations, including estimated water use efficiency improvements, if any.

(h) The department may update the efficient water management practices required pursuant to subdivision (c), in consultation with the Agricultural Water Management Council, the United States Bureau of Reclamation, and the board. All efficient water management practices for agricultural water use pursuant to this chapter shall be adopted or revised by the department only after the department conducts public hearings to allow participation of the diverse geographical areas and interests of the state.

(i) (1) The department shall adopt regulations that provide for a range of options that agricultural water suppliers may use or implement to comply with the measurement requirement in paragraph (1) of subdivision (b).

(2) The initial adoption of a regulation authorized by this subdivision is deemed to address an emergency, for purposes of Sections 11346.1 and 11349.6 of the Government Code, and the department is hereby exempted for that purpose from the requirements of subdivision (b) of Section 11346.1 of the Government Code. After the initial adoption of an emergency regulation pursuant to this subdivision, the department shall not request approval from the Office of Administrative Law to readopt the regulation as an emergency regulation pursuant to Section 11346.1 of the Government Code.

Chapter 5 Sustainable Water Management

Section 10608.50

10608.50.(a) The department, in consultation with the board, shall promote implementation of regional water resources management practices through increased incentives and removal of barriers consistent with state and federal law. Potential changes may include, but are not limited to, all of the following:

(1) Revisions to the requirements for urban and agricultural water management plans.

(2) Revisions to the requirements for integrated regional water management plans.

(3) Revisions to the eligibility for state water management grants and loans.

(4) Revisions to state or local permitting requirements that increase water supply opportunities, but do not weaken water quality protection under state and federal law.

(5) Increased funding for research, feasibility studies, and project construction.

(6) Expanding technical and educational support for local land use and water management agencies.

(b) No later than January 1, 2011, and updated as part of the California Water Plan, the department, in consultation with the board, and with public input, shall propose new statewide targets, or review and update existing statewide targets, for regional water resources management practices, including, but not limited to, recycled water, brackish groundwater desalination, and infiltration and direct use of urban stormwater runoff.

Chapter 6 Standardized Data Collection

SECTION 10608.52

10608.52.(a) The department, in consultation with the board, the California Bay-Delta Authority or its successor agency, the State Department of Public Health, and the Public Utilities Commission, shall develop a single standardized water use reporting form to meet the water use information needs of each agency, including the needs of urban water suppliers that elect to determine and report progress toward achieving targets on a regional basis as provided in subdivision (a) of Section 10608.28.

(b) At a minimum, the form shall be developed to accommodate information sufficient to assess an urban water supplier's compliance with conservation targets pursuant to Section 10608.24 and an agricultural water supplier's compliance with implementation of efficient water management practices pursuant to subdivision (a) of Section 10608.48. The form shall accommodate reporting by urban water suppliers on an individual or regional basis as provided in subdivision (a) of Section 10608.28.

Chapter 7 Funding Provisions

Section 10608.56-10608.60

10608.56.(a) On and after July 1, 2016, an urban retail water supplier is not eligible for a water grant or loan awarded or administered by the state unless the supplier complies with this part.

(b) On and after July 1, 2013, an agricultural water supplier is not eligible for a water grant or loan awarded or administered by the state unless the supplier complies with this part.

(c) Notwithstanding subdivision (a), the department shall determine that an urban retail water supplier is eligible for a water grant or loan even though the supplier has not met the per capita reductions required pursuant to Section 10608.24, if the urban retail water supplier has submitted to the department for approval a schedule, financing plan, and budget, to be included in the grant or loan agreement, for achieving the per capita reductions. The supplier may request grant or loan funds to achieve the per capita reductions to the extent the request is consistent with the eligibility requirements applicable to the water funds.

(d) Notwithstanding subdivision (b), the department shall determine that an agricultural water supplier is eligible for a water grant or loan even though the supplier is not implementing all of the efficient water management practices described in Section 10608.48, if the agricultural water supplier has submitted to the department for approval a schedule, financing plan, and budget, to be included in the grant or loan agreement, for implementation of the efficient water management practices. The supplier may request grant or loan funds to implement the efficient water management practices to the extent the request is consistent with the eligibility requirements applicable to the water funds.

(e) Notwithstanding subdivision (a), the department shall determine that an urban retail water supplier is eligible for a water grant or loan even though the supplier has not met the per capita reductions required pursuant to Section 10608.24, if the urban retail water supplier has submitted to the department for approval documentation demonstrating that its entire service area qualifies as a disadvantaged community.

(f) The department shall not deny eligibility to an urban retail water supplier or agricultural water supplier in compliance with the requirements of this part and Part 2.8 (commencing with Section 10800), that is participating in a multiagency water project, or an integrated regional water management plan, developed pursuant to Section 75026 of the Public Resources Code, solely on the basis that one or more of the agencies participating in the project or plan is not implementing all of the requirements of this part or Part 2.8 (commencing with Section 10800).

10608.60.(a) It is the intent of the Legislature that funds made available by Section 75026 of the Public Resources Code should be expended, consistent with Division 43 (commencing with Section 75001) of the Public Resources Code and upon appropriation by the Legislature, for grants to implement this part. In the allocation of funding, it is the intent of the Legislature that the department give consideration to disadvantaged communities to assist in implementing the requirements of this part.

(b) It is the intent of the Legislature that funds made available by Section 75041 of the Public Resources Code, should be expended, consistent with Division 43 (commencing with Section 75001) of the Public Resources Code and upon appropriation by the Legislature, for direct expenditures to implement this part.

Chapter 8 Quantifying Agricultural Water Use Efficiency

SECTION 10608.64

10608.64. The department, in consultation with the Agricultural Water Management Council, academic experts, and other stakeholders, shall develop a methodology for quantifying the efficiency of agricultural water use. Alternatives to be assessed shall include, but not be limited to, determination of efficiency levels based on crop type or irrigation system distribution uniformity. On or before December 31, 2011, the department shall report to the Legislature on a proposed methodology and a plan for implementation. The plan shall include the estimated implementation costs and the types of data needed to support the methodology. Nothing in this section authorizes the department to implement a methodology established pursuant to this section.

180	272	0	0	0	0	180	180	Yes

**All values are in Gallons per Capita per Day (GPCD)*

NOTES: The persistent drought and Stage 2 Water Use Restrictions imposed by BCVWD resulted in a 24.3% water savings in year 2015-16 vs.

Table 6-1 Retail: Groundwater Volume Pumped						
☐	Supplier does not pump groundwater. The supplier will not complete the table below.					
Groundwater Type ***Drop Down List*** *May use each category multiple times*	Location or Basin Name	2011	2012	2013	2014	2015
Add additional rows as needed						
Alluvial Basin	Little San Gorgonio Creek	2158	1990	1732	1325	1418
Alluvial Basin	Beaumont Basin	9431	10162	11097	10806	8833
	TOTAL	11,589	12,152	12,829	12,131	10,251

NOTES: Little San Gorgonio Creek, also known as Edgar Canyon, is a mix of shallow alluvial deposits and fractured rock aquifer. The Little San Gorgonio Creek extractions in 2014 and 2015 were low primarily due to larger canyon wells (Well No. 6 and Well No. 14) being out of service.

Table 6-2 Retail: Wastewater Collected Within Service Area in 2015						
☐	There is no wastewater collection system. The supplier will not complete the table below.					
39	Percentage of 2015 service area covered by wastewater collection system *(optional)*					
86	Percentage of 2015 service area population covered by wastewater collection system *(optional)*					
Wastewater Collection			**Recipient of Collected Wastewater**			
Name of Wastewater Collection Agency	Wastewater Volume Metered or Estimated? *Drop Down List*	Volume of Wastewater Collected from UWMP Service Area 2015	Name of Wastewater Treatment Agency Receiving Collected Wastewater	Treatment Plant Name	Is WWTP Located Within UWMP Area? *Drop Down List*	Is WWTP Operation Contracted to a Third Party? *(optional)* *Drop Down List*
Add additional rows as needed						
City of Beaumont	Metered	3,360	City of Beaumont	Plant No. 1	Yes	Yes
Total Wastewater Collected from Service Area in 2015:		3,360				

NOTES: Wastewater volume based on monthly reports to RWQCB. Except for Highland Springs Village, which is sewered by the City of Beaumont, the remainder of Cherry Valley is unsewered.

Table 6-3 Retail: Wastewater Treatment and Discharge Within Service Area in 2015

☐ No wastewater is treated or disposed of within the UWMP service area.
The supplier will not complete the table below.

Wastewater Treatment Plant Name	Discharge Location Name or Identifier	Discharge Location Description	Wastewater Discharge ID Number *(optional)*	Method of Disposal *Drop down list*	Does This Plant Treat Wastewater Generated Outside the Service Area?	Treatment Level *Drop down list*	2015 volumes			
							Wastewater Treated	Discharged Treated Wastewater	Recycled Within Service Area	Recycled Outside of Service Area
Add additional rows as needed										
City of Beaumont	DP-001	Cooper's Creek	8 330101001	River or creek outfall	No	Tertiary	3,360	3,360	0	0
City of Beaumont	DP-007	Tributary of Marshall Creek	8 330101001	River or creek outfall	No	Tertiary	0	0	0	0
City of Beaumont	R-001	Tukwet Golf Course	8 330101001	Other	No	Tertiary	0	0	0	0
City of Beaumont	R-002	Oak Valley Golf Course	8 330101001	Other	No	Tertiary	0	0	0	0
City of Beaumont	R-003	BCVWD RW System	8 330101001	Other	No	Tertiary	0	0	0	0
						Total	3,360	3,360	0	0

NOTES: City of Beaumont claims that a portion of the effluent discharged at DP-001 and DP-007 incidentally recharge the Beaumont Groundwater Basin. Watermaster is still awaiting proof. The effluent does not comply with planned groundwater recharge regulations.

Table 6-4 A Retail: Current and Projected Recycled Water Direct Beneficial Uses Within Service Area

☐ Recycled water is not used and is not planned for use within the service area of the supplier.
The supplier will not complete the table below.

Name of Agency Producing (Treating) the Recycled Water:	Yucaipa Valley Water District
Name of Agency Operating the Recycled Water Distribution System:	Beaumont Cherry Valley Water District
Supplemental Water Added in 2015	0
Source of 2015 Supplemental Water	NA

Beneficial Use Type	General Description of 2015 Uses	Level of Treatment *Drop down list*	2015	2020	2025	2030	2035	2040 (opt)
Agricultural irrigation	none							
Landscape irrigation (excludes golf courses)	none	Advanced	0	921	977	1,018	1,028	1,032
Golf course irrigation	none	Advanced	0	121	66	25	16	11
Commercial use	none							
Industrial use	none							
Geothermal and other energy production	none							
Seawater intrusion barrier	none							
Recreational impoundment	none							
Wetlands or wildlife habitat	none							
Groundwater recharge (IPR)*	none							
Surface water augmentation (IPR)*	none							
Direct potable reuse	none							
Other *(Provide General Description)*	none							
		Total:	0	1,042	1,043	1,043	1,044	1,043

**IPR - Indirect Potable Reuse*

NOTES: YVWD must provide some amount of effluent discharge to maintain habitat. Per DWR instructions, this is not considered recycled water beneficial use. YVWD provides membrane treatment using reverse osmosis. Supply AF is based on correspondence from YVWD to BCVWD and is assumed to not change over time to be conservative. Supply includes some filter washwater during summer months.

Table 6-4 B Retail: Current and Projected Recycled Water Direct Beneficial Uses Within Service Area

☐ Recycled water is not used and is not planned for use within the service area of the supplier.
The supplier will not complete the table below.

Name of Agency Producing (Treating) the Recycled Water:	City of Beaumont
Name of Agency Operating the Recycled Water Distribution System:	Beaumont Cherry Valley Water District
Supplemental Water Added in 2015	0
Source of 2015 Supplemental Water	NA

Beneficial Use Type	General Description of 2015 Uses	Level of Treatment *Drop down list*	2015	2020	2025	2030	2035	2040 (opt)
Agricultural irrigation	none							
Landscape irrigation (excludes golf courses)	none	Secondary, Disinfected - 2.2	0	822	1,117	1,462	1,753	2,019
Golf course irrigation	none	Secondary, Disinfected - 2.2	0	332	365	387	441	517
Commercial use	none							
Industrial use	none							
Geothermal and other energy production	none							
Seawater intrusion barrier	none							
Recreational impoundment	none							
Wetlands or wildlife habitat	none							
Groundwater recharge (IPR)*	none							
Surface water augmentation (IPR)*	none							
Direct potable reuse	none							
Other *(Provide General Description)*	none							
		Total:	0	1,154	1,482	1,849	2,194	2,536

**IPR - Indirect Potable Reuse*

NOTES: City of Beaumont is required to discharge 1.8 mgd (2,016 AFY) to maintain habitat in Cooper's Creek. Per DWR this is not considered a beneficial use. Recycled water for GW recharge (IPR) assumes 80% recovery. Total does not reflect advance treated recycled water recharged to Beaumont Basin since this is not a demand, but rather a water supply. (Year 2025 -- 418 AF, Year 2030 -- 491 AFY, Year 2035 -- 646 AF, Year 2040 -- 827 AF)

Table 6-5 Retail: 2010 UWMP Recycled Water Use Projection Compared to 2015 Actual			
☐	Recycled water was not used in 2010 nor projected for use in 2015. The supplier will not complete the table below.		
Use Type		**2010 Projection for 2015**	**2015 Actual Use**
Agricultural irrigation			
Landscape irrigation (excludes golf courses)		1,500	0
Golf course irrigation			
Commercial use			
Industrial use			
Geothermal and other energy production			
Seawater intrusion barrier			
Recreational impoundment			
Wetlands or wildlife habitat			
Groundwater recharge (IPR)			
Surface water augmentation (IPR)			
Direct potable reuse			
Other	*Type of Use*		
Total		1,500	0
NOTES: City of Beaumont is required to discharge 1.8 mgd (2016 AFY) to maintain habitat in Cooper's Creek. Per DWR instructions this is not considered a beneficial use			

Table 6-6 Retail: Methods to Expand Future Recycled Water Use			
☐	Supplier does not plan to expand recycled water use in the future. Supplier will not complete the table below but will provide narrative explanation.		
6-56	Provide page location of narrative in UWMP		
Name of Action	Description	Planned Implementation Year	Expected Increase in Recycled Water Use
Add additional rows as needed			
Const. YVWD Connection	Construct connection to YVWD non-potable water system including pumping station	2018	1043
Const. City of Beaumont Connection	Construct storage and pumping station at City Treatment Plant	2020	1154
Edgar Canyon Nitrate Wells	Install extraction wells at mouth of Edgar Canyon to extract high nitrate groundwater for non-potable water system	2030	300
San Timoteo Groundwater Capture	Install extraction wells in San Timoteo Canyon to extract wastewater which percolates from 1.8 mgd habitat mitigation flow	2030	800
		TOTAL AFY	3,297
NOTES: These projects will increase the non-potable water supply which allows BCVWD to serve more non-potable water.			

Table 6-7 Retail: Expected Future Water Supply Projects or Programs						
☐	No expected future water supply projects or programs that provide a quantifiable increase to the agency's water supply. Supplier will not complete the table below.					
☐	Some or all of the supplier's future water supply projects or programs are not compatible with this table and are described in a narrative format.					
6-59	Provide page location of narrative in the UWMP					
Name of Future Projects or Programs	Joint Project with other agencies?		Description (if needed)	Planned Implementation Year	Planned for Use in Year Type *Drop Down List*	Expected Increase in Water Supply to Agency *This may be a range*
	Drop Down List (y/n)	*If Yes, Agency Name*				
Add additional rows as needed						
Beaumont MDP Line 16	Yes	RCF&WCD	Const of SD to divert water into BCVWD Recharge Facility	2021	All Year Types	185
Misc. Urban Runoff Capture	Yes	Beaumont	Various recharge basin enhancements	2025	All Year Types	200-545
Lower Edgar Canyon Non-potable Groundwater	No		Install extraction wells for high nitrate GW for non-potable water system	2025	All Year Types	300
San Timoteo Canyon GW Extraction	Yes	Beaumont	Install series of wells to recapture percolated ww used for habitat mitigation	2030	All Year Types	400-800
Non-potable water interconnection with YVWD	Yes	YVWD	Install Interconnecting pipeline and booster pumping station and pressure regulating stations	2018	All Year Types	1,043
Connection to City of Beaumont for recycled water	Yes	Beaumont	Install storage tank, booster pumping station and interconnecting pipeline	2020	All Year Types	1,154
Advance Treated Recycled Water	Yes	Beaumont	Construct advanced treatment facility and brine line	2025	All Year Types	300-660
NOTES: Yield from City of Beaumont Recycled Water Connection will increase to 3363 AFY by 2040 due to increases in wastewater flows over time. Expected increase in water supply for Advance Treated Wastewater is based on 80% recovery in membrane treatment process.						

Table 6-8 Retail: Water Supplies — Actual

Water Supply	Additional Detail on Water Supply	2015		
Drop down list *May use each category multiple times. These are the only water supply categories that will be recognized by the WUEdata online submittal tool*		Actual Volume	Water Quality *Drop Down List*	Total Right or Safe Yield *(optional)*
Add additional rows as needed				
Groundwater	Little San Gorgonio Canyon	1,418	Drinking Water	2,200
Groundwater	Beaumont Basin	2,300	Drinking Water	
Purchased or Imported Water	SGPWA	2,090	Raw Water	
Transfers	From banked GW Storage	3,984	Drinking Water	
	Total	9,792		2,200

NOTES: BCVWD typically receives reallocated and unused Overlying Party Rights, forbearance water for suppling potable or non-potable water to Overlying Parties, and return flow credits for importing SPW, groundwater, or reycled water per the Beaumont Basin Watermaster. This varies from year to year.

Table 6-9 Retail: Water Supplies — Projected

NOTES: Beaumont Basin Groundwater includes forbearance water (except for golf courses), unused overlier rights and return flow credits.											

Table 7-1 Retail: Basis of Water Year Data			
Year Type	**Base Year** *If not using a calendar year, type in the last year of the fiscal, water year, or range of years, for example, water year 1999-2000, use 2000*	**Available Supplies if Year Type Repeats**	
		☑	Quantification of available supplies is not compatible with this table and is provided elsewhere in the UWMP. Location Tables 7-2 thru 7-8
		☐	Quantification of available supplies is provided in this table as either volume only, percent only, or both.
		Volume Available	**% of Average Supply**
Average Year			100%
Single-Dry Year			
Multiple-Dry Years 1st Year			
Multiple-Dry Years 2nd Year			
Multiple-Dry Years 3rd Year			
Multiple-Dry Years 4th Year *Optional*			
Multiple-Dry Years 5th Year *Optional*			
Multiple-Dry Years 6th Year *Optional*			

Agency may use multiple versions of Table 7-1 if different water sources have different base years and the supplier chooses to report the base years for each water source separately. If an agency uses multiple versions of Table 7-1, in the "Note" section of each table, state that multiple versions of Table 7-1 are being used and identify the particular water source that is being reported in each table.

NOTES:

Appendix D
SB X7-7 Verification Form

SB X7-7 Table 0: Units of Measure Used in UWMP* *(select one from the drop down list)*
Acre Feet
**The unit of measure must be consistent with Table 2-3*
NOTES:

SB X7-7 Table-1: Baseline Period Ranges			
Baseline	**Parameter**	**Value**	**Units**
10- to 15-year baseline period	2008 total water deliveries	12,607	Acre Feet
	2008 total volume of delivered recycled water	-	Acre Feet
	2008 recycled water as a percent of total deliveries	0.00%	Percent
	Number of years in baseline period[1, 2]	10	Years
	Year beginning baseline period range	1999	
	Year ending baseline period range[3]	2008	
5-year baseline period	Number of years in baseline period	5	Years
	Year beginning baseline period range	2004	
	Year ending baseline period range[4]	2008	

[1] If the 2008 recycled water percent is less than 10 percent, then the first baseline period is a continuous 10-year period. If the amount of recycled water delivered in 2008 is 10 percent or greater, the first baseline period is a continuous 10- to 15-year period. *[2] The Water Code requires that the baseline period is between 10 and 15 years. However, DWR recognizes that some water suppliers may not have the minimum 10 years of baseline data.*

[3] The ending year must be between December 31, 2004 and December 31, 2010.

[4] The ending year must be between December 31, 2007 and December 31, 2010.

a California corporation; MERLIN PROPERTIES, LLC; LEONARD M. STEARNS and DOROTHY D. STEARNS, individually and as Trustees of the LEONARD M. STEARNS FAMILY TRUST OF 1991; and DOES 1 through 500, inclusive,

Defendants.

I. INTRODUCTION

1. Pleadings, Parties and Jurisdiction

The complaint herein was filed on February 20, 2003, seeking an adjudication of water rights, injunctive relief and the imposition of a physical solution. The defaults of certain defendants have been entered, and certain other defendants dismissed. Other than defendants who have been dismissed or whose defaults have been entered, all defendants have appeared herein. This Court has jurisdiction of the subject matter of this action and of the parties herein.

2. Stipulation for Judgment

Stipulation for Entry of Judgment has been filed by and on behalf of all defendants who have appeared herein.

3. Definitions

As used in this Judgment, these terms shall have the following meanings:

A. Appropriator or Appropriator Parties: the pumpers identified in Exhibit "C" attached hereto.

B. Appropriator's Production Right: consists of an Appropriator's share of Operating Yield, plus (1) any water acquired by an Appropriator from an Overlying Producer or other Appropriator pursuant to this Judgment, (2) any water

LAW OFFICES
AKLUFI & WYSOCKI
3403 TENTH ST, SUITE 610
RIVERSIDE, CALIFORNIA 92501
(909) 682-5480

withdrawn from the Appropriator's storage account, (3) and New Yield created by the Appropriator.

C. Appropriative Water: the amount of Safe Yield remaining after satisfaction of Overlying Water Rights.

D. Appropriative Water Right: each Appropriator's share of Appropriative Water, such share expressed as a percentage as shown on Exhibit "C".

E. Beaumont Basin or Beaumont Storage Unit: the area situated within the boundaries shown on Exhibit "A" attached hereto.

F. Conjunctive Use: the storage of water in a Groundwater Basin for use at a later time.

G. Groundwater: water beneath the surface of the ground within the zone below the water table in which soil is saturated with water.

H. Groundwater Basin: an area underlain by one or more permeable formations capable of furnishing a substantial water supply.

I. Groundwater Storage Agreement: a standard form of written agreement between the Watermaster and any Person requesting the storage of Supplemental Water.

J. Groundwater Storage Capacity: the space available in a Groundwater Basin that is not utilized for storage or regulation of Safe Yield and is reasonably available for Stored Water and Conjunctive Use.

K. Minimal Producer: any Producer who pumps 10 or fewer acre feet of Groundwater from the Beaumont Basin per year.

LAW OFFICES
AKLUFI & WYSOCKI
3403 TENTH ST, SUITE 610
RIVERSIDE, CALIFORNIA 92501
(909) 682-5480

L. New Yield: increases in yield in quantities greater than historical amounts from sources of supply including, but not limited to, capture of available storm flow, by means of projects constructed after February 20, 2003, as determined by the Watermaster.

M. Operating Yield: the maximum quantity of water which can be produced annually by the Appropriators from the Beaumont Basin, which quantity consists of Appropriative Water plus Temporary Surplus.

N. Overdraft: a condition wherein the total annual production from a Groundwater Basin exceeds the Safe Yield thereof.

O. Overlying Parties: the Persons listed on Exhibit "B", who are owners of land which overlies the Beaumont Basin and have exercised Overlying Water Rights to pump therefrom. Overlying Parties include successors in interest and assignees.

P. Overlying Water Rights: the quantities decreed to Overlying Parties in Column 4 of Exhibit "B" to this Judgment.

Q. Overproduction: by an Appropriator, measured by an amount equal to the Appropriator's actual annual production minus the Appropriator's Production Right. By a new overlying producer, an amount equal to what the overlying producer pumped during the year.

R. Party (Parties): any Person(s) named in this action, or who has intervened, or has become subject to this Judgment either through stipulation, trial or otherwise

LAW OFFICES
AKLUFI & WYSOCKI
3403 TENTH ST, SUITE 610
RIVERSIDE, CALIFORNIA 92501
(909) 682-5480

S. Person: any individual, partnership, association, corporation, governmental entity or agency, or other organization.

T. Physical Solution: the physical solution set forth in Part V of this Judgment.

U. Produce, Producing, Production, Pump or Pumping: the extraction of groundwater.

V. Producer or Pumper: any Person who extracts groundwater.

W. Recycled Water: has the meaning provided in Water Code Section 13050(n) and includes other nonpotable water for purposes of this Judgment.

X. Safe Yield: the maximum quantity of water which can be produced annually from a Groundwater Basin under a given set of conditions without causing a gradual lowering of the groundwater level leading eventually to depletion of the supply in storage. The Safe Yield of the Beaumont Basin is 8650 acre feet per year in each of the ten (10) years following entry of this Judgment.

Y. San Timoteo Watershed Management Authority: a joint powers public agency whose members are the Beaumont-Cherry Valley Water District, the City of Beaumont, the South Mesa Mutual Water Company and the Yucaipa Valley Water District.

Z. Stored Water: Supplemental Water stored in the Beaumont Basin pursuant to a Groundwater Storage Agreement with the Watermaster.

AA. Supplemental Water: water imported into the

LAW OFFICES
AKLUFI / WYSOCKI
3403 TENTH ST., SUITE 610
RIVERSIDE, CALIFORNIA 92501
(909) 682-5480

Beaumont Basin from outside the Beaumont Basin including, without limitation, water diverted from creeks upstream and tributary to Beaumont Basin and water which is recycled and useable within the Beaumont Basin.

BB. Temporary Surplus: the amount of groundwater that can be pumped annually in excess of Safe Yield from a Groundwater Basin necessary to create enough additional storage capacity to prevent the waste of water.

CC. Watermaster: the Person appointed by the Court to administer and enforce the Physical Solution.

4. List of Exhibits

The following exhibits are attached to this Judgment and made a part hereof:

Exhibit "A" -- "Location Map of Beaumont Basin"
Exhibit "B" -- "Overlying Owners and Their Water Rights"
Exhibit "C" -- "Appropriators and Their Water Rights"
Exhibit "D" -- "Legal Description of Lands of the Overlying Parties"
Exhibit "E" -- "Location of Overlying Producer Parcels and Boundary of the Beaumont Basin"

II. INJUNCTIONS

1. Injunction Against Unauthorized Production of Beaumont Basin Water

Each party herein is enjoined, as follows:

A. Overlying Parties: Each defendant who is an Overlying Party, and its officers, agents, employees, successors and assigns, is hereby enjoined and restrained from producing groundwater from the Beaumont Basin in any five-year period hereafter in excess of five times the share of the Safe Yield assigned to the Overlying Parties as set

LAW OFFICES
AKLUFI & WYSOCKI
3403 TENTH ST., SUITE 610
RIVERSIDE, CALIFORNIA 92501
(909) 682-5480

forth in Column 4 of Exhibit "B", as more fully described in the Physical Solution.

B. Appropriator Parties: Each defendant who is an Appropriator Party, and its officers, agents, employees, successors and assigns, is hereby enjoined and restrained from producing groundwater from the Beaumont Basin in any year hereafter in excess of such party's Appropriator's Production Right, except as additional annual Production may be authorized by the provisions of the Physical Solution.

2. Injunction Against Unauthorized Storage or Withdrawal of Stored Water

Each and every Party, and its officers, agents, employees, successors and assigns, is hereby enjoined and restrained from storing Supplemental Water in the Beaumont Basin for withdrawal, or causing withdrawal of water stored by that Party, except pursuant to the terms of a written Groundwater Storage Agreement with the Watermaster and in accordance with Watermaster Rules and Regulations. Any Supplemental Water stored in the Beaumont Basin, except pursuant to a Groundwater Storage Agreement, shall be deemed abandoned and not classified as Stored Water.

III. DECLARATION AND ADJUSTMENT OF RIGHTS

1. Overlying Rights

The Overlying Parties are currently exercising Overlying Water Rights in the Beaumont Basin. As shown on Exhibit "B", the aggregate Projected Maximum Production of water from the Beaumont Basin pursuant to Overlying Water Rights is 8650 acre feet and the Overlying Water Rights are individually decreed, in Column 4 of Exhibit "B", for each Overlying Party. The Overlying Parties

LAW OFFICES
AKLUFI & WYSOCKI
3403 TENTH ST, SUITE 610
RIVERSIDE, CALIFORNIA 92501
(909) 682-5480

shall continue to have the right to exercise their respective Overlying Water Right as set forth in Column 4 of Exhibit "B" except to the extent their respective properties receive water service from an Appropriator Party, as contemplated by Paragraph III.3 of this Judgment.

2. Appropriator's Share of Operating Yield

Each Appropriator Party's share of Operating Yield is shown on Exhibit "C". Notwithstanding any other provision of this Judgment, each Appropriator Party may use its Appropriator's Production Right anywhere within its service area.

3. Adjustment of Rights

A. The Overlying Parties shall have the right to exercise their respective Overlying Water Rights except as provided in this Paragraph 3.

B. To the extent any Overlying Party requests, and uses its Exhibit "B", Column 4 water to obtain water service from an Appropriator Party, an equivalent volume of potable groundwater shall be earmarked by the Appropriator Party which will serve the Overlying Party, up to the volume of the Overlying Water Right as reflected in Column 4 of Exhibit "B" attached hereto, for the purpose of serving the Overlying Party. The intent of this provision is to ensure that the Overlying Party is given credit towards satisfying the water availability assessment provisions of Government Code, Section 66473.7 et seq. and Water Code, Section 10910 et seq. or other similar provisions of law, equal to the amount of groundwater earmarked hereunder.

C. When an Overlying Party receives water service as

LAW OFFICES
AKLUFI & WYSOCKI
3403 TENTH STREET, SUITE 610
RIVERSIDE, CALIFORNIA 92501
(909) 682-5480

provided for in subparagraph III.3.B the Overlying Party shall forebear the use of that volume of the Overlying Water Right earmarked by the Appropriator Party. The Appropriator Party providing such service shall have the right to produce the volume of water foregone by the Overlying Party, in addition to other rights otherwise allocated to the Appropriator Party.

D. Should the volume of the Overlying Water Right equal or exceed the volume of potable groundwater earmarked as provided in subparagraph 3.B, the Appropriator Party which will serve the Overlying Party shall (i) impose potable water charges and assessments upon the Overlying Party and its successors in interest at the rates charged to the then-existing regular customers of the Appropriator Party, and (ii) not collect from such Overlying Party any development charge that may be related to the importation of water into the Beaumont Basin. The Appropriator Party which will serve the Overlying Party pursuant to Subparagraph III.3.B shall also consider, and negotiate in good faith regarding, the provision of a meaningful credit for any pipelines, pump stations, wells or other facilities that may exist on the property to be served.

E. In the event an Overlying Party receives Recycled Water from an Appropriator Party to serve an overlying use served with groundwater, the Overlying Water Right of the Overlying Party shall not be diminished by the receipt and use of such Recycled Water. Recycled Water provided by an Appropriator Party to an Overlying Party shall satisfy the

AKLUFI & WYSOCKI
3403 TENTH ST, SUITE 610
RIVERSIDE, CALIFORNIA 92501
(909) 682-5480

criteria set forth in the California Water Code including, without limitation, the criteria set forth in Water Code Sections 13550 and 13551. The Appropriator Party which will serve the Recycled Water shall have the right to use that portion of the Overlying Water Right of the Overlying Party offset by the provision of Recycled Water service pursuant to the terms of this subparagraph; provided, however, that such right of use by the Appropriator Party shall no longer be valid if the Recycled Water, provided by the Appropriator Party to the Overlying Party, does not satisfy the requirements of Sections 13550 and 13551 and the Overlying Party ceases taking delivery of such Recycled Water.

F. Nothing in this Judgment is intended to impair or adversely affect the ability of an Overlying Party to enter into annexation or development agreements with any Appropriator Party.

G. Oak Valley Partners LP ("Oak Valley") is developing its property pursuant to Specific Plans 216 and 216A adopted by the County of Riverside ("County") in May 1990, and Specific Plan 318 adopted by the County in August, 2001, (Specific Plans 216, 216A and 318 are collectively referred to as the "Specific Plans"). The future water supply needs at build-out of the Specific Plans will greatly exceed Oak Valley's Projected Maximum Production, as reflected in Exhibit "B" to the Judgment, and may be as much as 12,811 acre feet per year. Oak Valley has annexed the portion of its property now within the City of Beaumont into the Beaumont-Cherry Valley Water District ("BCVWD"), and is in

LAW OFFICES
AKLUFI & WYSOCKI
3403 TENTH ST, SUITE 610
RIVERSIDE, CALIFORNIA 92501
(909) 682-5480

the process of annexing the remainder portion of its property into the Yucaipa Valley Water District ("YVWD"), in order to obtain retail water service for the development of the Oak Valley property pursuant to the Specific Plans (for purposes of this subparagraph BCVWD and YVWD are collectively referred to as the "Water Districts", and individually as a "Water District"). YVWD covenants to use its best efforts to finalize the annexation of the Oak Valley property within the Calimesa City limits. Oak Valley, for itself and its successors and assigns, hereby agrees, by this stipulation and upon final annexation of its property by YVWD, to forbear from claiming any future, unexercised, overlying rights in excess of the Projected Maximum Production of Exhibit "B" of 1806 acre feet per year. As consideration for the forbearance, the Water Districts agree to amend their respective Urban Water Management Plans ("UWMP") in 2005 as follows: BCVWD agrees that 2,400 acre feet per year of projected water demand shall be included for the portion of Oak Valley to be served by BCVWD in its UWMP, and YVWD agrees to include 8,000 acre feet per year of projected water demand as a projected demand for the portion of Oak Valley to be served by YVWD in its UWMP by 2025. The Water Districts agree to use their best judgment to accurately revise this estimate to reflect the projected water demands for the UWMP prepared in 2010. Furthermore, the Water Districts further agree that, in providing water availability assessments prior to 2010, as required by Water Code §10910 and water supply verifications as required by Government Code §§66455.3 and

LAW OFFICES
AKLUFI & WYSOCKI
3403 TENTH ST, SUITE 610
RIVERSIDE, CALIFORNIA 92501
(909) 682-5480

66473.7, or any similar statute, and in maintaining their respective UWMP, each shall consider the foregoing respective projected water demand figures for Oak Valley as proposed water demands. The intent of the foregoing requirements is to ensure that Oak Valley is credited for the forbearance of its overlying water rights and is fully accounted for in each Water District's UWMP and overall water planning. The Water Districts' actions in performance of the foregoing planning obligations shall not create any right or entitlement to, or priority or allocation in, any particular water supply source, capacity or facility, or any right to receive water service other than by satisfying the applicable Water District's reasonable requirements relating to application for service. Nothing in this subparagraph G is intended to affect or impair the provision of earmarked water to Overlying Parties who request and obtain water service from Appropriator Parties, as set forth in subparagraph III.3.B, above.

H. Persons who would otherwise qualify as Overlying Producers based on an interest in land lying within the City of Banning's service area shall not have the rights described in this Paragraph III.3.

4. Exemption for Minimal Producers

Unless otherwise ordered by the Court, Minimal Producers are exempt from the provisions of this Judgment.

IV. CONTINUING JURISDICTION

Full jurisdiction, power and authority is retained and reserved to the Court for purposes of enabling the Court, upon

application of any Party, by a motion noticed for at least a 30-day period (or consistent with the review procedures of Paragraph VII.6 herein, if applicable), to make such further or supplemental order or directions as may be necessary or appropriate for interim operation of the Beaumont Basin before the Physical Solution is fully operative, or for interpretation, or enforcement or carrying out of this Judgment, and to modify, amend or amplify any of the provisions of this Judgment or to add to the provisions hereof consistent with the rights herein decreed; except that the Court's jurisdiction does not extend to the redetermination of (a) Safe Yield during the first ten years of operation of the Physical Solution, and (b) the fraction of the share of Appropriative Water of each Appropriator.

V. THE PHYSICAL SOLUTION

1. Purpose and Objective

In accordance with the mandate of Section 2 of Article X of the California Constitution, the Court hereby adopts, and orders the parties to comply with, a Physical Solution. The purpose of the Physical Solution is to establish a legal and practical means for making the maximum reasonable beneficial use of the waters of Beaumont Basin, to facilitate conjunctive utilization of surface, ground and Supplemental Waters, and to satisfy the requirements of water users having rights in, or who are dependent upon, the Beaumont Basin. Such Physical Solution requires the definition of the individual rights of all Parties within the Beaumont Basin in a manner which will fairly allocate the native water supplies and which will provide for equitable sharing of costs of Supplemental Water.

AKLUFI AND WYSOCKI
3403 TENTH STREET, SUITE 610
RIVERSIDE, CALIFORNIA 92501
(909) 682-5480

2. Need for Flexibility

The Physical Solution must provide maximum flexibility and adaptability in order that the Watermaster and the Court may be free to use existing and future technological, social, institutional and economic options. To that end, the Court's retained jurisdiction shall be utilized, where appropriate, to supplement the discretion granted herein to the Watermaster.

3. Production and Storage in Accordance With Judgment

This Judgment, and the Physical Solution decreed herein, address all Production and Storage within the Beaumont Basin. Because the Beaumont Basin is at or near a condition of Overdraft, any Production outside the framework of this Judgment and Physical Solution will potentially damage the Beaumont Basin, injure the rights of all Parties, result in the waste of water and interfere with the Physical Solution. The Watermaster shall bring an action or a motion to enjoin any Production that is not in accordance with the terms of this Judgment.

4. General Pattern of Operation

One fundamental premise of the adjudication is that all Producers shall be allowed to pump sufficient water from the Beaumont Basin to meet their respective requirements. Another fundamental premise of the adjudication is that Overlying Parties who pump no more than the amount of their Overlying Water Right as shown on Column 4 of Exhibit "B" hereto, shall not be charged for the replenishment of the Beaumont Basin. To the extent that pumping exceeds five (5) times the share of the Safe Yield assigned to an Overlying Party (Column 4 of Exhibit "B") in any five (5) consecutive years, or the share of Operating Yield

RIVERSIDE, CALIFORNIA 92501
(909) 682-5480

Right of each Appropriator Party, each such Party shall provide funds to enable the Watermaster to replace such Overproduction.

5. Use of Available Groundwater Storage Capacity

A. There exists in the Beaumont Basin a substantial amount of available Groundwater Storage Capacity. Such Capacity can be reasonably used for Stored Water and Conjunctive Use and may be used subject to Watermaster regulation to prevent injury to existing Overlying and Appropriative water rights, to prevent the waste of water, and to protect the right to the use of Supplemental Water in storage and Safe Yield of the Beaumont Basin.

B. There shall be reserved for Conjunctive Use a minimum of 200,000 acre feet of Groundwater Storage Capacity in the Beaumont Basin provided that such amount may be reduced as necessary to prevent injury to existing water rights or existing uses of water within the Basin, and to prevent the waste of water. Any Person may make reasonable beneficial use of the Groundwater Storage Capacity for storage of Supplemental Water; provided, however, that no such use shall be made except pursuant to a written Groundwater Storage Agreement with the Watermaster. The allocation and use of Groundwater Storage Capacity shall have priority and preference for Producers within the Beaumont Basin over storage for export. The Watermaster may, from time-to-time, redetermine the available Groundwater Storage Capacity.

VI. ADMINISTRATION

1. Administration and Enforcement by Watermaster

The Watermaster shall administer and enforce the provisions of this Judgment and any subsequent order or instructions of the Court.

2. Watermaster Control

The Watermaster is hereby granted discretionary powers to develop and implement a groundwater management plan and program for the Beaumont Basin, which plan shall be filed with and shall be subject to review and approval by, the Court, and which may include water quantity and quality considerations and shall reflect the provisions of this Judgment. Except for the exercise by Overlying Parties of their respective Rights described in Column 4 of Exhibit "B" hereto in accordance with the provisions of the Physical Solution, groundwater extractions and the replenishment thereof, and the storage of Supplemental Water, shall be subject to procedures established and administered by the Watermaster. Such procedures shall be subject to review by the Court upon motion by any Party.

3. Watermaster Standard of Performance

The Watermaster shall, in carrying out its duties and responsibilities herein, act in an impartial manner without favor or prejudice to any Party or purpose of use.

4. Watermaster Appointment

The Watermaster shall consist of a committee composed of persons nominated by the City of Banning, the City of Beaumont, the Beaumont-Cherry Valley Water District, the South Mesa Mutual Water Company and the Yucaipa Valley Water District, each of

AKLUFI AND WYSOCKI
3403 TENTH ST, SUITE 610
RIVERSIDE, CALIFORNIA 92501
(909) 682-5480

which shall have the right to nominate one representative to the Watermaster committee who shall be an employee of or consultant to the nominating agency. Each such nomination shall be made in writing, served upon the other parties to this Judgment and filed with the Court, which shall approve or reject such nomination. Each Watermaster representative shall serve until a replacement nominee is approved by the Court. The nominating agency shall have the right to nominate that representative's successor.

5. Powers and Duties of the Watermaster

Subject to the continuing supervision and control of the Court, the Watermaster shall have and may exercise the following express powers, and shall perform the following duties, together with any specific powers, authority, and duties granted or imposed elsewhere in this Judgment or hereafter ordered or authorized by the Court in the exercise of its continuing jurisdiction:

A. Rules and Regulations: The adoption of appropriate rules and regulations for the conduct of Watermaster affairs, copies of which shall be provided to all interested parties.

B. Wellhead Protection and Recharge: The identification and management of wellhead protection areas and recharge areas.

C. Well Abandonment: The administration of a well abandonment and well destruction program.

D. Well Construction: The development of minimum well construction specifications and the permitting of new wells.

AKLUFI AND WYSOCKI
3403 TENTH ST, SUITE 610
RIVERSIDE, CALIFORNIA 92501
(909) 682-5480

E. Mitigation of Overdraft: The mitigation of conditions of uncontrolled overdraft.

F. Replenishment: The acquisition and recharge of Supplemental Water.

G. Monitoring: The monitoring of groundwater levels, ground levels, storage, and water quality.

H. Conjunctive Use: The development and management of conjunctive-use programs.

I. Local Projects: The coordination of construction and operation, by local agencies, of recharge, storage, conservation, water recycling, extraction projects and any water resource management activity within or impacting the Beaumont Basin.

J. Land Use Plans: The review of land use plans and coordination with land use planning agencies to mitigate or eliminate activities that create a reasonable risk of groundwater contamination.

K. Acquisition of Facilities: The purchase, lease and acquisition of all necessary real and personal property, including facilities and equipment.

L. Employment of Experts and Agents: The employment or retention of such technical, clerical, administrative, engineering, accounting, legal or other specialized personnel and consultants as may be deemed appropriate. The Watermaster shall maintain records allocating the cost of such services as well as all other expenses of Watermaster administration.

M. Measuring Devices: Except as otherwise provided

LAW OFFICES

3403 TENTH [illegible]T, SUITE 610
RIVERSIDE, CALIFORNIA 92501
(909) 682-5480

by agreement the Watermaster shall install and maintain in good operating condition, at the cost of the Watermaster, such necessary measuring devices or meters as Watermaster may deem appropriate. Such devices shall be inspected and tested as deemed necessary by the Watermaster and the cost thereof borne by the Watermaster. Meter repair and retesting will be a Producer expense.

N. Assessments: The Watermaster is empowered to levy and collect the following assessments:

(1) Annual Replenishment Assessments

The Watermaster shall levy and collect assessments in each year, in amounts sufficient to purchase replenishment water to replace Overproduction by any Party.

(2) Annual Administrative Assessments

a. Watermaster Expenses: The expenses of administration of the Physical Solution shall be categorized as either "General Watermaster Administration Expenses", or "Special Project Expenses".

i. General Watermaster Administration Expenses: shall include office rent, labor, supplies, office equipment, incidental expenses and general overhead. General Watermaster Administration Expenses shall be assessed by the Watermaster equally against the Appropriators who have appointed representatives to the Watermaster.

LAW OFFICES
AKLUFI AND WYSOCKI
3403 TENTH ST, SUITE 610
RIVERSIDE, CALIFORNIA 92501
(909) 682-5480

ii. Special Project Expenses: shall include special engineering, economic or other studies, litigation expenses, meter testing or other major operating expenses. Each such project shall be assigned a task order number and shall be separately budgeted and accounted for. Special Project Expenses shall be allocated to the Appropriators, or portion thereof, on the basis of benefit.

O. Investment of Funds; Borrowing: The Watermaster may hold and invest Watermaster funds as authorized by law, and may borrow, from time-to-time, amounts not exceeding annual receipts.

P. Contracts: The Watermaster may enter into contracts for the performance of any of its powers.

Q. Cooperation With Other Agencies: The Watermaster may act jointly or cooperate with other local, state and federal agencies.

R. Studies: The Watermaster may undertake relevant studies of hydrologic conditions and operating aspects of the management program for the Beaumont Basin.

S. Groundwater Storage Agreements: The Watermaster shall adopt uniform rules and a standard form of agreement for the storage of Supplemental Water, provided that the activities undertaken pursuant to such agreements do not injure any Party.

T. Administration of Groundwater Storage Capacity: Except for the exercise by the Overlying Parties of their

LAW OFFICES
AKLUFI AND WYSOCKI

RIVERSIDE, CALIFORNIA 92501
(909) 682-5480

respective Overlying Water Rights described in Part III, above, in accordance with the provisions of the Physical Solution, all Groundwater Storage Capacity in the Beaumont Basin shall be subject to the Watermaster's rules and regulations, which regulations shall ensure that sufficient storage capacity shall be reserved for local projects. Any Person or entity may apply to the Watermaster to store water in the Beaumont Basin.

U. Accounting for Stored Water: The Watermaster shall calculate additions, extractions and losses and maintain an annual account of all stored water in the Beaumont Basin, and any losses of water supplies or Safe Yield resulting from such stored water.

V. Accounting for New Yield: Recharge of the Beaumont Basin with New Yield water shall be credited to the Party that creates the New Yield. The Watermaster shall make an independent scientific assessment of the estimated New Yield created by each proposed project. New Yield will be allocated on an annual basis, based upon monitoring data and review by the Watermaster.

W. Accounting for Acquisitions of Water Rights: The Watermaster shall maintain an accounting of acquisitions by Appropriators of water otherwise subject to Overlying Water Rights as the result of the provision of water service thereto by an Appropriator.

X. Annual Administrative Budget: The Watermaster shall prepare an annual administrative budget for public review, and shall hold a public hearing on each such budget

LAW OFFICES
AKLUFI AND WYSOCKI
3403 TENTH STREET, SUITE 610
RIVERSIDE, CALIFORNIA 92501
(909) 682-5480

prior to adoption. The budget shall be prepared in sufficient detail so as to make a proper allocation of the expenses and receipts. Expenditures within budgeted items may thereafter be made by the Watermaster as a matter of course.

Y. Redetermining the Safe Yield: The Safe Yield of the Beaumont Basin shall be redetermined at least every 10 years beginning 10 years after the date of entry of this Judgment.

6. Reports and Accounting

(a) Production Reports: Each Pumper shall periodically file, pursuant to Watermaster rules and regulations, a report showing the total production of such Pumper from each well during the preceding report period, and such additional information as the Watermaster may reasonably require.

(b) Watermaster Report and Accounting: The Watermaster shall prepare an annual report of the preceding year's operations, which shall include an audit of all assessments and Watermaster expenditures.

7. Replenishment

Supplemental Water may be obtained by the Watermaster from any source. The Watermaster shall seek the best available quality of Supplemental Water at the most reasonable cost for recharge in the Basin. Sources may include, but are not limited to:

(a) Recycled Water;

(b) State Water Project Water;

(c) Other imported water.

Replenishment may be accomplished by any reasonable method including:

(a) Spreading and percolation, or injection of water in existing or new facilities; and/or

(b) In-lieu deliveries for direct surface use, in lieu of groundwater extraction.

VII. MISCELLANEOUS PROVISIONS

1. Designation of Address for Notice and Service

Each Party shall designate, in writing to the plaintiff, the name and address to be used for purposes of all subsequent notices and service herein, such designation to be delivered to the plaintiff within 30 days after the Judgment has been entered. The plaintiff shall, within 45 days after judgment has been entered, file the list of designees with the Court and serve the same on the Watermaster and all Parties. Such designation may be changed from time-to-time by filing a written notice of such change with the Watermaster. Any Party desiring to be relieved of receiving notices of Watermaster activity may file a waiver of notice on a form to be provided by the Watermaster. The Watermaster shall maintain, at all times, a current list of Parties to whom notices are to be sent and their addresses for purposes of service. The Watermaster shall also maintain a full current list of names and addresses of all Parties or their successors, as filed herein. Copies of such lists shall be available to any Person. If no designation is made, a Party's designee shall be deemed to be, in order of priority: (i) the Party's attorney of record; or (ii) if the Party does not have an

attorney of record, the Party itself at the address on the Watermaster list.

2. Intervention After Judgment

Any Person who is neither a Party to this Judgment nor a successor or assignee of a Party to this Judgment may seek to become a party to this Judgment by filing a petition in intervention.

3. Interference with Pumping

Nothing in this judgment shall be deemed to prevent any party from seeking judicial relief against any other party whose pumping activities constitute an unreasonable interference with the complaining party's ability to extract groundwater.

4. Successors and Assigns

This Judgment and all provisions herein shall be binding on and shall inure to the benefit of the heirs, executors, administrators, successors and assigns of the parties hereto.

5. Severability

The provisions of this Judgment are severable. If any provision of this Judgment is held by the Court to be illegal, invalid or unenforceable, that provision shall be excised from the Judgment. The remainder of the terms of the Judgment shall remain in full force and effect and shall in no way be affected, impaired or invalidated by such excision. This Judgment shall be reformed to add, in lieu of the excised provision, a provision as similar in terms to the excised provision as may be possible and be legal, valid and enforceable.

6. Review Procedures

Any action, decision, rule or procedure of the Watermaster

LAW OFFICES
AKLUFI AND WYSOCKI
3403 TENTH ST., SUITE 610
RIVERSIDE, CALIFORNIA 92501
(909) 682-5480

pursuant to this Judgment shall be subject to review by the Court on its own motion or on timely motion by any Party, as follows:

A. Effective Date of Watermaster Action: Any order, decision or action of the Watermaster pursuant to this Judgment on noticed specific agenda items shall be deemed to have occurred on the date of the order, decision or action.

B. Notice of Motion: Any Party may, by a regularly-noticed motion, petition the Court for review of the Watermaster's action or decision pursuant to this Judgment. The motion shall be deemed to be filed when a copy, conformed as filed with the Court, has been delivered to the Watermaster, together with the service fee established by the Watermaster sufficient to cover the cost to photocopy and mail the motion to each Party. The Watermaster shall prepare copies and mail a copy of the motion to each Party or its designee according to the official service list which shall be maintained by the Watermaster according to Part VII, paragraph 1, above. A Party's obligation to serve the notice of a motion upon the Parties is deemed to be satisfied by filing the motion as provided herein. Unless ordered by the Court, any petition shall not operate to stay the effect of any Watermaster action or decision which is challenged.

C. Time for Motion: A motion to review any Watermaster action or decision shall be filed within 90 days after such Watermaster action or decision, except that motions to review Watermaster assessments hereunder shall be filed within 30 days of mailing of notice of the assessment.

AKLUFI & WYSOCKI
3403 TENTH STREET, SUITE 610
RIVERSIDE, CALIFORNIA 92501
(909) 682-5480

D. De Novo Nature of Proceeding: Upon filing of a petition to review a Watermaster action, the Watermaster shall notify the Parties of a date when the Court will take evidence and hear argument. The Court's review shall be de novo and the Watermaster decision or action shall have no evidentiary weight in such proceeding.

E. Decision: The decision of the Court in such proceedings shall be an appealable Supplemental Order in this case. When the same is final, it shall be binding upon the Watermaster and the Parties.

Dated: FEB - 4 2004

Note 7 -- Parcels owned by Sunny-Cal Egg & Poultry Company include the overlying water rights of Manheim, Manheim and Berman (MMB) and is aggregated as shown in Column 4 of Exhibit B as attributable to Sunny-Cal Egg & Poultry Company. As requested, Watermaster designated a portion of these aggregated rights to Hector Gutierrez, Luis Gutierrez and Sebastian Monroy on June 13, 2006.

Note 8 -- Parcels owned by Sunny-Cal Egg & Poultry Company include the overlying water rights of Manheim, Manheim and Berman (MMB) and is aggregated as shown in Column 4 of Exhibit B as attributable to Sunny-Cal Egg & Poultry Company. As requested, Watermaster designated a portion of these aggregated rights to Boris and Miriam Durmont on June 13, 2006.

RESOLUTION NO. 2015 – 01

A RESOLUTION OF THE BEAUMONT BASIN WATERMASTER ADOPTING THE 2013 REEVALUATION OF THE BEAUMONT BASIN SAFE YIELD REPORT AND REDETERMINATION OF THE SAFE YIELD OF THE BEAUMONT BASIN

WHEREAS, the Stipulated Judgment filed February 4, 2004 establishing the Beaumont Basin Watermaster (Riverside Superior Court Case No. 389197) empowers Watermaster to adopt appropriate rules and regulations for the conduct of Watermaster affairs; and

WHEREAS, the Stipulated Judgment, per section VI.5.Y. requires Watermaster to redetermine the Safe Yield of the Beaumont Basin at least every 10 years beginning 10 years after the date of entry of the Stipulated Judgment; and

WHEREAS, a special projects committee, consisting of representatives from the City of Banning, the Beaumont-Cherry Valley Water District, the South Mesa Mutual Water Company, and the Yucaipa Valley Water District was commissioned to provide Watermaster with a recommendation concerning the redetermination of safe yield; and

WHEREAS, the special projects committee commissioned Thomas Harder & Co. in association with Alda, Inc. to prepare a report analyzing and recommending a redetermined Safe Yield as defined by Rule 4.1 of the Beaumont Basin Watermaster Rules and Regulations; and

WHEREAS, the special projects committee conducted several public workshops concerning the redetermination of the Safe Yield of the Beaumont Basin during which considered and analyzed studies and draft reports prepared by Thomas Harder & Co. in association with Alda, Inc., and also received and considered comments submitted by overlyers, appropriators and members of the public; and

WHEREAS, Thomas Harder & Co. in association with Alda, Inc. conducted studies and prepared a report entitled "Final 2013 Reevaluation of the Beaumont Basin Safe Yield" based on the projected water balance for the 10 year period between 2013 to 2022; and

WHEREAS, the Thomas Harder & Co. in association with Alda, Inc. report recommended the redetermined Safe Yield of the Beaumont Basin to be 6,700 acre-feet/yr for the next 10 years of operations within the Beaumont Basin; and

WHEREAS, the special projects committee has recommended to Watermaster that the Final 2013 Reevaluation of the Beaumont Basin Safe Yield report be approved and adopted, and that the redetermined Safe Yield of the Beaumont Basin be 6,700 acre-feet/yr;

NOW, THEREFORE, BE IT HEREBY RESOLVED BY THE BEAUMONT BASIN WATERMASTER that:

1. The Beaumont Basin Watermaster does accept and adopt the Final 2013 Reevaluation of the Beaumont Basin Safe Yield report; and
2. The Beaumont Basin Watermaster redetermines the Safe Yield of the Beaumont Basin to be 6,700 acre-feet/yr.

PASSED AND ADOPTED this 1st day of April, 2015.

RE: 2015 Regional Urban Water Management Plan for Beaumont-Cherry Valley Water District

Dear Mr. Vela,

Beaumont-Cherry Valley Water District is in the process of developing the 2015 Urban Water Management Plan. The Urban Water Management Planning Act requires every "urban water supplier" of a certain size to prepare and adopt an Urban Water Management Plan (UWMP) at least once every five years. The UWMP is a planning document in which water suppliers evaluate and compare their water supply and reliability to their existing and projected demands. A complete UWMP is necessary for Beaumont-Cherry Water District to remain eligible for state drought water bank assistance and is a requirement of state grant and loan funding programs.

The 2015 UWMP will include an update of anticipated water demands in the Beaumont-Cherry Valley Water District service area which includes portions of San Bernardino and Riverside County. Water demand projections will rely upon growth and population estimates from local land use plans and state and regional agencies. Beaumont-Cherry Valley Water District is encouraging participation by land use agencies, water use agencies, and other interested parties in the UWMP**. Beaumont-Cherry Valley Water District would like to extend to your agency an opportunity to meet with us to go over the various elements of the Urban Water Management Plan., including assumptions about future population, future water demand, future water supplies, and upcoming water conservation programs.**

We anticipate that a draft UWMP will be available for public review starting in May or early June 2016 and our agency will hold a public hearing in June 2016, prior to adoption of the UWMP. Hence we would like to solicit your input in the near future.

If your agency would like to learn more about Beaumont-Cherry Valley Water District's Urban Water Management Plan, please contact Dan Jaggers at (951) 845-0159.

Sincerely,

Dan Jaggers

The UWMP is a planning document in which water suppliers evaluate and compare their water supply and reliability to their existing and projected demands. A complete UWMP is necessary for Beaumont-Cherry Water District to remain eligible for state drought water bank assistance and is a requirement of state grant and loan funding programs.

The 2015 UWMP will include an update of anticipated water demands in the Beaumont-Cherry Valley Water District service area which includes portions of San Bernardino and Riverside County. Water demand projections will rely upon growth and population estimates from local land use plans and state and regional agencies. Beaumont-Cherry Valley Water District is encouraging participation by land use agencies, water use agencies, and other interested parties in the UWMP**. Beaumont-Cherry Valley Water District would like to extend to your agency an opportunity to meet with us to go over the various elements of the Urban Water Management Plan., including assumptions about future population, future water demand, future water supplies, and upcoming water conservation programs.**

We anticipate that a draft UWMP will be available for public review starting in May or early June 2016 and our agency will hold a public hearing in June 2016, prior to adoption of the UWMP. Hence we would like to solicit your input in the near future.

If your agency would like to learn more about Beaumont-Cherry Valley Water District's Urban Water Management Plan, please contact Dan Jaggers at (951) 845-0159.

Subject: Notice of Public Hearing and Possible Adoption of Beaumont-Cherry Valley Water District 2016 Urban Water Management Plan Update

Dear Mr. Davis,

In accordance with §106442 of the California Water Code, The Beaumont-Cherry Valley Water District (District) will be holding a public hearing to receive input and comment on the draft version of the District's 2016 Urban Water Management Plan (UWMP) Update. Both written and oral comments will be accepted either on or prior to the date of the public hearing.

Date of Public Hearing: December 14, 2016

Location: Beaumont-Cherry Valley Water District
Board Room
560 Magnolia Avenue
Beaumont, CA 91123

Time of Public Hearing: 7:00 pm

The Beaumont Cherry Valley Water District has revised its 2016 Urban Water Management Plan and one copy of the draft 2016 UWMP Update is included herein.

The 2016 UWMP Update is also available for review and comment on the District's website: www.bcvwd.org

Sincerely,

Dan Jaggers
Director of Engineering

UWMP Public Hearing Presentation

Draft 2015 Urban Water Management Plan

Beaumont Cherry Valley Water District
December 14, 2016

Beaumont-Cherry Valley Water District
Serving the Beaumont, Cherry Valley and some areas of Calimesa

What is the UWMP?

- Required by California Water Code
  - For all water suppliers with 3,000 customers or supplying more than 3,000 acre-ft/year (AFY)
- Must be completed every 5 years
  - DWR extended the 2015 deadline into 2016
- Demonstrates how BCVWD will meet water demands over next 20 to 25 years
- It is a "Planning Document" that complements BCVWD's Potable and Non-potable Water Master Plans

Beaumont-Cherry Valley Water District
Serving the Beaumont, Cherry Valley and some areas of Calimesa

Some Specific Requirements for this "Edition"

- Are we complying with SB X7-7?
  - Reduce per capita water use by 20% by 2020
- How are we doing with respect to system water losses?
- Do we have adequate supply for single and multi-year drought conditions?
- Can we meet demands during catastrophic supply interruptions?
- Potential climate change impacts on imported and local water supplies

Beaumont-Cherry Valley Water District
Serving the Beaumont, Cherry Valley and some areas of Calimesa

Purpose of Today's Presentation

- Present Draft UWMP and receive Board, Public, and other Agency Comments
  - Required by the Water Code
- Provide an insight into what BCVWD is considering for future water supplies
- Provide an opportunity for Board and Public input into the planning direction
- Make revisions as needed to the "Draft"
- Adopt the UWMP (assuming no significant changes)

Beaumont-Cherry Valley Water District
Serving the Beaumont, Cherry Valley and some areas of Calimesa

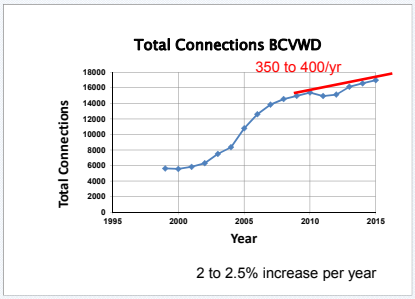
The Next Steps

- Submit the adopted version along with a Board resolution of adoption to DWR
- DWR will place the adopted BCVWD's UWMP on DWR's website
- BCVWD will place the adopted UWMP on the District's website

Beaumont-Cherry Valley Water District
Serving the Beaumont, Cherry Valley and some areas of Calimesa

Presentation Outline

- Historical water use and projection of future demands
- Sources of water to meet demands
- Supply reliability
- Water shortage contingency planning
- Demand management measures

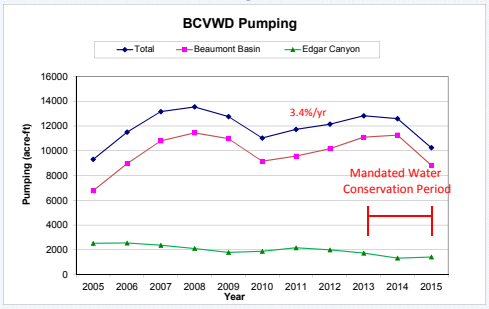


Beaumont-Cherry Valley Water District
Serving the Beaumont, Cherry Valley and some areas of Calimesa

BCVWD's Plan

- Rely on Firm Sources
- Ensure there is adequate, reliable imported water supply available to meet future needs
- Supplement with future sources to reduce the need to purchase imported water
- Encourage conservation and using water wisely

Beaumont-Cherry Valley Water District
Serving the Beaumont, Cherry Valley and some areas of Calimesa



Connection Growth in BCVWD

2 to 2.5% increase per year

Beaumont-Cherry Valley Water District
Serving the Beaumont, Cherry Valley and some areas of Calimesa

Total Water Pumped

Beaumont-Cherry Valley Water District
Serving the Beaumont, Cherry Valley and some areas of Calimesa

Predicting the Future

- Population growth in BCVWD service area taken from adopted Potable Water Master Plan
  - Construction started and grading and utilities completed when construction stalled
  - Still about 4,200 EDUs left to construct in Sundance, K-Hov, and Fairway Canyon
  - Approximately 10,500 additional planned EDUs in other areas
- Cherry Valley growth – very gradual

Beaumont-Cherry Valley Water District
Serving the Beaumont, Cherry Valley and some areas of Calimesa

Planned EDU Status

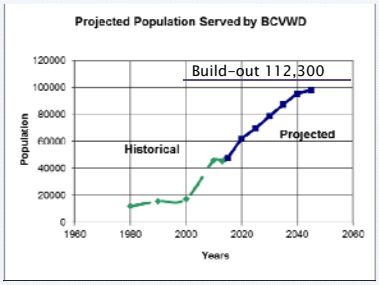
- Housing Sites Under Construction: ~4,200 EDUs
  - Sundance, K-Hov, Fairway Canyon, Heartland (partially graded)
- Housing Sites Approved For Construction: ~3,800 EDUs
- Development/Tracts Under Review (By City of Beaumont): ~6,700

Beaumont-Cherry Valley Water District
Serving the Beaumont, Cherry Valley and some areas of Calimesa

Projected Growth – probably aggressive

Table 3-7
Summary of New EDUs in BCVWD Service Area (base year 2013)
(Taken from BCVWD 2015 Potable Water Master Plan)

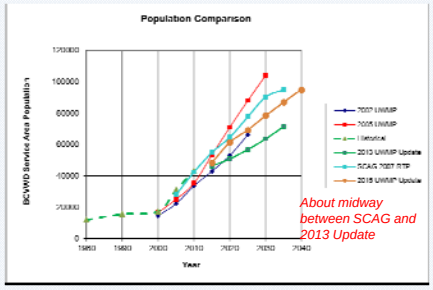
	Cumulative New EDUs							
	2015	2020	2025	2030	2035	2040	2045	Build-out
Beaumont	893	5,530	8,301	11,382	14,144	15,852	16,317	17,856
Cherry Valley	13	23	82	251	552	1,661	2,233	4,655
Totals	918	5,553	8,383	11,633	14,696	17,513	18,550	22,511
Average New EDUs/year		927	566	650	612	563	207	



Beaumont-Cherry Valley Water District
Serving the Beaumont, Cherry Valley and some areas of Calimesa

Table 3-8
Current and Projected Population in BCVWD Service Area

	Population						
	2015	2020	2025	2030	2035	2040	Build-out
Based on EDU Growth in Table 3-5							
Beaumont	41,780	54,764	62,522	71,149	78,883	83,665	92,806
Cherry Valley	6,597	6,622	6,784	7,244	8,066	11,139	19,494
Totals BCVWD	48,377	61,386	69,306	78,393	86,949	94,804	112,300
Based on 500 EDUs/year in Beaumont							
Cherry Valley	6,597	6,622	6,784	7,244	8,066	11,139	19,494
Beaumont	41,780	48,780	55,780	62,780	69,780	76,780	92,806
Totals BCVWD	48,377	55,402	62,564	70,024	77,846	87,919	112,300



Reduced growth rate results in a 5-year lag
-- not significant in water supply planning

Projections for Future Populations

Beaumont-Cherry Valley Water District
Serving the Beaumont, Cherry Valley and some areas of Calimesa

Comparison to Previous UWMPs

About midway between SCAG and 2013 Update

Beaumont-Cherry Valley Water District
Serving the Beaumont, Cherry Valley and some areas of Calimesa

Water Demands

	2015	2020	2025	2030	2035	2040
Potable Water, AFY	9,792	14,753	16,576	18,674	20,658	22,483
Non-Potable Water, AFY	0	1,906	2,374	2,931	3,228	3,449
Subtotal, AFY	9,792	16,659	18,950	21,605	23,886	25,932
Imported Water for Banking to meet Reliability Requirements for Future Growth, AFY		1,000	1,500	2,000	2,500	2,500
Total Demands, AFY	9,792	17,659	20,450	23,605	26,386	28,432

Beaumont-Cherry Valley Water District
Serving the Beaumont, Cherry Valley and some areas of Calimesa

Water Demand Summary

- Potable water demand increase of about 400 AF to 500 AF per Year over next 25 years (average)
- Imported water "banking" will increase from 1,000 AFY to over 2,500 AFY over next 25 years to build up storage account for drought contingency
  - Over and above that needed to offset replacement obligations

Beaumont-Cherry Valley Water District
Serving the Beaumont, Cherry Valley and some areas of Calimesa

Sources to Meet Demands

Source	Current	Future
Groundwater	X	X
Imported Water from SGPWA	X	X
Recycled Water for Landscape Irrigation (YVWD & Beaumont)		X
Advance Treated Recycled Water for Groundwater Recharge (YVWD & Beaumont)		Potential
Captured Urban Runoff and Stormwater		X
Non-potable Groundwater	X	X
Joint Projects with Other Agencies with Exchanges		Potential

Beaumont-Cherry Valley Water District
Serving the Beaumont, Cherry Valley and some areas of Calimesa

Total Groundwater Sources

Source/Year	2015	2020	2025	2030	2035	2040
Edgar Canyon, AFY	1,418	2,200	2,200	2,200	2,200	2,200
Beaumont Basin, AFY	1,927	1,765	1,970	2,334	2,782	2,836
Beaumont Basin Forbearance from Supplying Golf Courses. AFY	0	453	431	416	457	528
Total Extractable Groundwater without replacement, AFY	3,345	4,418	4,601	4,950	5,439	5,564
BCVWD Total Potable Water Demand, AFY	9,792	14,753	16,576	18,674	20,658	22,483
Shortfall, AFY	6,447	10,335	11,975	13,724	15,219	16,919

Beaumont-Cherry Valley Water District
Serving the Beaumont, Cherry Valley and some areas of Calimesa

Meeting the Potable Water Shortfall

- Captured urban and storm water runoff
- Imported water from SGPWA
- Advance treated recycled water percolated to the groundwater
- Increased conservation

Beaumont-Cherry Valley Water District
Serving the Beaumont, Cherry Valley and some areas of Calimesa

Stormwater can be captured!

Beaumont-Cherry Valley Water District
Serving the Beaumont, Cherry Valley and some areas of Calimesa

Stormwater Capture

Facility	Estimated Amount of New Water, AFY
Grand Ave. Storm Drain (Beaumont MDP Line 16)	185
Cherry Ave. Basin	245
Eighth St. Basin	220
Starlight Basin	80
Total	730

Amount captured depends on drainage area, extend of development, storm pattern, and recharge/storage basin capacity

Beaumont-Cherry Valley Water District
Serving the Beaumont, Cherry Valley and some areas of Calimesa

Advance Treated Recycled Water

Source	2015	2020	2025	2030	2035	2040

Beaumont-Cherry Valley Water District
Serving the Beaumont, Cherry Valley and some areas of Calimesa

Potable Water Summary

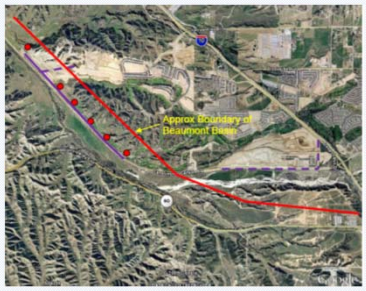
Source	2015	2020	2025	2030	2035	2040
Shortfall, AFY	6,447	10,335	11,975	13,724	15,219	16,919
Captured Urban Runoff & Storm Water, (New Water), AFY	0	185	430	730	730	730
Advance Treated Recycled Water, Percolated, AFY	0	0	418	491	646	827
Imported Water from SGPWA to meet potable water demand, AFY	6,447	10,150	11,127	12,503	13,843	15,362

Beaumont-Cherry Valley Water District
Serving the Beaumont, Cherry Valley and some areas of Calimesa

Sources to Meet Non-potable Water Demands

- Non-potable nitrate groundwater from mouth of Edgar Canyon
- Non-potable groundwater extracted from San Timoteo Canyon
- Recycled Water

Beaumont-Cherry Valley Water District
Serving the Beaumont, Cherry Valley and some areas of Calimesa



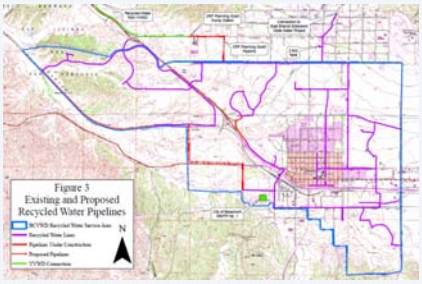
High Nitrate Groundwater at Mouth of Edgar Canyon

A series of extraction wells which would pump high nitrate groundwater into the non-potable water system

Beaumont-Cherry Valley Water District
Serving the Beaumont, Cherry Valley and some areas of Calimesa

San Timoteo Extraction Wells

A series of extraction wells along Oak Valley Pkwy to extract high groundwater to non-potable water system



Beaumont-Cherry Valley Water District
Serving the Beaumont, Cherry Valley and some areas of Calimesa

Recycled Water

- Very Important and Reliable Source
- YVWD
- City of Beaumont

Beaumont-Cherry Valley Water District
Serving the Beaumont, Cherry Valley and some areas of Calimesa

BCVWD's Existing Recycled Water System – 40+ miles of pipe!

Beaumont-Cherry Valley Water District
Serving the Beaumont, Cherry Valley and some areas of Calimesa

City of Beaumont Recycled Water

- Status
  - Completed the UV Validation Testing and UV is approved
  - Need to install instrumentation and monitoring systems and coagulation system to meet Title 22
  - Title 22 Engineering Report for WWTP has been completed and awaiting approval
  - WWTP flows are above 75% trigger point; City needs to move forward to increase capacity
  - A consulting firm is under contract to perform preliminary design

Beaumont-Cherry Valley Water District
Serving the Beaumont, Cherry Valley and some areas of Calimesa

Special Requirements

- Need to maintain 1.8 mgd (about 2000 AFY) of flow in Cooper's Creek for Environmental Mitigation
  - Reduces the amount which can be recycled
  - Some may be recovered through extraction wells
- Need to treat to meet TDS limits
- Need to construct storage tank and booster pumping station at or near WWTP
  - BCVWD pipelines already extend front of WWTP

YVWD Recycled Water

- Recycled Water meets Max Benefit requirements (meets TDS requirements)
- Approximately 1,045 AFY of recycled water and filter washwater from the water treatment plant is available
- Requires a 5-mile long pipeline connection along I-10
  - Joint project with YVWD since it would also serve their Summerwind project
  - BCVWD prepared a facility plant for a loan/grant from SWRCB

Non-potable Water Demand

Source	2015	2020	2025	2030	2035	2040
Non-potable Water Demand, (Landscaping), AFY	0	1,906	2,374	2,931	3,228	3,449
Non-potable Water to Golf Courses, as available, AFY	0	453	431	412	457	528
Total Non-Potable, AFY	0	2,362	2,805	3,343	3,685	3,977
YVWD Supplied, AFY	0	1,042	1,043	1,043	1,044	1,043
City of Beaumont Supplied, AFY	0	1,154	1,482	1,849	2,194	2,536

Non-potable Groundwater or Other Sources, AFY	0	166	280	451	447	398

Imported Water

- Subject to Reliability Issues
  - Currently per DWR, on the average, 50% of the time, only 64% of SGPWA's Table A available
- No immediate system capacity limitations except for BCVWD's turnout from EBX at Noble Creek
  - Limited by SGPWA to 24 cfs. More flow is possible with turnout upgrades already requested

Imported Water Requirement from SGPWA

Source	2015	2020	2025	2030	2035	2040

Imported Water for Banking to Meet Reliability Requirements for Growth, AFY	0	1,000	1,500	2,000	2,500	2,500
Total Imported Water Needed, AFY	6,447	11,150	11,627	14,503	16,343	17,862

Note imported water totals for 2020 and 2025 differ from Table 6-26 in UWMP. UWMP assumes imported water will be used instead of non-potable groundwater

BCVWD Imported Water Facilities

- Pipeline
  - Current 24-in pipeline (34 cfs) – up to 22,500 AFY
  - Requested Second Turnout to Recharge Facility
- Groundwater Recharge Facility
  - Total Capacity – 25,000 AFY to 35,000 AFY
- Putting in perspective BCVWD projected 2040 total water demand only about 17,860 AFY
- Having extra capacity makes it possible to take Article 21 & Turnback pool water when available

Underlying Principles for Imported Water

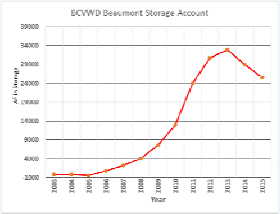
WHEREAS, the Board of Directors of the SGPWA finds and determines that the present existing water importation, production, transportation, delivery facilities and water supplies are inadequate to meet anticipated demand;"

"The Agency is prepared to take the necessary actions to provide its service area with adequate supplies of water to meet expanding and increasing needs in the years ahead. As additional water resources are required to meet increasing needs, the Agency will be prepared to take the necessary actions to deliver such supplies."

"The Agency would ensure that future development within that entity's service area would be covered in the Agency's urban water management plan and that entity would have a right to expect future water supplies to be provided by the Agency for that development."

Imported Water Responsibility

Based on the foregoing, BCVWD can rely on the SGPWA to secure and deliver the imported water needed to meet BCVWD's current and future demands as set forth in this 2015 UWMP and subsequent UWMP Updates.



It is assumed the Pass Agency will consider the SWP reliability factor (64%) in the purchase of any additional Table A water from other State Water Contractors to ensure 100% reliability of Table A water.

Reliability Assessment

- Evaluated our water supply under:
  - Single Dry Year
  - 2 Consecutive Dry Years
  - 3 Consecutive Dry Years
  - 6 Consecutive Dry Years
  - For Edgar Canyon based on 33 years of record
- Imported Water Deliveries (based on historical):
  - Minimum year 5%
  - Minimum 2 consecutive years 12.5%
  - Minimum 3 consecutive years 20%
  - Minimum 6 consecutive years 42.5%
- Evaluated for conditions from 2015 through 2040

Key to Water Supply Reliability

- BCVWD's Beaumont Basin Storage Account
  - Capacity for up to 80,000 AF of banked water

Was nearly 34,000 AF, end of 2012
25,568 AF at start of 2016

Decline due to lack of imported water supply

Water available this year so should partially recover storage account level

Results of Reliability Analysis

BCVWD Groundwater Storage Account Needs

	Amount Needed in Storage, AF	
	2020	2040
Single Dry Year	11,700	17,900
2 Consecutive Dry Years	21,800	33,600
3 Consecutive Dry Years	30,200	46,800
6 Consecutive Dry Years	40,400	64,300

To achieve 40,400 AF in storage, need about 3,000 AFY to be recharged

To achieve 64,300 AF in storage by 2040, need about 1,600 AFY to be recharged

Our Plan of banking 1,000 to 2,500 AFY over next 25 years will achieve this goal

Water Shortage Contingency Planning

- UWMP presents 5 stages of mandatory water reductions and mandatory prohibitions in the event of an emergency
- Reduction depends on the severity & length of the outage
- A public hearing will be held to discuss implementation of voluntary or mandatory reductions
- Board has responsibility to assess emergency situation and make recommendation on appropriate stage of reduction

Table 8-1 Retail
Stages of Water Shortage Contingency Plan

Stage	Percent Supply Reduction[1] *Numerical value as a percent*	Water Supply Condition *(Narrative description)*
1	10	Up to a 10% reduction in normal, "long term" water supply; imported waer supply allocation averages approximately 50% over a 2-year (or longer) period
2	20	Up to 20% reduction in normal, "long term" water supply; imported waer supply allocation between 49.9% and 25% over a 3-year (or longer) period
3	25	Up to 25% reduction in normal, "long term" water supply; imported waer supply allocation between 24.9% and 10% over a 3-year (or longer) period
4	30	Up to 30% reduction in normal, "long term" water supply; imported waer supply allocation between 9.9% and 5% over a 3-year (or longer) period
5	50	Up to 50% reduction in normal, "long term" water supply; imported waer supply allocation averages less than 5% over a 4-year (or longer)period

[1] *One stage in the Water Shortage Contingency Plan must address a water shortage of 50%.*

NOTES:

Beaumont-Cherry Valley Water District
Serving the Beaumont, Cherry Valley and some areas of Calimesa

Contingency Planning Stages

- Stage 1
  - 10% demand reduction
  - SWP allocation 50% over 2-year period
  - Voluntary through notification and public awareness
- Stage 2
  - 20% demand reduction
  - 49.9% > SWP allocation > 25%
  - Restrictions similar to Resolution 2105-05

Beaumont-Cherry Valley Water District
Serving the Beaumont, Cherry Valley and some areas of Calimesa

Contingency Planning Stages

- Stage 3
  - 25% reduction in water use
  - 24.9% < SWP Allocation >10% over 3-year period
  - Restrictions similar to Resolution 2015-05 plus one day per week watering
- Stage 4
  - 30% reduction in water use
  - 9.9% < SWP Allocation >5% over 3-year period
  - Restrictions similar to Resolution 2015-05 but may include no lawn turf watering except for recycled water

Beaumont-Cherry Valley Water District
Serving the Beaumont, Cherry Valley and some areas of Calimesa

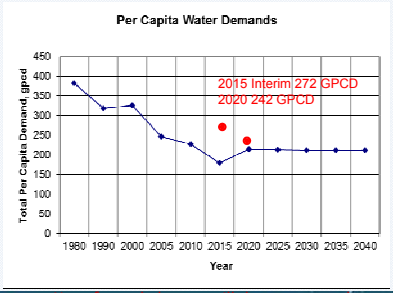
Contingency Planning Stages

- Stage 5
  - 50% water use reduction
  - SWP Allocation < 5% for 4 consecutive years
  - Restrictions similar to Resolution 2015-05 but may include no lawn turf watering except for recycled water
  - Hand watering of plants 2 days per week
  - Water conservation advisory committee formed
  - Work with commercial/industrial users to reduce water consumption

Beaumont-Cherry Valley Water District
Serving the Beaumont, Cherry Valley and some areas of Calimesa

Catastrophic Supply Interruption

- Regional and local power outages
  - 23.5 MG of above ground storage
  - Major wells have standby power generators
- Earthquakes
  - Upper Edgar, Cherry III, Vineland II and III, and Taylor Tank are anchored, Hannon is a new pre-stressed concrete tank
- Contaminated wells
  - Adequate standby wells available



Beaumont-Cherry Valley Water District
Serving the Beaumont, Cherry Valley and some areas of Calimesa

Imported Water Interruptions

- Will have to rely on banked water in the Beaumont Basin
- As of end of 2015, 25,568 AF in storage
- 2015 demand was 9,792 AF
  - With Edgar Canyon we have 3-years worth of water

Beaumont-Cherry Valley Water District
Serving the Beaumont, Cherry Valley and some areas of Calimesa

BCVWD's Per Capita & Targets

Doing well and with recycled water available the per capita will reduce

Use of recycled water will decrease actual per capita

We should be OK

Beaumont-Cherry Valley Water District
Serving the Beaumont, Cherry Valley and some areas of Calimesa

Let's Summarize

Beaumont-Cherry Valley Water District
Serving the Beaumont, Cherry Valley and some areas of Calimesa

Water Supply Summary Plan

- Heavy reliance on imported water
  - 11,350 AFY (2020) to 17,870 AFY (2040)
  - Bank between 1,000 and 2,500 AFY for future
- Recycled water will be important source for landscaping irrigation and advance treated water for groundwater recharge
- Storm water and urban runoff capture and other local water resource projects will help offset need for imported water

Beaumont-Cherry Valley Water District
Serving the Beaumont, Cherry Valley and some areas of Calimesa

Comment Letters, Minutes of Public Hearing, and Responses

BEAUMONT-CHERRY VALLEY WATER DISTRICT
AGENDA
MINUTES OF REGULAR MEETING OF THE BOARD OF DIRECTORS
560 Magnolia Avenue, Beaumont, CA 92223
Wednesday, December 14th, 2016
Regular Session 7:00 p.m.

Swearing-in of re-elected Director Douglass and newly elected Director Ramirez

Director of Finance & Administrative Services Rodriguez swore in new Director Andy Ramirez and returning Director Nathan Douglass.

Call to Order, Vice President Hoffman

Vice President Hoffman began the meeting at 7:02 p.m.

Pledge of Allegiance, Director Slawson

Director Slawson led the pledge.

Invocation, Director Covington

Director Covington led the invocation.

Roll Call

Present at the meeting were: Director Covington, Ramirez, Hoffman, Slawson and Director Douglass. Legal Counsel: James Markman. District Staff: General Manager: Eric Fraser, Director of Engineering: Dan Jaggers, Director of Operations: Anthony Lara and Director of Finance & Administrative Services: Yolanda Rodriguez.

Public who registered their attendance were Lloyd White, David Fenn, and Jannshed Yazdani.

Public Comment

Mr. Lloyd White, Mayor for the City of Beaumont, congratulated and welcomed new Board member Director Ramirez and returning Board member Director Douglass.

Mr. White shared that he heard BCVWD November's Board meeting recordings, and stated that he disagreed with Beaumont's Councilman Mr. Mark Orozco's comments. He stated that it is not the role of council to tell the Board what to do with management and staff, but instead he looks forward to reaching out from elected Board to elected Board and work together for the best solutions for the community with issues such as the recycled water and the SGPWA challenges.

ACTION ITEMS

1. Adjustments to the Agenda

There were no changes to the Agenda.

2. **Reorganization of the Board of Directors**** (page 4)

   - Nomination and Election of the President

     Director Hoffman nominated Director Slawson for President. The motion was seconded by Director Douglass and passed 5-0 by roll call: Director Covington - Aye; Director Ramirez - Aye; Director Hoffman – Aye; Director Douglass – Aye; Director Slawson – Aye.

     .

   - Nomination and Election of the Vice President

     Director Ramirez nominated Director Covington for Vice President. The motion was seconded by President Slawson and passed 5-0 by roll call: Director Ramirez - Aye; Director Hoffman – Aye; Director Douglass – Aye; President Slawson – Aye; Director Covington – Aye.

   - Nomination and Election of the District Treasurer

     Director Douglass nominated Director Hoffman for Treasurer. The motion was seconded by President Slawson and passed 5-0 by roll call: Director Ramirez - Aye; Director Hoffman – Aye; Director Douglass – Aye; President Slawson – Aye; Director Covington – Aye.

   - Nomination and Election of the District Secretary

     Director Hoffman nominated Director Douglass for Secretary. The motion was seconded by President Slawson and passed 5-0 by roll call: Director Ramirez - Aye; Director Hoffman – Aye; Director Douglass – Aye; President Slawson – Aye; Director Covington – Aye.

   - Appointment of the Personnel Committee

     President Slawson appointed Director Covington and Director Ramirez to the Personnel Committee.

   - Appointment of the Finance & Audit Committee

     President Slawson appointed Director Hoffman and Director Douglass to the Finance & Audit Committee.

3. **Consent Calendar:** All matters listed under the Consent Calendar are considered by the Board of Directors to be routine and will be enacted in one motion. There will be no discussion of these items prior to the time the Board considers the motion unless members of the Board, the administrative staff, or the public request specific items to be discussed and/or removed from the Consent Calendar.

   a. October 2016 Budget Variance Report Review** (pages 5-9)
   b. October 31st, 2016 Cash/Investment Balance Report** (page 10)
   c. November 2016 Check Register Review** (pages 11-22)
   d. November 2016 Invoices Pending Approval**(pages 23-24)
   e. Minutes of the Regular Meeting November 9th, 2016**(pages 25-30)
   f. Minutes of the Special Meeting December 1st, 2016***(pages 31-32)

Director Hoffman motioned to approve all items on the Consent Calendar. The motion was seconded by Director Douglass and passed 5-0.

4. **Public Hearing and Consideration of Adoption of the District's 2015 Urban Water Management Plan Update****(pages 33-37)

    a. Open the Public Hearing for consideration of the 2015 Urban Water Management Plan Update;
    b. Consider the final draft 2015 Urban Water Management Plan Update and any related public comments thereon;
    c. Close the public hearing; and
    d. Consider the resolution of the Board of Directors of the Beaumont-Cherry Valley Water District Adopting the 2015 Urban Water Management Plan Update and associated staff actions.

Mr. David Fenn shared his concerns regarding the 80% increase in water usage projection in the five year span from 2015 to 2020, compared to the population growth projection of 27% for the same period and stated that he thought it was overestimated.

Mr. Michael Tidus, attorney for Pardee Homes, shared Pardee Homes' concerns in regards to the investment they have already made for infrastructure and water rights and requested that the Sundance Project be properly categorized as a development project that the District is obligated to serve as an existing use.

Legal Counsel Markman responded to Mr. Tidus' concerns regarding the projections and stated that this is a planning document, and does not warrant exempting people at this point.

General Manager Fraser gave an overview displaying a reconciliation spreadsheet of Capacity Fees Collected versus the Facilities Built from the period of 2000 to 2016, which demonstrates approximately $8.1 million reserved for Facilities. He stated that moving forward with the Capital Improvement Plan the District will build facilities as needed.

Mr. Jeff Chambers, with Pardee Homes, had questions regarding the deficit of Facility Fees collected versus Facilities built.

General Manager Fraser thanked Director of Engineering Dan Jaggers and contract Engineer Joe Reichenberger for their hard work in the Urban Water Management Plan Update.

Director of Engineering Jaggers introduced Joe Reichenberger, who gave a PowerPoint presentation on the proposed 2015 Urban Water Management Plan Update. Mr. Reichenberger shared that the District received comments from the Riverside County Flood Control and Water Conservation District relating to the Grand Avenue Storm drain, which he included in the errata sheet. He shared that the City of Yucaipa also commented on their concerns regarding recycled water not always being available. Mr. Reichenberger stated that he prepared an errata sheet to correct any inconsistencies.

After receiving no further public comment, the hearing was closed. Director Ramirez requested additional time to review the errata sheet and motioned

to consider the resolution at the January 2017 Regular Board meeting. The motion was seconded by Director Douglass and passed 5-0 to bring back item in January 2017 Regular Board meeting for final consideration.

Consideration of Request for Update of "Will Serve Letter" for Commercial Development Infill Parcel - Riverside County Assessor's Parcel No. 419-267-075.**(pages 38-67)

Public Comment on Item:

Ms. Judy Bingham shared her concerns regarding the Urban Water Management Plan, and stated she just wanted to share that the City of Beaumont is out of the bond market.

Director of Engineering Jaggers gave an overview of the request for the update "Will Serve Letter".

After discussion, Director Covington motioned to approve the Request for Update of the "Will Serve Letter". The motion was seconded by Director Ramirez and passed 5-0.

a. Ad Hoc Committees

No reports were made.

b. General Manager

General Manager Fraser presented slides showing the City of Beaumont's Council meeting at which accusations made by the City's consultant Brian Knoll, from Webb Associates, stated that the BCVWD was nonresponsive in providing water infrastructure information. General Manager Fraser shared slides showing multiple email exchanges between District staff and the Webb Consultant, which demonstrated that the District provided comprehensive recycled water planning information. In addition, the emails showed that District staff was more than happy to meet with Webb's consultant. General Manager Fraser stated that the District has always been very responsive to any type of public records requests or meeting requests. He stated that the District is an agency based on getting things done. He stated he just wanted to set the record straight.

Director Ramirez thanked General Manager Fraser for keeping the integrity of the District regarding these statements presented by Brian Knoll.

c. Directors Reports

Director Covington reported that the Annual Ground Water Conference is being held at the Radisson in Ontario on February 15th – 16th, 2017.

Director Douglass shared that he attended the San Gorgonio Pass Water Agency (SGPWA) meeting. He shared that at the meeting it was discussed that the Noble Creek connection time frame would take about 6 months. Director Douglass wanted District staff to clarify with the SGPWA that it is the District's desire to upgrade this connection as soon as possible.
General Manager Fraser stated he will try to reach out to Mr. Davis.

d. Legal Counsel Report

No reports were made.

5. Announcements

- District Offices will be closed on December 26th, 2016 in observance of Christmas Day
- District Offices will be closed on January 2nd, 2017 in observance of New Year's Day
- Finance and Audit Committee meeting, January 5th, 2017 at 3:00 p.m.
- Regular Board meeting, January 11th, 2017 at 7:00 p.m.
- District Offices will be closed on January 16th, 2017 in observance of Martin Luther King Day

President Slawson made the announcements above.

6. Action List for Future Meetings

- Proposition 1 Bond Opportunities

President Slawson made the announcements above.

7. Adjournment

President Slawson adjourned the meeting at 9.38 p.m.

Attest:

_____	_____
Director Daniel Slawson, President to the Board of Directors of the Beaumont-Cherry Valley Water District	Director Nathan Douglass, Secretary to the Board of Directors of the Beaumont-Cherry Valley Water District

** Information included in the agenda packet

December 13, 2016

Daniel K. Jaggers, Director of Engineering
Beaumont-Cherry Valley Water District
560 Magnolia Avenue
Beaumont, CA 92223

SUBJECT: 2015 Urban Water Management Plan Update

Dear Mr. Jaggers:

The City of Yucaipa (City) has had the opportunity to review the Draft 2015 Urban Water Management Plan Update (UWMP) for the Beaumont-Cherry Valley Water District that was provided by your office. The UWMP is a very comprehensive document that identifies the District's planned growth, current and proposed infrastructure, and an analysis of water supply reliability to meet future growth.

The UWMP contains references to a Facilities Planning Report that was completed by the District in 2014 which would involve the construction of a recycled water supply pipeline and pump station. A key component of this plan would be a connection to the Yucaipa Valley Water District (YVWD) recycled system near the intersection of Interstate 10 and Cherry Valley Boulevard. In Section 7 of the UWMP, Water Supply Reliability Assessment, the anticipated use of recycled water from YVWD is factored into the reliability assessment. Table 7-7, Estimated Recycled Water Available During Extended Periods, identifies an estimated 921 acre-feet of recycled water from YVWD in 2020 and increasing to 1,032 acre-feet in 2040 (the table does reduce this amount by 10 to 15% for dry years). These figures are then used in Tables 7-9 through 7-12 to demonstrate water supply reliability to meet present and future demand.

In June 2016, the City had the opportunity to review and comment on the YVWD's Urban Water Management Plan. One of the City's comments addressed the the utilization of "surplus" recycled water. In Paragraph 12.6.5.2 of YVWD's Urban Water Management Plan the following is stated:

> "YVWD will be constructing a Regional Recycled Water Conveyance System to the YVWD's southernmost service area boundary. This extension would involve the construction of a 24" recycled water pipeline, approximately 18,500 linear feet (3.5 miles) through the City of Calimesa. The purpose of the pipeline is to provide recycled water service to customers within YVWD and provide surplus recycled water to neighboring water agencies such as the Beaumont-Cherry Valley Water district and the City of Banning."

The City understands and appreciates the benefit of recycled water, and the work that both the YWVD and BCVWD has, and continues to pursue, in developing this valuable resource. However, the City is not aware of reports or studies that have demonstrated that there is, or will

be, surplus recycled water generated by the residents of Yucaipa and Calimesa which would allow exportation beyond the boundaries of Yucaipa Basin. The City has partnered with several governmental agencies, including YVWD, to develop conjunctive use projects to recharge the Yucaipa basin, manage groundwater resources, and ensure basin stability. In addition, we have been attempting to maximize our use of recycled water, with some difficulty, in certain areas, for irrigating our parks and facilities through the City. Recycled water is a key component of this management strategy, and the City continues to work closely with YVWD to maximize its use within the Yucaipa Basin.

These comments are not meant to challenge the methodology used in the development of your UWMP. We are simply addressing the issue of whether or not there will be surplus recycled water available from YVWD, which could have an impact on BCVWD water supplies for future projects.

Thank you for the opportunity to review the UWMP. The City would be happy to discuss and review these comments with you at your convenience.

Sincerely

Fermin G. Preciado, P.E.
City Engineer

Re: Comments on Draft 2015 Beaumont-Cherry Valley Water District Urban Water Management Plan (December 14, 2016, Board Agenda Item No. 4)

Dear Members of the Board of Directors:

We represent Pardee Homes, a California corporation ("Pardee"), a master developer of homes in the City of Beaumont (the "City"). The purpose of this letter is to provide Pardee's comments on the draft 2015 Beaumont-Cherry Valley Water District ("District") Urban Water Management Plan ("Draft UWMP").

As discussed in greater depth below, the Draft UWMP should be revised as follows before its adoption, in order to fulfill its core purpose of providing an assessment of the extent to which current and future water supply sources will be adequate to reliably meet the needs of the District's various categories of customers (Water Code, §§ 10610.2, subds. (a)(4) and (b), 10631, subd. (c)(2)):

- Clarify that Pardee's Sundance development project's total water demand is included in the District's category of customers that the District is obligated to serve, and included in the Draft UWMP's "existing demand" calculations; and,

- Correct the Draft UWMP's internal inconsistencies and its inconsistencies with information in the District's 2015 Potable Water System Master Plan ("2015 Master Plan") and District's Urban Water Management Plan Update dated July 2013 ("2013 UWMP").

1. The Draft UWMP Should Clarify that Pardee's Sundance Project Is Included in the District's Category of Customers that the District is Obligated to Serve.

The Draft UWMP lists Pardee's Sundance project ("Sundance Project" or "Project") among several large development projects that were approved for development and started

construction before the economic downturn. (Draft UWMP, p. 3-14.) The Draft UWMP should clarify that Pardee's Sundance Project has already been grandfathered to obtain District water connections and is to be treated as an existing customer of the District.

When the Sundance Project was annexed into the District's service area, the District's Plan of Services dated March 4, 2002, identified water necessary for the Project, infrastructure necessary to serve the Project, and the fees necessary for the District to develop or obtain the water to supply the Project. Pardee has paid millions of dollars for this fee which "includes a new water source fee to construct or obtain additional water required as a result of new development." (Plan of Services, p. 7.) Also, Pardee has built millions of dollars of infrastructure to supply water to its Sundance Project and the City of Beaumont.

Specifically, Pardee has incurred about $25 million for District facility fees (including $3.5 million for the District facility fee Water Rights (SWP) component), Pardee constructed and paid about $7.5 million for local infrastructure, and Pardee constructed and paid for about $4.5 million for backbone infrastructure. The District is obligated to supply water for the Project's demands as an existing obligation, or else the District would have to reimburse Pardee (plus interest and other damages) for its significant expenditures. If the District treated its water service obligation to the Sundance Project as being subject to securing additional future water supplies, the District would be at risk of taking Pardee's property by way of unconstitutional exactions under *Nollan v. California Coastal Commission* (1987) 483 U.S. 825, 837, and *Dolan v. City of Tigard* (1994) 512 U.S. 374, 391.

The District recognized its water service obligation in 2014, when it included a "grandfather" exception in Section 2(b) of District Resolution No. 2014-05 that precluded the issuance of will serve letters under certain circumstances. The grandfather provision excepted projects such as Sundance where a will serve letter was previously issued and the recipient relied on that letter to pay fees to the District, annex into the District, or construct District infrastructure to provide water service to the property in reliance on that will serve letter. Resolution No. 2014-05 recognized and protected Pardee's significant investment to secure water supplies and infrastructure in reliance on the District's will serve commitment.

The Sundance Project's water demands were already considered by the District's 2013 UWMP, and the District has concluded that there is enough water to serve the Project. For example, a District staff memo dated October 6, 2016 confirms:

> "The impact of this development on the District's water supply system is identified in the District's 2013 Urban Water Management Plan Update."

The District's need to secure additional water supplies to serve future water demands is the result of planned development projects that have not fully paid into and improved the District's water system. The Draft UWMP should clarify that, due to Pardee's significant investment in the District's infrastructure and water rights, Pardee's Sundance Project has

already been grandfathered to obtain District water connections and is treated as an existing customer of the District.

2. **The Draft UWMP Contains A Number Of Errors and Inconsistencies That Should Be Corrected In Order for the Draft UWMP to Comply with the Required UWMP Provisions and Include Substantial Evidence Supporting its Assessment of the Adequacy of the District's Water Supplies.**

The Draft UWMP uses supply and demand figures that are internally inconsistent and inconsistent with information in the District's 2015 Master Plan. These inconsistencies and errors should be corrected in order to provide substantial evidence to support the Draft UWMP's assessment of the District's water supplies.

A. The Draft UWMP includes inconsistent supply and demand figures, and does not explain how those figures match up.

Though the Draft UWMP contains a number of inconsistencies, the summary below focuses on some of the more substantive inconsistencies as opposed to the non-substantive drafting issues.

1) Calculations of the amount of water in the Beaumont Basin Storage Account Balance are inconsistent.

The water supply during the Two, Three and Six Consecutive Dry Years scenarios relies heavily on water supplied from the District's Storage Account. Therefore, the correct Storage Account balance number is critical to understanding the District's groundwater banking plans. The 2015 Storage Account balance is inconsistently reported throughout the Draft UWMP. On page 6-27, it is listed as 21,700 AF. On p. 8-23 it is listed as 25,568 AF. On page 8-2 it is described as "about 28,000 AF." There is a significant difference (more than 30%) in these inconsistent figures.

Page 7-4 provides that adding 35,000 AF to the Storage Account over the next twenty years will bring the account balance to "about 50,000." However, significantly less water would need to be banked to reach that goal. For example, if the current Storage Account balance is 21,700 AF above is correct, the balance after adding 35,000 AF would be 56,700 AF; if the 25,568 AF number is correct the balance would be 60,658 AF; and if the 28,000 AF number is correct the balance would be 63,000 AF. This inconsistency needs to be corrected.

2) Numbers in the Water Supply and Demand Tables are Inconsistent.

The supply and demand numbers for all years in the Single Dry Year scenario in California Department of Water Resources ("DWR") Table 7-3 in Appendix C do not match the corresponding numbers in Table 7-9 on p. 7-9.

The available supply numbers in DWR Table 8-4 in Appendix C are not the same as the numbers in Table 8-7 at p. 8-25 (2018 supply numbers do not match, Table 8-8 may need to be corrected depending on the correct number). Similarly, the 2016 number in Table 8-7 is supposed to carry over into Table 8-8, but it does not.

The Draft UWMP incorrectly underestimates water supply from future water supply projects. Table 6-24 on p. 6-60 (Expected Future Water Supply Projects or Programs) includes seven future projects. It is unclear whether the supply totals from all of the projects is carried over into Table 6-26 on p. 6-62 (BCVWD Water Supplies). But, at least with respect to two supply totals that are carried over (for the "Lower Edgar Canyon Non-potable Groundwater" and "San Timoteo Canyon GW Extraction" projects), the supply totals listed in Table 6-26 are less than the supply totals listed in Table 6-24.

The Draft UWMP also underestimates supply from the Edgar Canyon wells. Specifically, in the dry years scenarios, Edgar Canyon supply ranges from 1,117 AFY (Single Dry Year) to 1,367 AFY (Six Consecutive Dry Years). (Draft UWMP, pp. 7-9 to 7-11) However, according to Table 2-2 in the 2015 Master Plan, the annual Edgar Canyon supply during 2007-2014 exceeded 1,700 AF in every year except one – 2014. In 2014, the supply was 1,325 AF, but the Draft UWMP notes that the supply in 2014 and 2015 (1,418 AF) "were low, partially due to [two] larger canyon wells…being out of service." (Draft UWMP, Table 6-7, p. 6-31).

The Draft UWMP also mistakenly overestimates demand. First, the full build out demand numbers under all conditions are inflated because the trend in development projects has shown a reduction in the construction of approved units. For example, Pardee is reducing the number of units to be constructed in its Sundance project below the number of approved units. Second, the water demand projections in Table 4-2 do not include any water conservation effects, resulting in overestimating demand by as much as 10% to 15%. (Draft UWMP, pp. 4-6 – 4-7.) This overestimation is due to the District's decision not to take into account the construction of "much more water efficient homes with limited turf landscaping and more efficient landscaping." (Draft UWMP, p. 4-7.) As a result, the District's use of .65 AFY/EDU to calculate demand is questionable and overestimates projected demand.

Also, in the Single Dry Year, Two Consecutive Dry Years and Three Consecutive Dry Years scenarios, demand is overestimated by omitting water conservation/water restrictions under the District's Water Shortage Contingency Plan. As explained on page 7-11, only the Six Consecutive Dry Years scenario includes any demand reduction due to conservation/water restrictions. However, some or all of the other dry year scenarios would trigger at least Stage 1 of the District's Water Shortage Contingency Plan, which would include a District recommended 10% voluntary use reduction. The dry year demand projections should account for conservation.

B. The Draft UWMP's anticipated imported water needs are inconsistent with the District's 2015 Master Plan.

The numbers included in the Draft UWMP discussion of the District's anticipated need for imported water (Draft UWMP, p. 6-13) are based on the District's projections in the 2015 Master Plan, but are inconsistent with the numbers in the 2015 Master Plan. Specifically, the Draft UWMP projects between 18,500 AFY to 23,000 AFY of imported water will be needed at buildout, but Table 5-29 of the 2015 Master Plan projects significantly lower imported water demands of between 15,600 AFY and 18,300 AFY (a difference of over 18% & 25%, respectively). The Draft UWMP should explain how the District's imported water demand projections in the Draft UWMP relate to the projections in the 2015 Master Plan.

C. The Draft UWMP is missing the required distribution system water loss calculation.

The Draft UWMP is required to include the District's distribution system water loss quantification calculated in accordance with the DWR worksheet. (Water Code, § 10631, subd. (c)(1)(B).) Instead, the Draft UWMP "estimates" the District's distribution system water loss in 2015 to be 500 AFY (Draft UWMP Table 4-4). Table 4-4 explains that the reason the District estimated water loss in the current Draft UWMP is that it "believes the amount calculated in the Water Audit Spreadsheet is not correct due to change in this method of accounting for the 2 month lag between production (measured daily) and consumption (meter read time)". The Draft UWMP does not include the required Water Audit Spreadsheet calculation or even provide the methodology required for calculating the District's distribution system water losses. The Draft UWMP references Appendix L for details on the required methodology for calculating system losses (Draft UWMP, p. 4-3), but Appendix L is missing.

The discussion of District water loss is also inconsistent with information provided in the 2013 UWMP. The Draft UWMP explains that the District annually audits its distribution system water losses by comparing the amount of water produced from wells to the amount of water used by consumers (as reported by metering readings). (Draft UWMP, p. 9-5.) However, the Draft UWMP deletes information from the 2013 UWMP about the range of loss the District has determined is acceptable for its distribution system. The 2013 UWMP reported that the District "annually reviews data records to confirm that unaccounted for water losses stay within an acceptable range of 5% to 7%". (2013 UWMP, p. 6-3.) The District's distribution system water losses projected in Table 4-2 of the Draft UWMP are inconsistent with the District's 5% to 7% acceptable loss standard. The water losses projected in the Draft UWMP are underestimated at less than half the amount of loss that the District's standard would allow in every 5-year increment shown in Table 4-2.

Quantifying the District's distribution system water losses based on DWR's standardized calculation is important to assess the District's distribution system efficiency, find leaks that inevitably occur through the many miles of District pipes and fittings that bring water to the District's customers, and promote timely repairs. The UWMP's compliance with the required DWR worksheet calculation of water loss is needed to prohibit waste and free up additional water supplies. Without the DWR worksheet calculation, the Draft UWMP does not calculate

and disclose the District's distribution system water losses in the manner required by Water Code section 10631(e)(3)(B).

Conclusion

Thank you for the opportunity to comment on the Draft UWMP. As discussed in this letter, a core purpose of the Draft UWMP is to provide an assessment of the extent to which current and future water supply sources will be adequate to reliably meet the needs of the District's various categories of customers. Pardee's Sundance Project is not properly categorized because it is discussed amongst planned development projects that have not fully paid into and improved the District's water system. Due to Pardee's significant investment in the District's infrastructure and water rights for Sundance Project, Pardee requests that the Sundance Project be properly categorized as a development project that the District is obligated to serve as an existing use.

In addition, before adopting the Draft UWMP, the District should fix the Draft UWMP to include the information and correct the errors discussed in this letter, and provide an adequate opportunity for public review and comment of the revised Draft UWMP.

Very truly yours,

Michael L. Tidus

Subject: BCVWD 2015 Urban Water Management Plan Update
Attachments: 2015 Urban Water Management Plan Update_RCFC Comments.pdf

Good Afternoon Dan,

Please see the attached pdf for comments from RCFC&WCD on the 2015 Urban Water Management Plan Update. A summary of the comments is below.

General Comment:
Please change project name throughout document from "Grand Ave Storm Drain/Grand Ave Interceptor" to match the grant's language of "Beaumont MDP Line 16".
Pages: 2-5, 6-37 (table 6-10), 6-38, 6-39 (Figure 6-11), 6-40 (Tables 6-11, 6-12), 6-41 (Table 6-13), 6-59, 6-60 (Table 6-24)

Other Comments:
6-37, Table 6-10: Project Marshal Creek: Typo "developed area"
6-37, Table 6-10: Project Grand Avenue Storm Drain: Change area from 505 Acres to 571
6-38, 2nd Paragraph: Delete "It should be operational before 2018". Change to "Deadline for completion of construction is December 31st, 2021" (or something equivalent).
6-40, Table 6-11: Change area from 505 to 571 Acres.
6-60, Table 6-24: Project title, Agency-RCFC&WCD, Implementation year 2021

Please call if you have any questions.

Respectfully,

Michael L. Venable
Watershed and Water Conservation Planning
Riverside County Flood Control & Water Conservation District

December 12, 2016

2015 Urban Water Management Plan

Errata Sheet

Pardee-Sundance Comments (Jackson Tidus):

1. **Page 6-27, 2nd last paragraph**

   Revise sentence to read: "Data from Watermaster's 2015 Annual Report indicates that BCVWD's groundwater storage account balance at the end of 2015 is 25,568 AF."

2. **Page 7-4, 3rd paragraph, Second last sentence to read**:

   "Looking at the quantities in Table 6-26, (rather than 6-25), BCVWD anticipates banking 35,000 AF over the next 20 years which would bring BCVWD's storage account to about 60,560 AF."

3. **Page 8-2, paragraph above "Stage 1", 2nd sentence:**

   Revise sentence to read: "BCVWD currently has 25,568 AF in storage…."

4. **Appendix C DWR Table 7-3, Substitute the following:**

Table 7-3 Retail: Single Dry Year Supply and Demand Comparison					
	2020	2025	2030	2035	2040 (Opt)
Supply totals	4,962	5,877	6,657	7,472	8,042
Demand totals	16,659	18950	21,605	23,886	25,932
Difference	(11,697)	(13,073)	(14,948)	(16,414)	(17,890)
NOTES: The Difference between Supply and Demand will be provided from Banked Water in the Beaumont Basin.					

5. **Appendix C DWR Table 8-4, revise as follows and replace Table 8-7 with the following:**

DWR Table 8-4 Retail: Minimum Supply Next Three Years			
	2016	2017	2018
Available Water Supply	13,826	9,650	4,508
NOTE: 2016 based on BCVWD receiving 9,870 AF per SGPWA email. Year 2017 and 2018 assumes 35% and 5% SWP Allocation as used in Stress Test. SPW amounts per SGPWA for Stess Test Analysis.			

Riverside County Flood Control and Water Conservation District:

6. **Page 2-5, Last line, revise name of "Grand Avenue Storm Water Capture" to "Beaumont MDP Line 16"**
7. **Table 6-10, Revise Title of Grand Avenue Storm Drain, correct typographical error "area" in Marshall Creek Description**

Table 6-10
Potential Storm Water Capture Projects

Project	Brief Description
Soft plug in Noble Creek at BCVWD Groundwater Recharge Facility	Large flows which would bypass the spreading basins at the mouth of Edgar Canyon (Figure 6-10 above) could still be captured. Provide "soft plug" in lined portion of Noble Creek channel and divert flows into BCVWD's recharge facility. (Note that only extreme flows actually make it out of the canyon). Estimated Yield – 500 AFY.
Stormwater Capture Noble Creek	Noble Creek flows could be desilted on property owned by BCVWD (15.7 acres) along Noble Creek upstream of Noble St and west of Cherry Ave. Unfortunately this area is not over the Beaumont Basin, but the property could be used for desilting basins with the desilted water released back into Noble Cr. and recaptured at a soft plug in the lined channel and diverted into the District's recharge site. Estimated Yield = 400 AFY.
Marshall Creek s/o Elm to I-10	There is a significant amount of urban runoff from the developed area east of Beaumont Ave, between Oak Valley Parkway and Brookside Ave. which could be captured in the soft bottom of Marshall Creek using training dikes to prevent the water from going under the I-10 bridge. There is about 300 ac of urban drainage. Estimated Yield = 150 AFY.
Beaumont MDP Line 16	Approximately 517 acres of area could be intercepted by a storm drain along Grand Ave. and conveyed to the District's Recharge facility. This water is relatively free of sediments and runoff is generated with even the slightest amount of rainfall

8. **Table 6-11, page 6-40 Revise title and Drainage Area for Grand Avenue Interceptor**

Table 6-11
Summary of the Urban Runoff Drainage Areas and Retention Basin Volumes

Facility	Drainage Area, acres	Basin Volume, acre-ft
Beaumont MDP Line 16	517	90[1]

9. Table 6-12, page 6-40 Revise title for Grand Avenue Interceptor

Table 6-12
Urban Runoff Capture Summary

Facility	Estimated Captured Runoff, AFY	Percent of Storms Totally Captured	Total Average Annual Runoff, AFY, Based on 77 years of Record	Percent of All Possible Storm Water Captured
Beaumont MDP Line 16	200	98.5%	232	90.0%

10. Table 6-13, page 6-41, Revise title of Grand Avenue Interceptor

Table 6-13

Estimate of "New Water" from Storm Water Capture

Facility	Estimated Captured Runoff, AFY	Runoff from Undeveloped Land		Estimated Amount of New Water, AFY
		3-in Total Storm Rainfall, AFY	4-in Total Storm Rainfall, AFY	
Beaumont MDP Line 16	200	41	75	172 to 192 (Use185)

11. Figure 6-11 Change Title of Figure to "Beaumont MDP Line 16" and the drainage area to 517 acres.

12. Table 6-24, (DWR Table 6-7) Revise First Line of Table to change name from Grand Avenue Storm Drain to Beaumont MDP Line 16 and change the year of implementation to 2021

DWR Table 6-7 Retail: Expected Future Water Supply Projects or Programs						
☐	No expected future water supply projects or programs that provide a quantifiable increase to the agency's water supply. Supplier will not complete the table below.					
☐	Some or all of the supplier's future water supply projects or programs are not compatible with this table and are described in a narrative format.					
	Provide page location of narrative in the UWMP					
Name of Future Projects or Programs	Joint Project with other agencies?		Description (if needed)	Planned Implementation Year	Planned for Use in Year Type	Expected Increase in Water Supply to Agency, AFY
Beaumont MDP Line 16 (Line 16)	Yes	RCF&WCD	Const of SD to divert water into BCVWD Rehcharge Facility	2021	All Year Types	185

13. Page 6-59, 2nd Paragraph, revise first sentence as follows:

"The Beaumont MPD Line 16 Project is already in the preliminary…."

District Staff Corrections:

14. Page 5-6, 3rd paragraph from bottom: Change confirmed 2020 target to 242 GPCD.

15. Page 5-6, 2nd last paragraph: Change 2015 interim target to 272 GPCD.

16. Table DWR Table 5-1, pg 5-7; Replace with the following to revise interim and 2020 GPCD Target:

Table 5-1 Baselines and Targets Summary *Retail Agency or Regional Alliance Only*					
Baseline Period	Start Year	End Year	Average Baseline GPCD*	2015 Interim Target GPCD *	Confirmed 2020 Target GPCD*
10-15 year	*1999*	*2008*	*302*	*272*	*242*
5 Year	*2004*	*2008*	*291*		
*All values are in Gallons per Capita per Day (GPCD)					
NOTES:					

17. Page 5-7, middle of page, Revise sentence to the following:

"BCVWD's actual per capita for 2015 was 180 GPCD, which is well below the interim target of 272 GPCD in Table 5-1."

18. Appendix D, SB X7-7 Verification Forms, Table 7F and Table 8, Substitute the following:

SB X7-7 Table 7-F: Confirm Minimum Reduction for 2020 Target			
5 Year Baseline GPCD *From SB X7-7 Table 5*	Maximum 2020 Target[1]	Calculated 2020 Target[2]	**Confirmed 2020 Target**
291	276	242	**242**
[1] Maximum 2020 Target is 95% of the 5 Year Baseline GPCD *[2] 2020 Target is calculated based on the selected Target Method, see SB X7-7 Table 7 and corresponding tables for agency's calculated target.*			
NOTES:

Staff Report for UWMP Adoption

BEAUMONT-CHERRY VALLEY WATER DISTRICT
AGENDA
MINUTES OF REGULAR MEETING OF THE BOARD OF DIRECTORS
560 Magnolia Avenue, Beaumont, CA 92223
Wednesday, January 11th, 2017
Regular Session 7:00 p.m.

Call to Order, President Slawson

President Slawson began the meeting at 7:01 p.m.

Pledge of Allegiance, Director Covington

Director Covington led the pledge.

Invocation, Director Hoffman

Director Hoffman led the invocation.

Roll Call

Present at the meeting were: President Slawson, Directors Covington, Hoffman, Ramirez, Director Douglass was absent. Legal Counsel: James Markman. District Staff: General Manager: Eric Fraser, Director of Engineering: Dan Jaggers and Director of Finance & Administrative Services: Yolanda Rodriguez.

Public who registered their attendance were Patsy Reeley and Barbara Brown.

Public Comment

Mr. Pat Doherty, Cherry Valley resident, shared his concerns regarding the Gateway warehouse and asked the Board to renew the objections in building the Gateway warehouse.

Mr. Mike Lara, City of Beaumont Councilman, introduced himself as the new appointed liaison for the City of Beaumont and Beaumont-Cherry Valley Water District and stated he looked forward in working with BCVWD.

Ms. Judy Bingham asked regarding the status of the 90 day period given by the Board in a prior Board meeting, for the BCVWD's General Manager and the San Gorgonio Pass Water Agency's General Manager to come up with an agreement from the SGPWA on a plan to secure water supply. She additionally shared her concerns regarding the City of Beaumont's recent audit.

ACTION ITEMS

1. **Adjustments to the Agenda**

   There were no changes to the Agenda.

2. **Consent Calendar:** All matters listed under the Consent Calendar are considered by the Board of Directors to be routine and will be enacted in one

motion. There will be no discussion of these items prior to the time the Board considers the motion unless members of the Board, the administrative staff, or the public request specific items to be discussed and/or removed from the Consent Calendar.

a. November 2016 Budget Variance Report Review** (pages 3-7)
b. November 30th, 2016 Cash/Investment Balance Report** (page 8)
c. December 2016 Check Register Review** (pages 9-21)
d. December 2016 Invoices Pending Approval**(pages 22-23)
e. Minutes of the Regular Meeting December 14th, 2016**(pages 24-28)
f. Consideration of Resolution 2017-02: A Resolution of the Board of Directors of the Beaumont-Cherry Valley Water District establishing the District's Investment Policy**(pages 29-38)

Director Ramirez requested item 2e be pulled for correction to the minutes to include his recommendation in the Urban Water Management Plan of a water schedule of two days of watering when at level four restrictions. Director Covington motioned to approve item 2e with the amendments stated by Director Ramirez. The motion was seconded by Director Hoffman, and passed 4-0, with Director Douglass absent.

Director Covington motioned to approve items 2a – 2d and 2f. The motion was seconded by Director Hoffman and passed 4-0, with Director Douglass absent.

3. Consider Adoption of the District's 2015 Urban Water Management Plan in Accordance with Resolution 2017-01. ** (pages 39-66).

Public Comment on Item:

Mr. Jeff Chambers, with Pardee Homes, asked questions regarding the final plan and its modifications stated on the errata sheet. He also asked if the current change in water conditions would reflect in the final document.

General Manager Fraser, shared that the final Urban Water Management Plan would have the changes reflected in the errata sheet.

After discussion, Director Covington motioned to approve the 2015 Urban Water Management Plan. The motion was seconded by Director Hoffman and passed 4-0, with Director Douglass absent.

4. Reports For Discussion

a. Ad Hoc Committees

Director Covington shared that at the last Collaborative Committee meeting, representatives from the City of Beaumont shared that the City is working on the General Plan and is asking for members of public agencies to sit on the task force. He also shared that if anyone was interested to contact the City Manager.

b. General Manager

General Manager Fraser, gave an update on the current reservoir conditions and the effects of the atmospheric river conditions which are currently taking place. He stated that there is a risk of losing carryover water if the San Luis Reservoir has to release some of its water to capture rain water. He also shared, this is one of the reasons why staff

has urged the SGPWA to give the District as much water at the highest rate as possible early in the season, so if events such as the one currently does happen, it will diminish the risk of losing carryover water. He shared that currently the flow of water is 25 cfs, versus the 20 cfs historically staff has been told it can do.

General Manager Fraser also gave an update on the ponds and shared that the District is preparing to have a shut-down of some of the ponds to do maintenance and remove any algae growth.

General Manager Fraser addressed Ms. Bingham's concerns and stated he is working collaborative with Yucaipa Valley Water District and the SGPWA for the last two and a half months to come up with an agreement that works for both agencies for the collection of Capacity fees. He shared that the process is engaged and legal counsel has been participating to ensure the District's interests are protected.

General Manager shared that the Capital Improvement Plan will be shared at the first Engineering Workshop on February 2, 2017.

Director Covington had questions regarding the agreement and if there was any opposition from the SGPWA to revise the Capacity Fee agreement. He also wanted to know if the agreement would be a different agreement than the existing agreement between YVWD and Calimesa. Lastly, he asked about any knowledge of SGPWA intentions to rescind a 2014 Resolution.

General Manager Fraser explained that the SGPWA has hired a consultant to revisit the Capacity Fee rates to revise the numbers where needed to reflect the changes in the market condition.

General Manager Fraser stated the goal of the agreement is to ensure long term supply and make sure permanent water rights are acquired for future generations, not just spot market water. He shared that the Calimesa agreement is the basis, but that the verbiage of the agreement is being reviewed carefully.

General Manager Fraser shared his knowledge of the proposed intention to rescind the SGPWA Resolution, which is the basis to acquire additional water supply. He stated that our issue is whether they are going out to get the water and if not, they need to let the agencies know so they can figure out how to secure water supply for the region. He stated that he reminded the SGPWA's Board that the days of supplemental water are long gone, and that imported water is the basis of supply for all new customers.

Director Hoffman asked how many ponds were available and also if the algae was coming in with the imported water. He also requested to have the status of the maintenance of the pond as a follow up on a future agenda.

General Manager Fraser explained that the algae was present with the imported water. He also shared that there were 2-3 ponds available, but at this point the District is looking at strategies to remove and prevent algae growth.

Director Ramirez asked what was more cost effective: copper sulfate treatment or draining the pond and scrapping it, to which General Manager Fraser replied that both would have to be done.

c. Directors Reports

No reports were made.

d. Legal Counsel Report

No reports were made.

5. Announcements

- District Offices will be closed on January 16th, 2017 in observance of Martin Luther King Day.
- Beaumont Basin Watermaster meeting, February 1st, 2017 at 10:00 a.m.
- Finance and Audit Committee meeting, February 2nd, 2017 at 3:00 p.m.
- Regular Board meeting, February 8th, 2017 at 7:00 p.m.
- District Offices will be closed February 20th, 2017 in observance of President's Day.

President Slawson made the announcements above.

6. Action List for Future Meetings

- Proposition 1 Bond Opportunities

President Slawson made the announcements above.

Director Ramirez shared he would like to get with the fellow Director regarding the Personnel Committee and investigate further when they can have their next meeting.

7. Adjournment

President Slawson adjourned the meeting at 7:54 p.m.

Attest:

_____	_____
Director Daniel Slawson, President to the Board of Directors of the Beaumont-Cherry Valley Water District	Director Nathan Douglass, Secretary to the Board of Directors of the Beaumont-Cherry Valley Water District

** Information included in the agenda packet

Beaumont-Cherry Valley Water District
Regular Board Meeting
January 11th, 2017

DATE: January 5, 2017

TO: Board of Directors

FROM: Eric Fraser, General Manager

SUBJECT: Consider Adoption of the District's 2015 Urban Water Management Plan in Accordance with Resolution 2017-01

Recommendation

Staff recommends adoption of the District's 2015 Urban Water Management Plan in accordance with Resolution 2017-01:

Background

Pursuant to the requirements of the California Urban Water Management Act of 1984 (Act), the Beaumont-Cherry Valley Water District (District) Board of Directors held public hearing regarding the District's draft 2015 Urban Water Management Plan (UWMP) at the December 14, 2016 regular meeting. Prior to, and during that meeting, the District received public comment related to the draft plan. An errata sheet was distributed at the meeting to address the relevant changes to the plan based on the comments received and additional staff review. The Board directed staff to bring the item back for Board consideration at the January 2017 meeting to allow for further review of the minor changes. No other comments or changes have been made since the errata sheet was distributed at the public hearing. The revised pages are attached to this report for insertion into the plan presented at the December meeting.

Upon adoption of District's 2015 UWMP by the Board of Directors, the plan will be filed with the DWR and will be made available to other agencies and the public, in accordance with the Act. The adoption and filing of the 2015 UWMP with DWR is required for the District to be eligible for any state grants and loans, and for drought assistance.

Post Hearing Modifications

The final 2015 UWMP may include *de minimis* modifications related to grammar, typographical errors, and formatting as necessary.

Financial Impact

The fiscal impact to the District will be minimal and will include reproduction and mailing costs associated with transmitting copies of the District's Final 2015 UWMP to the Department of Water Resources and appropriate agencies. The 2015 UWMP was prepared completely in-house by District staff.

BEAUMONT CHERRY VALLEY WATER DISTRICT

560 Magnolia Avenue

Beaumont, CA 92223

(951)-845-9581

December 12, 2016

2015 Urban Water Management Plan

Errata Sheet

Pardee-Sundance Comments (Jackson Tidus):

1. **Page 6-27, 2nd last paragraph**

   Revise sentence to read: "Data from Watermaster's 2015 Annual Report indicates that BCVWD's groundwater storage account balance at the end of 2015 is 25,568 AF."

2. **Page 7-4, 3rd paragraph, Second last sentence to read**:

   "Looking at the quantities in Table 6-26, (rather than 6-25), BCVWD anticipates banking 35,000 AF over the next 20 years which would bring BCVWD's storage account to about 60,560 AF."

3. **Page 8-2, paragraph above "Stage 1", 2nd sentence:**

   Revise sentence to read: "BCVWD currently has 25,568 AF in storage…."

4. **Appendix C DWR Table 7-3, Substitute the following:**

Table 7-3 Retail: Single Dry Year Supply and Demand Comparison					
	2020	2025	2030	2035	2040 (Opt)
Supply totals	4,962	5,877	6,657	7,472	8,042
Demand totals	16,659	18950	21,605	23,886	25,932
Difference	(11,697)	(13,073)	(14,948)	(16,414)	(17,890)
NOTES: The Difference between Supply and Demand will be provided from Banked Water in the Beaumont Basin.					

5. **Appendix C DWR Table 8-4, revise as follows and replace Table 8-7 with the following:**

DWR Table 8-4 Retail: Minimum Supply Next Three Years			
	2016	2017	2018
Available Water Supply	13,826	9,650	4,508
NOTE: 2016 based on BCVWD receiving 9,870 AF per SGPWA email. Year 2017 and 2018 assumes 35% and 5% SWP Allocation as used in Stress Test. SPW amounts per SGPWA for Stess Test Analysis.			

Riverside County Flood Control and Water Conservation District:

6. **Page 2-5, Last line, revise name of "Grand Avenue Storm Water Capture" to "Beaumont MDP Line 16"**
7. **Table 6-10, Revise Title of Grand Avenue Storm Drain, correct typographical error "area" in Marshall Creek Description**

Table 6-10
Potential Storm Water Capture Projects

Project	Brief Description
Soft plug in Noble Creek at BCVWD Groundwater Recharge Facility	Large flows which would bypass the spreading basins at the mouth of Edgar Canyon (Figure 6-10 above) could still be captured. Provide "soft plug" in lined portion of Noble Creek channel and divert flows into BCVWD's recharge facility. (Note that only extreme flows actually make it out of the canyon). Estimated Yield – 500 AFY.
Stormwater Capture Noble Creek	Noble Creek flows could be desilted on property owned by BCVWD (15.7 acres) along Noble Creek upstream of Noble St and west of Cherry Ave. Unfortunately this area is not over the Beaumont Basin, but the property could be used for desilting basins with the desilted water released back into Noble Cr. and recaptured at a soft plug in the lined channel and diverted into the District's recharge site. Estimated Yield = 400 AFY.
Marshall Creek s/o Elm to I-10	There is a significant amount of urban runoff from the developed area east of Beaumont Ave, between Oak Valley Parkway and Brookside Ave. which could be captured in the soft bottom of Marshall Creek using training dikes to prevent the water from going under the I-10 bridge. There is about 300 ac of urban drainage. Estimated Yield = 150 AFY.
Beaumont MDP Line 16	Approximately 517 acres of area could be intercepted by a storm drain along Grand Ave. and conveyed to the District's Recharge facility. This water is relatively free of sediments and runoff is generated with even the slightest amount of rainfall

Riverside County Planning Department			San Bernardino County Land Use Services	

The City of Beaumont has a direct interest since the city is served by BCVWD; BCVWD is also in discussions with the City about recycled water. The City of Banning has agreements with BCVWD to recharge imported water on their behalf, has an existing emergency potable water connection with BCVWD and stub outs across Highland Springs Avenue for potable and recycled water connections and has financially participated with BCVWD in the construction of several production wells. BCVWD has pipeline facilities within the City of Calimesa; however the District does not serve the city. The city is served by YVWD.

YVWD has been working with BCVWD to provide recycled (non-potable) water to BCVWD. BCVWD prepared a Facilities Planning Report in June 2014 for a Recycled Water Supply Pipeline and Pump Station; this report has been approved by the SWRCB.

The County of Riverside Planning Department is involved with land use planning and building permit approval in the unincorporated community of Cherry Valley; the County of San Bernardino Land Use Services controls land use planning in the unincorporated portion of the District's service in that county. The Riverside and San Bernardino County LAFCOs have an interest since they have requirements for water supply assessments whenever there is an annexation. Riverside County Flood Control and Water Conservation District are involved with BCVWD on the Beaumont MDP Line 16 project

2015 and 2020 Targets

> *CWC 10608.20*
>
> *(e) An urban retail water supplier shall include in its urban water management plan due in 2010. . . urban water use target, interim urban water use target,…along with the bases for determining those estimates, including references to supporting data (10608.20(e)).*
>
> *CWC 10608.20*
>
> *(g) An urban retail water supplier may update its 2020 urban water use target in its 2015 urban water management plan…*

The Water Code identified four methods which could be used to establish the target GPCD; BCVWD chose Target Method 1 – 80% of the 10-year Baseline GPCD.

Year 2020 Target (by Target Method 1) = 0.80 * 302 GPCD = 242 GPCD

5-year Target Confirmation

> *CWC 10608.22*
>
> *Notwithstanding the method adopted by an urban retail water supplier pursuant to Section 10608.20, an urban retail water supplier's per capita daily water use reduction shall be no less than 5 percent of base daily per capita water use as defined in paragraph (3) of subdivision (b) of Section 10608.12. This section does not apply to an urban retail water supplier with a base daily per capita water use at or below 100 gallons per capita per day.*

Year 2020 Target (by Target Confirmation) = 0.95 * 291 GPCD = 276 GPCD

In BCVWD's case, CWC §10608.22 controls, and the District's confirmed **year 2020 target is 242 GPCD.**

Calculate the 2015 Interim Urban Water Use Target

The year 2015 Interim Target GPCD is midway between the 10-year Baseline (302 GPCD) and the year 2020 Confirmed Target (276 GPCD). BCVWD's **year 2015 Interim Target is 272 GPCD.**

Baselines and Targets Summary

Table 5-1 presents a summary of results of the baseline per-capita and target analysis. Table 5-2 shows that BCVWD met the intermediate, year 2015 target and the year 2020 target by a considerable margin. It should be pointed out that Stage 2 Water Restrictions were in effect in the District during this period.

Table 5-1 Baselines and Targets Summary *Retail Agency or Regional Alliance Only*					
Baseline Period	Start Year	End Year	Average Baseline GPCD*	2015 Interim Target GPCD *	Confirmed 2020 Target GPCD*
10-15 year	*1999*	*2008*	*302*	*272*	*242*

		Extraordinary Events*	Economic Adjustment*	Weather Normalization*	TOTAL Adjustments*	Adjusted 2015 GPCD*		
180	272	0	0	0	0	180	180	Yes
All values are in Gallons per Capita per Day (GPCD)								
NOTES: The persistent drought and Stage 2 Water Use Restrictions imposed by BCVWD resulted in a 24.3% water savings year 2015-16 vs comparable period in 2013. Without the water savings the year 2015 per capita would have been closer to 223 GPCD								

Table 5-2 provides for some adjustments to the 2015 GPCD for such reasons as defined in the Water Code. For BCVWD there were no adjustments needed. But is should be pointed out that the Stage II water restrictions and water conservation measures resulted in a 24.3% savings in potable water. Without the restrictions the 2015 GPCD would have been about 223 GPCD. Still well below the interim target.

- Minimal producers (10 or less acre-ft/yr) are exempt from the Adjudication. §III.4.and §I.3.K

Watermaster is responsible for providing the legal and practical means of ensuring the waters of the Beaumont Basin are put to maximum beneficial use and include:

- Administer the Judgement; approve Producer activities,
- Maintain and improve water supply; maintain and improve water quality; monitor and understand the Basin
- Develop and administer a well policy; develop contracts for beneficial programs and services; provide cooperative leadership

To simplify the Judgement, an appropriator, like BCVWD, after February 2014, can only extract water within the appropriator's storage account as determined by Watermaster. Water in the storage account can include:

- Imported water recharged by the Appropriator.
- Water transferred from one Appropriator's storage account to the Appropriator.
- Recycled water recharged to the Beaumont Basin which meets Regional Board and SWRCB Division of Drinking Water (DDW) groundwater water recharge regulations.
- "New" captured storm water or urban runoff recharged by the Appropriator.
- Unused Overlying Party pumping rights allocated back to the Appropriator.
- Return flows from imported water or recycled water applied to land overlying the Beaumont Basin by the Appropriator
- Forbearance water allocated to the Appropriator for providing potable or recycled water to the Overlying Party's land.

Watermaster performs an annual accounting of these sources and produces an annual report identifying the water in storage for each appropriator.

According to Watermaster, BCVWD had 28,930 acre-ft in storage in the Beaumont Basin at the end of 2014. Data from Watermaster's 2015 Annual Report, indicates that BCVWD's storage account balance at the end of 2015 is 25,568 AF.[21] BCVWD's storage account has a maximum capacity of 80,000 acre-ft.

The entire Judgment is contained in Appendix E.

[21] Beaumont Basin Watermaster (2016). 2015 Annual Report, Alda, Inc., Thomas Harder and Company, December

The diversions in Upper and Middle Edgar Canyon capture most of the storm flows and runoff that flows in the creek and diverts the flow to a series of percolation basins. The water is subsequently extracted by the adjacent wells.

On occasion there are very high flows which flow the entire length of Edgar Canyon. A portion of these flows can be captured in the new basins at the mouth of Edgar Canyon shown in Figure 6-10. In addition, BCVWD retains the right to use the older ponds, downstream of the new basins to capture flood water when they occur. During those times, the SGPWA would be precluded from percolating SPW.

Potential Storm Water Capture Projects

There were a number of projects which were explored in more detail in BCVWD's 2016 Potable Water Master Plan. These projects are listed in Table 6-11.

Edgar Canyon, Noble Creek and Marshall Creek

In BCVWD's 2013 UWMP Update, an estimate of the yield from the Edgar Canyon, Noble Creek and Marshall Creek Capture Projects was presented. No further work has been performed on these conceptual projects, so at this time the preliminary yield from the projects remains at 1,050 AFY.

Table 6-10
Potential Storm Water Capture Projects

Project	Brief Description
Soft plug in Noble Creek at BCVWD Groundwater Recharge Facility	Large flows which would bypass the spreading basins at the mouth of Edgar Canyon (Figure 6-10 above) could still be captured. Provide "soft plug" in lined portion of Noble Creek channel and divert flows into BCVWD's recharge facility. (Note that only extreme flows actually make it out of the canyon). Estimated Yield – 500 AFY.
Stormwater Capture Noble Creek	Noble Creek flows could be desilted on property owned by BCVWD (15.7 acres) along Noble Creek upstream of Noble St and west of Cherry Ave. Unfortunately this area is not over the Beaumont Basin, but the property could be used for desilting basins with the desilted water released back into Noble Cr. and recaptured at a soft plug in the lined channel and diverted into the District's recharge site. Estimated Yield = 400 AFY.
Marshall Creek s/o Elm to I-10	There is a significant amount of urban runoff from the developed area east of Beaumont Ave, between Oak Valley Parkway and Brookside Ave. which could be captured in the soft bottom of Marshall Creek using training dikes to prevent the water from going under the I-10 bridge. There is about 300 ac of urban drainage. Estimated Yield = 150 AFY.
Beaumont MDP Line 16	Approximately 517 acres of area could be intercepted by a storm drain along Grand Ave. and conveyed to the District's Recharge facility. This water is relatively free of sediments and runoff is generated with even the slightest amount of rainfall
Sundance Urban Runoff	Eighth St., Cherry Ave., and Starlight Ave. Basins capture runoff from the Sundance development. These basins capture runoff effectively, but percolation needs to be improved.

Figure 6-10
Runoff Collected in Sundance Detention Basin

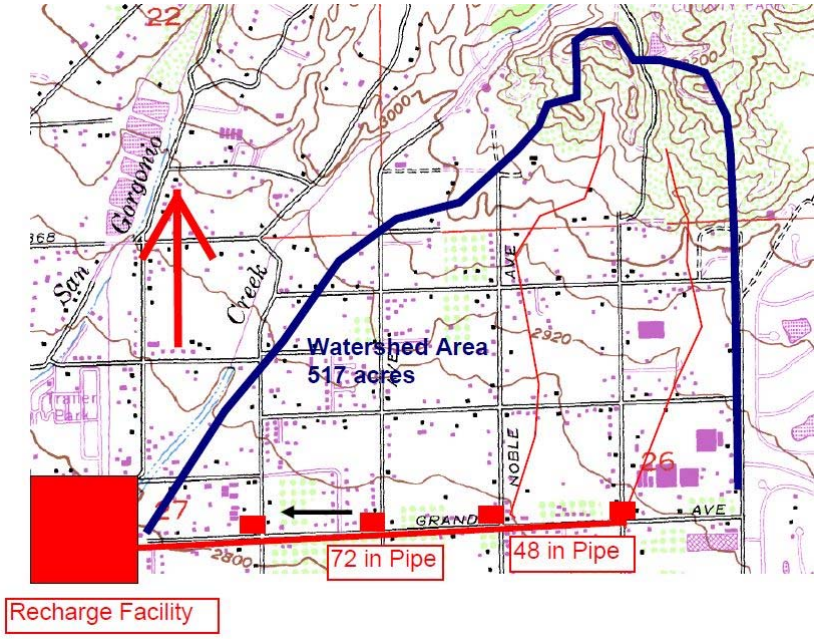

Figure 6-11
Beaumont MDP Line 16Watershed Area

Table 6-11 shows some information about the watershed and the detention basin volume.

A detailed analysis of the runoff potential from these projects was performed as part of the 2016 BCVWD Potable Water Master Plan. Daily Beaumont rainfall totals for the 77-year period January 1, 1929 through December 31, 2006 were used in the runoff analysis. Individual rainfall periods were identified and the runoff from each storm was determined using the Natural Resources Conservation Service (NRCS) Curve Number approach. Table 6-12 shows the amount of storm runoff that can actually be captured – close to 800 acre-ft annual average.

Table 6-11
Summary of the Urban Runoff Drainage Areas and Retention Basin Volumes

Facility	Drainage Area, acres	Basin Volume, acre-ft
Beaumont MDP Line 16	517	90[1]
Cherry Ave Basin	426	240
Eighth St. Basin	475	128
Starlight Basin	250	32

[1] Recharge during a multi-day storm even would add another 100 to 125 acre-ft

"Before and after" development calculations were made to determine "new water." From a water resources perspective, the Beaumont Basin Watermaster would likely not consider all of the captured storm water as "new water." "New water" is water which is developed over and above what would have occurred naturally, in an undeveloped condition.

Table 6-12
Urban Runoff Capture Summary

Facility	Estimated Captured Runoff, AFY	Percent of Storms Totally Captured	Total Average Annual Runoff, AFY, Based on 77 years of Record	Percent of All Possible Storm Water Captured
Beaumont MDP Line 16	200	98.5%	232	90.0%
Cherry Ave Basin	258	95.8%	276	93.4%
Eighth St Basin	237	94.6%	308	76.9%
Starlight Basin	89	89.2%	171	52%
Total	784			

Table 6-13 shows an estimate of "new water" from the projects – about 730 AFY.

Table 6-13
Estimate of "New Water" from Storm Water Capture

Facility	Estimated Captured Runoff, AFY	Runoff from Undeveloped Land		Estimated Amount of New Water, AFY
		3-in Total Storm Rainfall, AFY	4-in Total Storm Rainfall, AFY	
Beaumont MDP Line 16	200	41	75	172 to 192 (Use185)
Cherry Ave Basin	258	9	19	249 to 239 (Use 245
Eighth St Basin	237	10	21	226 to 216 (Use 220)
Starlight Basin	89	5	11	84 to 78 (use 80)
Total				730

Wastewater and Recycled Water

Recycled water use for non-potable purposes has a major role in BCVWD's water portfolio. BCVWD began planning the use of recycled water for landscape and golf course irrigation since the early 1990s with the development of a cooperative financing agreement to fund water supply infrastructure including recycled water. In November 1997, the City of Beaumont City Council adopted Ordinance 773 mandating the use of potable water for non-potable uses including cemeteries, golf courses, parks, street and highway landscaping, athletic fields, and other irrigation uses is a waste or an unreasonable use of water if recycled water is available. BCVWD's UWMPs dating to the 90s included plans and projections for the use of recycled water from the City of Beaumont. BCVWD continues in discussions with the City of Beaumont.

Recognizing that additional water may be needed than can be supplied by the City of Beaumont, BCVWD began discussions with YVWD around 2013. In June 2014, BCVWD prepared a Recycled Water Facilities Planning Report for a Recycled Water Supply Pipeline and Pump Station for a connection to YVWD's non-potable water system. The Facilities Planning report was approved by the SWRCB in August 2014. Since then discussions have move forward with YVWD

BCVWD's Existing Non-potable Water System

BCVWD has an extensive network of about 30 miles of non-potable transmission pipelines already constructed that can convey untreated SPW, groundwater, and recycled water. An extensive network of smaller distribution mains have been constructed by Tract developers to serve parks, medians, schools and common areas in their respective developments. The system includes a 2 million gallon non-potable water reservoir (2800 Zone Non-potable

Future Water Projects

> *CWC 10631*
>
> *(g) …The urban water supplier shall include a detailed description of expected future projects and programs…that the urban water supplier may implement to increase the amount of the water supply available to the urban water supplier in average, single-dry, and multiple-dry water years. The description shall identify specific projects and include a description of the increase in water supply that is expected to be available from each project. The description shall include an estimate with regard to the implementation timeline for each project or program.*

Table 6-24 (DWR Table 6-7) presents a list of potential future projects which BCVWD could construct to increase the available water supply.

The Beaumont MDP Line 16 Project is already in the preliminary design phase with work being done by the Riverside County Flood Control and Water Conservation District. This is funded under a DWR grant through SAWPA. BCVWD and YVWD are in discussions on the non-potable water connection with YVWD. BCVWD completed a Facilities Planning report in 2014 for the project which was approved by the SWRCB for potential funding.

These projects, when all are implemented, will yield about 3,900 AFY initially and about 6,100 AFY by year 2040. The large growth is due to increases in recycled water from the City of Beaumont as a result of development and population growth in the City of Beaumont.

Table 6-25, (DWR Table 6-8), summarizes BCVWD's water supply for the year 2015.

Summary of Existing and Planned Sources of Water

> *CWC 10631*
>
> *(b) Identify and quantify, to the extent practicable, the existing and planned sources of water available to the supplier over the same five-year increments described in subdivision 10631(a).*
>
> *(4) (Provide a) detailed description and analysis of the amount and location of groundwater that is projected to be pumped by the urban water supplier. The description and analysis shall be based on information that is reasonably available, including, but not limited to, historic use records.*

Table 6-26, (DWR Table 6-6), summarizes BCVWD's projected water supply for the years 2020, 2025, 2030, 2035 and 2040.

Table 6-24
(DWR Table 6-7) Expected Future Water Supply Projects or Programs

DWR Table 6-7 Retail: Expected Future Water Supply Projects or Programs						
☐	No expected future water supply projects or programs that provide a quantifiable increase to the agency's water supply. Supplier will not complete the table below.					
☐	Some or all of the supplier's future water supply projects or programs are not compatible with this table and are described in a narrative format.					
	Provide page location of narrative in the UWMP					
Name of Future Projects or Programs	Joint Project with other agencies?		Description (if needed)	Planned Implementation Year	Planned for Use in Year Type	Expected Increase in Water Supply to Agency, AFY
Beaumont MDP Line 16 (Line 16)	Yes	RCF&WCD	Const of SD to divert water into BCVWD Rehcharge Facility	2021	All Year Types	185
Misc Urban Runoff Capture	Yes	Beaumont	Various recharge basin enhancements	2025	All Year Types	200-545
Lower Edgar Canyon Non-potable Groundwater	No		Install extraction wells for high nitrate GW for non potable water system	2025	All Year Types	300
San Timoteo Canyon GW Extraction	Yes	Beaumont	Install series of wells to recapture percolated ww used for habitat mitigation	2030	All Year Types	400-800
Non-potable Water interconnection with YVWD	Yes	YVWD	Install interconnecting pipeline, and booster pumping station and pressure regulating stations	2018	All Year Types	1,043
Connection to City of Beaumont for recycled water	Yes	Beaumont	Install storage tank, booster pumping station and interconnecting piping	2020	All Year Types	1,154
Advance Treated Recycled Water	Yes	Beaumont	Construct Advanced Treatment Facility and Brine Line	2025	All Year Types	300-660
NOTES: Yield from City of Beaumont Recycled Water Connection will increae to 3,363 AFY by 2040 due to increases in wastewater flows over time. Expected increase in water supply for Advance Treated Wastewater is based on 80% recovery in the membrane treatment process						

At the end of 2015, for example, BCVWD had 25,568 AF in storage. This dropped from a maximum in 2013 of nearly 34,000 AF due to the drought and the reduced SWP. BCVWD can store up to 80,000 AF in the Beaumont Basin managed by the Watermaster.

In Section 6, Table 6-25 (DWR Table 6-9), a quantity of BCVWD-purchased imported water was identified as "SGPWA for Banking." This varied from 1,000 AFY to 2,500 AFY and is over and above the amount of imported water needed to meet demands. The purpose of this "banking water" is to build up BCVWD's Beaumont Basin Groundwater Storage Account to be used as reserve for drought periods when adequate, (as projected in Table 6-25), SPW is not available.

SGPWA is to supply the imported water requested in Table 6-25 (DWR Table 6-9) to meet BCVWD's needs plus the anticipated SPW for banking. If in any year(s), either of these quantities cannot be supplied, for any reason, the accumulated shortfall is expected to be delivered to BCVWD by SGPWA as soon as possible once imported water is available. In this way, BCVWD will be able to keep adequate water in storage for current (2015) needs and accommodate growth in BCVWD's service area. Looking at the quantities in Table 6-26, BCVWD anticipates banking 35,000 AF of water over the next 20 years, which would bring BCVWD's storage account to about 60,560 AF. This is over 3 years of SPW requirements to meet demand. In other words, BCVWD would be able to meet year 2040 demands with no SPW for over 3 years.

Groundwater

Beaumont Basin

The Beaumont Basin is managed by the Beaumont Basin Watermaster. A discussion of the principles of the Adjudication was presented previously in Section 6.

In any given year, BCVWD can pump out its stored (banked) water. The storage is replenished, at least partially, every year by forbearance water, reallocated unused Overlying Party pumping rights, return flows, and imported water when available. The amount of imported water that can be recharged in any year depends on DWR's SWP allocation. This varies from year to year. See Figure 6-2 presented previously.

Table 6-9, presented previously, showed the amount the Watermaster credits to BCVWD's Beaumont Basin Storage Account annually. The amount of unused Overlying Party rights is based on a 5-year moving average and could decrease slightly during drought periods as the Overlying Parties use more well water to compensate for the lack of rainfall. The forbearance water and return flows will decrease during dry periods as users reduce water consumption.

Table 7-2 shows the estimated amount of water credited to BCVWD by Watermaster for a single or multiple dry year analysis. For the dry year analysis, it was estimated that there would be a 15% conservation effect; in other words, for dry year analysis, only 85% of average annual forbearance, reallocated Overlying Party rights, etc. would be available. In Table 7-2, the 15% reduction factor is also applied to the recycled forbearance water to account for a potential

Table 8-1 Retail Stages of Water Shortage Contingency Plan		
Stage	Percent Supply Reduction[1] *Numerical value as a percent*	Water Supply Condition (*Narrative description)*
1	10	Up to a 10% reduction in normal, "long term" water supply; imported waer supply allocation averages approximately 50% over a 2-year (or longer) period
2	20	Up to 20% reduction in normal, "long term" water supply; imported waer supply allocation between 49.9% and 25% over a 3-year (or longer) period
3	25	Up to 25% reduction in normal, "long term" water supply; imported waer supply allocation between 24.9% and 10% over a 3-year (or longer) period
4	30	Up to 30% reduction in normal, "long term" water supply; imported waer supply allocation between 9.9% and 5% over a 3-year (or longer) period
5	50	Up to 50% reduction in normal, "long term" water supply; imported waer supply allocation averages less than 5% over a 4-year (or longer)period
[1] *One stage in the Water Shortage Contingency Plan must address a water shortage of 50%.*		
NOTES:		

These stages and the percent reductions in demand are based on BCVWD's experience during the state mandated water conservation program targets comparing 2015 with a similar period in 2013. BCVWD was able to reduce consumption by 24.3% for the period May 2015 through April 2016. This was done through the restrictions in Board of Directors Resolution 2015-05 which limited watering to two days per week.

In establishing the "Stages," BCVWD has the advantage of the Beaumont Basin, its large storage capacity for banked water, and BCVWD's 80,000 AF storage account. BCVWD currently has 25,568 AF in storage, despite an average SWP allocation of only 43% for the period 2012 through 2015. BCVWD's plan is to purchase additional imported water over that needed to meet demands to add to the storage account balance each year including making up for any shortfall that may occur during dry years. The District's goal is to fill the storage account by 2040 or before.

Stage 1

Stage 1 occurs when:

- A 10% water use reduction from the established base year is required, or

5. Reduce park, school and street median landscape watering to the minimum needed to sustain plant life.

Once the short term emergency is over, BCVWD staff will again notify the customers that the water supply is "back to normal," thank them for using water wisely and encourage them to continue to do so.

District-wide Interruption

If the interruption is District-wide, individual customer notification is not practical. A more extensive outreach program is needed.

BCVWD management will notify the District's Board of Directors, City of Beaumont elected officials and management, and the Riverside County Supervisor whose district covers the service area of the District-wide interruption, as appropriate. In addition BCVWD will notify the newspapers, e.g., Riverside Press-Enterprise, Banning Record Gazette, etc., cable TV provider (Time Warner), and local radio stations in Riverside, San Bernardino, and the Coachella Valley, including the Spanish language stations In addition a notice will be posted on the BCVWD website.

Consumers will be urged to conserve water by taking the steps listed above for a localized interruption. Once the short term emergency is over, BCVWD staff will again notify all of the local elected officials, newspapers and cable TV and radio stations that the water supply is "back to normal," thank them for their conservation efforts and encourage customers to continue to use water wisely.

Minimum supply Next Three Years

§10632(b) An estimate of the minimum water supply available during each of the next three water years based on the driest three-year historic sequence for the agency's water supply.

Table 8-7 (DWR Table 8-4) presents a summary of the water supply available over the next 3 years (2016, 2017, and 2018). Table 8-8 provides the back-up for Table 8-7.

Table 8-7
(DWR Table 8-4) Minimum Water Supply Next Three Years (2016 – 2018)

DWR Table 8-4 Retail: Minimum Supply Next Three Years			
	2016	2017	2018
Available Water Supply	13,826	9,650	4,508
NOTE: 2016 based on BCVWD receiving 9,870 AF per SGPWA email. Year 2017 and 2018 assumes 35% and 5% SWP Allocation as used in Stress Test. SPW amounts per SGPWA for Stess Test Analysis.			

Table 5-1 Baselines and Targets Summary

Retail Agency or Regional Alliance Only

Baseline Period	Start Year	End Year	Average Baseline GPCD*	2015 Interim Target GPCD *	Confirmed 2020 Target GPCD*
10-15 year	*1999*	*2008*	*302*	*272*	*242*
5 Year	*2004*	*2008*	*291*		

*All values are in Gallons per Capita per Day (GPCD)

NOTES:

Table 5-2: 2015 Compliance

Retail Agency or Regional Alliance Only

Actual 2015 GPCD*	2015 Interim Target GPCD*	Optional Adjustments to 2015 GPCD Enter "0" if no adjustment is made *From Methodology 8*					2015 GPCD* *(Adjusted if applicable)*	Did Supplier Achieve Targeted Reduction for 2015? Y/N
		Extraordinary Events*	Economic Adjustment*	Weather Normalization*	TOTAL Adjustments*	Adjusted 2015 GPCD*		
180	272	0	0	0	0	180	180	Yes

**All values are in Gallons per Capita per Day (GPCD)*

NOTES: The persistent drought and Stage 2 Water Use Restrictions imposed by BCVWD resulted in a 24.3% water savings year 2015-16 vs comparable period in 2013. Without the water savings the year 2015 per capita would have been closer to 223 GPCD

DWR Table 6-7 Retail: Expected Future Water Supply Projects or Programs						
☐	No expected future water supply projects or programs that provide a quantifiable increase to the agency's water supply. Supplier will not complete the table below.					
☐	Some or all of the supplier's future water supply projects or programs are not compatible with this table and are described in a narrative format.					
	Provide page location of narrative in the UWMP					
Name of Future Projects or Programs	Joint Project with other agencies?		Description (if needed)	Planned Implementation Year	Planned for Use in Year Type	Expected Increase in Water Supply to Agency, AFY
Beaumont MDP Line 16 (Line 16)	Yes	RCF&WCD	Const of SD to divert water into BCVWD Rehcharge Facility	2021	All Year Types	185
Misc Urban Runoff Capture	Yes	Beaumont	Various recharge basin enhancements	2025	All Year Types	200-545
Lower Edgar Canyon Non-potable Groundwater	No		Install extraction wells for high nitrate GW for non potable water system	2025	All Year Types	300
San Timoteo Canyon GW Extraction	Yes	Beaumont	Install series of wells to recapture percolated ww used for habitat mitigation	2030	All Year Types	400-800
Non-potable Water interconnection with YVWD	Yes	YVWD	Install interconnecting pipeline, and booster pumping station and pressure regulating stations	2018	All Year Types	1,043
Connection to City of Beaumont for recycled water	Yes	Beaumont	Install storage tank, booster pumping station and interconnecting piping	2020	All Year Types	1,154
Advance Treated Recycled Water	Yes	Beaumont	Construct Advanced Treatment Facility and Brine Line	2025	All Year Types	300-660
NOTES: Yield from City of Beaumont Recycled Water Connection will increae to 3,363 AFY by 2040 due to increases in wastewater flows over time. Expected increase in water supply for Advance Treated Wastewater is based on 80% recovery in the membrane treatment process						

Table 7-3 Retail: Single Dry Year Supply and Demand Comparison					
	2020	2025	2030	2035	2040 (Opt)
Supply totals	4,962	5,877	6,657	7,472	8,042
Demand totals	16,659	18950	21,605	23,886	25,932
Difference	(11,697)	(13,073)	(14,948)	(16,414)	(17,890)
NOTES: The Difference between Supply and Demand will be provided from Banked Water in the Beaumont Basin.

DWR UWMP Checklist

RESOLUTION No. 2017-01

RESOLUTION OF THE BOARD OF DIRECTORS OF THE BEAUMONT-CHERRY VALLEY WATER DISTRICT ADOPTING THE 2015 URBAN WATER MANAGEMENT PLAN AND AUTHORIZING THE GENERAL MANAGER TO FILE THE URBAN WATER MANAGEMENT PLAN AND TAKE SUCH OTHER NECESSARY ACTION TO IMPLEMENT AND ADMINISTER THE PLAN

WHEREAS, the California Legislature enacted Assembly Bill 797 (Water Code Section 10610 et seq., known as the Urban Water Management Planning Act) during the 1983-84 Regular Session, and as amended subsequently, which mandates that every water supplier providing water for municipal purposes to more than 3,000 customers or supplying more than 3,000 acre-feet of water annually, prepare an Urban Water Management Plan and update it as required, the primary objective of which is to plan for the conservation and efficient use of water; and

WHEREAS, the California Water Conservation Bill of 2009, SB 7X-7, also known as the "20% by 2020" bill, requires that California achieve a 20 percent reduction in urban per-capita water use on or before December 31, 2020 and that the District's UWMP include a baseline per-capita water use, an interim (year 2015) urban water use per-capita target, demonstrated compliance with that year 2015 target, and a year 2020 compliance daily per-capita water use; and

WHEREAS, the District is an urban water supplier delivering nearly 10,000 acre-feet of water annually (year 2015); and

WHEREAS, the Plan shall be periodically reviewed at least once every five years, and that the District shall make any amendments or changes to its plan which are indicated by the review; and

WHEREAS, the District has therefore, prepared and circulated for public review a draft 2015 Urban Water Management Plan, and a properly noticed public hearing regarding the Plan was held by the Board of Directors on December 14, 2016; and

WHEREAS, the District shall file the Plan with the California Department of Water Resources and the California State Library, Government Publications Section on or before January 14, 2016

NOW THEREFORE, BE IT RESOLVED by the Board of Directors of the Beaumont-Cherry Valley Water District as follows:

1. The 2015 Urban Water Management Plan is hereby adopted, including modifications to the 2015 Urban Water Management Plan made after the Public Hearing by the General Manager limited to (i) de minimis refinements, and (ii) such changes to address public input received (if any) at the Public Hearing.

2. The General Manager is hereby authorized and directed to file the 2015 Urban Water Management Plan within thirty (30) days after its adoption with the California Department of Water Resources, the California State Library - Government Publications Section, and any city or county within which the District provides water supplies,

RESOLUTION No. 2017-01

RESOLUTION OF THE BOARD OF DIRECTORS OF THE BEAUMONT-CHERRY VALLEY WATER DISTRICT ADOPTING THE 2015 URBAN WATER MANAGEMENT PLAN AND AUTHORIZING THE GENERAL MANAGER TO FILE THE URBAN WATER MANAGEMENT PLAN AND TAKE SUCH OTHER NECESSARY ACTION TO IMPLEMENT AND ADMINISTER THE PLAN

3. The General Manager is hereby authorized and directed to take any necessary actions to implement and administer the 2015 Urban water Management Plan.

ADOPTED, SIGNED AND APPROVED, THIS 11th DAY OF JANUARY 2017 BY THE FOLLOWING VOTES:
AYES:
NOES:
ABSENT:
ABSTAIN:

APPROVED:

Daniel Slawson, President of the
Board of Directors of the
Beaumont-Cherry Valley Water District

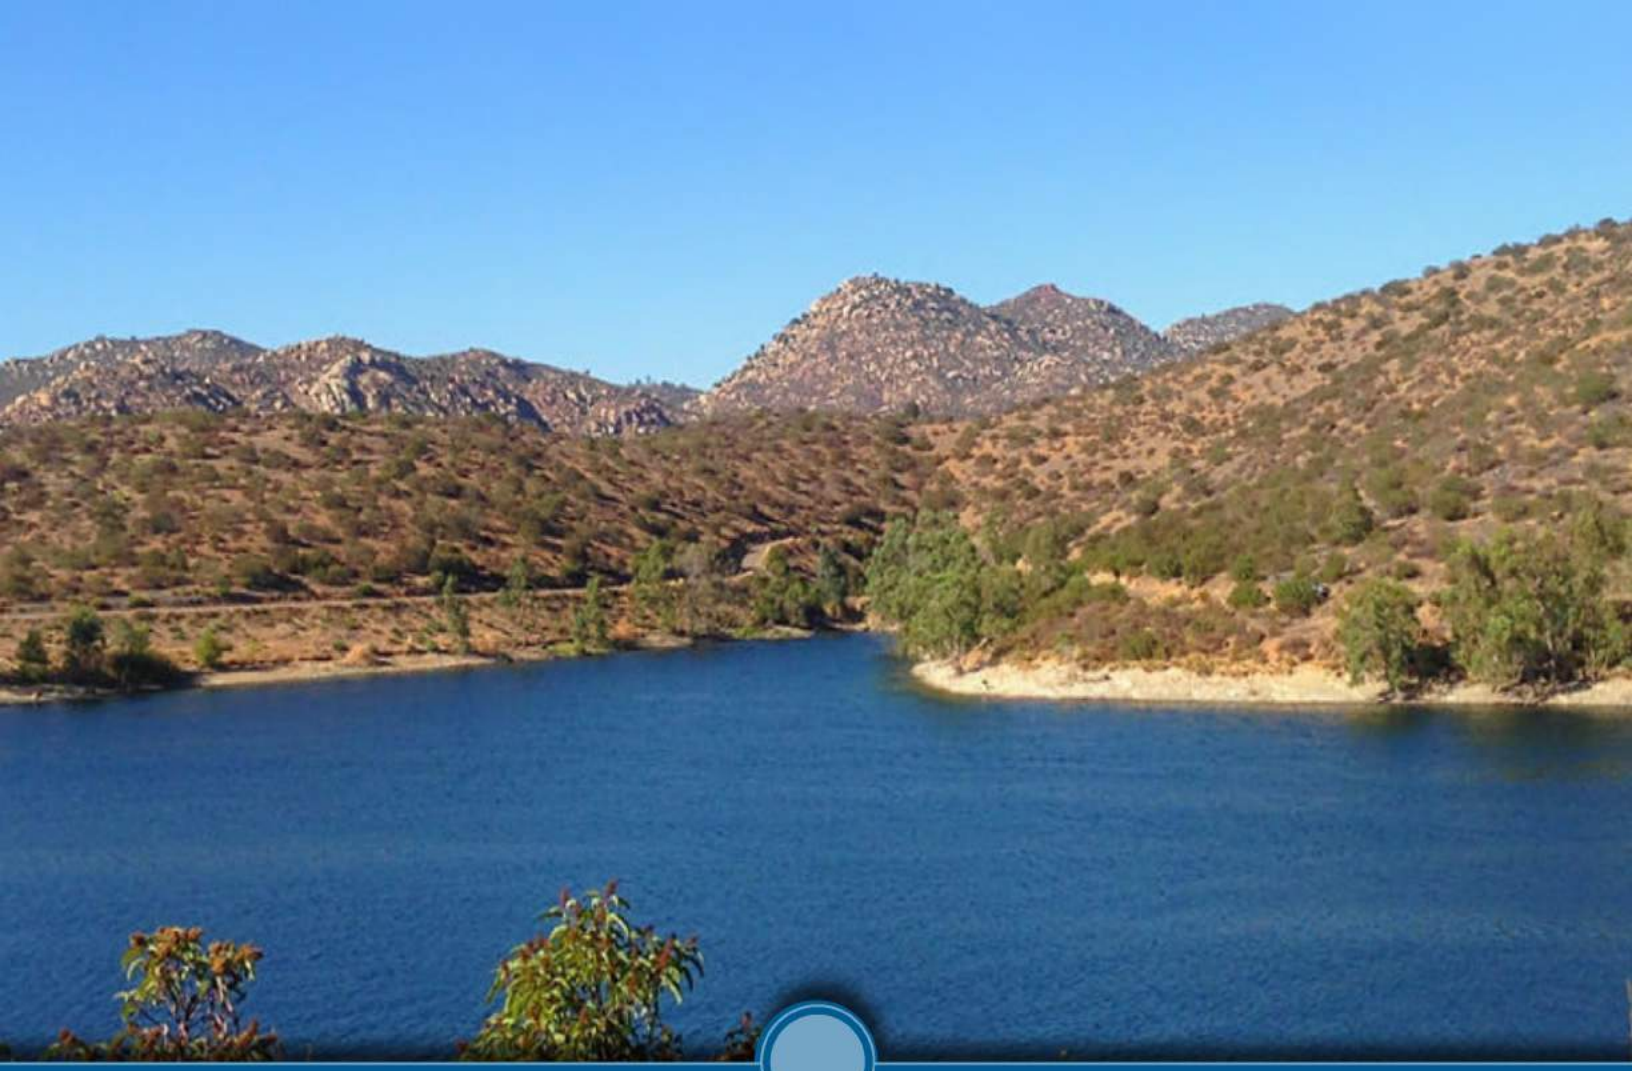
Nathan Douglass, Secretary to the
Board of Directors of the
Beaumont-Cherry Valley Water District

Checklist Arranged by Subject

CWC Section	UWMP Requirement	Subject	Guidebook Location	UWMP Location *(Optional Column for Agency Use)*
10620(b)	Every person that becomes an urban water supplier shall adopt an urban water management plan within one year after it has become an urban water supplier.	Plan Preparation	Section 2.1	Pg 10-4
10620(d)(2)	Coordinate the preparation of its plan with other appropriate agencies in the area, including other water suppliers that share a common source, water management agencies, and relevant public agencies, to the extent practicable.	Plan Preparation	Section 2.5.2	Pg 10-1 thru 10-3
10642	Provide supporting documentation that the water supplier has encouraged active involvement of diverse social, cultural, and economic elements of the population within the service area prior to and during the preparation of the plan.	Plan Preparation	Section 2.5.2	Table 10-2
10631(a)	Describe the water supplier service area.	System Description	Section 3.1	Pg 3-2
10631(a)	Describe the climate of the service area of the supplier.	System Description	Section 3.3	Pg 3-8
10631(a)	Provide population projections for 2020, 2025, 2030, and 2035.	System Description	Section 3.4	Table 3-10
10631(a)	Describe other demographic factors affecting the supplier's water management planning.	System Description	Section 3.4	Pg 3-27
10631(a)	Indicate the current population of the service area.	System Description and Baselines and Targets	Sections 3.4 and 5.4	Table 3-3, Table 3-10
10631(e)(1)	Quantify past, current, and projected water use, identifying the uses among water use sectors.	System Water Use	Section 4.2	Pg 4-4 and Table 4-1 and Table 4-2
10631(e)(3)(A)	Report the distribution system water loss for the most recent 12-month period available.	System Water Use	Section 4.3	Pg 4-8
10631.1(a)	Include projected water use needed for lower income housing projected in the service area of the supplier.	System Water Use	Section 4.5	Table 4-4A, pg 4-11

10608.20(b)	Retail suppliers shall adopt a 2020 water use target using one of four methods.	Baselines and Targets	Section 5.7 and App E	Pg 5-6
10608.20(e)	Retail suppliers shall provide baseline daily per capita water use, urban water use target, interim urban water use target, and compliance daily per capita water use, along with the bases for determining those estimates, including references to supporting data.	Baselines and Targets	Chapter 5 and App E	Pg 5-6 and Table 5-1 and SB X7-7 Verification Tables
10608.22	Retail suppliers' per capita daily water use reduction shall be no less than 5 percent of base daily per capita water use of the 5 year baseline. This does not apply if the suppliers base GPCD is at or below 100.	Baselines and Targets	Section 5.7.2	Pg 5-6
10608.24(a)	Retail suppliers shall meet their interim target by December 31, 2015.	Baselines and Targets	Section 5.8 and App E	Pg 5-7
10608.24(d)(2)	If the retail supplier adjusts its compliance GPCD using weather normalization, economic adjustment, or extraordinary events, it shall provide the basis for, and data supporting the adjustment.	Baselines and Targets	Section 5.8.2	N/A, no adjustment made
10608.36	Wholesale suppliers shall include an assessment of present and proposed future measures, programs, and policies to help their retail water suppliers achieve targeted water use reductions.	Baselines and Targets	Section 5.1	BCVWD is not Wholesale Agency
10608.40	Retail suppliers shall report on their progress in meeting their water use targets. The data shall be reported using a standardized form.	Baselines and Targets	Section 5.8 and App E	See SB X7-7 Verification Tables
10631(b)	Identify and quantify the existing and planned sources of water available for 2015, 2020, 2025, 2030, and 2035.	System Supplies	Chapter 6	Table 6-25
10631(b)	Indicate whether groundwater is an existing or planned source of water available to the supplier.	System Supplies	Section 6.2	Section 6
10631(b)(1)	Indicate whether a groundwater management plan has been adopted by the water supplier or if there is any other specific authorization for groundwater management. Include a copy of the plan or authorization.	System Supplies	Section 6.2.2	Basin is Adjudicated
10631(b)(2)	**Describe the groundwater basin.**	**System Supplies**	**Section 6.2.1**	P 6-16 to 6-24



10631(b)(2)	Indicate if the basin has been adjudicated and include a copy of the court order or decree and a description of the amount of water the supplier has the legal right to pump	System Supplies	Section 6.2.2	Appendix E and Pg 6-24
10631(b)(2)	For unadjudicated basins, indicate whether or not the department has identified the basin as overdrafted, or projected to become overdrafted. Describe efforts by the supplier to eliminate the long-term overdraft condition.	System Supplies	Section 6.2.3	Edgar Canyon not adjudicated and not in overdraft See Table 6-8
10631(b)(3)	Provide a detailed description and analysis of the location, amount, and sufficiency of groundwater pumped by the urban water supplier for the past five years	System Supplies	Section 6.2.4	Table 6-7
10631(b)(4)	Provide a detailed description and analysis of the amount and location of groundwater that is projected to be pumped.	System Supplies	Sections 6.2 and 6.9	Table 6-8 and Table 6-9, Table 6-25
10631(d)	Describe the opportunities for exchanges or transfers of water on a short-term or long-term basis.	System Supplies	Section 6.7	Pg 6-57
10631(g)	Describe the expected future water supply projects and programs that may be undertaken by the water supplier to address water supply reliability in average, single-dry, and multiple-dry years.	System Supplies	Section 6.8	Table 6-23
10631(h)	Describe desalinated water project opportunities for long-term supply.	System Supplies	Section 6.6	Pg 6-56
10631(j)	Retail suppliers will include documentation that they have provided their wholesale supplier(s) – if any - with water use projections from that source.	System Supplies	Section 2.5.1	Pg 2-4
10631(j)	Wholesale suppliers will include documentation that they have provided their urban water suppliers with identification and quantification of the existing and planned sources of water available from the wholesale to the urban supplier during various water year types.	System Supplies	Section 2.5.1	BCVWD is a Retailer
10633	For wastewater and recycled water, coordinate with local water, wastewater, groundwater, and planning agencies that operate within the supplier's service area.	System Supplies (Recycled Water)	Section 6.5.1	Pg 2-5

10633(a)	Describe the wastewater collection and treatment systems in the supplier's service area. Include quantification of the amount of wastewater collected and treated and the methods of wastewater disposal.	System Supplies (Recycled Water)	Section 6.5.2	Pg 6-42
10633(b)	Describe the quantity of treated wastewater that meets recycled water standards, is being discharged, and is otherwise available for use in a recycled water project.	System Supplies (Recycled Water)	Section 6.5.2.2	Pg 6-45 and Table 6-14,
10633(c)	Describe the recycled water currently being used in the supplier's service area.	System Supplies (Recycled Water)	Section 6.5.3 and 6.5.4	Table 6-17
10633(d)	Describe and quantify the potential uses of recycled water and provide a determination of the technical and economic feasibility of those uses.	System Supplies (Recycled Water)	Section 6.5.4	Tble 6-18 and 6-19
10633(e)	Describe the projected use of recycled water within the supplier's service area at the end of 5, 10, 15, and 20 years, and a description of the actual use of recycled water in comparison to uses previously projected.	System Supplies (Recycled Water)	Section 6.5.4	Table 6-19
10633(f)	Describe the actions which may be taken to encourage the use of recycled water and the projected results of these actions in terms of acre-feet of recycled water used per year.	System Supplies (Recycled Water)	Section 6.5.5	Pg 6-53
10633(g)	Provide a plan for optimizing the use of recycled water in the supplier's service area.	System Supplies (Recycled Water)	Section 6.5.5	Pg 6-54 to 6-55, Table 6-22
10620(f)	Describe water management tools and options to maximize resources and minimize the need to import water from other regions.	Water Supply Reliability Assessment	Section 7.4	See Storm Water pg 6-35 and Recycled Water pg 6-40
10631(c)(1)	Describe the reliability of the water supply and vulnerability to seasonal or climatic shortage.	Water Supply Reliability Assessment	Section 7.1	Section 7, Table 7-1
10631(c)(1)	Provide data for an average water year, a single dry water year, and multiple dry water years	Water Supply Reliability Assessment	Section 7.2	Pg 7-5 to 7-8
10631(c)(2)	For any water source that may not be available at a consistent level of use, describe plans to supplement or replace that source.	Water Supply Reliability Assessment	Section 7.1	Pg 7-11

10634	Provide information on the quality of existing sources of water available to the supplier and the manner in which water quality affects water management strategies and supply reliability	Water Supply Reliability Assessment	Section 7.1	Pg 6-16, 6-20 and 6-44
10635(a)	Assess the water supply reliability during normal, dry, and multiple dry water years by comparing the total water supply sources available to the water supplier with the total projected water use over the next 20 years.	Water Supply Reliability Assessment	Section 7.3	Tables 7-9 through 7-12
10632(a) and 10632(a)(1)	Provide an urban water shortage contingency analysis that specifies stages of action and an outline of specific water supply conditions at each stage.	Water Shortage Contingency Planning	Section 8.1	Pg 8-1
10632(a)(2)	Provide an estimate of the minimum water supply available during each of the next three water years based on the driest three-year historic sequence for the agency.	Water Shortage Contingency Planning	Section 8.9	Pg 8-25 and 8-26
10632(a)(3)	Identify actions to be undertaken by the urban water supplier in case of a catastrophic interruption of water supplies.	Water Shortage Contingency Planning	Section 8.8	Pg 8-12 thru 8-25
10632(a)(4)	Identify mandatory prohibitions against specific water use practices during water shortages.	Water Shortage Contingency Planning	Section 8.2	Pg 8-24
10632(a)(5)	Specify consumption reduction methods in the most restrictive stages.	Water Shortage Contingency Planning	Section 8.4	Pg 8-1 thru 8-5
10632(a)(6)	Indicated penalties or charges for excessive use, where applicable.	Water Shortage Contingency Planning	Section 8.3	Pg 8-6
10632(a)(7)	Provide an analysis of the impacts of each of the actions and conditions in the water shortage contingency analysis on the revenues and expenditures of the urban water supplier, and proposed measures to overcome those impacts.	Water Shortage Contingency Planning	Section 8.6	Pg 8-10
10632(a)(8)	Provide a draft water shortage contingency resolution or ordinance.	Water Shortage Contingency Planning	Section 8.7	See Pg 8-28
10632(a)(9)	Indicate a mechanism for determining actual reductions in water use pursuant to the water shortage contingency analysis.	Water Shortage Contingency Planning	Section 8.5	Pg 8-10

10631(f)(1)	Retail suppliers shall provide a description of the nature and extent of each demand management measure implemented over the past five years. The description will address specific measures listed in code.	Demand Management Measures	Sections 9.2 and 9.3	Pg 9-1 thru 9-5
10631(f)(2)	Wholesale suppliers shall describe specific demand management measures listed in code, their distribution system asset management program, and supplier assistance program.	Demand Management Measures	Sections 9.1 and 9.3	BCVWD is a Retailer
10631(i)	CUWCC members may submit their 2013-2014 CUWCC BMP annual reports in lieu of, or in addition to, describing the DMM implementation in their UWMPs. This option is only allowable if the supplier has been found to be in full compliance with the CUWCC MOU.	Demand Management Measures	Section 9.5	BCVWD is not a CUWCC member
10608.26(a)	Retail suppliers shall conduct a public hearing to discuss adoption, implementation, and economic impact of water use targets.	Plan Adoption, Submittal, and Implementation	Section 10.3	Pg 10-4 as part of UWMP adoption
10621(b)	Notify, at least 60 days prior to the public hearing, any city or county within which the supplier provides water that the urban water supplier will be reviewing the plan and considering amendments or changes to the plan.	Plan Adoption, Submittal, and Implementation	Section 10.2.1	Pg 10-2
10621(d)	Each urban water supplier shall update and submit its 2015 plan to the department by July 1, 2016.	Plan Adoption, Submittal, and Implementation	Sections 10.3.1 and 10.4	Submitted before end of 2016
10635(b)	Provide supporting documentation that Water Shortage Contingency Plan has been, or will be, provided to any city or county within which it provides water, no later than 60 days after the submission of the plan to DWR.	Plan Adoption, Submittal, and Implementation	Section 10.4.4	Provided with copy of 2015 UWMP Update
10642	Provide supporting documentation that the urban water supplier made the plan available for public inspection, published notice of the public hearing, and held a public hearing about the plan.	Plan Adoption, Submittal, and Implementation	Sections 10.2.2, 10.3, and 10.5	See Appendix F of 2015 UWMP Update
10642	The water supplier is to provide the time and place of the hearing to any city or county within which the supplier provides water.	Plan Adoption, Submittal, and Implementation	Sections 10.2.1	See Appendix F of 2015 UWMP Update

10642	Provide supporting documentation that the plan has been adopted as prepared or modified.	Plan Adoption, Submittal, and Implementation	Section 10.3.1	See Appendix F of 2015 UWMP Update
10644(a)	Provide supporting documentation that the urban water supplier has submitted this UWMP to the California State Library.	Plan Adoption, Submittal, and Implementation	Section 10.4.3	See Appendix F of 2015 UWMP Update
10644(a)(1)	Provide supporting documentation that the urban water supplier has submitted this UWMP to any city or county within which the supplier provides water no later than 30 days after adoption.	Plan Adoption, Submittal, and Implementation	Section 10.4.4	See Appendix F of 2015 UWMP Update
10644(a)(2)	The plan, or amendments to the plan, submitted to the department shall be submitted electronically.	Plan Adoption, Submittal, and Implementation	Sections 10.4.1 and 10.4.2	It will on completion
10645	Provide supporting documentation that, not later than 30 days after filing a copy of its plan with the department, the supplier has or will make the plan available for public review during normal business hours.	Plan Adoption, Submittal, and Implementation	Section 10.5	On BCVWD Website www.bcvwd.org

FINAL

2015 Urban Water Management Plan *for* **San Gorgonio Pass Water Agency**

March 2017

Prepared by

Kennedy/Jenks Consultants

RESOLUTION NO. 2017-03

RESOLUTION OF THE BOARD OF DIRECTORS OF THE SAN GORGONIO PASS WATER AGENCY ADOPTING THE 2015 URBAN WATER MANAGEMENT PLAN

WHEREAS, the Urban Water Management Planning Act (Water Code, Part 2.6, Section 10610 et seq.) mandates that every urban water supplier providing water for municipal purposes either directly or indirectly to more than 3,000 customers or supplying more than 3,000 acre feet of water annually, prepare an Urban Water Management Plan, and update its Urban Water Management Plan at least once every five years; and

WHEREAS, the Water Conservation Act of 2009 (Water Code, Part 2.55, Section 10608 et seq.) established, among other things, standards for urban retail water suppliers to achieve reductions in urban per capita water use statewide; and

WHEREAS, the San Gorgonio Pass Water Agency (Agency) is an urban wholesale water supplier for purposes of the requirements of the Urban Water Management Planning Act and the Water Conservation Act of 2009; and

WHEREAS, in accordance with the Urban Water Management Planning Act and the Water Conservation Act of 2009 , the Agency has prepared its 2015 Urban Water Management Plan (2015 UWMP) and has undertaken certain coordination, notice, public involvement, public comment, and other procedures in relation to its 2015 UWMP;

WHEREAS, as authorized by Section 10620(e) of the Urban Water Management Planning Act, the Agency has prepared its 2015 UWMP with its own staff, with the assistance of consulting professionals, and in cooperation with other governmental agencies, and has utilized and relied upon industry standards and the expertise of industry professionals in preparing its 2015 UWMP, and has also utilized and relied upon the California Department of Water Resources Guidebook for Urban Water Suppliers to Prepare 2015 Urban Water Management Plans (March 2016), including its related appendices; and

WHEREAS, in accordance with applicable law, including Water Code Section 10642 and Government Code Section 6066, a properly noticed public hearing regarding the Agency's 2015 UWMP was conducted by the Agency's Board of Directors on March 6, 2017 in order to provide members of the public and other interested entities with the opportunity to be heard in connection with the 2015 UWMP and the proposed adoption thereof; and

WHEREAS, pursuant to said public hearing on the 2015 UWMP, the Agency, among other things, encouraged the active involvement of diverse social, cultural, and economic members of the community within the Agency's service area with regard to the preparation and proposed adoption of the 2015 UWMP; and

WHEREAS, the Board of Directors of the Agency has reviewed and considered the purposes and requirements and of the Urban Water Management Planning Act and the Water Conservation Act of 2009, the contents of the 2015 UWMP, and the documentation contained in the administrative record in support of the 2015 UWMP, and has determined that the factual analyses and conclusions set forth in the 2015 UWMP are supported by substantial evidence.

NOW, THEREFORE, BE IT RESOLVED by the Board of Directors of the San Gorgonio Pass Water Agency as follows:

1. The Board of Directors approves and adopts the Agency's 2015 Urban Water Management Plan, a final copy of which is attached hereto as Exhibit "A";

2. The General Manager is hereby authorized and directed to include a copy of this Resolution in the 2015 Urban Water Management Plan, and to electronically submit a copy of the 2015 Urban Water Management Plan to the California Department of Water Resources;

3. The General Manager is hereby authorized and directed, in accordance with Water Code section 10644(a) to submit a copy of the 2015 Urban Water Management Plan to the California State Library within thirty (30) days after this adoption date;

4. The General Manager is hereby authorized and directed, in accordance with Water Code section 10644(a), and in satisfaction of Water Code section 10635(b), to submit a copy of the 2015 Urban Water Management Plan, specifically including the portion of the Plan prepared in accordance with Water Code section 10635(a), to any city or county within which the Agency provides water supplies within thirty (30) days after this adoption date;

5. The General Manager is hereby authorized and directed, in accordance with Water Code section 10645, to make the 2015 Urban Water Management Plan available for public review at the Agency's offices during normal business hours not later than thirty (30) days after filing a copy thereof with the California Department of Water Resources;

6. The General Manager is hereby authorized and directed to recommend to the Board of Directors additional steps necessary or appropriate to effectively carry out the implementation of the 2015 Urban Water Management Plan in accordance with the Urban Water Management Planning Act and the Water Conservation Act of 2009.

Resolution No. 2017-03 was adopted this 20th day of March 2017, by the following vote:

Ayes: Stephenson, Lehtonen, Castaldo, Duncan Thompson and Fenn
Noes:
Abstain: Ball
Absent:

ADOPTED AND APPROVED this 20th day of March, 2017.

President, Board of Directors
San Gorgonio Pass Water Agency

Section 1: Introduction

1.1 Overview

This document presents the wholesale Urban Water Management Plan 2015 (Plan) for the San Gorgonio Pass Water Agency (Agency, SGPWA) service area. This chapter describes the general purpose of the Plan, discusses Plan implementation, and provides general information about SGPWA, retail water purveyors, and service area characteristics.

The State of California mandates that all urban water suppliers within the state prepare an Urban Water Management Plan (UWMP). Detailed information on what must be included in these plans as well as who must complete them can be found in California Water Code sections 10610 through 10657. According to the UWMP Act of 1983, an urban water supplier is defined as a supplier, either public or private, that provides water for municipal purposes either directly or indirectly to more than 3,000 customers or supplies more than 3,000 acre-feet (AF) annually.

1.2 Purpose

An UWMP is a planning tool that generally guides the actions of water management agencies. It provides managers and the public with a broad perspective on a number of water supply issues. It is not a substitute for project-specific planning documents, nor was it intended to be when mandated by the State Legislature. For example, the Legislature mandated that a plan include a Section which "describes the opportunities for exchanges or water transfers on a short-term or long-term basis." (California Urban Water Management Planning Act, Article 2, Section 10630(d).) The identification of such opportunities, and the inclusion of those opportunities in a general water service reliability analysis, neither commits a water management agency to pursue a particular water exchange/transfer opportunity, nor precludes a water management agency from exploring exchange/transfer opportunities not identified in the plan. When specific projects are chosen to be implemented, detailed project plans are developed, environmental analysis, if required, is prepared, and financial and operational plans are detailed.

"A plan is intended to function as a planning tool to guide broad-perspective decision making by the management of water suppliers." (*Sonoma County Water Coalition v. Sonoma County Water Agency* (2010) 189 Cal. App. 4th 33, 39.) It should not be viewed as an exact blueprint for supply and demand management. Water management in California is not a matter of certainty and planning projections may change in response to a number of factors. "[L]ong-term water planning involves expectations and not certainties. The State Supreme Court has recognized the uncertainties inherent in long-term land use and water planning and observed that the generalized information required . . . in the early stages of the planning process are replaced by firm assurances of water supplies at later stages." (*Id.*, at 41.) From this perspective, it is appropriate to look at the UWMP as a general planning framework, not a specific action plan. It is an effort to generally answer a series of planning questions including:

- What are the potential sources of supply and what is the reasonable probable yield from them?

- What is the probable demand, given a reasonable set of assumptions about growth and implementation of good water management practices?

- How well do supply and demand figures match up, assuming that the various probable supplies will be pursued by the implementing agency?

Using these "framework" questions and resulting answers, the implementing agency will pursue feasible and cost-effective options and opportunities to meet demands. SGPWA will explore enhancing basic supplies from traditional sources such as the State Water Project (SWP) as well as other options.

The California Urban Water Management Planning Act (Act) requires preparation of a plan that:

- Accomplishes water supply planning over a 20-year period in five year increments. (SGPWA is going beyond the requirements of the Act by developing a plan which spans 25 years.)

- Identifies and quantifies adequate water supplies, including recycled water, for existing and future demands, in normal, single dry, and multiple dry years.

- Implements conservation and efficient use of urban water supplies.

Significant new requirements for quantified demand reductions have been added by the enactment of SBX7-7, which amends the Act; a portion of this law applies to SGPWA. In addition, a number of changes to the Water Code have been enacted since 2010 that affect implementation of the 2015 Plan updates. These changes apply to:

- Demand Management Measures CWC (CWC) Section 10631(f)(1) and (2) Assembly Bill (AB) 2067, 2014

- Submittal Date CWC Section 10621 (d) AB 2067, 2014

- Electronic Submittal CWC Section 10644 (a)(2) Senate Bill (SB) 1420, 2014

- Standardized Forms CWC Section 10644(1)(2) SB 1420, 2014

- Water Loss CWC Section 10631 (e)(1)(J) and (e)(3)(A) and (B) SB 1420, 2014

- Estimating Future Water Savings CWC Section 10631 (e)(4) SB 1420, 2014

- Voluntary Reporting of Energy Intensity CWC Section 10631.2 (a) and (b) Senate Bill 1036, 2014

- Defining Water Features CWC Section 10632 (b) Assembly Bill 2409, 2014

A checklist to ensure compliance of this Plan with the Act requirements is provided in Appendix A. A copy of the required standardized data tables is provided as Appendix B.

In short, the Plan answers the question: *Will there be enough water for the communities within the SGPWA service area in future years?* It also addresses what mix of programs should be explored for making this water available, and sets a framework for discussion of the priority of these programs.

It is the stated goal of SGPWA to import supplemental water and to protect and enhance local water supplies for use by present and future water users and to sell imported water at wholesale to local retail water purveyors within its service area. Based on conservative water supply and demand assumptions over the next 25 years in combination with conservation of non-essential demand during certain dry years, the Plan successfully achieves this goal. It is important to note that this document has been completed to address regional resource management and does not address the particular conditions of any specific retail water agency or entity within the SGPWA service area. The retail urban water suppliers within SGPWA service area are preparing their own separate UWMPs, but SGPWA has coordinated with the retailers during development of this Plan to ensure a level of consistency with the retailers to the extent possible.

1.3 Basis for preparing a plan

In accordance with the California Water Code, urban water suppliers with 3,000 or more service connections, or supplying 3,000 or more AF of water per year, are required to prepare a UWMP every five years. The 2015 UWMP shall be updated and submitted to the California Department of Water Resources (DWR) by July 1, 2016.

1.4 Implementation of the Plan

The SGPWA service area encompasses a number of different local water agencies, three (3) of which are required to prepare individual UWMPs because they meet the threshold requirement. The three retail purveyors within SGPWA service area required to prepare their own UWMP include:

- City of Banning
- Beaumont-Cherry Valley Water District (BCVWD)
- Yucaipa Valley Water District (YVWD)

Other retail water agencies within the SGPWA service area that fall under the threshold for preparation of an UWMP (less than 3,000 connections or provide less than 3,000 AFY) include the following:

- South Mesa Water Company (SMWC)
- Cabazon Water District (CWD)
- Banning Heights Mutual Water Company (BHMWC)
- High Valleys Water District (HVWD)

- Mission Springs Water District (MSWD)
- Morongo Band of Mission Indians

1.5 Cooperative Preparation of the Plan

Wholesale water agencies are permitted by the State to either work independently to develop a wholesale UWMP or they can coordinate their planning with retail agencies within their service area to develop a cooperative regional plan. The former approach has been adopted by the SGPWA; however, the Plan was developed in coordination with the retail water agencies within the SGPWA service area. Water resource specialists with expertise in water resource management were retained to assist the local water agencies in preparing the details of their Plans. Agency coordination for this Plan is summarized in Table 1-1.

TABLE 1-1

1.5.1 Plan Adoption

SGPWA began preparation of this Plan for its service area in October 2015. The final draft of the Plan was adopted by the SGPWA Board in March 2017 and submitted to DWR within 30 days of Board approval. This Plan includes all information necessary to meet the requirements of Water Conservation Act of 2009 (Wat. Code, §§ 10608.12-10608.64) and the Urban Water Management Planning Act (Wat. Code, §§ 10610-10656).

1.5.2 Public Outreach

The SGPWA has encouraged community participation in water planning. Interested groups were informed about the development of the Plan along with the schedule of public activities. Notices of the Public Hearing were published in the local press. Copies of the Draft Plan were made available at the water agency's office, local public libraries and sent to the County of San Bernardino as well as interested parties.

SGPWA coordinated the preparation of the Plan with the local land use planning agencies; SGPWA notified the cities and counties within its service area of the opportunity to provide input regarding the Plan. Table 1-2 presents a timeline for public participation during the development of the Plan. A copy of the public outreach materials are provided in Appendix C.

TABLE 1-2

PUBLIC PARTICIPATION TIMELINE

Date	Event	Description
October 20, 2015	UWMP Kick-off	Describe UWMP requirements and process
January 17, 2017	Draft UWMP	Draft UWMP released to solicit input
March 6, 2017	Public Hearing	Review contents of Draft UWMP and take comments
March 20, 2017	Board Adoption	Final Draft UWMP considered for approval by the Board of Directors

The components of public participation include local media, water agency public participation, city and county government outreach, and public availability of documents.

Local Media

- Paid advertisements in local newspapers

Water Agencies Public Participation

- Draft UWMP sent to retail purveyors for review (see Table 1-1)

City/County and Other Government Outreach

- Notice sent to various Local, County, and State agencies

Public Availability of Documents

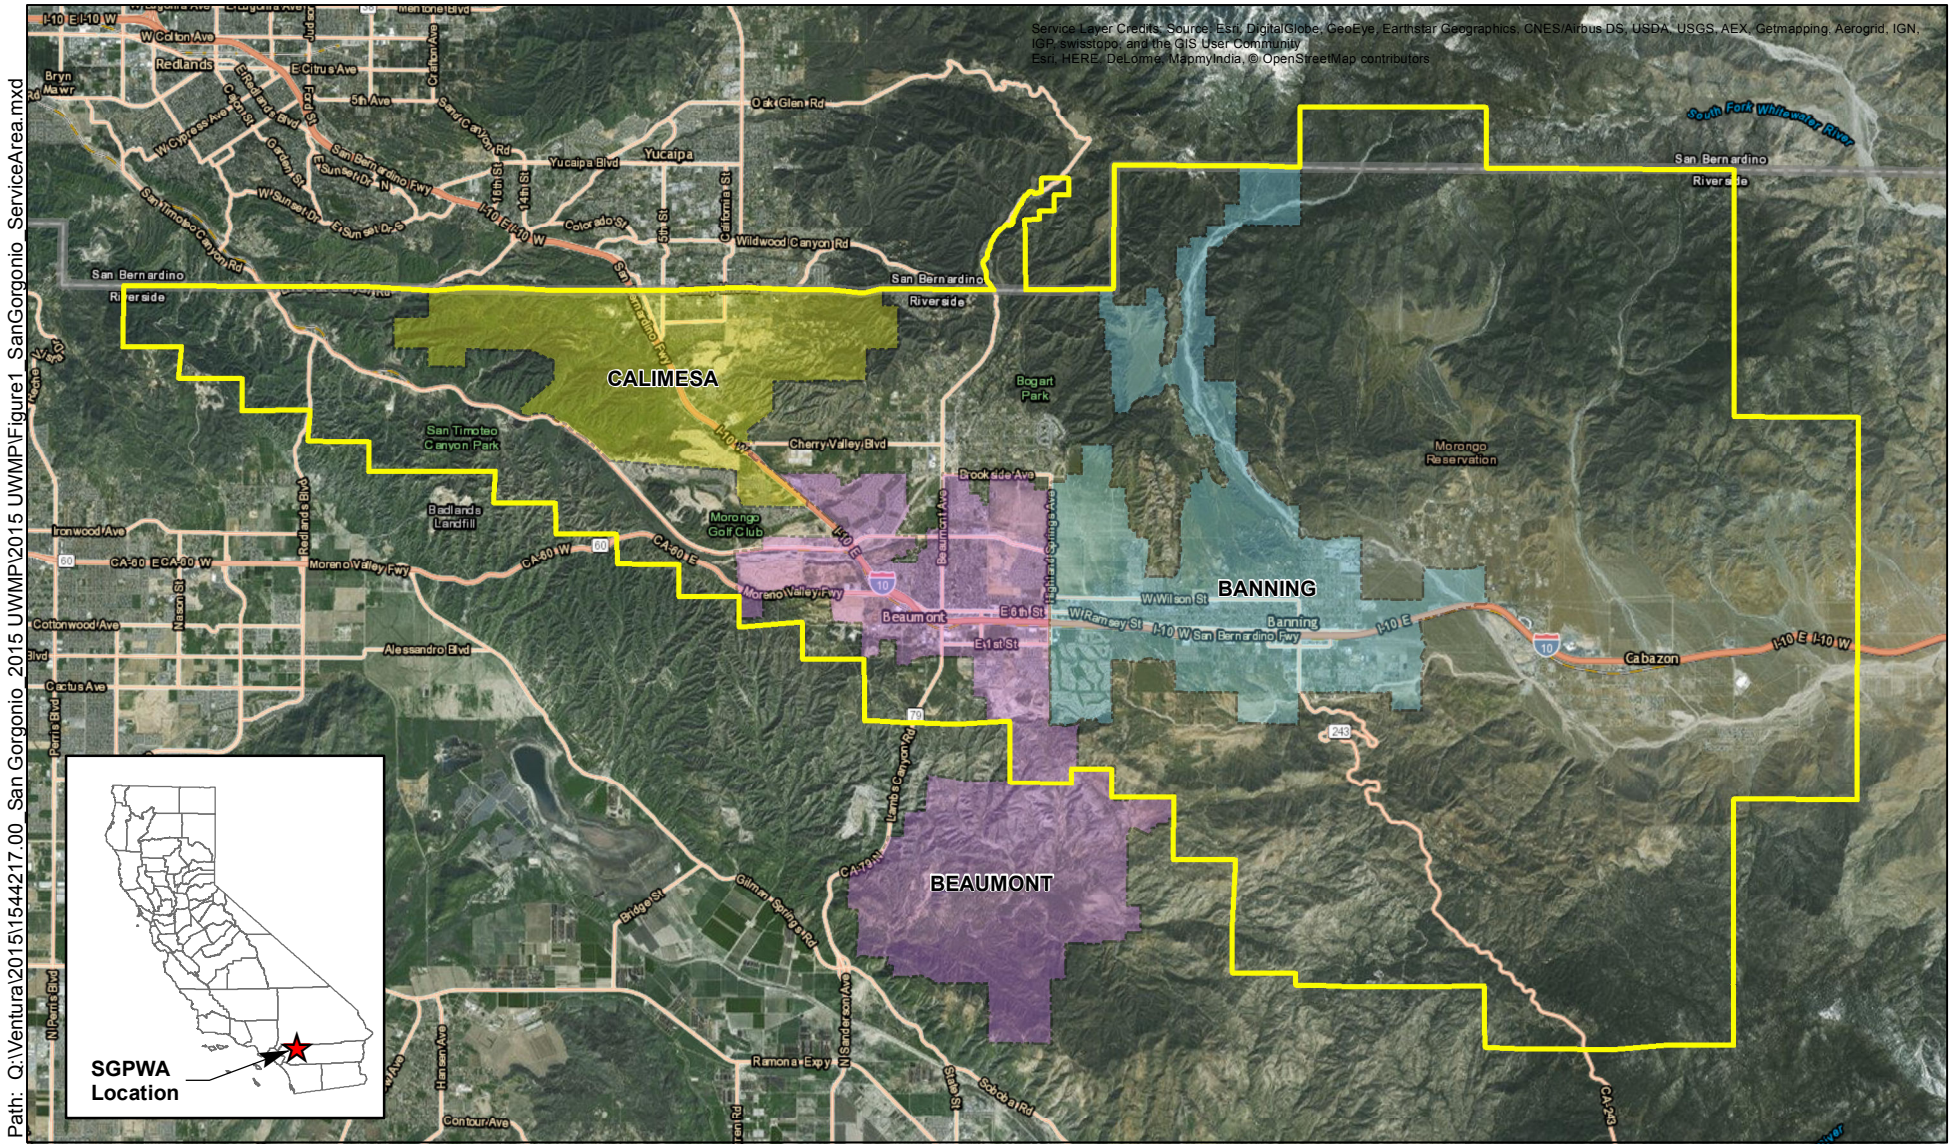
- SGPWA website
- Local libraries

1.5.3 Resources Maximization

Several documents were developed to enable the water suppliers to maximize the use of available resources and minimize use of imported water, including the 2010 SGPWA UWMP, the Integrated Regional Water Management Plan for the Upper Santa Ana River Watershed (2015), DWR's 2015 State Water Project Delivery Capability Report (2015 DCR), SGPWA's Reports on Water Conditions (2010 to 2014), the 2012 SGPWA Strategic Plan, and discussions with SGPWA staff. Chapter 3 of this Plan describes in detail the water resources available to SGPWA and the retail purveyors for the twenty-five-year period covered by the Plan. A complete reference list is provided in Section 8 of this Plan.

1.5.4 Fiscal or Calendar Year

A water supplier may report on a fiscal year or calendar year basis, but must clearly state in its UWMP the type of year that is used for reporting. The type of year should remain consistent throughout the Plan. This plan provides data consistent with a calendar year, in acre-feet per year (AFY).



1.6 Water Management within the SGPWA Service Area

1.6.1 San Gorgonio Pass Water Agency

The SGPWA was established by the SGPWA Act, passed by the California Legislature in 1961 and signed by Governor Pat Brown in July of 1961. At its inception, the agency service area had a population of approximately 21,000 (today is closer to 95,000).

The San Gorgonio Pass is located between the San Bernardino Mountains on the north and the San Jacinto Mountains on the south, connecting the San Bernardino Valley on the west to the Coachella Valley on the east. The Cities of Calimesa, Beaumont, and Banning are within the SGPWA's service area (Figure 1-1). The municipalities located within the service areas of water agencies in the SGPWA service area are summarized below.

The principle drainage basins and streams within the service area are shown on Figure 1-2.

1.6.2 Exclusively or Primarily Wholesale Urban Water Supplier

If an urban water supplier meets the definition of an urban wholesale water supplier, as found in 10608.12 (r), it is considered a wholesale urban water supplier. Only the water code requirements that apply to wholesale suppliers must be addressed. SGPWA is a wholesale urban water supplier.

1.6.3 Retail Water Purveyors

Nine retail purveyors provide water services to most residents and businesses within the SGPWA service area[1]. While only the City of Banning, BCVWD, and YVWD currently receive SWP water directly from the SGPWA, all nine retailers supply water to their customers from local groundwater, which is replenished by SWP water imported by SGPWA. In addition, the YVWD serves water to its customers through direct deliveries from its surface water filtration plant.

City of Banning supplies water and wastewater services to the City of Banning. The City currently comprises a total land area of approximately 23 square miles in northern Riverside County. The City's water system is currently part of the City of Banning Public Works Department and Water Division.

Beaumont-Cherry Valley Water District's service area covers approximately 28 square miles, in Riverside and San Bernardino Counties, and includes the City of Beaumont and the community of Cherry Valley. The District purchases imported water from the SWP through the SGPWA for recharge of the Beaumont groundwater basin. The District also jointly owns and operates three groundwater wells with the City of Banning.

Yucaipa Valley Water District provides drinking water, recycled water, sewer collection, sewer treatment, and brine disposal services to the City of Yucaipa and the City of Calimesa in both San Bernardino and Riverside Counties. Yucaipa's service area encompasses approximately 40 square miles. YVWD also receives water from the San Bernardino Valley Municipal Water District (SBVMWD). Water demands and supplies within this portion of YVWD's service area are excluded from this UWMP.

South Mesa Water Company's service area includes parts of both the City of Calimesa and the City of Yucaipa.

Cabazon Water District's service area includes the unincorporated community of Cabazon in the eastern portion of SGPWA's service area.

Banning Heights Mutual Water Company's service area is the unincorporated community of Banning Bench, north of the City of Banning.

High Valleys Water District provides service to residents of the Twin Pines and Poppet Flats communities. HVWD receives all of its water from the City of Banning.

Mission Springs Water District's service area includes Desert Hot Springs and surrounding areas.

Morongo Band of Mission Indians' service area is approximately 35,000 acres northeast of the City of Banning.

[1] Other very small mutual water companies, such as Cherry Valley, exist in the Agency's service area. Their demands will be considered in future updates of the UWMP as appropriate.

1.6.4 Public Water Systems

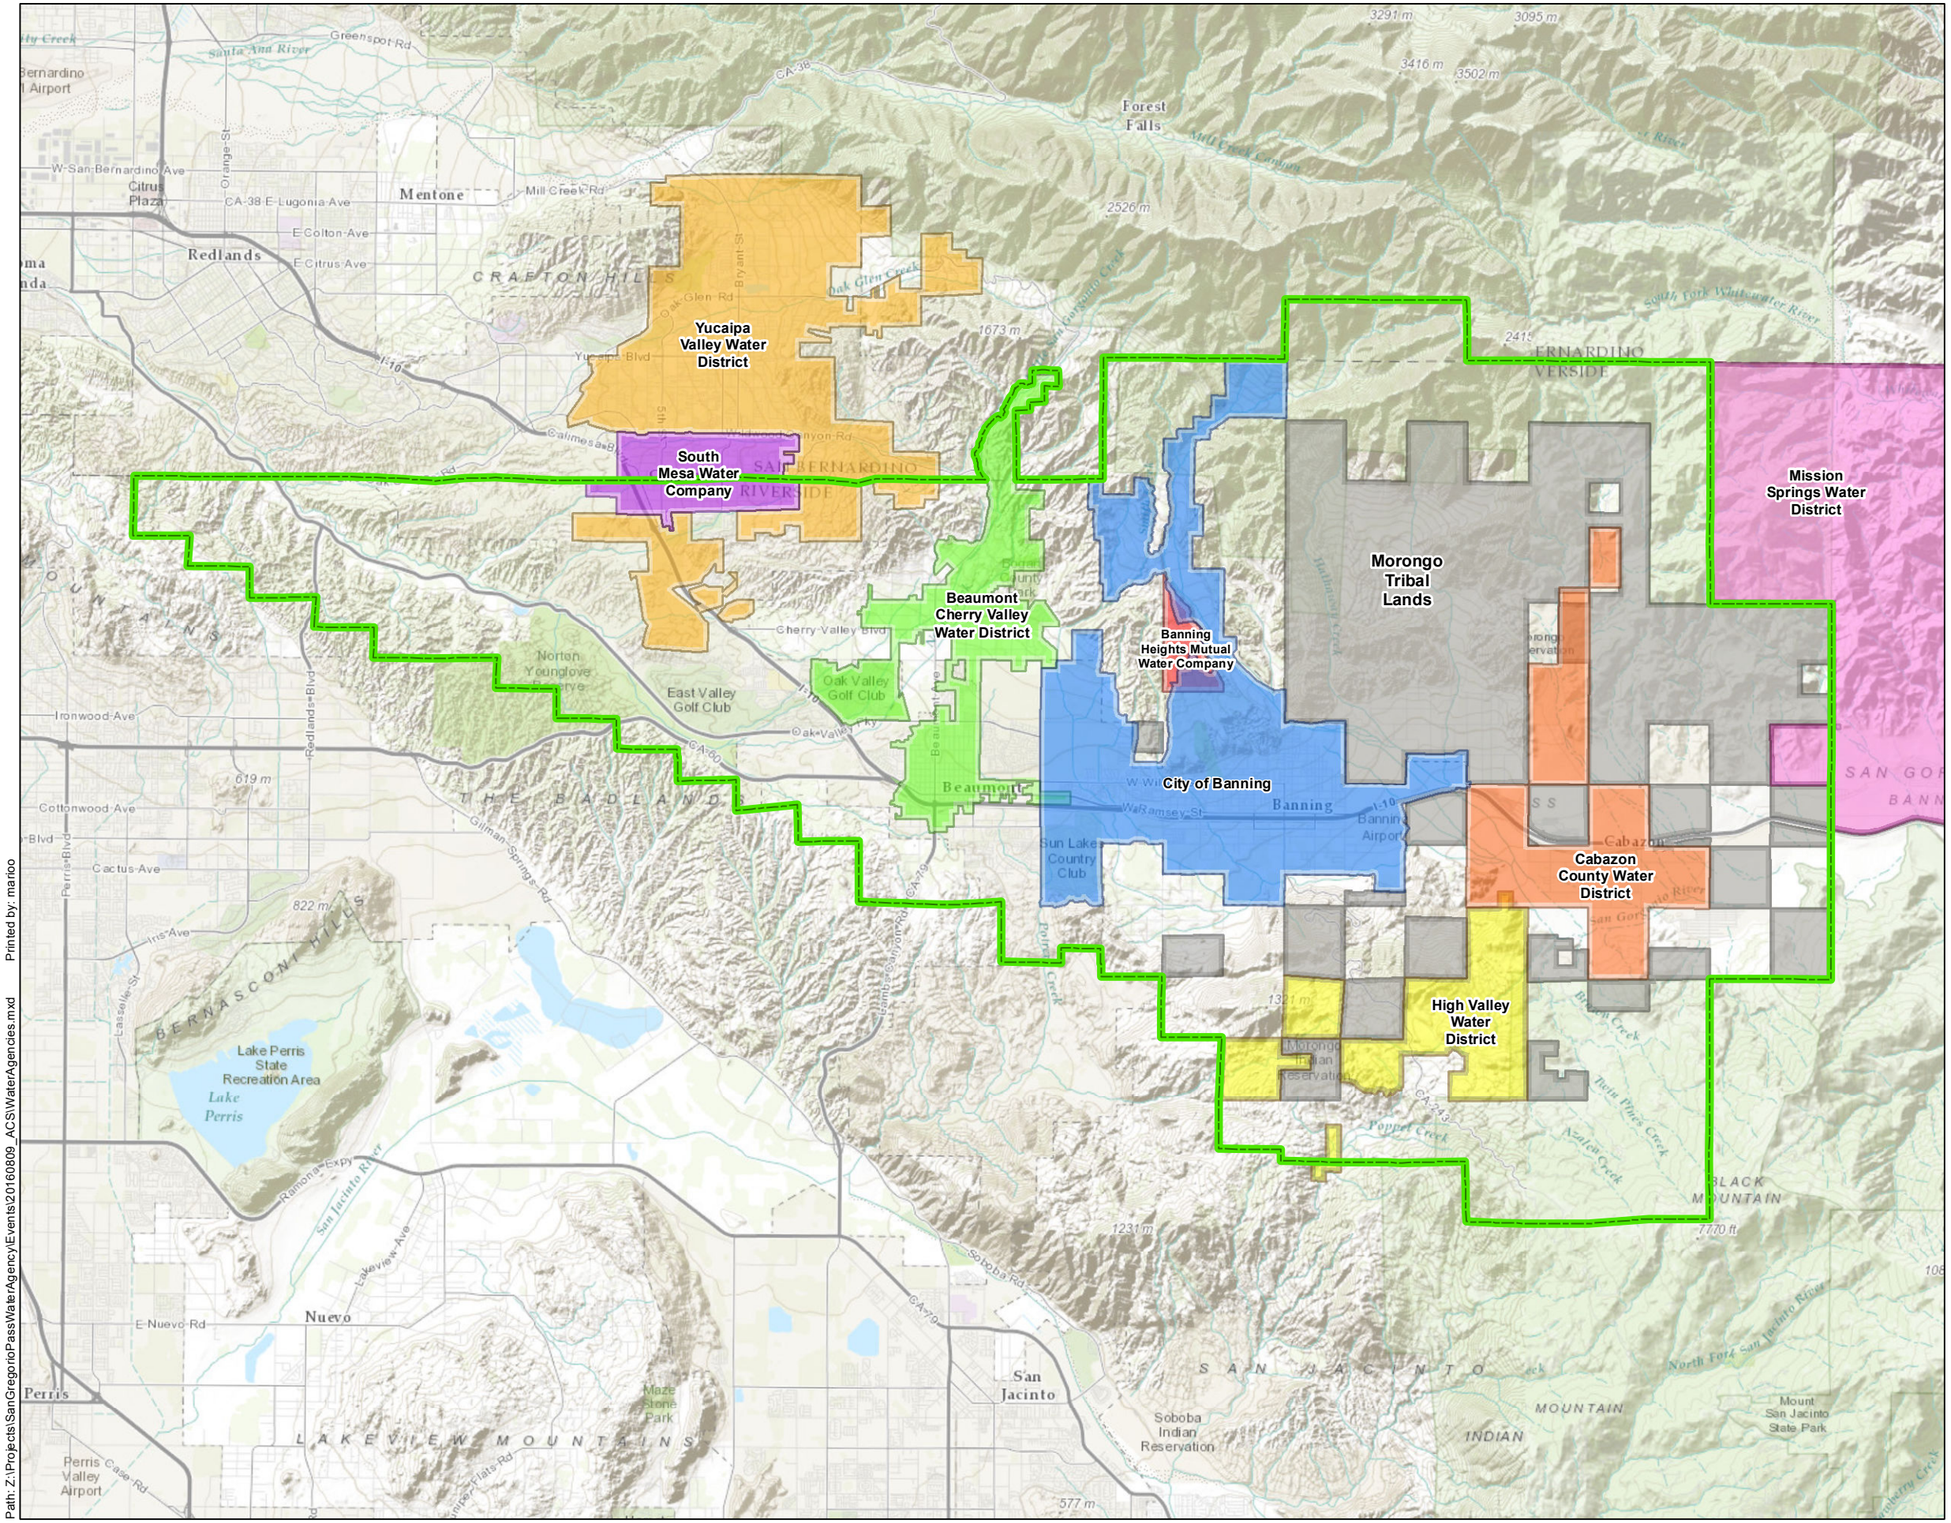
Public water systems are the systems that provide drinking water for human consumption and these systems are regulated by the State Water Resources Control Board (SWRCB), Division of Drinking Water. Reporters file electronic Annual Reports to the Drinking Water Program to the Board, which include annual reports of water usage and other information.

The service areas of SGPWA and the major retail water purveyors are shown on Figure 1-3. As of 2015, retail water purveyors with demands on SGPWA, which are also agencies required to complete UWMPs, served approximately 25,000 connections, as presented in Table 1-3.

TABLE 1-3

RETAIL PUBLIC WATER SYSTEMS[a]

Public Water System Number	Public Water System Name	Number of Municipal Connections 2015	Volume of Water Supplied 2015 (AFY)
3310002	BCVWD[b]	16,799	9,293
3310006	City of Banning[c]	10,650	5,971
3610055	YVWD[d]	12,304	9,595
Total		39,753	24,859



Notes:
(a) Data provided only for those retail agencies with 2015 demands on SGPWA
(b) BCVWD 2015 UWMP
(c) City of Banning 2015 UWMP
(d) San Bernardino Valley Regional 2015 UWMP; includes supply from both SGPWA and San Bernardino Valley Municipal Water District.

1.7 Climate

The SGPWA service area experiences a semi-arid climate with hot, dry summers and cool winters (Table 1-3). Temperatures in the summer can exceed 95 degrees Fahrenheit (F), but with low humidity. In the winter, high temperatures may not rise above 55 degrees F during rainy days. On average, January is the coldest month with an average high/low of 61degrees F/39 degrees F while August is the hottest with a high/low of 96 degrees F/58 degrees F. SGPWA receives about 17 inches of precipitation annually with most of it occurring from January through March, with February being the wettest month. Average rainfall within the lower lying areas of the region is roughly five to seven inches per year. The large variation in annual rainfall within the surrounding mountains directly affects the annual water supply of the region. During El Niño years, southern California can receive considerably more precipitation and cooler temperatures than average. Evapotranspiration follows a similar trend as temperature, peaking in July, and decreasing in December.

Representative precipitation, temperature, and average evapotranspiration (ETo) data are reported in Table 1-4, as recorded at Beaumont Station (040609) and Hemet Station (Station 239).

September	6.1	0.5	90	56
October	4.1	0.7	80	49
November	2.6	1.8	69	43
December	1.9	2.5	62	39

Notes:

(a) ETo data was obtained from the California Irrigation Management Information System (CIMIS) website at http://www.cimis.water.ca.gov/ for the Hemet Station (Station 239).

(b) Average rainfall data and average temperature data were obtained from the Western Regional Climate Center website at http://www.wrcc.dri.edu/ for the Beaumont #2 Station (040609) for the period of record 08/01/1939 to 1/20/2015.

1.8 Potential Effects of Climate Change

DWR's California Water Plan Update 2013 (CWP) considers how climate change may affect water availability, water use, water quality, and the ecosystem.[2]

Volume 1, Chapter 5 of the CWP, "Managing an Uncertain Future," evaluated how statewide and regional water demands that might change by 2050 in response to uncertainties both gradual and sudden. Gradual or long term factors include population growth, land use changes, and climate change. Sudden or short term changes include drought, flooding, earthquakes, the vulnerable condition of the Delta, fire, the economy, accidents, terrorist acts, and changes in policies, regulations, and laws. The uncertainties will play out differently across the regions of California. Each region will need to develop a portfolio of resource management strategies that consider regional water-management challenges and can be implemented to address regional issues.

In its 2015 State Water Project Delivery Capability Report (DCR), DWR included the potential effects of climate change in its analysis of SWP delivery reliability under future conditions. For that report, DWR selected a climate change scenario with median effects out of a number of climate change scenarios it analyzed in 2014.

[2] California Water Plan Update 2013 Investing in Innovation & Infrastructure: Bulletin 160-13.

Even without population changes, water demand could increase. Precipitation and temperature influence water demand for outdoor landscaping and irrigated agriculture. Outdoor water use is a large component of water demands in the service area. Lower spring rainfall increases the need to apply irrigation water. Further, warmer temperatures increase crop evapotranspiration, which increases consumptive use of water.

These effects and their potential to impact the supplies available to SGPWA have been evaluated indirectly in the DWR 2015 DCR, and their potential to impact demand is considered in SGPWA's assessment of demands in Chapter 2 of this UWMP.

1.9 Climate Change Vulnerability Analysis

Identification of watershed characteristics that could potentially be vulnerable to future climate change is the first step in assessing the climate change vulnerabilities in the Region. In the context of this analysis, vulnerability is defined as the degree to which a system is exposed to, susceptible to, and able to cope with and adapt to, the adverse effects of climate change, consistent with the definition in the recently issued Climate Change Handbook for Regional Water Planning (USEPA and DWR, 2011).

Water-related resources that are considered important in the Region and potentially sensitive to future climate change include water demands, water supplies, water quality, sea level rise, flooding, and ecosystem and habitat. A qualitative assessment of each of these resources with respect to anticipated climate change impacts has been prepared in the 2015 Integrated Regional Water Management Plan for the Upper Santa Ana River Watershed, in which SGPWA is a participant. The assessment follows the climate change vulnerability checklist assessment as defined in the Climate Change Handbook for Regional Water Planning and highlights those water-related resources that are important to the Region and are sensitive to climate change. This checklist is provided as Appendix D.

1.10 Other Demographic Factors

The past several years have been marked by both an economic recession and drought conditions in California, which have combined to substantially reduce water consumption in the SGPWA service area. The Governor issued an Executive Order in 2015 for mandatory water conservation calling for a 25 percent reduction in water consumption across the state in response to the severity of the drought.

It is anticipated that per capita water consumption will continue to decrease in the future, even with an economic recovery. This is due to the actions taken by local and state water agencies in response to the drought and the Governor's mandate, which are anticipated to remain in place moving into the future, as well as passive savings that will be realized through legislated codes, fixture and appliance standards, ordinances and education coupled with changing water use habits. Overall water consumption may stay relatively flat in the future as lower per capita water consumption is offset by increased population and economic activity.

Section 2: Water Use

2.1 Overview

This chapter describes past, current and projected water demands on SGPWA, including the methodology used to project future demands. Sales to other agencies, specifically BCVWD, City of Banning, and YVWD currently account for 100 percent of SGPWA's water demands. Additional smaller agencies and the Morongo Band of Mission Indians do not currently purchase water from the SGPWA, but may potentially request supplies in the future.

Numerous factors, including but not limited to, weather, conservation, population growth and land use changes, can affect the amount of water needed, as well as the timing of when it is needed. In addition, during an economic recession, there is a major downturn in development and a subsequent slowing of the projected demand for water. The projections in this Plan do not attempt to forecast recessions or droughts. Likewise, no speculation is made about future building and plumbing codes or other regulatory changes.

To the extent possible, relevant data was obtained from individual purveyor UWMPs that were completed for the 2015 cycle.

2.2 Demographics

Water service within the SGWPA service area is provided by retail purveyors to residential, commercial, industrial, institutional, recreational, and agricultural customers and for environmental and other uses, such as fire protection and landscaping. The total water demand trend is expected to continue to rise within the SGPWA's service area (along with most of California) because of population growth, economic activity, environmental and water quality needs and regulatory requirements.

2.3 Population

Table 2-1 shows the population projections for the SGPWA service area through 2040. The 2015 population is based on a 5-year American Community Survey (ACS) estimate for 2010-2014. Projections to 2040 were estimated using an average growth rate for the area based on available population projections for agencies within the SGPWA service area. When looking at individual agency projections, including BCVWD, City of Banning, YVWD and SMWC, projections are collectively higher than population projections estimated for the SGPWA service area using ACS data. This could be based on higher 2015 estimates for the individual agencies, as well as the fact that the SGPWA service area does not fully encompass the boundaries of all the individual agencies. Refer to Figure 1-1 for the purveyor service area boundaries.

TABLE 2-1
POPULATION PROJECTIONS FOR THE SGPWA SERVICE AREA

Subarea	2015	2020	2025	2030	2035	2040
SGPWA	87,192[a]	96,954	107,809	119,880	133,302	148,226

Notes:
(a) 2015 population based on 2010-2014 ACS 5-year estimate.

2.4 Historic Water Use, Sales to Other Agencies

SGPWA is a State Water Project Contractor and provides imported SWP water to the retail water purveyors within its service area. Purveyor demands on SGPWA generally showed a significant decrease between 2010 and 2015, primarily as a result of severe drought conditions and implementation of effective conservation measures. Table 2-2 shows historical (2010) and current (2015) water demands on SGPWA.

TABLE 2-2
HISTORICAL (2010) AND CURRENT (2015) WATER DEMANDS ON SGPWA (AF)[a]

Agency Name	2010	2015
BCVWD[b][c]	5,727	2,773
City of Banning[c]	1338	694
YVWD[c]	713	454
Total Demands	7,778	3,921

Notes:
(a) Volumes shown are actual deliveries.
(b) 2010 Data provided by BCVWD; 2015 data from BCVWD 2015 UWMP.
(c) Data from retailer 2015 UWMPs.

2.4.1 Historical Other Water Uses

In general, distribution systems experience system losses, being the difference between the amount of water supplied and the amount of authorized consumption. New legislation requires the analysis for the 2015 UWMP to include the reporting of distribution system water loss for the most recent 12-month period available. For future UWMP updates (i.e., 2020, 2025, etc.) the distribution system water loss shall be quantified for each of the five years preceding the plan update. It should be noted that recent legislation requires that as of January 1, 2017, distribution water loss must be reported on an annual basis. The data from these audits will be reported in future UWMP cycles.

SGPWA does not own or operate a distribution system; the water received from the SWP goes directly into groundwater recharge without treatment or distribution. However, in compliance with UWMP guidelines, SGPWA completed a water audit using the American Water Works Association (AWWA) water audit tool (provided in Appendix E), which is summarized in Table 2-3.

TABLE 2-3
12 MONTH WATER LOSS AUDIT REPORT SUMMARY

Reporting Period Start Date	Volume of Water Loss (AFY)[(a)]
January 2015	5

Notes:
(a) Sum of real and apparent losses based on AWWA water audit software output.

The SGPWA does not have any other sales to other water agencies to report in this UWMP.

2.5 Projected Water Use, Sales to Other Agencies

Table 2-4, below, shows retail purveyor demands that reflect reasonably anticipated demands on SGPWA supplies through the planning period. The distribution of water demands by water use sectors was not performed in this wholesale UWMP, but is detailed in each of the retail water purveyors' UWMPs. These demands take into account non-SGPWA supplies available to retail purveyors, such as local groundwater, local surface water, recycled water, and other imported water sources.

As discussed in Section 2.4, only three retail agencies within the SGPWA service area had demands on SGPWA in 2015, as noted in their respective UWMPs. However, additional retail agencies within the service area such as SMWC, CWD, BHMWC, HVWD, MSWD, and the Morongo Band of Mission Indians may have demands on the SGPWA in the future. Collective demands from those entities are estimated at 5,000 AF by 2040, as shown in Table 2-4 under "Other". These estimates will be revised every five years as the UWMP is updated.

Table 2-5, below, shows the projected imported water demands on SGPWA through the planning period, based on the potential maximum that can be expected. Future retail purveyor demands on SGPWA may differ based on the availability and actual use of non-SGPWA supplies, as well as actual "Other" demands.

TABLE 2-4
PROJECTED WATER DEMANDS ON SGPWA (AF)

Agency Name	2020	2025	2030	2035	2040
BCVWD[(a)]	10,860	12,476	14,087	15,886	17,334
City of Banning[(b)]	-	501	1,344	2,237	2,718
YVWD[(c)]	1,809	1,967	2,162	2,391	2,644
Other[(d)]	500	1,600	2,800	3,900	5,000
Total Water Demands	**13,169**	**16,544**	**20,393**	**24,414**	**27,696**

Notes:

(a) These demands are calculated by subtracting total BCVWD demands (BCVWD 2015 UWMP Table 4-2) from total non-SGPWA supplies (BCVWD 2015 UWMP Table 6-26 less the assumed imported supply from SGPWA). The remainder is assumed to be the demand for SGPWA supplies only. For example, for year 2025 demands were 20,450 AF (Table 4-2). Total supply in 2025 was 20,881 AF (Table 6-26) less 12,907 AF (Table 6-26) assumed supply from SGPWA for 7,974 AF. Total adjusted supply 7,974 AF less total adjusted demand 20,450 is -12,476 AF; therefore 12,476 AF is the assumed demand for imported SGPWA supplies. This assumes that BCVWD will prioritize non-SGPWA supplies, hence using SGPWA imported water to meet demands in excess of non-SGPWA supplies. Drinking water and banking demands are lumped together for purposes of this table, as the split for these demands is unknown.

(b) These demands are calculated by subtracting total adjusted Banning demands (City of Banning 2015 UWMP Table 3-3 plus system water losses from Table 3-1) from total non-SGPWA supplies, (City of Banning 2015 UWMP Table 5-4 less the assumed 2,718 AF from SGPWA). The remainder is assumed to be the demand for SGPWA supplies only. For example, for year 2025 demands were 10,199 AF (Table 3-1) plus 1,122 AF system water loss (Table 3-2) for 11,321 AF. Total supply in 2025 was 13,538 AF (Table 5-4) less 2,718 AF assumed supply from SGPWA for 10,820 AF. Total adjusted supply 10,820 AF less total adjusted demand 11,321 is -501 AF; therefore 501 AF is the assumed demand for imported SGPWA supplies. It assumed that City of Banning demands shown in UWMP Table 3-3 are accurate and calculations assume that the City of Banning will prioritize non-SGPWA supplies, hence using SGPWA imported water to meet demands in excess of non-SGPWA supplies.

(c) Projected imported SGPWA supply needs to meet drinking water demands from the Yucaipa Valley Water Filtration Facility and drinking water demands (referred to in the SBVRUWMP as conjunctive use demands) from 2015 SBVRUWMP, Table 12-15.

(d) Conservative projections of future demand on SGPWA from agencies within the service area that do not have current demands on the Agency, including SMWC, CWD, BHMWC, HVWD, MSWD, and Morongo Band of Mission Indians. This value may increase through time as service area demands are re-evaluated.

TABLE 2-5
PROJECTED MAXIMUM WATER DEMANDS ON SGPWA (AF)

Agency Name	2020	2025	2030	2035	2040
BCVWD[(a)]					
Drinking Water Demands	10,150	11,127	12,503	13,843	15,362
Raw Water to Supplement Non-Potable Water	163	280	0	0	0
Banking Demands	1,000	1,500	2,000	2,500	2,500
City of Banning[(b)]	2,718	2,718	2,718	2,718	2,718
YVWD[(c)]					
Drinking Water Demands	609	767	962	1,191	1,444
Conjunctive Use Demands	1,200	1,200	1,200	1,200	1,200
New Development Supply Sustainability Program	2,504	3,040	3,596	4,344	3,407
Other[(d)]	500	1,600	2,800	3,900	5,000
Total Water Demands	**18,844**	**22,232**	**25,779**	**29,696**	**31,631**

Notes:
(a) From BCVWD 2015 UWMP, Table 6-26 (DWR Table 6-9).
(b) Total imported SGPWA supply projections from City of Banning 2015 UWMP; based on draft "Regional Water Allocation Agreement" for Water Imported by the SGPWA.
(c) Total imported SGPWA supply projections from 2015 SBVRUWMP, Table 12-15.
(d) Same as Table 2-4.

Table 2-5 shows demands on SGPWA that are considered to be potential maximum water demands, as they incorporate demand management assumptions beyond the need to only meet municipal demands, as described in the following.

BCVWD in its 2015 UWMP shows projections for SGPWA supplies needing to meet municipal demands, raw water demands to supplement non-potable water, and demands to meet groundwater banking needs. The demands are based on the District's 2015 Potable Water Master Plan Update. BVCWD intends to use imported SGPWA supplies to supplement groundwater recharge to build-up or maintain BCVWD's Beaumont Basin groundwater storage account. If imported water from SGPWA is not available in a given year, the District says no groundwater recharge would occur. But when imported water is available, any deficiencies from previous years would be "carried over" and made up (BCVWD 2015 UWMP pg. 4-8).

In its 2015 UWMP, the City of Banning shows projections for SGPWA supplies based on a draft "Regional Water Allocation Agreement for Water Imported by SGPWA." The draft allocation agreement states that the City of Banning would receive 27.3% of the SGPWA Annual Table A Amount allocation, assuming 58% SWP delivery reliability (City of Banning 2016). The draft allocation agreement has not been adopted by SGPWA. Those demands are shown in Table 2-5.

YVWD demand projections in its 2015 UWMP are based on various potential needs, including drinking water demands, conjunctive use demands for local water banking, and demands by new development projects as part of the District's "New Development Supply Sustainability Program." The sustainability program requires developers to purchase a 20-year water supply for each new house built, in order to ensure that long-term supplies will be available for new developments prior to construction. These sustainability demands would be contingent upon

availability of supplies and the timing of such supplies (J. Zoba, personal communication 2016). These demand projections are also shown as potential maximum demands in Table 2-5.

Demands shown in Tables 2-4 and 2-5 are anticipated demands in average/normal hydrologic years.

2.6 Demands in Dry Years

Tables 2-6 through 2-9 show anticipated retail water demands on SGPWA in single-dry and multiple-dry years.

TABLE 2-6
PROJECTED WATER DEMANDS ON SGPWA – SINGLE-DRY YEAR (AF)

Agency Name	2020	2025	2030	2035	2040
BCVWD[(a)]	520	570	630	690	770
City of Banning[(b)]	-	501	1,344	2,237	2,718
YVWD[(c)]	600	600	700	700	700
Other[(d)]	500	1,600	2,800	3,900	5,000
Total Water Demands	**1,620**	**3,271**	**5,474**	**7,527**	**9,188**

Notes:
(a) From BCVWD 2015 UWMP, Table 7-9.
(b) City of Banning dry year supplies and demands are the same as normal years (City of Banning 2015 UWMP Tables 6-4 to 6-6). Demands here are the same as water demands for normal years (Table 2-4).
(c) YVWD demand projections in dry years are based on demands shown in the YVWD 2015 UWMP, Table 12-18, and assuming 10% of all of YVWD's demands are met through SGPWA.2
(d) Projections of future demand from "other" agencies is assumed to be the same as during normal/average water years.

TABLE 2-7
PROJECTED MAXIMUM WATER DEMANDS ON SGPWA – SINGLE-DRY YEAR (AF)

Agency Name	2020	2025	2030	2035	2040

City of Banning[(b)]	2,718	2,718	2,718	2,718	2,718
YVWD[(c)]	600	600	700	700	700
Other[(d)]	500	1,600	2,800	3,900	5,000
Total Water Demands	**4,338**	**5,488**	**6,848**	**8,008**	**9,188**

Notes:

(a) From BCVWD 2015 UWMP, Table 7-9.

(b) City of Banning dry year supplies and demands are the same as normal years (City of Banning 2015 UWMP Tables 6-4 to 6-6). Demands here are the same as projected maximum water demands for normal years (Table 2-5).

(c) YVWD demand projections in dry years are based on demands shown in the YVWD 2015 UWMP, Table 12-18, and assuming 10% of all of YVWD's demands are met through SGPWA.[3]

(d) Projections of future demand from "other" agencies is assumed to be the same as during normal/average water years.

TABLE 2-8
PROJECTED WATER DEMANDS ON SGPWA – MULTIPLE-DRY YEAR (AF)

Agency Name	2020	2025	2030	2035	2040
BCVWD[(a)]	2,060	2,280	2,500	2,780	3,070
City of Banning[(b)]	-	501	1,344	2,237	2,718
YVWD[(c)]	600	600	700	700	700
Other[(d)]	500	1,600	2,800	3,900	5,000
Total Water Demands	**3,160**	**4,981**	**7,344**	**9,617**	**11,488**

Notes:

(a) From BCVWD 2015 UWMP, Table 7-11 and Appendix C UWMP Table 7-4, three-year extended dry period.

(b) City of Banning dry year supplies and demands are the same as normal years (City of Banning 2015 UWMP Tables 6-4 to 6-6). Demands here are the same as water demands for normal years (Table 2-4).

(c) YVWD demand projections in dry years are based on demands shown in the YVWD 2015 UWMP, Table 12-18, and assuming 10% of all of YVWD's demands are met through SGPWA.3

(d) Projections of future demand from "other" agencies is assumed to be the same as during normal/average water years.

[3] Approximately 10% of YVWD's supplies are provided by SGPWA; the remaining 90% is supplied by SBVMWD.

TABLE 2-9
PROJECTED MAXIMUM WATER DEMANDS ON SGPWA – MULTIPLE-DRY YEAR (AF)

Agency Name	2020	2025	2030	2035	2040
BCVWD[(a)]	2,060	2,280	2,500	2,780	3,070
City of Banning[(b)]	2,718	2,718	2,718	2,718	2,718
YVWD[(c)]	600	600	700	700	700
Other[(d)]	500	1,600	2,800	3,900	5,000
Total Water Demands	**5,878**	**7,198**	**8,718**	**10,098**	**11,488**

Notes:

(a) From BCVWD 2015 UWMP, Table 7-11 and Appendix C UWMP Table 7-4, three-year extended dry period..

(b) City of Banning dry year supplies and demands are the same as normal years (City of Banning 2015 UWMP Tables 6-4 to 6-6). Demands here are the same as potential maximum water demands for normal years (Table 2-5).

(c) YVWD demand projections in dry years are based on demands shown in the YVWD 2015 UWMP, Table 12-18, and assuming 10% of all of YVWD's demands are met through SGPWA.3

(d) Projections of future demand from "other" agencies is assumed to be the same as during normal/average water years.

2.7 Conservation Effects on Water Usage

Major factors that can affect water usage include weather and demand reducing behaviors. Historically, when the weather is hot and dry, water usage generally increases. The amount of increase varies according to the number of consecutive years of hot, dry weather and the conservation activities imposed. During cool, wet years, water usage generally decreases, reflecting less water usage for exterior landscaping.

In recent years, water conservation has become an increasingly important factor in water supply planning and management in California. Over the past ten years there have been a number of regulatory changes related to conservation including new standards for plumbing fixtures, a new landscape ordinance, a state universal retrofit ordinance, new Green Building standards, mandatory demand reduction goals and more. The California plumbing code has also instituted requirements for new construction that mandate the installation of ultra-low-flow toilets and low-flow showerheads.

During the 1987 to 1992 drought period, overall demands due to the effects of hot, dry weather were projected to increase by approximately ten percent. As a result of extraordinary conservation measures enacted during the period, the overall water demand actually decreased by more than ten percent.

During the current drought, Governor Brown issued a January 2014 drought proclamation and April 2014 emergency declaration, calling on urban water suppliers to implement their local water shortage contingency plans. In April 2015, following the lowest snowpack ever recorded, Governor Brown directed the SWRCB to implement mandatory water reductions to reduce water usage by 25 percent.

In May 2015, the SWRCB adopted an emergency regulation requiring an immediate 25 percent reduction in overall potable urban water use. (See SWRCB Resolution No. 2015-0032.) The SWRCB began to track water conservation for each of the state's larger urban retail water suppliers (those with more than 3,000 connections) on a monthly basis; compliance with individual water supplier conservation requirements and the statewide 25 percent mandate is based on cumulative savings.

In February 2016, the SWRCB approved an updated and extended emergency regulation that will continue mandatory reductions through October 2016, unless revised before then. The extended regulation provides more flexibility to urban water suppliers in meeting their conservation requirements and provides credits for certain factors that affect water use such as hotter-than-average climates, population growth, and significant investments in new local drought resilient water sources such as recycled water. Locally, these mandates translated into water conservation standards ranging from 28 to 36 percent for the retail purveyors.

In 2015, the three retailers (BCVWD, City of Banning, and YVWD) reduced their total groundwater production by 24.5% over the previous year (2014). Assuming the focus on conservation continues it is conceivable that demands would continue to be reduced.

On May 18, 2016, the SWRCB adopted a new approach, which replaced the percentage reduction-based water conservation standard with a localized "stress test" approach. The new approach mandated urban water suppliers to ensure a three year supply of water under drought conditions. The regulation requires locally developed conservation standards based on each agency's specific circumstances and is currently in effect through January 2017.

In addition to, and in combination with, statewide regulations and mandates, demand management measures implemented by SGPWA and purveyors are contributing to increased water conservation in the service area. Details on ongoing and future water conservation actions are provided in Section 7, Demand Management Measures.

2.8 SBX7-7 Baseline and Targets

This section is not required for SGPWA as a wholesale water supplier. Measures, programs, and policies that SGPWA has adopted to help the retail water suppliers within its service area to achieve their SBX7-7 water use reduction targets are discussed in Section 7.

Section 3: Water Resources

3.1 Overview

This section describes the water resources available to SGPWA for the 25-year period covered by the Plan and provides a high-level overview of the local water supplies used by purveyors within the SGPWA service area. SGPWA receives exclusively water supplies from the SWP to meet purveyor demands. Retail agencies within the SGPWA service area also use local water supplies, including surface water, groundwater, and recycled water. SGPWA supplies are summarized in Table 3-1 and discussed in more detail below.

TABLE 3-1
SUMMARY OF CURRENT AND PLANNED WATER SUPPLIES (AFY)

Water Supply Source	2015	2020	2025	2030	2035	2040
Existing Supplies

Notes: Values are rounded to the nearest hundred.

(a) Assumes 62% of Table A amount (17,300 AFY) based on the California Department of Water Resources Final Delivery Capability Report 2015 (DWR 2015 DCR).

(b) See Section 3.2.4.1.

(c) An average of 2,000 AF is assumed over a five year period through a future agreement with SBVMWD. See Section 3.3.1.2.

(d) The Agency has a financial plan in place to obtain additional supplies necessary to meet projected demands within its service area (shown in Table 2-5). These future supplies are described in Section 3.3. Sources include the dry-year water purchase program, exchanges with CLAWA, and other supplemental water as available. The Agency is expected to purchase additional supplies by 2020 in order to meet demands shown in Table 2-5. Volumes shown assume the DWR 2015 DCR average reliability of 62%.

This section assesses supplies in an average year, a single dry year, and during multiple dry years.

- An average year (also called a normal year) is the average supply over a range of years and represents the median water supply available to SGPWA.
- The single-dry year is the year that represents the lowest water supply available to SGPWA.
- The multiple-dry year period is the lowest average water supply available to SGPWA for three or more consecutive dry years.

The term "dry" is used throughout this section and in subsequent sections concerning water resources and reliability as a measure of supply availability. As used in this Plan, dry years are those years when supplies are the lowest and demands are the highest, which occurs primarily when precipitation is lower than the long-term average precipitation. The impact of low precipitation in a given year on a particular source of supply may differ based on how low the precipitation is, or whether the year follows a high-precipitation year or another low-precipitation year. For the SWP, a low-precipitation year may or may not affect supplies, depending on how much water is in SWP storage at the beginning of the year. Also, dry conditions can differ geographically. For example, a dry year can be local to the San Gorgonio Pass Area (thereby affecting local groundwater replenishment and production), local to northern California (thereby affecting SWP water deliveries), or statewide (thereby affecting both local groundwater and the SWP). When the term "dry" is used in this Plan, statewide drought conditions are assumed, affecting both local groundwater and SWP supplies at the same time.

3.2 Imported Water Supplies

3.2.1 SWP Facilities

Water supplies available to SGPWA are imported from the SWP – the largest state-built, multi-purpose water project in the country. It was authorized by the California State Legislature in 1959, with the construction of most facilities completed by 1973. Today, the SWP includes 28 dams and reservoirs, 26 pumping and generating plants, and approximately 660 miles of aqueducts. The primary water source for the SWP is the Feather River, a tributary of the Sacramento River. Storage released from Oroville Dam on the Feather River flows down natural river channels to the Sacramento-San Joaquin River Delta (Delta). While some SWP supplies are pumped from the northern Delta into the North Bay Aqueduct, the vast majority of SWP supplies are pumped from the southern Delta into the 444-mile-long California Aqueduct. The California Aqueduct conveys water along the west side of the San Joaquin Valley to Edmonston Pumping Plant, where water is pumped over the Tehachapi Mountains and the California Aqueduct then divides into the East and West Branches. SGPWA delivers its SWP supplies through the East Branch to use within the local groundwater basins through extensive transmission pipeline systems and direct releases from Silverwood Lake, a SWP regulating reservoir.

3.2.2 SWP Supplies Available to SGPWA

In the early 1960s, DWR began entering into individual SWP Water Supply Contracts with urban and agricultural public water supply agencies located throughout northern, central, and southern California for SWP water supplies. SGPWA is one of 29 water agencies (commonly referred to as “contractors”) that have a SWP Water Supply Contract with DWR.

The SWP Contracts entered into in the 1960s had initial 75-year terms, which thus would begin to expire in 2035. While the SWP Contracts provide for continued water service to the contractors beyond the initial term, efforts are currently underway to extend the SWP Contracts to improve financing for the SWP.

Negotiations on extending the SWP Contracts took place between DWR and the contractors during 2013 and 2014, and were open to the public. The following terms were agreed to and

are currently the subject of analysis under the requirements of the California Environmental Quality Act (CEQA) (Notice of Preparation dated September 12, 2014):

- Extend the term of the 29 SWP Contracts to December 31, 2085.
- Provide for increased SWP financial operating reserves during the extended term of the SWP Contracts.
- Provide additional funding mechanisms and accounts to address SWP needs and purposes.
- Develop a revised payment methodology with a corresponding billing system that better matches the timing of future SWP revenues to future expenditures.

It is anticipated that the term of the SWP Contracts will be extended to December 31, 2085. The Contracts and associated amendments are scheduled to be finalized summer 2017. To improve coordination between supply and demand projections beyond the year 2035, the data and information contained in this UWMP reflect that assumption, as provided in the Urban Water Management Planning Act. (CWC Section 10631(b).)

Each SWP contractor's SWP Water Supply Contract contains a "Table A," which lists the maximum amount of water an agency may request each year throughout the life of the contract. Table A is used in determining each contractor's proportionate share, or "allocation," of the total SWP water supply DWR determines to be available each year. The total planned annual delivery capability of the SWP and the sum of all contractors' maximum Table A amounts was originally 4.23 million acre-feet (AF). The initial SWP storage facilities were designed to meet contractors' water demands in the early years of the SWP, with the construction of additional storage facilities planned as demands increased. However, essentially no additional SWP storage facilities have been constructed since the early 1970s. SWP conveyance facilities were generally designed and have been constructed to deliver maximum Table A amounts to all contractors. After the permanent retirement of some Table A amount by two agricultural contractors in 1996, the maximum Table A amounts of all SWP contractors now totals about 4.17 million AF.

While Table A identifies the maximum annual amount of water an SWP contractor may request, the amount of SWP water actually available and allocated to SWP contractors each year is dependent on a number of factors and can vary significantly from year to year. The primary factors affecting SWP supply availability include hydrology, the amount of water in SWP storage at the beginning of the year, regulatory and operational constraints, and the total amount of water requested by SWP contractors.

According to the water supply contract between DWR and the SGPWA, SGPWA's maximum annual entitlement from the SWP ("Table A Amount") is 17,300 AFY. Table 3-2 presents historical SWP deliveries to SGPWA.

TABLE 3-2
HISTORICAL SWP DELIVERIES TO SGPWA

Year	Deliveries (AFY)
2003	116
2004	814
2005	687
2006	4,420
2007	4,815
2008	4,905
2009	6,609
2010	8,403
2011	10,730
2012	10,974
2013	9,695
2014	5,131
2015	3,930

Notes:
(a) Source: 2014 San Gorgonio Pass Water Agency Report on Water Conditions; 2015 data provided by SGPWA.

In addition to Table A supplies, the SWP Contracts provide for additional types of water that may periodically be available, including "Article 21" water and Turnback Pool water. Article 21 water (which refers to the SWP Contract provision defining this supply) is water that may be made available by DWR when excess flows are available in the Delta (i.e., when Delta outflow requirements have been met, SWP storage south of the Delta is full and conveyance capacity is available beyond that being used for SWP operations and delivery of allocated and scheduled Table A supplies). Article 21 water is made available on an unscheduled and interruptible basis and is typically available only in average to wet years, generally only for a limited time in the late winter. The Turnback Pool is a program through which contractors with allocated Table A supplies in excess of their needs in a given year may "turn back" that excess supply for purchase by other contractors who need additional supplies that year. The Turnback Pool can make water available in all types of hydrologic years, although generally less excess water is turned back in dry years. As urban contractor demands have increased, the amount of water turned back and available for purchase has diminished.

The availability of Article 21 water and Turnback Pool water is uncertain. When available, these supplies provide additional water that SGPWA may be able to use, either directly to meet demands or for later use after storage in its groundwater banking programs. Due to the uncertainty in availability of Article 21 water and Turnback Pool water, supplies of these types of SWP water are not included in this report. However, to the extent SGPWA is able to make use of these supplies when available, SGPWA may be able to improve the reliability of its SWP supplies beyond the values used throughout this Plan.

While not specifically provided for in the SWP Contracts, DWR has in critically dry years created Dry Year Water Purchase Programs for contractors needing additional supplies. Through these programs, water is purchased by DWR from willing sellers in areas that have available supplies and is then sold by DWR to agencies willing to purchase those supplies. The availability of these supplies is generally uncertain. However, SGPWA's access to these supplies when they

are available would enable it to improve the reliability of its dry-year supplies beyond the values used throughout this report.

3.2.3 Factors Affecting SWP Table A Supplies

Primary factors affecting SWP supply availability include: the availability of water at the source of supply in northern California, the ability to transport that water from the source to the primary SWP diversion point in the southern Delta and the magnitude of total contractor demand for that water, as summarized below.

Availability of SWP Source Water

SWP supplies originate in northern California, primarily from the Feather River watershed. The availability of these supplies is dependent on the amount of precipitation in the watershed, the amount of that precipitation that runs off into the Feather River, water use by others in the watershed and the amount of water in storage in the SWP's Lake Oroville at the beginning of the year. Variability in the location, timing, amount and form (rain or snow) of precipitation, as well as how wet or dry the previous year was, produces variability from year to year in the amount of water that flows into Lake Oroville. However, Lake Oroville acts to regulate some of that variability, storing high inflows in wetter years that can be used to supplement supplies in dry years with lower inflows.

As discussed in Section 1.8 and in DWR's 2015 State Water Project Delivery Capability Report (2015 DCR), climate change adds another layer of uncertainty in estimating the future availability of SWP source water. Current literature suggests that global warming may change precipitation patterns in California from the patterns that occurred historically. While different climate change models show differing effects, potential changes could include more precipitation falling in the form of rain rather than snow and earlier snowmelt, which would result in more runoff occurring in the winter rather than spread out over the winter and spring.

Ability to Convey SWP Source Water

As discussed previously, water released from Lake Oroville flows down natural river channels into the Delta. The Delta is a network of channels and reclaimed islands at the confluence of the Sacramento and San Joaquin rivers. The SWP and the federal Central Valley Project (CVP) use Delta channels to convey water to the southern Delta for diversion, making the Delta a focal point for water distribution throughout the state.

A number of issues affecting the Delta can impact the ability to divert water supplies from the Delta, including water quality, fishery protection and levee system integrity. Water quality in the Delta can be adversely affected by both SWP and CVP diversions, which primarily affect salinity, as well as by urban discharge and agricultural runoff that flows into the Delta, which can increase concentrations of constituents such as mercury, organic carbon, selenium, pesticides, and toxic pollutants, and reduce dissolved oxygen. The Delta also provides a unique estuarine habitat for many resident and migratory fish species, some of which are listed as threatened or endangered. The decline in some fish populations is likely the result of a number of factors, including water diversions, habitat destruction, degraded water quality and the introduction of non-native species. Delta islands are protected from flooding by an extensive levee system.

Levee failure and subsequent island flooding can lead to increased salinity requiring the temporary shutdown of SWP pumps.

In order to address some of these issues, SWP and CVP operations in the Delta are limited by a number of regulatory and operational constraints. These constraints are primarily incorporated into the SWRCB Water Rights Decision 1641 (D-1641), which establishes Delta water quality standards and outflow requirements that the SWP and CVP must comply with. In addition, SWP and CVP operations are further constrained by requirements included in Biological Opinions (BOs) for the protection of threatened and endangered fish species in the Delta, issued by the United States Fish and Wildlife Service (FWS) in December 2008 and the National Marine Fishery Service (NMFS) in June 2009. The requirements in the BOs are based on real-time physical and biological phenomena (such as turbidity, water temperature and location of fish), which results in uncertainty in estimating potential impacts on supply of the additional constraints imposed by the BOs.

Demand for SWP Water

The reliability of SWP supplies is affected by the total amount of water requested and used by SWP contractors, since an increase in total requests increases the competition for limited SWP supplies. As previously mentioned, contractor Table A Amounts in the SWP Contracts ramped up over time, based on projected increases in population and water demand at the time the contracts were signed. Urban SWP contractors' requests for SWP water were low in the early years of the SWP, but have increased steadily over time, although more slowly than the ramp-up in their Table A Amounts, which reached a maximum for most contractors in the early to mid-1990s. Since that time, urban contractors' requests for SWP water have continued to increase until recent years when nearly all SWP contractors are requesting their maximum Table A Amounts.

Consistent with other urban SWP contractors, SWP deliveries to SGPWA have increased as its requests for SWP water have increased. Historical total SWP deliveries to SGPWA are shown in Table 3-2.

3.2.3.1 SWP Table A Supply Assessment

DWR prepares a biennial report to assist SWP contractors and local planners in assessing the near and long-term availability of supplies from the SWP. DWR issued its most recent update, the 2015 DWR SWP Delivery Capability Report (2015 DCR), in July 2015. In the 2015 DCR, DWR provides SWP supply estimates for SWP contractors to use in their planning efforts, including for use in their 2015 UWMPs.

3.2.3.1.1 Analysis Assumptions

DWR's estimates of SWP deliveries are based on a computer model that simulates monthly operations of the SWP and CVP systems. Key assumptions and inputs to the model include the facilities included in the system, hydrologic inflows to the system, regulatory and operational constraints on system operations, and projected contractor demands for SWP water.

In the 2015 DCR, DWR uses the following assumptions to model current conditions: existing facilities; hydrologic inflows to the model based on 82 years of historical inflows (1922 through 2003), adjusted to reflect current levels of development in the supply source areas; current regulatory and operational constraints, including D-1641, the 2008 FWS BO, and the 2009 NMFS BO; and contractor demands for SWP water at maximum Table A Amounts.

To evaluate SWP supply availability under future conditions, the 2015 DCR included four model studies. The first of the future-conditions studies, the Early Long Term (ELT) scenario, used all of the same model assumptions for current conditions, but reflected changes expected to occur from climate change, specifically, a 2025 emission level and a 15 cm sea level rise. The other three future-conditions studies also include varying model assumptions related to the Bay Delta Conservation Plan (BDCP)/California Water Fix (Cal WaterFix), such as changes to facilities and/or regulatory and operational constraints.

BDCP/Cal WaterFix plans are currently in flux, environmental review is ongoing, and several regulatory and legal requirements must be met prior to any construction.

This UWMP uses the ELT scenario to estimate future SWP supply availability because it is based on existing facilities and regulatory constraints, with hydrology adjusted for the expected effects of climate change. This scenario is consistent with the studies DWR has used in its previous SWP Delivery Reliability Reports for supply availability under future conditions. Therefore, in this UWMP, future SWP supply availability is based on the ELT study included in the 2015 DCR.

3.2.3.1.2 Analysis Results

In the 2015 DCR, DWR estimates that for all contractors combined, the SWP can deliver on a long-term average basis a total Table A supply of 62 percent of total maximum Table A Amounts. In the worst-case single critically dry year, DWR estimates the SWP can deliver a total Table A supply of 11 percent of total maximum Table A Amounts. DWR estimates the SWP can deliver a total Table A supply during a four-year dry period averaging 33 percent of total maximum Table A Amounts.

DWR's analysis of current (2015) conditions is used in this Plan to estimate 2015 SWP supplies and its analysis of future (2035) conditions is used to estimate 2035-2050 SWP supplies. As has been suggested by DWR, SWP supplies for the five-year increments between 2015 and 2035 are interpolated between these values. SWP supplies for years beyond 2035 are assumed to be the same as for 2035.

The extremely dry sequence from the beginning of January 2013 through the end of 2015 was one of the driest two-year periods in the historical record. Water year 2013 was a year with two hydrologic extremes.[4] October through December 2012 was one of the wettest fall periods on record, but was followed by the driest consecutive 12 months on record. Accordingly, the 2013 SWP supply allocation was a low 35 percent of SWP Table A Amounts. The 2013 hydrology ended up being even drier than DWR's conservative hydrologic forecast, so the SWP began 2014 with reservoir storage lower than targeted levels and less stored water available for 2014

[4] A water year begins in October and runs through September. For example, water year 2013 is October 2012 through September 2013.

supplies. Compounding this low storage situation, 2014 also was an extremely dry year, with runoff for water year 2014 the fourth driest on record. Due to extraordinarily dry conditions in 2013 and 2014, the 2014 SWP water supply allocation was a historically low 5 percent of Table A Amounts. The dry hydrologic conditions that led to the low 2014 SWP water supply allocation were extremely unusual, and to date this hydrology has not been included in the SWP delivery estimates presented in DWR's 2015 DCR. It is anticipated that the hydrologic record used in the DWR model will be extended to include the period through 2014 during the next update of the model, which is expected to be completed prior to issuance of the next update to the biennial DCR. For purposes of this UWMP, the historical single dry year of 1977 is used to estimate single dry year supplies; however the worst-case scenario seen in 2014 is also calculated.

Table 3-3 shows SWP supplies projected to be available to SGPWA in average/normal years, a single dry year, and over a multiple dry year period, based on the supply reliability analyses provided in the 2015 DCR.

TABLE 3-3

SWP TABLE A AMOUNT SUPPLY RELIABILITY (AF)[a]

SWP Supply	2020	2025	2030	2035	2040
Average Water Year[b]					
Table A Supply	10,700	10,700	10,700	10,700	10,700
% of Table A Amount[c]	62%	62%	62%	62%	62%
Single Dry Year[d]					
Table A Supply	1,900	1,900	1,900	1,900	1,900
% of Table A Amount[c]	11%	11%	11%	11%	11%
Worst-Case Single Dry Year[e]					
Table A Supply	900	900	900	900	900
% of Table A Amount[c]	5%	5%	5%	5%	5%
Multi-Dry Year[f]					
Table A Supply	5,700	5,700	5,700	5,700	5,700
% of Table A Amount[c]	33%	33%	33%	33%	33%

Notes: Values rounded to nearest hundred.

(a) Projected SWP supplies to SGPWA based on analyses presented in DWR's "2015 Delivery Capability Report (DCR)."
(b) Based on average deliveries over the DCR's historic hydrologic period of 1921 through 2003.
(c) Supply as a percentage of SGPWA's Table A Amount of 17,300 AF.
(d) Based on a repeat of the worst case historic single dry year of 1977 (from DWR 2015 DCR).
(e) Based on the worst-case actual allocation of 2014 of 5%.
(f) Supplies are annual averages over four consecutive dry years, based on the historic four-year dry period of 1931-1934.

3.2.3.1.1 Potential Future SWP Supplies

An ongoing planning effort to increase long-term supply reliability for both the SWP and CVP is taking place through the California Water Fix and EcoRestore (Cal Water Fix) process. The co-equal goals of the Cal Water Fix are to improve water supply reliability and restore the Delta ecosystem. The Cal Water Fix is being prepared through a collaboration of state, federal and local water agencies, state and federal fish agencies, environmental organizations and other interested parties. Several "isolated conveyance system" alternatives are being considered in the plan that would divert water from the north Delta to the south Delta where water is pumped

into the south-of-Delta stretches of the SWP and CVP. The new conveyance facilities would allow for greater flexibility in balancing the needs of the estuary with the reliability of water supplies. The plan could also provide other benefits, such as reducing the risk of long outages from Delta levee failures.

Cal Water Fix has been in development since 2006, initially as the BDCP and is currently undergoing extensive environmental review. The Draft BDCP and its associated Draft Environmental Impact Report (EIR)/Environmental Impact Statement (EIS) were released for public review in December 2013. In response to public comments, the Cal Water Fix was reevaluated, and in April 2015 the lead agencies announced a modified alternative which effectively split the project into two parts: the conveyance portion (known as Cal WaterFix), and the restoration portion (known as EcoRestore). The Cal WaterFix alternative is evaluated in a partially recirculated draft environmental document (Recirculated Draft EIR/Supplemental Draft EIR) that was released for public review in July 2015. That environmental document is not anticipated to be final until at least 2016.

While there is support for the BDCP/Cal WaterFix project, plans are currently in flux and environmental review is ongoing. Additionally, several regulatory and legal requirements must be met prior to any construction. Because of this uncertainty, any improvements in SWP supply reliability or other benefits that could result from this proposed project are not included in this Plan.

3.2.4 Other Imported Supplies

3.2.4.1 Yuba Accord Water

SGPWA entered into the Yuba Accord Agreement (Appendix F), which allows for the purchase of water from the Yuba County Water Agency through DWR to 21 SWP contractors (including SGPWA) and the San Luis and Delta- Mendota Water Authority. Yuba Accord water comes from north of the Delta, and the water purchased under this agreement is subject to losses associated with transporting it through the Delta. While the amount of this water varies each year depending on hydrologic conditions, the average amount that the Agency has received has been approximately 300 AFY. The Agency recently signed an extension to this agreement allowing it to purchase this water well into the future.

3.2.4.2 Multi-Year Pool Demonstration Project

In 2013, DWR and the State Water Contractors developed a multi-year pool in which Contractors could purchase unused Table A water from a pool formed by several Contractors. The price of this water varied on a sliding scale depending on hydrologic conditions. The Agency, through this program, purchased 1,000 AF of water and delivered it to retail water agencies in its service area. This is not a long-term reliable supply and is only available in some years.

3.2.5 SGPWA SWP Supply Facilities

3.2.5.1 Conveyance

SGPWA receives SWP supplies via the East Branch Extension of the SWP. The East Branch Extension begins at Devil Canyon Power Plant in San Bernardino and ends in Cherry Valley. Efforts to increase the conveyance capacity of the East Branch extension to 48 cubic feet per second (CFS) are currently ongoing, with construction scheduled to be complete by the end of 2016 and startup testing to be concluded in the first half of 2017. This East Branch Extension, Phase 2 project will provide the additional capacity necessary to convey the full allocation of SWP supplies, as available.

SGPWA plans to purchase an additional 16 CFS of capacity from the East Branch Extension Phase 2 expansion from SBVMWD, bringing the conveyance capacity to 64 CFS or approximately 35,000 AFY at a 75 percent frequency of operation, sufficient to meet regional demand through 2035, assuming SGPWA obtains supplemental sources of imported water.

3.2.5.2 Treatment

SWP supplies delivered to the SGPWA service area are treated at the Yucaipa Valley Regional Water Filtration Facility (YVRWFF), with a capacity of 12 million gallons per day (MGD). Treated water from the YVRWFF is used to meet demands in both the SBVMWD and SGPWA service areas.

3.3 Transfers, Exchanges, and Groundwater Banking Programs

In addition to existing SWP water supplies, SGPWA is currently exploring opportunities to purchase water supplies from other water agencies and sources. Transfers, exchanges, and groundwater banking programs, such as those described below, are important elements to enhancing the long-term reliability of the total mix of supplies currently available to meet water demand.

3.3.1.1 Exchanges

Since 2010, the Agency has been involved in three exchanges with the Crestline-Lake Arrowhead Water Agency (CLAWA). In 2010, the Agency received 1,000 AF of CLAWA's Table A amount in exchange for a like amount to be returned by 2020. In 2013, the Agency received 2,000 AF of CLAWA's Table A amount in exchange for 1,300 AF to be returned by 2023. In 2016 the Agency is receiving 1,200 AF of CLAWA's Table A amount in exchange for 600 AF to be returned by 2026. The latter two exchanges are unbalanced exchanges approved by DWR.

3.3.1.2 Purchases

The Agency has a number of plans to procure additional water supplies. The Agency is currently in final negotiations with the SBVMWD to purchase up to 5,000 AF of its Table A water in years in which SBVMWD's Board declares a surplus. Based on past hydrologic conditions, that is likely to occur approximately two years out of every five. Thus, on the average, this will

amount to approximately 2,000 AFY. The SBVMWD Board of Directors has approved the concept; both Boards still need to approve the final terms, which should be finalized in calendar year 2017. This supply is reflected in Table 3-1. The term of this agreement is expected to be at least 20 years.

The Agency's Board has committed to keeping ahead of the regional water demand curve and implementation of the capacity fee will enable it to do so financially. The Agency has updated a study identifying additional supplemental supplies that are for sale around the state, particularly south of the Delta, and will move quickly to negotiate a deal for one or more of these sales in 2016 or early 2017.

3.3.1.3 Other Supplies

The Agency's Board has voted to participate as an owner of capacity in the proposed Sites Reservoir project, and submitted a proposal to the Sites Joint Powers Association to that effect in July 2016. The proposal was for 14,000 acre-feet of yield from the reservoir. It is anticipated that this will be a long-term investment whose returns will not become tangible for at least 10 years, if at all.

In addition to these efforts, the Agency has completed the design of a conjunctive use storage facility in its service area that will enable it to take advantage of additional supplies, including Article 21 water from the SWP when available. The Agency has the funds on hand to construct this facility and will do so within the next few years. This will ensure that there is ample space to store all new water supplies procured by the Agency to meet the projected demands within its service area.

A summary of planned supplies is provided in Table 3-4.

TABLE 3-4

SUMMARY OF POTENTIAL WATER TRANSFER AND EXCHANGE OPPORTUNITIES FOR SGPWA

Supplemental Water Source	Description	Type and Reliability	Potential Partners
Table A Transfers	Purchase of Table A allocations from agencies with allocations in excess of demand	Permanent, 60%	Kern County Water Agency (KCWA); Tulare Lake Basin Water District; Dudley Ridge Water District; Empire West Side Irrigation District; MWDSC; San Bernardino Valley Municipal Water District
Kern River Exchanges	Water agencies obtain diversion rights from the Kern River, making available Table A SWP supplies for exchange	Permanent, 100%	Nickel Family Farms via KCWA exchange; Buena Vista Water Storage District (WSD) via Buena Vista WSD or Rosedale-Rio Bravo WSD exchange
Banked Groundwater Exchanges	Purchases of banked groundwater delivered in-lieu from unused Table A deliveries	Short-term, 100%	Rosedale-Rio Bravo WSD; Water agencies participating in the Semitropic WSD Groundwater Storage Program; Water agencies south of Edmonston Pumping Plant
Banked Groundwater Pumpback	Purchase of banked groundwater delivered via "pumpback" to the California aqueduct	Short-term, 100%	Rosedale-Rio Bravo WSD; Kern Delta Water District; Semitropic WSD Stored Water Recovery Unit
Excess SWP Purchases	Purchase excess SWP supply from SWP or water agencies with a surplus	Short-term, 100%	SWP Article 21; SWP Turnback Pool (Table A); San Bernardino Valley Municipal Water District; Crestline-Lake Arrowhead Water Agency; West Side San Joaquin Valley Districts
Dry Year Water Purchases or Transfer Programs	Purchase or transfer of unused water from water agencies with a surplus to water agencies requesting supplemental dry year supply	Short-term in dry years, 100%	SWP Contractors (buyers and sellers are treated as singular entities); SWP Turnback Pool (Table A); Western Canal Water District; Yuba County Water Agency Dry Year Water Transfer Program

3.3.2 Plans to Acquire Additional Supplies

As discussed in Section 3.3, the Agency is planning to develop a diverse portfolio of water supplies that include a mix of dry year supplies, SWP Table A allocation purchased from or exchanged with other SWP Contractors, purchase of surplus water from a neighboring State Water Contractor, and other supplemental water as available. The Agency has put a financial plan in place to purchase additional supplemental water supplies from various sources, including Table A water, riparian water rights, or other various sources. This financial plan includes four sources of revenue: withdrawal from reserves, dedication of a portion of general fund and *ad valorem* tax revenues as needed and appropriate, a component of the wholesale water rate, and a recently adopted capacity fee on new growth in the region. The Agency currently has $5.7 million in reserves to purchase new water rights.

In order to collect the capacity fee, the Agency would have to sign cooperative agreements with retail water agencies or land use planning agencies. In areas where the Agency can collect the fee, it is assuring its retail customers that it will have the financial resources to procure the needed additional water supplies. As this report is being written, the Agency is in final negotiations with the YVWD and the City of Calimesa to sign a cooperative agreement to enable it to collect the fee and thus assure future water supplies for the YVWD service area. Meeting future water demands within the service area of the City of Banning and the BCVWD will be more difficult until cooperative agreements are signed with these entities. In the meantime, the Agency still has some financial resources to use to procure additional water for these areas, including the sources listed above (with the exception of the capacity fee).

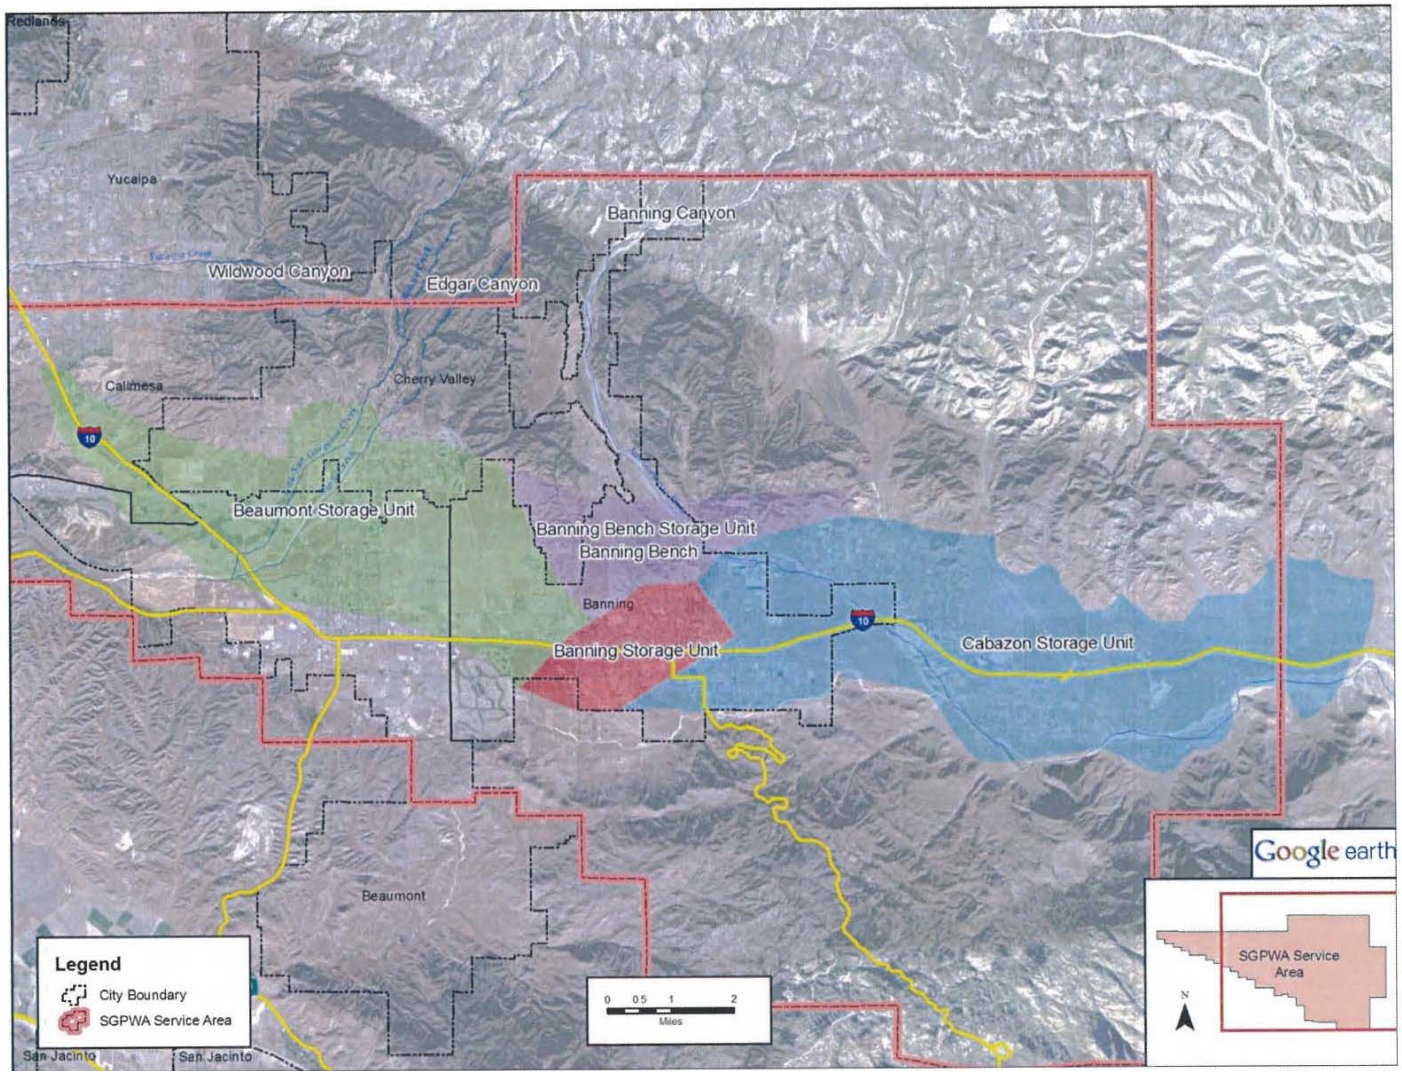
3.4 Groundwater

Local groundwater does not provide a source of water to SGPWA, however the predominant means of providing SWP supply to retail agencies is to recharge the Beaumont groundwater Basin. The storage capacity of the Beaumont Basin (adjudicated at 200,000 AF, practically estimated to be 100,000 AF) exceeds the total annual demand for water at build-out. Storage capacity is not likely to be a limiting factor for importing SWP supplies and any additional supplemental imported water. The capacity to store imported water in the Beaumont Basin by spreading water in recharge basins is a key component of SGPWA's role as a wholesaler of SWP supply.

It is noted that local runoff of surface water accounts for a small portion of local water resources utilized by the retail agencies. Most of this runoff is typically recharged into local groundwater basins where it becomes part of the groundwater supply. Storm water capture represents a potential new source of water within the service area, however it is not currently considered a large supply source. Capturing storm water would present a water quality benefit to the groundwater if recharged.

3.4.1 Groundwater Recharge Facilities

BCVWD's Noble Creek facility is used to recharge SWP deliveries. The facility consists of recharge basins (eight cells) with a long-term recharge capacity of approximately 20,000 – 30,000 AFY. SWP deliveries to this facility will consist of BCVWD's imported water supply requirements, plus any water purchased for long-term banking prior to completion of additional basins. BCVWD has recently completed Phase 2, increasing the capacity.



The Beaumont Avenue Recharge Facility, expected to be completed in 2017, enables SGPWA to import more water in wet years when available and to store it in the local groundwater basin. The facility consists of five large ponds, a pipeline connecting the ponds to the East Branch Extension and a new connection to the East Branch Extension.

3.4.2 Groundwater Basins

SGPWA is underlain by portions of two large groundwater basins, the Upper Santa Ana Valley Basin and Coachella Valley Basin, both of which are divided into subbasins. Of the many subbasins, three fall within the SGPWA boundaries, including the Yucaipa, San Timoteo, and San Gorgonio Pass Subbasins. The latter two subbasins are in turn divided into water storage

units, (also colloquially termed “basins”). The principal storage units and basins that are used by the water purveyors are the Beaumont, Banning, Yucaipa, and Cabazon groundwater basins. A summary of these local groundwater basins is provided below and shown on Figure 3-1. Details on basin characteristics, groundwater pumping, and basin management are provided in individual purveyor UWMPs.

FIGURE 3-1
GROUNDWATER BASINS WITH PUMPING BY SGPWA RETAIL AGENCIES

Source: SGPWA 2010 Urban Water Management Plan, prepared by CDM.

3.4.2.1 Beaumont Basin

The Beaumont Basin (storage unit) encompasses approximately 28 square miles and underlies the Cities of Calimesa, Beaumont, and Banning. Generally, hydro-geologic studies have identified major inflows to the Beaumont storage unit as runoff from Edgar Canyon (Little San Gorgonio and Noble Creeks) and from infiltration of rainfall within the groundwater basin boundary. The Beaumont Basin is the only adjudicated groundwater basin within the SGPWA service area. The Judgment for the adjudication (provided in Appendix G) allocates pumping rights to both overliers and appropriators, and provides guidelines for conversion of pumping rights from overliers to appropriators. Overliers are parties that own land overlying the Beaumont Basin and have exercised pumping rights. Appropriators are the water purveyors who serve water to serve demands within the Beaumont Basin, including the City of Banning, BCVWD, SMWC, and YVWD. Appropriators can obtain additional pumping rights from an overlier by providing water service, either potable or recycled. The Beaumont Basin Water Master develops annual projections of pumping rights conversion from overliers to appropriators.

According to the stipulated judgment, the long-term safe yield of the Basin is 8,650 AFY, recently (2013) updated to 6,700 AFY. Since 2003, SGPWA has purchased a portion of its Table A allocation to sell to retailers within its service area, including BCVWD, and the City of Banning.

3.4.2.2 Banning Groundwater Basin

The Banning Basin consists of the East Banning and West Banning storage units. The East Banning and Banning Bench storage units are separated from the West Banning storage unit by the McMullen fault (Bloyd 1971). The East Banning storage units encompass approximately 7 square miles and the West Banning storage unit encompasses approximately 4 square miles. The City of Banning is the only water purveyor that extracts water from the East Banning and West Banning storage units. The average of the estimated maximum perennial yield from the East Banning storage units is 1,050 AFY, and 350 AFY from the West Banning storage unit (Geoscience, 2003). Historical trends in water level have declined in the Banning groundwater basin, especially in the West Banning storage unit, where most well pumping occurs. The Banning groundwater basin is not adjudicated.

3.4.2.3 Yucaipa Basin

The Yucaipa Basin encompasses approximately 40 square miles and underlies the southeast part of San Bernardino Valley. The Basin is not adjudicated; sustainable yield is estimated to be approximately 9.600 AFY with a storage capacity of more than 800,000 AF (DWR Bulletin 118). Extractions from the basin are approximately 14,000 AFY (DWR Bulletin 118, California's Groundwater, 2004). DWR identifies the basin in overdraft in its Bulletin-118, however water levels have been historically rising. Moreover, the amount of groundwater pumping from the basin has significantly decreased being attributable to the supplemental supply of SWP and the use of recycled water.

The Basin is conjunctively managed by the Agency, SBVMWD, YVWD, SMWC, Western Heights Water Company, and the City of Yucaipa.

3.4.2.4 Cabazon Basin

The Cabazon Basin (storage unit) is located on the eastern boundary of SGPWA's service area. City of Banning, CWD, Mission Springs Water District, and the Morongo tribes rely on pumping from this basin to serve a portion of their respective water demands. The safe yield estimate of the Cabazon storage unit is estimated to be 1,770 AFY (Geoscience 2010).

3.4.2.5 Sustainable Groundwater Management Act

The Sustainable Groundwater Management Act (SGMA), passed in 2014, requires all groundwater basins in California to be managed sustainably by 2022. The legislation requires that a Groundwater Sustainability Plan (GSP) be prepared by 2022 in those basins the DWR has identified as medium to high priority. The San Gorgonio Pass, San Timoteo and Yucaipa Subbasins are listed as medium priority basins (per DWR's Final CASGEM Basin Prioritization Reports, June 2014). SGMA does not apply to basins that are managed through adjudication.

SGPWA is currently working with other water agencies that overly the San Gorgonio Pass Subbasin to develop a cooperative agreement to manage the subbasin in accordance with the legislation. The other agencies involved include Desert Water Agency, MSWD, HVWD, Morongo Band of Mission Indians, City of Banning, and BHMWC.

3.4.3 Recycled Water

The Agency does not provide supplemental treatment to recycled water and does not distribute recycled water, nor does the Agency have plans to provide recycled water as a part of its deliveries. As a result, UWMP Act Guideline Tables 6-3, 6-4 and 6-5 will not be completed.

The Cities of Beaumont and Banning, YVWD, and the Morongo Band of Mission Indians discharge treated wastewater within the SGPWA service area. The use of recycled water to offset potable water demands and for groundwater replenishment is a major component in the supply plans for most of the retail agencies and therefore is discussed briefly below.

BCVWD has an extensive non-potable water system, which provides non-potable water for landscape irrigation throughout the City of Beaumont. In the BCVWD 2015 UWMP, recycled water demands are estimated to range from 1,154 FY to 3,363 AFY between 2020 and 2040 (BCVWD 2015 UWMP Table 6-19).

YVWD operates an 8 MGD Wochholz Water Recycling Facility that provides advanced tertiary treatment of wastewater from its sewer system. Recycled water is used to meet approximately 10-15 percent of YVWD's overall water demands. YVWD plans to implement aggressive recycled water use for new development in the City of Calimesa, requiring dual plumbing for front yard irrigation on Single-family residential properties. Ultimately their facility will be capable of treating up to 11 MGD of wastewater. YVWD currently operates a 2.5 MGD reverse osmosis treatment system to purify the recycled water produced at their facility and a brineline to dispose of the salts removed by the treatment system. A 4.0 million gallon (MG) recycled water storage reservoir and pump station is used to store the recycled water. YVWD will be constructing a Regional Recycled Water Conveyance System which will allow it to provide surplus recycled water to BCVWD and the City of Banning.

The City of Banning currently spreads treated wastewater effluent in ponds overlying the Cabazon storage unit which has limited storage capacity to allow for indirect potable reuse of

this effluent. Banning has plans to upgrade its wastewater treatment plant to meet Title 22 requirements and increase capacity by 2025. Once on-line, this upgrade would make approximately 1,680 AFY of recycled water available to the City for irrigation use[5].

3.5 Development of Desalination

The California UWMP Act requires a discussion of potential opportunities for use of desalinated water (Water Code Section 10631[i]). SGPWA has explored such opportunities, and they are described in the following section, including opportunities for desalination of brackish water, groundwater and seawater. However, at this time, none of these opportunities are practical or economically feasible for SGPWA and SGPWA has no current plans to pursue them. Therefore, desalinated supplies are not included in the supply summaries in this Plan.

3.5.1 Opportunities for Brackish Water and/or Groundwater Desalination

As discussed in Section 4, groundwater supplies within the SGPWA service area impacted by total dissolved solids, and desalination could be implemented by the individual retail agencies to address this issue. YVWD for example is close to obtaining a permit to serve desalted recycled wastewater for non-potable uses.

It is noted that SGPWA could team with other SWP contractors and provide financial assistance in construction of other regional groundwater desalination facilities in exchange for SWP supplies. The desalinated water would be supplied to users in communities near the desalination plant, and a similar amount of SWP supplies would be exchanged and allocated to SGPWA from the SWP contractor. A list summarizing the groundwater desalination plans of other SWP contractors is not available; however, SGPWA would begin this planning effort should the need arise.

In addition, should an opportunity emerge with a local agency other than a SWP contractor, an exchange of SWP deliveries would most likely involve a third party, such as Metropolitan. Most local groundwater desalination facilities would be projects implemented by retail purveyors of SWP contractors and, if an exchange program was implemented, would involve coordination and wheeling of water through the contractor's facilities to SGPWA.

3.5.2 Opportunities for Seawater Desalination

Because the SGPWA service area is not in a coastal area, it is neither practical nor economically feasible for SGPWA to implement a seawater desalination program. However, similar to the brackish water and groundwater desalination opportunities described above, SGPWA and the purveyors could provide financial assistance to other SWP contractors in the construction of their seawater desalination facilities in exchange for SWP supplies.

SGPWA has been following the existing and proposed seawater desalination projects along California's coast. Table 3-5 provides a summary of the status of several of California's

[5] City of Banning 2015 UWMP

municipal/domestic seawater desalination facilities. As of December 2015, there was an estimated 10 active proposals for seawater desalination plants along the California Coast, as well as two additional proposed plants in Baja California, Mexico that would provide water to southern California communities (Pacific Institute, 2015). This is down from an estimated 21 proposals in 2006 and 19 in 2012 (Pacific Institute, 2015).

As shown Table 3-5, most of the existing and proposed seawater desalination facilities are/would be operated by agencies that are not SWP contractors. However, in these cases as described above, an exchange for SWP deliveries would most likely involve a third party (SWP contractor), the local water agency and SGPWA.

TABLE 3-5
EXISTING AND PROPOSED SEAWATER DESALINATION FACILITIES IN CALIFORNIA

Project	Member Agency Service Area or Project Developer	MGD	Status
Carlsbad Seawater Desalination Project	San Diego County Water Authority/Poseidon Water	50	Operational
Marina Desalination Plant	Marina Coast Water District	0.27	Idle
Sand City Coastal Desalination Facility	City of Sand City	0.3	Operational
Monterey Bay Aquarium	Monterey Bay Aquarium	0.008	Operational
Morro Bay Desalination Facility	City of Morro Bay	0.6	Idle
Diablo Canyon Power Plant	Pacific Gas and Electric	0.58	Operational
Gaviota Oil Heating Facility	Chevron Corporation	0.41	Operational
Santa Catalina Island	City of Avalon/Southern California Edison	0.325	Operational
San Nicholas Island	U.S. Navy	0.024	Operational
West Basin Seawater Desalination Project	West Basin Municipal Water District	20-60	Proposed
Huntington Beach Seawater Desalination Project	Orange County Water District	50	Proposed
DeepWater Desalination Project	DeepWater Desal, LLC	25	Proposed
Charles Meyer Desalination Plant	City of Santa Barbara	2.8	Idle
Expanding Diablo Canyon Nuclear Power's Desalination Plant	PG&E and San Luis Obispo County	1.5	Proposed
Monterey Peninsula Water Supply Project	Cal Am, Monterey County, Monterey Peninsula Regional Water Authority, Monterey Peninsula Water Management District	6.4 to 9.6	Proposed
The People's Moss Landing Water Desalination Project	Nader Agha	12	Proposed
Doheny Ocean Desalination Project	South Coast Water District and Laguna Beach County Water District	15 to 20	Proposed
City of Oceanside	City of Oceanside	5 to 10	Proposed

Section 4: Water Quality

4.1 Overview

The quality of any natural water is dynamic in nature. This is true for the SWP water brought into the SGPWA service area. During periods of intense rainfall or snowmelt, routes of surface water movement are changed; new constituents are mobilized and enter the water while other constituents are diluted or eliminated. The quality of water changes over time. These same basic principles apply to groundwater. Depending on water depth, groundwater will pass through different layers of rock and sediment and leach different materials from those strata. Water quality is not a static feature of water, and these dynamic variables must be recognized.

Water quality regulations also change. This is the result of the discovery of new contaminants, changing understanding of the health effects of previously known as well as new contaminants, development of new analytical technology, and the introduction of new treatment technology. All retail water purveyors are subject to drinking water standards set by the Federal EPA and the California Department of Public Health. SGPWA imports SWP water primarily for groundwater basin recharge. Retail purveyors extract groundwater from these groundwater basins for delivery, with the exception of YVWD, who treats the imported water and delivers it directly to its customers.

This Section provides a general description of the water quality of both imported water and groundwater supplies. A discussion of potential water quality impacts on the reliability of these supplies is also provided.

The Agency prepares an annual Report on Water Conditions that generally describes the water quality of imported SWP water and local groundwater. Several state, regional and county agencies have jurisdiction and responsibility for monitoring water quality and contaminant sites. Programs administered by these agencies include basin management, waste regulation, contaminant cleanup, public outreach, and emergency spill response.

4.2 Imported Water Quality

SGPWA provides imported SWP water to its service area. The source of SWP water is rain and snow from the Sierra Nevada, and Coastal mountain ranges. This water travels to the Sacramento-San Joaquin Delta, which is a network of natural and artificial channels and reclaimed islands at the confluence of the Sacramento and San Joaquin rivers. The Delta forms the eastern portion of the San Francisco estuary, receiving runoff from more than 40 percent of the state's land area. It is a low-lying region interlaced with hundreds of miles of waterways. From the Delta, the water is pumped into a series of canals and reservoirs, which provides water to urban and agricultural users throughout the San Francisco Bay Area and Central and Southern California. SGPWA samples its water quality at the Devil Canyon sampling station in San Bernardino. This is the closest sampling station to the Agency and is representative of the water that the Agency receives from the SWP.

One important property of SWP water is the mineral content. SWP water is generally low in dissolved minerals, such as calcium, magnesium, sodium, potassium, iron, manganese, nitrate,

and sulfate. Most of these minerals do not cause health concerns. Nitrate is the main exception, as it has significant health effects for infants in high concentrations; however, the nitrate content of SWP water is very low. Also of significance is the chloride content. Although not a human health risk, chloride can have a negative impact on agricultural activities and regulatory compliance for local sanitation agencies. The chloride content of SWP water varies widely from well over 100 milligrams per liter (mg/L) to below 40 mg/L, depending on Delta conditions.

Salinity is becoming more heavily regulated by Regional Water Quality Control Boards (RWQCBs) throughout the State, especially as water agencies construct recycled water systems. In order to maintain reasonable total dissolved solids (TDS) (also known as salinity or salts) levels in the lower reaches of the Santa Ana watershed, the Santa Ana RWQCB must set standards for TDS at relatively low concentrations in the upper reaches of the watershed, where the western portion of the Agency's service area is located. This watershed already has among the highest levels of TDS in the State. Sewage treatment plant effluent from Beaumont, Yucaipa, and Calimesa is discharged into tributaries to the Santa Ana River and is regulated by the Santa Ana RWQCB; effluent from Banning is currently regulated by the Colorado River RWQCB, though it is likely that the Santa Ana RWQCB may at some time regulate this discharge or portions thereof. This is due to the fact that the City of Banning has plans for a recycled water system, parts of which will overlie a portion of the Santa Ana watershed.

Since SWP water imports to the underlying groundwater basins will be persistent, long term, and increasing, these imports are deemed to be a significant factor in the long term salt balance in the region. Data regarding the quantity and quality of SWP water delivered to the SGPWA service area are available from Santa Ana Regional Board, and are also reported in the Agency's annual Report on Water Conditions. As discussed for groundwater quality, TDS is the most significant constituent in the SWP water. The concentration of TDS is very dependent on hydrologic conditions, and during dry years, the concentration of TDS increases. In January of 2011, which was a relatively wet hydrologic year in California, TDS concentrations were found to greatly decrease. This is significant because the ambient salinity concentration of the Beaumont Basin is benefited by the recharge of SWP water.

4.2.1 Municipal Water Quality Investigations Program

SGPWA participates in the DWR Municipal Water Quality Investigations (MWQI) Program. The MWQI Program is funded by the sixteen SWP Contractors that provide water to their customers for municipal and industrial uses. The mission of the MWQI Program is to: a) support the effective and efficient use of the Sacramento-San Joaquin Delta (Delta) and the SWP as a source water supply for municipal purposes through monitoring, forecasting, and reporting water quality; b) provide early warning of changing conditions in source water quality used for municipal purposes; c) provide data and knowledge based support for operational decision-making on the SWP; d) conduct scientific studies of drinking water importance; and e) provide scientific support to DWR, the State Water Project Contractors Authority MWQI-Specific Project Committee, and other governmental entities.

The MWQI Program conducts extensive monitoring in the Delta and the outlet to San Luis Reservoir. The data from this program, combined with data collected throughout the SWP by the DWR Division of Operations and Maintenance, are used to understand how water quality changes from the Delta to the turn outs of the SWP Municipal and Industrial (M&I) Contractors.

The MWQI Program has also developed a forecasting model to forecast organic carbon concentrations and salinity levels throughout the SWP. A daily report is sent out via email to the M&I Contractors with recent water quality data at key locations and information on Delta conditions and pumping at the Banks and Jones pumping plants.

Ongoing work includes refinement of the forecasting model to more accurately predict water quality conditions and to better model the impacts of groundwater and surface water pump-ins. The MWQI Program is also conducting studies to better understand the dynamics of algal and aquatic plant growth in the SWP. Algae and aquatic plants create a number of problems, including taste and odor issues, wide swings in pH, filter clogging, and clogging of conveyance structures. The MWQI Program also conducts the sanitary survey of the SWP, which must be submitted to the State Water Resources Control Board, Division of Drinking Water every five years.

4.3 Groundwater Quality

Groundwater quality in the region is very high. There is no known historical industrial or mining activity in the region that has generated harmful plumes of pollutants. The Santa Ana RWQCB has a "maximum benefit" goal of 330 parts per million (ppm) for TDS (or salinity) for the Beaumont Basin. The current ambient TDS concentration in the Beaumont Basin is approximately 280 ppm (Report on Water Conditions, 2013). The Basin Plan requires local entities to begin planning desalters when the ambient TDS increases to 320 ppm. YVWD has constructed a desalination plant and brine disposal pipeline to address the TDS issue.

In addition to salinity or TDS, nitrate is also monitored closely. This too is regulated by the RWQCB, but nitrate concentrations are currently well within the maximum benefit standards. Over the past few years there have been isolated incidents of high nitrates at individual wells for short periods of time, typically after a large rainstorm that causes flushing of the system. These have not proven to be a health hazard.

Total chromium has been regulated by the SWRCB at an MCL of 50 microgram per liter (µg/L), which includes both chromium-3 and chromium-6. In 2011, California EPA Office of Environmental Health Hazard Assessment set a Public Health Goal (PHG) of 0.02 µg/L for chromium-6. California Department of Public Health then reviewed the PHG and recommended an MCL for chromium-6 at the level of 10 µg/L, which went into effect July 1st, 2014. In 2015, SB385 was passed and signed by Governor Jerry Brown that effectively pushed the enforcement of the new chromium-6 MCL out to 2020, if the water purveyor submitted a compliance plan to their local Division of Drinking Water (DDW).

Within the SGPWA service area, chromium-6 concentrations have been measured at levels above the MCL in several wells owned by the City of Banning and BCVWD, forcing some wells to be taken out of production temporarily, pending implementation of a fix to the problem.

More detail on groundwater quality management actions are identified in the retail water agencies' UWMPs.

4.4 Groundwater Protection

The general goal of groundwater protection activities is to maintain the groundwater and the aquifer to ensure a reliable high quality supply. Activities to meet this goal include continued and increased monitoring, data sharing, education and coordination with other agencies that have local or regional authority or programs. To increase its groundwater protection activities, SGPWA, YVWD, and BCVWD have been taking the actions to manage salinity in the Yucaipa, Beaumont, and San Timoteo Basins. The City of Banning is also planning to reduce TDS in recycled water for irrigation use.

4.5 Water Quality Impacts on Reliability

The quality of water dictates numerous management strategies a water purveyor will implement, including, but not limited to, the selection of raw water sources, treatment alternatives, blending options, and modifications to existing treatment facilities. Maintaining and utilizing high quality sources of water simplifies management strategies by increasing water supply alternatives, water supply reliability, and decreasing the cost of treatment. Maintaining high quality source water allows for efficient management of water resources by minimizing costs.

Maintaining the quality of water supplies increases the reliability of each source by ensuring that deliveries are not interrupted due to water quality concerns. A direct result from the degradation of a water supply source is increased treatment cost before consumption. The poorer the quality of the source water, the greater the treatment cost. Groundwater may degrade in quality to the point that is not economically feasible for treatment. In this scenario the degraded source water is taken off-line. This in turn can decrease water supply reliability by potentially decreasing the total supply and increasing demands on alternative water supplies.

Overall, the quality of imported water is not anticipated to affect water reliability. Water quality issues are constantly evolving, the Agency will continue to take action to protect supplies when needed, however it is recognized water quality treatment can have significant costs.

Section 5: Reliability Planning

5.1 Overview

The Act requires urban water suppliers to assess water supply reliability that compares total projected water use with the expected water supply over the next twenty years in five year increments. The Act also requires an assessment for a single-dry year and multiple-dry years. This chapter presents the reliability assessment for SGPWA's service area through 2040.

As stated in SGPWA's mission statement, the goal of SGPWA is to "is to import supplemental water and to protect and enhance local water supplies for use by present and future water users and to sell imported water to local water districts within the service areas of the San Gorgonio Pass Water Agency." This Plan helps SGPWA to achieve this goal even during dry periods based on a conservative water supply and demand assumptions over the next 25 years, as discussed in the following sections.

5.2 Supply And Demand Comparisons

The available supplies and water demands for SGPWA's service area were analyzed to assess the region's ability to satisfy demands during three scenarios: an average water year, single-dry year, and multiple-dry years. Table 5-1 presents the base years for the development of water year data. Tables 5-2, 5-3, and 5-4 summarize, respectively, Average Water Year, Single-Dry Water Year, and Multiple-Dry Year supplies.

TABLE 5-1
BASIS OF WATER YEAR DATA

Water Year Type	Base Years	Historical Sequence
Average Water Year	Average	1921-2003
Single-Dry Water Year	1977	--
Multiple-Dry Water Years	1931-1934	--

5.2.1 Normal Water Year

Table 5-2 summarizes SGPWA's water supplies available to meet demands over the 25-year planning period during an average/normal year. For SWP supplies it is assumed 62 percent of Table A will be available as the long-term average supply. As presented in the table, SGPWA's water supply is broken down into existing and planned water supply sources.

TABLE 5-2
PROJECTED AVERAGE/NORMAL YEAR SUPPLIES AND DEMANDS (AFY)

Water Supply Source	2020	2025	2030	2035	2040
Existing Supplies					
Imported SWP[(a)]	10,700	10,700	10,700	10,700	10,700
Yuba Accord[(b)]	300	300	300	300	300
Total Existing Supplies	**11,000**	**11,000**	**11,000**	**11,000**	**11,000**
Planned Supplies[(c)]					
SBVMWD Purchased Supply	2,000	2,000	2,000	2,000	2,000
Available Purchases of Supply [(d)]	1,500	3,800	7,700	11,700	15,000
Total Planned Supplies[(e)]	**3,500**	**5,800**	**9,700**	**13,700**	**17,000**
Total Existing and Planned Supplies	**14,500**	**16,800**	**20,700**	**24,700**	**28,000**
Total Demands[(f)]	**13,200**	**16,500**	**20,400**	**24,400**	**27,700**
Total Maximum Demands[(g)]	**18,800**	**22,200**	**25,800**	**29,700**	**31,600**

Notes: Values are rounded to the nearest hundred.

(a) Assumes 62% of Table A amount (17,300 AFY) based on the California Department of Water Resources Final Delivery Capability Report 2015 (DWR 2015 DCR).
(b) See Section 1.2.3.
(c) See Section 1, Table 3-1.
(d) The Agency is expected to purchase additional supplies by 2020 to meet projected demands during average years.
(e) SWP is the assumed source of planned supplies. Volumes shown assume 62% reliability of planned supplies based on the DWR 2015 DCR. Refer to Table 3-1.
(f) Demands from Table 2-4.
(g) Demands from Table 2-5.

5.2.2 Single-Dry Year

The water supplies and demands for SGPWA's service area over the 25-year planning period were analyzed in the event that a single-dry year occurs, similar to the drought that occurred in California in 1977. During a single-dry year, SWP supply availability is anticipated to be reduced to 11 percent. Table 5-3 summarizes the existing and planned supplies available to meet demands during a single-dry year. Demand during single-dry years are presented in section 2.6 and shown below. Dry year demand is lower than average year demand, as shown in Table 5-3.

TABLE 5-3
PROJECTED SINGLE-DRY YEAR SUPPLIES AND DEMANDS (AFY)

Water Supply Source	2020	2025	2030	2035	2040
Existing Supplies					
Imported SWP[(a)]	1,900	1,900	1,900	1,900	1,900
Yuba Accord[(b)]	300	300	300	300	300
Total Existing Supplies	**2,200**	**2,200**	**2,200**	**2,200**	**2,200**
Planned Supplies					
Future Dry Year Supplies[(c)] **[(d)]**	400	600	1,100	1,500	1,900
Total Planned Supplies	**400**	**600**	**1,100**	**1,500**	**1,900**
Total Existing and Planned Supplies	**2,600**	**2,800**	**3,300**	**3,700**	**4,100**
Total Demands[(e)]	**1,600**	**3,300**	**5,500**	**7,500**	**9,200**
Total Maximum Demands[(f)]	**4,300**	**5,500**	**6,800**	**8,000**	**9,200**

Notes: Values are rounded to the nearest hundred.

(a) Assumes 11% of Table A amount (17,300 AFY) based on the California Department of Water Resources Final Delivery Capability Report 2015 (DWR 2015 DCR).

(b) See Section 1.2.3.

(c) As described for average year supplies, the Agency is expected to purchase additional supplies by 2020 to meet projected demands during average years. SWP is the assumed source of planned supplies. Future dry year supplies shown here assume 11% availability of those planned supplies based on the DWR 2015 DCR.

(d) The Agency is negotiating a cooperative agreement with YVWD and the City of Calimesa to provide as-needed supplies as discussed in Section 3.3.2. Therefore, supplies shown are projected to meet those demands at a minimum. Procurement of additional dry year supplies will be ongoing to meet additional dry year demands, as discussed in Section 3.3.

(e) Demands from Table 2-6.

(f) Demands from Table 2-7.

5.2.3 Multiple-Dry Year

The water supplies and demands for SGPWA's service area over the 25-year planning period were analyzed in the event that a four-year multiple-dry year event occurs, similar to the drought that occurred during the years 1931 to 1934. During multiple-dry years, SWP availability is anticipated to be reduced to 33 percent. Table 5-4 summarizes the existing and planned supplies available to meet demands during multiple-dry years.

TABLE 5-4
PROJECTED MULTIPLE-DRY YEAR SUPPLIES AND DEMANDS (AFY)

Water Supply Source	2020	2025	2030	2035	2040
Existing Supplies					
Imported SWP[(a)]	5,700	5,700	5,700	5,700	5,700
Yuba Accord[(b)]	300	300	300	300	300
Total Existing Supplies	**6,000**	**6,000**	**6,000**	**6,000**	**6,000**
Planned Supplies					
Future Dry Year Supplies [(c) (d)]	1,200	1,900	3,200	4,500	5,600
Total Planned Supplies	**1,200**	**1,900**	**3,200**	**4,500**	**5,600**
Total Existing and Planned Supplies	**7,200**	**7,900**	**9,200**	**10,500**	**11,600**
Total Demands[(e)]	**3,200**	**5,000**	**7,300**	**9,600**	**11,500**
Total Maximum Demands[(f)]	**5,900**	**7,200**	**8,700**	**10,100**	**11,500**

Notes: Values are rounded to the nearest hundred.

(a) Assumes 33% of Table A amount (17,300 AFY) based on the DWR 2015 DCR.

(b) See Section 1.2.3.

(c) As described for average year supplies, the Agency is expected to purchase additional supplies by 2020 to meet projected demands during average years. SWP is the assumed source of planned supplies. Future dry year supplies shown here assume 33% availability of those planned supplies based on the DWR 2015 DCR.

(d) The Agency is negotiating a cooperative agreement with YVWD and the City of Calimesa to provide dry year supplies as discussed in Section 3.3.2. Therefore, supplies shown are projected to meet those demands at a minimum; other retail agencies are assumed to meet dry year demands with local supplies. Procurement of additional dry year supplies will be ongoing.

(e) Demands from Table 2-8.

(f) Demands from Table 2-9.

5.2.4 Summary of Comparisons

As shown in the analyses above, SGPWA has planned adequate supplies to meet demands during average and multiple-dry years throughout the 25-year planning period. However, the Agency will need to procure additional water supplies to meet projected future needs in single-dry year conditions. As discussed in Section 3.3, these additional supplies will represent a diverse portfolio of water, including dry year supplies, SWP Table A water purchased from or exchanged with other SWP Contractors, purchase of surplus water from a neighboring SWP Contractor, and other supplemental water as available. Refer to Section 3.4 for the Agency's plans to procure these additional supplies.

Section 6: Water Demand Management Measures

6.1 Demand Management

The purpose of the Demand Management Measures (DMM) section of this UWMP is to (a) provide a description of the past wholesaler water conservation programs that the Agency has implemented since 2010 and (b) describe the activities and actions the Agency plans to use in the future to assist its retailers in meeting their urban water use reduction targets. For the purposes of this UWMP the DMMs are categorized as "Foundational" and "Other". Foundational DMMs, listed below, are those DMMs that the UWMP Act and Water Code specifically mention that apply to a wholesaler such as SGPWA:

a) Metering
b) Public education and outreach
c) Water conservation program coordination and staffing support
d) Other demand management measures that have a significant impact on water use as measured in gallons per capita per day, including innovative measures, if implemented.
e) A narrative description of the wholesale supplier's distribution system asset management program
f) Wholesale supplier assistance programs

SGPWA does not have an internal distribution system. The Agency currently has three retail customers: the YVWD, the BCVWD, and the City of Banning. The YVWD is the only entity that purchases water for direct deliveries.

6.1.1 Metering

The Agency does not provide water directly to water users, hence it does not have a traditional metering system. The Agency does replenish the groundwater basin by recharging imported SWP water at several locations throughout the service area, as described in Section 3. The SWP water is metered at the turnouts where the Agency receives the water into its service area. All connections to the retailers listed above are metered.

6.1.2 Public Education and Outreach

The Agency recognizes the importance of public education and outreach for water resource conservation, and works towards providing materials to its customers informing them on ways to conserve water. A number of different resources including "Save our Water", "EPA Water Sense", "Be Water Wise", "Conservation Garden Brochure", and other activities related to conservation for children are made available on the Agency website (http://www.sgpwa.com/conservation) free of charge for the benefit of its customers and the public.

The Agency is involved in a number of outreach and education programs geared towards both children and adults.

Each year, the Agency sponsors a local high school in a regional solar boat race. During this weekend event, each high school team is required to write a paper and make a presentation on water conservation, and the Agency Board brings the high school to a Board meeting to hear from the students what they learned. Board members are judges for the event, which has raised the profile of water conservation considerably among high school students in the region. Approximately eight high schools compete each year.

The Agency has partnered with the Inland Empire Resource Conservation District to provide water conservation themed presentations in local schools for the three school districts within the Agency's service area. The programs focus on groundwater using a physical tabletop groundwater model purchased by the Agency. The program also describes the local retail water supplier that serves the school, where its water comes from, where the Agency's water comes from, how much water is used for everyday activities and to grow food, and other conservation-themed subjects. 2015 is the second year that the Agency began implementing this program. During the first year, 62 presentations were made to 48 different classes at eight different schools. These programs reached approximately 1,700 students. We anticipate similar numbers for 2015 and in subsequent years as the program continues.

The Agency has also contracted with a local small business, Drought Solutions, to provide workshops to gardening clubs, homeowners' associations, service organizations, and other adult groups. These typically focus on outdoor water use, though there are six separate topics that are offered. In 2015, approximately eight programs were given. Several hundred adults have attended these programs. The Agency will continue to build on this outreach program.

Finally, the Agency, its staff, and its Board of Directors participate in numerous speaking engagements in the communities of the service area whereby the importance of water conservation and investments in infrastructure and water supplies for the future are consistent themes that are emphasized.

6.1.3 Water Conservation Program Coordination and Staffing Support

The General Manager acts as the conservation coordinator. In addition to the above programs, he has direction from the Board to examine other conservation programs that meet the needs of the region and the retailers.

The Agency has set an example for other public agencies by re-landscaping its administration building with low water use vegetation and other hardscape. It has created a demonstration "back yard" that is a true conservation garden. Garden clubs and schools students have visited this garden. Flyers are available with the names of each of the plants so that the public is aware of what to purchase. The garden includes artificial turf, a winding pathway, and seats. This was done well before the recent drought, thus setting an example for other local public agencies, which have since begun to take similar actions.

6.1.4 Conservation pricing

SGPWA Ordinance No. 8 mandates that the Agency, at a minimum, shall establish and charge rates for the delivery of water sufficient to cover SGPWA's variable costs for delivery of imported water, internal SGPWA costs and other amounts as determined by the Board of Directors. Cost of delivery includes operations, administrative overhead, SBVMWD pass-through, dry year transfer costs, rate stabilization surplus reserves, new water purchase surplus reserve contributions, and DWR imported water purchase.

Currently, SGPWA charges a volumetric rate of $317/AF to its retailers. The wholesale water rate was established via Resolution No. 2009-3. The rate structure is supported by the 2009 Water Rate Study prepared for SGPWA (David Taussig Associates, Inc., 2009).

6.1.5 Wholesale Supplier Assistance Programs

SGPWA regularly explores potential support options for its retailers to assist them in meeting their SBX7-7 demand reduction targets. Where possible, SGPWA identifies partnerships to support DMM implementation. For example, SGPWA has contracted with the local Inland Empire Resource Conservation District to implement some of the Agency's education programs, and makes this program available to the retailers.

6.2 Asset Management Program

The Agency does not at this time have an internal distribution system or any other physical facilities. It anticipates constructing a distribution system in the future. Since it does not have an internal distribution system but rather sells water directly from the SWP to local retail water agency systems, no asset management program is required. At such time as the Agency constructs an internal distribution system, it will implement an asset management program.

6.3 Planned Wholesale Supplier Assistance Programs

Over the next five years, the Agency will continue to implement the Foundational DMMs as described in Section 6.1 and will offer to provide help to its retail agencies in meeting their water use targets. The Agency staff will continue to provide residents (adults and children) with educational information and outreach and other DMMs as feasible and appropriate.

The Agency General Manager is Chair of the Conservation Committee of the San Gorgonio Pass Regional Water Alliance, a consortium of water agencies and cities in the region, including the retail agencies with demands on SGPWA. Through this committee, the Agency is providing technical support and information to the smaller retail agencies that do not have staff to implement conservation programs or even to understand the implications of the State Board's recently-enacted emergency conservation regulations. It is also ensuring that local retail agencies are aware of the regulations and all public hearings associated with them so that the water agencies in the region can provide input on the emergency regulations as well as understand them. This is a valuable resource, especially for the smaller retail water agencies.

Monthly meetings include presentations on local, regional and state water issues, committee reports and individual agency presentations and updates. Topics have included California Water Plan Update, Integrated Regional Water Management Plans, Urban Water Management Plans,

water conservation programs, 2014 water bond, storm water resources, salinity management, State Water Project, and drought conditions presented by a representative of the California Department of Water Resources.

The Committee's website can be accessed at http://www.passwateralliance.com/conservation/.

6.3.1 Planned Implementation of DMMs to Achieve Water Use Targets

SGPWA will continue to implement the DMMs described in this section, and will continue to collaborate with the other retail purveyors to implement the measures outlined in this UWMP. These programs, taken together, will assist SGPWA in helping its retail agencies achieve their SBX7-7 2020 targets as described in their respective UWMPs.

Section 7: Water Shortage Contingency Planning

7.1 Overview

Water supplies may be interrupted or reduced significantly in a number of ways, such as a drought which limits supplies, an earthquake which damages water delivery or storage facilities, a regional power outage, or a toxic spill that affects water quality. This chapter of the Plan describes how SGPWA plans to respond to various stages of shortage.

Cities and water agencies within SGPWA rely on large groundwater reserves to meet potable water supply needs. During previous drought periods, municipal water suppliers continued to draft from these reserves to meet customer needs without imposing restrictions on water use, but at rates exceeding natural replenishment in most areas. Large groundwater basins in the region serve as reservoirs and buffer the impacts of seasonal and year-to-year variations in precipitation and imported and natural surface water deliveries. This has been demonstrated during the recent drought, as groundwater supply was available to meet demands; in addition, the retailers have complied with the Governor's emergency and executive orders requiring mandatory conservation actions statewide. The area aquifers are either currently in balance or expected to be in balance in the near future due to the combination of water imports, State-mandated conservation requirements, and/or court ordered production "ramp-down." During multiple-year droughts or State Water Project outages, adequate groundwater supplies will be available to meet demands through the use of conjunctively banked pre-stored imported water.

The SGPWA adopted Ordinance No. 10 establishing a water shortage contingency plan in July 2014. The ordinance established procedures for allocating reduces deliveries of water to Purchasers in the event of single and multiple dry years and a shortage of water available to meet the demands of the Purchasers. SGPWA produced a draft update to Ordinance No. 10 in August 2016 to further guide its actions in the event of a water shortage emergency. This new draft Ordinance (provided in Appendix H) includes stages of action to be undertaken by the Agency in response to shortages in wholesale water supplies available for purchase by the Agency, including up to a 50 percent reduction in those supplies and to provide an outline of the specific water supply conditions that are applicable to each stage of action by reference to the allocation scenarios established in Agency Ordinance No. 10. It is also noted that the SGPWA's role is limited to the use of imported water to replenish local groundwater basins for subsequent pumping by its retail agencies. As such, direct delivery of water provided by SGPWA is minimal.

Therefore, the majority of the water shortage contingency planning in the SGPWA service area is undertaken by retail agencies, Riverside County, and the cities throughout the County. This section summarizes water shortage contingency plans developed by SGPWA retail agencies.

Actions of the SGPWA to address water shortages are summarized below.

7.2 SGPWA Stages of Action to Respond to Water Shortages

SGPWA's Board of Directors determines when to declare a level 0, 1, 2, or 3 water supply shortage in response to drought, regulatory requirements, or other water supply conditions, and what reduction in water use is necessary to make the most efficient use of water, protect public health and safety, and respond to existing water supply and/or regulatory conditions.

Table 7-1 presents the three-stage water supply shortage action plan for the Agency.

These stages are outlined in SGPWA Draft Resolution No. XX, and described in further detail below. See Appendix H for the complete Draft Resolution.

As a wholesale agency, SGPWA does not have the authority to impose mandatory restrictions on retail customers due to water shortages. Therefore, this level of contingency planning is conducted by the retail water agencies.

TABLE 7-1

RATIONING AND REDUCTION GOALS

Stage	Percent Supply Reduction[(a)]	Water Supply Condition	Stages of Action
0	0%	Year when at least 62% of contractual SWP Table A imported supplies are available to the Agency	• Coordination. Meet and coordinate with retail water agencies and other entities in the San Gorgonio Pass area regarding current and projected water supplies and demands. • Public Messaging. Encourage the public to avoid water waste and increase water use efficiency. • Manage Water Supplies in Excess of Demands. Pursue programs and projects to manage water supplies in excess of demands, including, but not limited to, placing such water in storage or water banking or exchange programs.
1	25%	47%	• Water Shortage Plan. The Agency will determine whether a Water Shortage Year exists in accordance with Ordinance 10 and the extent to which imported water supplies available for purchase by the Agency will need to be allocated in accordance with Ordinance No. 10. • Coordination. Meet and coordinate with retail water agencies and other entities in the San Gorgonio Pass area regarding current and projected water supplies and demands, and the extent to which other agencies may implement the appropriate stages and actions under their respective water shortage contingency plans. • Continue to undertake other applicable actions identified above under a Stage 0 Water Supply Condition.

Stage	Percent Supply Reduction[(a)]	Water Supply Condition	Stages of Action
2	26-45%	46-34%	• Water Shortage Plan. The Agency will determine whether a Water Shortage Year exists in accordance with Ordinance 10 and the extent to which imported water supplies available for purchase by the Agency will need to be allocated in accordance with Ordinance No. 10. • Shift and Increase in Public Messaging. The Agency will utilize its own website and other local media and communication efforts to educate the public on the shortage and to encourage greater conservation on the part of individuals, businesses, and institutions. • Dry Year Supplies. Determine from its customers if they desire additional dry-year supplies at an additional cost and, if so, to make reasonable and practicable attempts to obtain and deliver such supplies to customers who request and ensure payment for them. • Continue to undertake other applicable actions identified above under Stage 0 and Stage 1 Water Supply Conditions.
3	Greater than 45%	Greater than 34%	• Water Shortage Plan. The Agency will determine whether a Water Shortage Year exists in accordance with Ordinance 10 and the extent to which imported water supplies available for purchase by the Agency will need to be allocated in accordance with Ordinance No. 10. • Shift and Increase in Public Messaging. The Agency will utilize its own website and other local media and communication efforts to educate the public on the shortage and to encourage greater conservation on the part of individuals, businesses, and institutions. • Dry-Year Supplies. Determine from its customers if they desire additional dry-year supplies at an additional cost and, if so, to make reasonable and practicable attempts to obtain and deliver such supplies to customers who request and ensure payment for them. • Transfers. Evaluate and solicit input from its customers whether the Agency should pursue any transfers to augment supplies during the Stage 3 Condition, including related considerations of potential impacts to future water supplies. • Continue to undertake other applicable actions identified above under Stage 0, Stage 1, and Stage 2 Water Supply Conditions.

Source: SGPWA Ordinance No. XX, Ordinance Adopting a Wholesale Water Shortage Contingency Plan for Purposes of the Urban Water Management Planning Act (in Appendix H).

7.3 Minimum Water Supply Available During Next Three Years

The minimum water supply available during the next three years would occur during a three-year multiple-dry year event between the years 2016 and 2018. As shown in Table 7-3, the minimum regional water supply for agencies in the SGPWA service area for the next three years is about 6,000 AF. The water supply and demand are based on dry-year assumptions for the SWP and annual supply available for groundwater.

When comparing these supplies to the demand projections provided in Chapters 2 and 5 of this Plan, SGPWA does not have adequate supplies available to meet projected demands should a multiple-dry year period occur during the next three years, assuming SWP imported supply deliveries would be reduced to 33 percent, and based on realization of retail agency demand projections on SGPWA, as shown below. SGPWA will actively pursue transfers and exchanges in order to help meet demands.

TABLE 7-3
ESTIMATE OF MINIMUM SUPPLY FOR THE NEXT THREE YEARS

Water Supply Source	2016	2017	2018
Existing Supplies			
Imported SWP[(a)]	5,700	5,700	5,700
Yuba Accord[(b)]	300	300	300
Total Existing Supplies	**6,000**	**6,000**	**6,000**

Notes: Values rounded to the nearest hundred.

(a) SWP supplies are calculated by multiplying SGPWA's Table A amount of 17,300 AF by 33 % of total deliveries projected to be available based on the worst-case historic four-year drought of 1931-1934 (DWR 2015 DCR).

(b) See Section 3, Table 3-1. Assumes Yuba Accord supply available to meet demands.

7.4 Actions to Prepare For Catastrophic Interruption

7.4.1 General

The SGPWA service area is bounded on the east by a major portion of the San Andreas Fault. A major earthquake along the southern portion of the San Andreas Fault would affect the SGPWA service area.

The California Division of Mines and Geology has stated two of the aqueduct systems that import water to southern California (including the portion of the California Aqueduct that traverses the San Joaquin Valley) could be ruptured by displacement on the San Andreas Fault, and supply may not be restored for a three to six-week period. The situation would be further complicated by physical damage to pumping equipment and local loss of electrical power. DWR has a contingency aqueduct outage plan for restoring the California Aqueduct to service should a major break occur, which it estimates would take approximately four months to repair.

In the case of the southern portion of the fault, experts agree it may be at least three days after the earthquake before outside help could get to the area. Extended supply shortages of both groundwater and imported water, due to power outages and/or equipment damage, would have to be managed although local effects of these types of outages would not materially affect the region based on local native groundwater and banked imported water supplies.

Power outages currently do not affect SGPWA because it does not own or operate any wells or distribution systems. However, for the retailer water agencies, all of the water systems have some form of storage as both regulating reservoirs and emergency supply. It is assumed that in an emergency the public would be asked to reduce consumption to minimum health and safety levels, extending the supply. This would provide sufficient time to restore a significant amount of groundwater production. After the groundwater supply is restored, the pumping capacity of the retail purveyors could meet the reduced demand until such time that the imported water supply was reestablished. Updates on the water situation would be made as often as necessary. In addition, the County of San Bernardino has an Emergency Response Plan (2005) which further defines functions, assigns responsibilities, specifies policies and general procedures for coordination of planning efforts of various department and staff to assist in an emergency situation.

The area's water sources are generally of good quality, and no insurmountable problems resulting from industrial or agricultural contamination are foreseen. If contamination did result from a toxic spill or similar accident, the contamination would be isolated and should not significantly impact the total water supply. In addition, such an event would be addressed in the retailers' emergency response plan.

7.4.2 SWP Emergency Outage Scenarios

In addition to earthquakes, the SWP could experience other emergency outage scenarios. Past examples include slippage of aqueduct side panels into the California Aqueduct near Patterson in the mid-1990s, the Arroyo Pasajero flood event in 1995 (which also destroyed part of Interstate 5 near Los Banos), flood damage to the East Branch of the Aqueduct in 2015, and various subsidence and leakage repairs needed along the Main Branch and East Branch of the Aqueduct since the 1980s. All these outages were short-term in nature (on the order of weeks to several months), and DWR's Operations and Maintenance Division worked diligently to devise methods to keep the Aqueduct in operation and continue SWP deliveries while repairs were made. Thus, the SWP contractors generally experienced no interruption in total annual deliveries.

One of the SWP's important design engineering features is the ability to isolate parts of the system. The Aqueduct is divided into "pools." Thus, if one reservoir or portion of the California Aqueduct is damaged in some way, other portions of the system can still remain in operation. The primary SWP facilities are shown on Figure 7-1.

Other events could result in significant outages and potential interruption of service. Examples of possible nature-caused events include a levee breach in the Delta near the Harvey O. Banks Pumping Plant, a flood or earthquake event that severely damages the Aqueduct along its San Joaquin Valley traverse, or an earthquake event along either the West or East Branches. Such events could impact some or all SWP contractors south of the Delta.

The response of DWR, SGPWA, and other SWP contractors to such events would be highly dependent on the type and location of any such event. In typical SWP operations, water flowing through the Delta is diverted at the SWP's main pumping facility, located in the southern Delta, and is pumped into the California Aqueduct. During the relatively heavier runoff period in the winter and early spring, Delta diversions generally exceed SWP contractor demands, and the excess is stored in San Luis Reservoir. SWP aqueduct terminal reservoirs, such as Pyramid and Castaic Lakes, are also replenished during these periods. During the summer and fall, when diversions from the Delta are generally more limited and less than contractor demands, releases from San Luis Reservoir are used to make up the difference in deliveries to contractors. The SWP share of maximum storage capacity at San Luis Reservoir is 1,062,000 AF.

SGPWA receives its SWP deliveries through the East Branch of the California Aqueduct. The other contractors receiving deliveries from the East Branch are Metropolitan Water District of Southern California, Antelope Valley-East Kern Water Agency, Palmdale Water District, Crestline-Lake Arrowhead Water Agency, Desert Water Agency, San Gabriel Valley Municipal Water District, San Bernardino Valley Municipal Water District, and Mojave Water Agency The East Branch has two terminal reservoirs, Silverwood Lake and Lake Perris, which were designed to provide emergency storage and regulatory storage (i.e., storage to help meet peak summer deliveries) for several of the East Branch contractors. However, SGPWA does not have contract rights to storage capacity in those reservoirs.

In addition to SWP storage south of the Delta in San Luis and the terminal reservoirs, a number of contractors have stored water in groundwater banking programs in the San Joaquin Valley and more recently along the East Branch, and many also have surface and groundwater storage within their own service areas.

Three scenarios that could impact the delivery to SGPWA of its SWP supply or other supplies delivered to it through the California Aqueduct are described below. For each of these scenarios, it was assumed that an outage of six months could occur. SGPWA's ability to meet demands during the worst of these scenarios is presented following the scenario descriptions.

FIGURE 7-1
PRIMARY SWP FACILITIES

7.4.2.1 Scenario 1: Emergency Freshwater Pathway

DWR has estimated that in the event of a major earthquake in or near the Delta, regular water supply deliveries from the SWP could be interrupted for up to three years, posing a substantial risk to the California business economy. Accordingly, a post-event strategy has been developed which would provide necessary water supply protections. The plan has been coordinated through DWR, the Army Corps of Engineers (Corps), Bureau of Reclamation, California Office of Emergency Services (Cal OES), the Metropolitan Water District of Southern California, and the State Water Contractors. Full implementation of the plan would enable resumption of at least partial deliveries from the SWP in less than six months.

DWR Delta Flood Emergency Management Plan. DWR has developed the Delta Flood Emergency Management Plan to provide strategies for a response to Delta levee failures, which addresses a range of failures up to and including earthquake-induced multiple island failures during dry conditions when the volume of flooded islands and salt water intrusion are large. Under such severe conditions, the plan includes a strategy to establish an emergency freshwater pathway from the central Delta along Middle River and Victoria Canal to the export pumps in the south Delta. The plan includes the pre-positioning of emergency construction materials at existing and new stockpiles and warehouse sites in the Delta, and development of tactical modeling tools (DWR Emergency Response Tool) to predict levee repair logistics, water quality conditions, and timelines of levee repair and suitable water quality to restore exports. The Delta Flood Emergency Management Plan has been extensively coordinated with state, federal and local emergency response agencies. DWR, in conjunction with local agencies, the Corps and Cal OES, regularly conduct simulated and field exercises to test and revise the plan under real time conditions.

DWR and the Corps provide vital Delta region response to flood and earthquake emergencies, complementary to an overall Cal OES structure. Cal OES is preparing its Northern California Catastrophic Flood Response Plan that incorporates the DWR Delta Flood Emergency Management Plan. These agencies utilize a unified command structure and response and recovery framework. DWR and the Corps, through a Draft Delta Emergency Operations Integration Plan (April 2014), would integrate personnel and resources during emergency operations.

Levee Improvements and Prioritization. The DWR Delta Levees Subvention Program has prioritized, funded, and implemented levee improvements along the emergency freshwater pathway and other water supply corridors in the central and south Delta region. These efforts have been complementary to the DWR Delta Flood Emergency Management Plan, which along with use of pre-positioned emergency flood fight materials in the Delta, relies on pathway and other levees providing reasonable seismic performance to facilitate restoration of the freshwater pathway after a severe earthquake. Together, these two DWR programs have been successful in implementing a coordinated strategy of emergency preparedness for the benefit of SWP and CVP export systems.

Significant improvements to the central and south Delta levee systems along Old and Middle Rivers began in 2010 and are continuing to the present time at Holland Island, Bacon Island, Upper and Lower Jones Tracts, Palm Tract and Orwood Tract. This complements substantially improved levees at Mandeville and McDonald Islands and portions of Victoria

and Union Islands. Together, levee improvements along the pathway and Old River levees consisting of crest raising, crest widening, landside slope fill and toe berms, meet the needs of local reclamation districts and substantially improve seismic stability to reduce levee slumping and create a more robust flood-fighting platform. Many urban water supply agencies have participated or are currently participating in levee improvement projects along the Old and Middle River corridors.

Assuming that the Banks Pumping Plant would be out of service for six months, DWR could continue making at least some SWP deliveries to all southern California contractors from water stored in San Luis Reservoir. The water available for such deliveries would be dependent on the storage in San Luis Reservoir at the time the outage occurred and could be minimal if it occurred in the late summer or early fall when San Luis Reservoir storage is typically low. In addition to supplies from San Luis Reservoir, water from the East Branch terminal reservoirs would also be available to the East Branch contractors, including SGPWA. SGPWA water stored in groundwater banking programs in the San Joaquin Valley may also be available for withdrawal and delivery to SGPWA.

7.4.2.2 Scenario 2: Complete Disruption of the California Aqueduct in the San Joaquin Valley

The 1995 flood event at Arroyo Pasajero demonstrated vulnerabilities of the California Aqueduct (the portion that traverses the San Joaquin Valley from San Luis Reservoir to Edmonston Pumping Plant). Should a similar flood event or an earthquake damage this portion of the aqueduct, deliveries from San Luis Reservoir could be interrupted for a period of time. DWR has informed the SWP contractors that a four-month outage could be expected in such an event. SGPWA's assumption for this Plan is a more conservative six-month outage.

Arroyo Pasajero is located downstream of San Luis Reservoir and upstream of the primary groundwater banking programs in the San Joaquin Valley. Assuming an outage at a location near Arroyo Pasajero that takes the California Aqueduct out of service for six months, supplies from San Luis Reservoir would not be available to those SWP contractors located downstream of that point. It is likely that in such an emergency, water from the East Branch terminal reservoirs would be made available to the East Branch contractors, including SGPWA.

7.4.2.3 Scenario 3: Complete Disruption of the East Branch of the California Aqueduct

The East Branch of the California Aqueduct begins at a bifurcation of the Aqueduct south of Edmonston Pumping Plant, which pumps SWP water through and across the Tehachapi Mountains. From the point of bifurcation, the East Branch is an open canal passing through Alamo Power Plant, Pearblossom Pumping Plant, and on to Silverwood Lake and Lake Perris.

If a major earthquake (an event similar to or greater than the 1994 Northridge earthquake) were to damage a portion of the East Branch, deliveries could be interrupted. The exact location of such damage along the East Branch would be key to determining emergency operations by DWR and the East Branch SWP contractors. For this scenario, it was assumed that the East Branch would suffer a single-location break and deliveries of SWP water from north of the Tehachapi Mountains would not be available. It was also assumed that Lake Perris and Silverwood Lake reservoirs would not be damaged by the event and that water in Lake Perris and Silverwood Lakes would be available to the East Branch SWP contractors, including SGPWA.

In any of these three SWP emergency outage scenarios, DWR and the SWP contractors would coordinate operations to minimize supply disruptions. Depending on the particular outage scenario or outage location, some or all of the SWP contractors south of the Delta might be affected. But even among those contractors, potential impacts would differ given each contractor's specific mix of other supplies and available storage. During past SWP outages, the SWP contractors have worked cooperatively to minimize supply impacts among all contractors. Past examples of such cooperation have included certain SWP contractors agreeing to rely more heavily on alternate supplies, allowing more of the outage-limited SWP supply to be delivered to other contractors, and exchanges among SWP contractors, allowing delivery of one contractor's SWP or other water to another contractor, with that water being returned after the outage was over.

Of these three SWP outage scenarios, the East Branch outage scenario presents the worst-case scenario for the SGPWA service area. In this scenario, the retail water suppliers would rely on local supplies and water available to SGPWA from Lake Perris and Silverwood Lakes. See Section 7.4.2 regarding recommendations for emergency outage storage using cooperative agreements with other East Branch SWP contractors and individual groundwater banking programs.

During such an outage, the local supplies available would consist of native and banked groundwater. It was assumed that local well production would be unimpaired by the outage and that the outage would occur during a year when average/normal supplies would be available. Note that adequate well and aquifer capacity exists to pump at levels higher than those assumed in this assessment, particularly during a temporary period such as an outage.

7.4.3 Regional Power Outage Scenarios

For a major emergency such as an earthquake, Southern California Edison (Edison) has declared that in the event of an outage, power would be restored within a 24 hour period. For example, following the 1994 Northridge earthquake, Edison was able to restore power within 19 hours. Edison experienced extensive damage to several key power stations, yet was still able to recover within a 24-hour timeframe.

SGPWA is committed to providing regular service and meeting the needs of the community during any emergency situation. SGPWA is obligated to respond to emergencies by using all available resources in the most effective way possible. Additionally, the East Branch Phase II Extension includes emergency and operational storage for the region.

7.5 Mandatory Prohibitions During Shortages

SGPWA is not a direct purveyor of retail water supplies and does not have any emergency powers or the authority to implement water shortage plans within its boundaries. It relies instead on efforts of the individual cities and water agencies. However, SGPWA does have an Ordinance No. 10 establishing a water shortage plan that allows the Agency to sell and deliver SWP water to these entities. SGPWA's Ordinance 10 requires customers taking direct delivery of SWP water from SGPWA to maintain a backup supply in the event of outages or shortages in supply from the SWP. SGPWA informs customers under Ordinance 10 that supplies are variable and interruptible, with no guarantee of a specified delivery quantity. Ordinance 10 is SGPWA's only authority to reduce water supplies to its customers during shortages. However, customers under Ordinance 10 represent only a small portion of the overall water

use within the SGPWA service area, with a majority of water users receiving water supply from groundwater production.

7.6 Consumption Reduction Methods During Restrictions

As explained in the previous section, SGPWA does not have the power to implement mandatory prohibitions during water supply shortages, with the exception of customers receiving direct SWP supplies under SGPWA Ordinance No. 10.

SGPWA will however manage water supplies to minimize the social and economic impact of water shortages. The Water Shortage Plan is designed to establish procedures for allocating reduced deliveries of water to Purchasers in the event of single or multiple-dry year and a shortage of water available to meet demands of Purchasers.

7.7 Penalties for Excessive Use

The penalties for excessive water use are stated in the text of the resolutions and ordinances outlined in Table 7-1 for the SGPWA and the regional retail agencies.

7.8 Financial Impacts of Actions During Shortages

During periods of reduced consumption, revenue from water sales will decline. Also, a natural disaster may entail unpredicted expenditures for repairs. Therefore, each retail water agency has plans to address financial challenges of water shortages that include a mix of temporary base rate adjustment, use of reserves, fines for violation of mandatory water use restrictions, and deferring of non-critical maintenance items and filling of some personnel vacancies.

SGPWA has sufficient operating funds to supplement any deficiencies in revenue caused from a water shortage.

7.9 Water Shortage Contingency Resolution

SGPWA has prepared a draft Water Shortage Contingency Plan, which is included in Appendix H.

7.10 Mechanism to Determine Reductions in Water Use

As explained in Section 7.5, SGPWA does not have the power to implement mandatory prohibitions during water supply shortages, with the exception of customers receiving direct SWP supplies under SGPWA Ordinance No. 10.

Appendix A – UWMP Checklist

CWC Section	UWMP Requirement	Subject	Guidebook Location	UWMP Location *(Optional Column for Agency Use)*
10620(b)	Every person that becomes an urban water supplier shall adopt an urban water management plan within one year after it has become an urban water supplier.	Plan Preparation	Section 2.1	**1.5.1**
10620(d)(2)	Coordinate the preparation of its plan with other appropriate agencies in the area, including other water suppliers that share a common source, water management agencies, and relevant public agencies, to the extent practicable.	Plan Preparation	Section 2.5.2	**1.5**
10642	Provide supporting documentation that the water supplier has encouraged active involvement of diverse social, cultural, and economic elements of the population within the service area prior to and during the preparation of the plan.	Plan Preparation	Section 2.5.2	**1.5.2, 6.1.2, 6.1.3, 6.2, 6.3**
10631(a)	Describe the water supplier service area.	System Description	Section 3.1	**1.6.1, 1.6.2, 1.6.3, 1.6.4**
10631(a)	Describe the climate of the service area of the supplier.	System Description	Section 3.3	**1.7, 1.8, 1.9**
10631(a)	Provide population projections for 2020, 2025, 2030, and 2035.	System Description	Section 3.4	**2.3**
10631(a)	Describe other demographic factors affecting the supplier's water management planning.	System Description	Section 3.4	**1.8, 1.9, 1.10**
10631(a)	Indicate the current population of the service area.	System Description and Baselines	Sections 3.4 and 5.4	**2.3**

CWC Section	UWMP Requirement	Subject	Guidebook Location	UWMP Location *(Optional Column for Agency Use)*
		and Targets		
10631(e)(1)	Quantify past, current, and projected water use, identifying the uses among water use sectors.	System Water Use	Section 4.2	**2.4, 2.5**
10631(e)(3)(A)	Report the distribution system water loss for the most recent 12-month period available.	System Water Use	Section 4.3	**2.4.1**
10631.1(a)	Include projected water use needed for lower income housing projected in the service area of the supplier.	System Water Use	Section 4.5	**N/A**
10608.20(b)	Retail suppliers shall adopt a 2020 water use target using one of four methods.	Baselines and Targets	Section 5.7 and App E	**N/A**
10608.20(e)	Retail suppliers shall provide baseline daily per capita water use, urban water use target, interim urban water use target, and compliance daily per capita water use, along with the bases for determining those estimates, including references to supporting data.	Baselines and Targets	Chapter 5 and App E	**N/A**
10608.22	Retail suppliers' per capita daily water use reduction shall be no less than 5 percent of base daily per capita water use of the 5 year baseline. This does not apply if the suppliers base GPCD is at or below 100.	Baselines and Targets	Section 5.7.2	**N/A**
10608.24(a)	Retail suppliers shall meet their interim target by December 31, 2015.	Baselines and Targets	Section 5.8 and App E	**N/A**
10608.24(d)(2)	If the retail supplier adjusts its compliance GPCD using weather normalization, economic adjustment, or extraordinary events, it shall	Baselines and Targets	Section 5.8.2	**N/A**

CWC Section	UWMP Requirement	Subject	Guidebook Location	UWMP Location *(Optional Column for Agency Use)*
	provide the basis for, and data supporting the adjustment.			
10608.36	Wholesale suppliers shall include an assessment of present and proposed future measures, programs, and policies to help their retail water suppliers achieve targeted water use reductions.	Baselines and Targets	Section 5.1	**6.3**
10608.40	Retail suppliers shall report on their progress in meeting their water use targets. The data shall be reported using a standardized form.	Baselines and Targets	Section 5.8 and App E	**N/A**
10631(b)	Identify and quantify the existing and planned sources of water available for 2015, 2020, 2025, 2030, and 2035.	System Supplies	Chapter 6	**Table 3-1**
10631(b)	Indicate whether groundwater is an existing or planned source of water available to the supplier.	System Supplies	Section 6.2	**3.4**
10631(b)(1)	Indicate whether a groundwater management plan has been adopted by the water supplier or if there is any other specific authorization for groundwater management. Include a copy of the plan or authorization.	System Supplies	Section 6.2.2	**3.4**
10631(b)(2)	Describe the groundwater basin.	System Supplies	Section 6.2.1	**3.4.2**
10631(b)(2)	Indicate if the basin has been adjudicated and include a copy of the court order or decree and a description of the amount of water the supplier has the legal right to pump.	System Supplies	Section 6.2.2	**3.4, Appendix G**
10631(b)(2)	For unadjudicated basins, indicate whether or not the department has identified the basin as overdrafted, or	System Supplies	Section 6.2.3	**3.4**

CWC Section	UWMP Requirement	Subject	Guidebook Location	UWMP Location *(Optional Column for Agency Use)*
	projected to become overdrafted. Describe efforts by the supplier to eliminate the long-term overdraft condition.			
10631(b)(3)	Provide a detailed description and analysis of the location, amount, and sufficiency of groundwater pumped by the urban water supplier for the past five years	System Supplies	Section 6.2.4	**3.4**
10631(b)(4)	Provide a detailed description and analysis of the amount and location of groundwater that is projected to be pumped.	System Supplies	Sections 6.2 and 6.9	**3.4**
10631(d)	Describe the opportunities for exchanges or transfers of water on a short-term or long-term basis.	System Supplies	Section 6.7	**3.3**
10631(g)	Describe the expected future water supply projects and programs that may be undertaken by the water supplier to address water supply reliability in average, single-dry, and multiple-dry years.	System Supplies	Section 6.8	**3.3, 3.3.2**
10631(h)	Describe desalinated water project opportunities for long-term supply.	System Supplies	Section 6.6	**3.5**
10631(j)	Retail suppliers will include documentation that they have provided their wholesale supplier(s) – if any - with water use projections from that source.	System Supplies	Section 2.5.1	**N/A**
10631(j)	Wholesale suppliers will include documentation that they have provided their urban water suppliers with identification and quantification of the existing and planned sources of water available from the wholesale to the urban supplier during	System Supplies	Section 2.5.1	**1.5**

Table 7-1 Wholesale: Basis of Water Year Data			
Year Type	**Base Year** *If not using a calendar year, type in the last year of the fiscal, water year, or range of years, for example, water year 1999-2000, use 2000*	**Available Supplies if Year Type Repeats**	
		☑ Quantification of available supplies is not compatible with this table and is provided elsewhere in the UWMP. Location _____	
		☐ Quantification of available supplies is provided in this table as either volume only, percent only, or both.	
		Volume Available	**% of Average Supply**
Average Year	2003		100%
Single-Dry Year	1977		
Multiple-Dry Years 1st Year	1931		
Multiple-Dry Years 2nd Year	1932		
Multiple-Dry Years 3rd Year	1933		
Multiple-Dry Years 4th Year *Optional*	1934		
Multiple-Dry Years 5th Year *Optional*			
Multiple-Dry Years 6th Year *Optional*			
Agency may use multiple versions of Table 7-1 if different water sources have different base years and the supplier chooses to report the base years for each water source separately. If an agency uses multiple versions of Table 7-1, in the "Note" section of each table, state that multiple versions of Table 7-1 are being used and identify the particular water source that is being reported in each table. Suppliers may create an additional worksheet for the additional tables.			
NOTES: UWMP Section 5.2

2015 Urban Water Management Plan for the San Gorgonio Pass Water Agency

San Gorgonio Pass Water Agency is undertaking review, update, and revision of its Urban Water Management Plan. San Gorgonio Pass Water Agency is located in Riverside County and serves the residents of the Cities of Calimesa, Beaumont, and Banning, as well as other unincorporated areas such as Cherry Valley, Cabazon, Poppet Flat, and the Banning Bench. The Urban Water Management Planning Act requires every "urban water supplier" of a certain size to prepare and adopt an Urban Water Management Plan (UWMP) at least once every five years. The UWMP is a planning document in which water suppliers evaluate and compare their water supply and reliability to their existing and projected demands. A complete UWMP is necessary for San Gorgonio Pass Water Agency to remain eligible for state drought water bank assistance and is a requirement of state grant and loan funding programs.

The 2015 UWMP will include an update of anticipated water demands in the San Gorgonio Pass Water Agency service area. Concurrent with the UWMP Update San Gorgonio Pass Water Agency will revise its Water Shortage Contingency Plan (WSCP). San Gorgonio Pass Water Agency is encouraging participation by land use agencies, water use agencies, and other interested parties in the UWMP and WSCP. San Gorgonio Pass Water Agency would like to extend to your agency an opportunity to meet with us to go over the various elements of the UWMP and WSCP, including assumptions about future population, future water demand, future water supplies, and upcoming water conservation programs.

We anticipate that a draft UWMP and WSCP will be available for public review starting in April 2016 and the Agency will hold a public hearing in June 2016, prior to adoption of the UWMP and WSCP. Hence we would like to solicit your input in the near future.

If your agency would like to learn more about the Urban Water Management Plan and Water Shortage Contingency Plan, please contact Jeff Davis, General Manager, 951/845-2577, JDavis@sgpwa.com, no later than February 29, 2016.

Sincerely,

Jeff Davis

2015 Urban Water Management Plan for the San Gorgonio Pass Water Agency

San Gorgonio Pass Water Agency is undertaking review, update, and revision of its Urban Water Management Plan. San Gorgonio Pass Water Agency is located in Riverside County and serves the residents of the Cities of Calimesa, Beaumont, and Banning, as well as other unincorporated areas such as Cherry Valley, Cabazon, Poppet Flat, and the Banning Bench. The Urban Water Management Planning Act requires every "urban water supplier" of a certain size to prepare and adopt an Urban Water Management Plan (UWMP) at least once every five years. The UWMP is a planning document in which water suppliers evaluate and compare their water supply and reliability to their existing and projected demands. A complete UWMP is necessary for San Gorgonio Pass Water Agency to remain eligible for state drought water bank assistance and is a requirement of state grant and loan funding programs.

The 2015 UWMP will include an update of anticipated water demands in the San Gorgonio Pass Water Agency service area. Concurrent with the UWMP Update San Gorgonio Pass Water Agency will revise its Water Shortage Contingency Plan (WSCP). San Gorgonio Pass Water Agency is encouraging participation by land use agencies, water use agencies, and other interested parties in the UWMP and WSCP. San Gorgonio Pass Water Agency would like to extend to your agency an opportunity to meet with us to go over the various elements of the UWMP and WSCP, including assumptions about future population, future water demand, future water supplies, and upcoming water conservation programs.

We anticipate that a draft UWMP and WSCP will be available for public review starting in September 2016 and the Agency will hold a public hearing in October 2016, prior to adoption of the UWMP and WSCP. Hence we would like to solicit your input in the near future.

If your agency would like to learn more about the Urban Water Management Plan and Water Shortage Contingency Plan, please contact Jeff Davis, General Manager, 951/845-2577, JDavis@sgpwa.com, no later than July 15, 2016.

Sincerely,

Jeffry W. Davis

Mr. Jeff Davis, General Manager
San Gorgonio Pass Water Agency
1210 Beaumont Avenue
Beaumont, California 92223

Subject: Demand Projections by the Yucaipa Valley Water District

Dear Mr. Davis:

I have reviewed your email message dated Wednesday, September 21, 2016 (attached), regarding *Table 12-16, SGPWA Wholesale Supplies - Existing and Planned Sources* contained within the Yucaipa Valley Water District's ("District") Urban Water Management Plan. As shown below, Table 12-16 summarized the projected imported water demands needed by the Yucaipa Valley Water District from the San Gorgonio Pass Water Agency to meet our projected water demands.

Table 12-16. SGPWA Wholesale Supplies – Existing and Planned Sources of Water (AF)

Imported Water Demands	2015	2020	2025	2030	2035	2040
Drinking Water Demands: Yucaipa Valley Water Filtration Facility	454	609	767	962	1,191	1,444
Conjunctive Use Demands: Local Water Banking	0	1,200	1,200	1,200	1,200	1,200
New Development Long-Term Supply Sustainability Program	0	2,504	3,040	3,596	4,344	3,407
Total	454	4,313	5,007	5,758	6,735	6,051

The following explanation should help clarify the imported water demands contained within Table 12-16:

- *Drinking Water Demands: Yucaipa Valley Water Filtration Facility* - This row within Table 12-16 identifies the quantity of imported water needed to be delivered at Yucaipa Valley Turnout No. 1 for the Yucaipa Valley Regional Water Filtration Facility to provide drinking water to area served within the boundary of both Yucaipa Valley Water District and San Gorgonio Pass Water Agency. This quantity of imported water is needed to meet existing water demands that are expected to increase in the future.
- *Conjunctive Use Demands: Local Water Banking* - This row within Table 12-16 identifies the quantity of imported water needed to be delivered to either the Beaumont Avenue

Directors and Officers

KENNETH P. MUÑOZ, Division 1 | BRUCE GRANLUND, Division 2 | JAY BOGH, Division 3 | LONNI GRANLUND, Division 4 | THOMAS SHALHOUB, Division 5 | JOSEPH B. ZOBA, General Manager and Secretary

Recharge Facility or the Beaumont Cherry Valley Water District's Spreading Basins to replenish groundwater that is currently extracted by the Yucaipa Valley Water District within the Beaumont Basin. This is a high priority for the Yucaipa Valley Water District in compliance with the San Gorgonio Pass Water Agency Act, Chapter 101-15.5. This quantity of imported water is needed to meet unfulfilled prior year water demands by the San Gorgonio Pass Water Agency and existing water demands that are expected to provide a baseline of 1,200 acre feet per year of water demands. The Yucaipa Valley Water District will be prepared to recharge this quantity of imported water prior to 2020.

- *New Development Long-Term Supply: Sustainability Program* - This row within Table 12-16 identifies the quantity of imported water needed to be delivered to either the Beaumont Avenue Recharge Facility or the Beaumont Cherry Valley Water District's Spreading Basins to ensure there is sufficient water resources available to sustain new development within the service area of the Yucaipa Valley Water District.

It is my understanding that the Regional Urban Water Management Plan prepared by the San Gorgonio Pass Water Agency will provide the urban water suppliers within your service area with sufficient information to identify and quantify the available imported water supplies assigned to each agency and projected in increments of five years, from 2015 through 2035 and for average, single, and multiple-dry years. In order to facilitate the review of the Regional Urban Water Management Plan, I would appreciate three hardcopies of the Draft San Gorgonio Pass Water Agency Regional Urban Water Management Plan. Please forward the copies to Jennifer Ares, Water Resource Manager at our main office.

Please do not hesitate to contact me if there are any further questions regarding the Yucaipa Valley Water District's Urban Water Management Plan.

Sincerely,

Joseph B. Zoba
General Manager

cc: Jennifer Ares, Water Resource Manager

Jeff Davis <JDavis@sgpwa.com>

UWMP Numbers

To Joseph Zoba

Joe,

Here is a table from your UWMP that gets us to the 4313 AF demand on the Agency in 2020:

Table 12-16. SGPWA Wholesale Supplies – Existing and Planned Sources of Water (AF)

Imported Water Demands	2015	2020	2025	2030	2035	2040
Drinking Water Demands:						
Yucaipa Valley Water Filtration Facility	454	609	767	962	1,191	1,444
Conjunctive Use Demands:						
Local Water Banking	0	1,200	1,200	1,200	1,200	1,200
New Development Long-Term Supply						
Sustainability Program	0	2,504	3,040	3,596	4,344	3,407
Total	454	4,313	5,007	5,758	6,735	6,051

So that I can explain this in my UWMP, can you please give me a better idea of what the 1200 AF is for? I'm not sure we have ever talked about that, or if we have, I forget. That would really help me in putting together our UWMP. I get the other numbers; I think they are pretty clear. The 2504 is for your sustainability program. Any help you can provide would be great.

On a separate but related topic, I have been thinking about our cooperative agreement and the pressure from some developers to move forward immediately. I was thinking that we (you) could make it an option, if they want to be assured of proceeding this year (or, more likely, next year), to add to their fees enough water to buy spot water for their sustainability water. I could probably come up with a rough price for that. That way, if a developer wants assurance of getting water next year, he could get it by paying extra. I would price the spot water at a high rate and if we get it for less money, we would provide a refund to the developer for funds not used. If they didn't want to pay extra, then they would be taking a chance that we would have water available next year over and above annual demands for their sustainability water. If it's a wet year, they would probably get it. If it's a dry or average year, they probably would not. What do you think of providing this as an option?

Jeff Davis
San Gorgonio Pass Water Agency
General Manager
951/845-2577

Appendix D: Climate Change

Appendix G: Climate Change Vulnerability Checklist

This page intentionally left blank.

Climate Change Vulnerability Checklist

Changes related to climate change in the IRWM guidelines made between the 2010 and 2012 versions need to be addressed. The new IRWM plan must include a list of prioritized vulnerabilities based on the vulnerability assessment checklist as well as a plan, program, or methodology for further data gathering and analysis of the prioritized vulnerabilities. Below is the vulnerability assessment checklist for the Upper Santa Ana River IRWM planning area.

Water Demand:

Are there major industries that require cooling/processed water in your planning region?

- The Mountain View power plant brings power to more than 685,000 homes. This high energy output requires the plant to utilize municipal effluent as well as ground water for cooling. The facility loses 3,300 gallons of water per minute to evaporation from the cooling towers, but for every pound of water that evaporates approximately 1,000 BTUs of heat are extracted. It also has a water treatment plant on site that recovers 75-80% of water that would normally have been disposed of. This recycling process has kept Redlands waste water fees at some of the lowest levels in the state. Despite the fact that the plant uses thirty percent less energy compared to other plants, it is the highest polluting power plant in the state; producing 1.85 million metric tons of carbon dioxide per year.

Does water use vary by more than 50% seasonally in parts of your region?

- The Inland Empire climate varies greatly from summer to winter, and therefore water demand varies accordingly. There is a greater demand for irrigation needs during the hotter season that drives up the per capita water use.

Are crops in your region climate sensitive? Would shifts in daily heat patterns, such as how long heat lingers before night-time cooling, be prohibitive for some crops?

- Citrus trees are not tolerable of below freezing temperatures. Colder winters with freezing nights have the potential to cause significant damage to citrus crops. In response to higher temperatures, evapotranspiration rates of the plants may increase, requiring more water to be used on warmer days

Do groundwater supplies in your region lack resiliency after drought events?

- Typically groundwater supplies do not lack resiliency because groundwater is replenished and stored in wet years.

Are water use curtailment measures effective in your region?

- Conservation efforts in the area include The Water Conservation Education Program, Weather Based Irrigation Controllers Program, “climate appropriate” plant promotion with Home Depot stores and other stores and nurseries, and the water conservation demonstration garden at California State University San Bernardino. These programs have begun to address the conservation needs of the area without implementing direct curtailment measures. Commercial, industrial, and institutional water reduction plans are also in place.

Are some in stream flow requirements in your region either currently insufficient to support aquatic life, or occasionally unmet?

- The in stream flows are sufficient to support aquatic life because natural flows are augmented by Publically Owned Treatment Works flows that are highly treated.

Water Supply:

Does a portion of the water supply in your region come from snowmelt?

- The water supply in the region does not come from snowmelt.

Does part of your region rely on water diverted from the Delta, imported from the Colorado River or imported from other climate-sensitive systems outside of your region?

- State Water Project water has been made available to East Valley. The water for the region is currently 57% ground water, 24% State Water Project water, 17% surface water, and 2% recycled water. The region does not rely on any water imported from the Colorado River.

Does part of your region rely of coastal aquifers? Has salt intrusion been a problem in the past?

- The region does not rely on coastal aquifers, but salt intrusion could affect the function of the State Water Project, which could ultimately have an impact on water supplies.

Would your region have difficulty in storing carryover supply surpluses from year to year?

- The region would only have issues storing surplus water in times when the basins are already saturated.

Has your region faced a drought in the past during which it failed to meet local water demands?

- The region has not faced a drought in which it was unable to meet local water demands.

Does your region have invasive species management issues at your facilities, along conveyance structures, or in habitat areas?

- The region has two invasive species, the Giant Reed and the Tamarisk Annual Grass. The Giant Reed was introduced in California in the 1820's in an attempt to help control erosion, but has since become an invasive plant. It has increased the fire fuel by 30% in the Santa Ana Basin area and also has the potential to cause major issues during floods. In addition to these issues, the Giant Reed uses 56,200 acre-ft per year in the Santa Ana River, decreasing the amount of water available to the population. Tamarisk was introduced as an ornamental planet, but has become invasive as it absorbs a large amount of water and creates salt deposits. Its seeds are dispersed by wind, have no dormancy requirements, and have a 24 hour germination period, allowing it to spread quickly and easily.

Water Quality:

Are increased wildfires a threat in your region? If so, does your region include reservoirs with fire-susceptible vegetation nearby which could pose a water quality concern from increased erosion?

- Wildfires are a threat in the region, especially during dry summers.

Does part of your region rely on surface water bodies with current or recurrent water quality issues related to eutrophication, such as low dissolved oxygen or algal blooms? Are there other water quality constituents potentially exacerbated by climate change?

- Big Bear Lake has had issues with high nitrogen and nutrient levels that promote algal growth. Although the lake is no longer a main water supply source, its contaminant levels affect recreational activity. The Middle Santa Anna River Watershed has been found to have issues with pathogens and high coliform count.

Are seasonal low flows decreasing for some water bodies in your region? If so, are the reduced flows limiting the water bodies' assimilative capacity?

- Flow levels for the water bodies in the region have been consistent with weather conditions.

Are there beneficial uses designated for some water bodies in your region that cannot always be met due to water quality issues?

- Big Bear Lake is a popular recreational area for swimming, boating and fishing in the San Bernardino Mountains. It was originally created by Bear Valley Mutual Water Company to serve as a storage reservoir in order to provide agricultural water to the customers downstream. Big Bear Lake faces many water quality issues that have the potential to affect its recreational uses. In 1990 Big Bear Lake was added to California's list of impaired water bodies by the Santa Ana Regional Water Quality Control Board. A Total Maximum Daily Load was implemented in 2007 in order to protect the lake's beneficial uses. Various water bodies in the Middle Santa Ana River Watershed were also added to the list of impaired water bodies in 1994 because the fecal coliform objective was exceeded, ultimately affecting the water contact recreation of the area. The table below lists the pollutants affecting the Big Bear Lake Watershed and the Middle Santa Ana Watershed.

Table 7: Pollutants Effecting Water bodies

Santa Ana Region Pollutants	
Water Body	Pollutants
Big Bear Lake Watershed	
Big Bear Lake	Metals, Noxious aquatic plants and Nutrients, Sedimentation/Siltation, and Mercury
Grout Creek	Metals and Nutrients
Knickerbocker Creek	Metals and Pathogens
Rathbone Creek	Nutrients and Sedimentation/Siltation
Summit Creek	Nutrients
Middle Santa Ana River Watershed	
Chino Creek, Reach 1	Pathogens
Chino Creek, Reach 2	High Coliform Count
Cucamonga Creek, Valley Ranch	High Coliform Count
Mill Creek (Prado Area)	Pathogens
Santa Ana River, Reach 3	Pathogens and Nitrate
Prado Park Lake	Pathogens

Does part of your region currently observe water quality shifts during rain events that impact treatment facility operation?

- The region does not observe water quality shifts during rain events that impact water treatment facility operations.

Sea Level Rise:

Has coastal erosion already been observed in your region?

- Coastal erosion has not been observed in the region.

Are there coastal structures, such as levees or breakwaters, in your region?

- There are no coastal structures in the region.

Is there significant coastal infrastructure, such as residences, recreation, water and wastewater treatment, tourism, and transportation at less than six feet above mean sea level in your region?

- There is no infrastructure less than six feet above mean sea level.

Are there climate-sensitive low-lying coastal habitats in your region?

- There are no climate-sensitive low-lying coastal habitats in the region.

Are there areas in your region that currently flood during extreme high tides or storm surges?

- There are no areas in the region that flood during extreme high tides or storm surges do to coastal waters.

Is there land subsidence in the coastal area of your region?

- There is no land subsidence in the coastal area of the region.

Do tidal gauges along the coastal parts of your region show an increase over the past several decades?

- There are no coastal parts in the region.

Flooding:

Does critical infrastructure in your region lie within the 200-year floodplain?

- The 200-year floodplain is not available at this time, but infrastructure such as Crafton Elementary School lies in the 100 year floodplain provided by FEMA for The Zanja as well as many buildings along the Santa Ana.

Does part of your region lie within the Sacramento-San Joaquin Drainage District?

- The region does not lie within the Sacramento-San Joaquin Drainage District.

Does aging critical flood protection infrastructure exist in your region?

- Flood protection in the area has been in place for several decades, but improvements have been made in the last decade. The federal Santa Ana River Mainstream project includes the Seven Oaks Dam, Prado Dam, and other flood control facilities along the Santa Ana River, which provide flood protection to the residents of San Bernardino, Riverside, and Orange Counties. The Seven Oaks Dam was completed in 1999 and the construction of the SAR project began in 1989.

Have flood control facilities (such as impoundment structures) been insufficient in the past?

- Flood control facilities have failed as recently as December 2010, when several creeks and debris basins overflowed and flooded the City of Highland.

Are wildfires a concern in parts of your region?

- Wildfires have always been a concern for the region. An example would be the Old Fire in 2003, which burned 91,281 acres, destroyed 993 homes, and killed 6 people. During this incident The East Valley Water District advised residents in certain areas to boil water for drinking and eating in order to ensure that the water was safe to drink.

Ecosystem and Habitat Vulnerability:

Does your region include inland or coastal aquatic habitats vulnerable to erosion and sedimentation issues?

- The region does not include inland or coastal aquatic habitats vulnerable to erosion.

Does your region include estuarine habitats which rely on seasonal freshwater flow patterns?

- The region does not include estuarine habitats.

Do climate-sensitive fauna or flora populations live in your region?

- Climate sensitive plants live in the region.

Do endangered or threatened species exist in your region? Are changes in species distribution already being observed in parts of your region?

- Endangered species live in the region.

Does the region rely on aquatic or water-dependent habitats for recreation or other economic activities?

- The region does rely on aquatic habitats for recreational purposes, as is the case for Big Bear Lake and Middle Santa Ana.

Are there rivers in your region with quantified environmental flow requirements or known water quality/quantity stressors to aquatic life?

- There are rivers in the region with water quality stressors such as Middle Santa Ana.

Do estuaries, coastal dues, wetlands, marshes, or exposed beaches exist in your region? If so, are coastal storms possible/frequent in your region?

- Exposed coastal areas do not exist in the region.

Does your region include one or more of the habitats described in the Endangered Species Coalition's Top 10 habitats vulnerable to climate change?

- The region does not include any of the habitats described in the Endangered Species Coalition's Top 10 habitats vulnerable to climate change.

Are there areas of fragmented estuarine, aquatic, or wetland wildlife habitat within your region? Are there movement corridors for species to naturally migrate? Are there infrastructure projects planned that might preclude species movement?

- The region is not aware of fragmented wildlife habitat within the region, or infrastructure projects planned that might preclude species movement.

Hydropower:

Is hydropower a source of electricity in your region?

- The hydropower stations located in the area include the Santa Ana No 1 & 2, Mill Creek No 2 & 3, San Gorgonio, and Lytle Creek. These stations are owned and operated by the Southern California Edison Company and produce 12.63 MW of electricity. Below lists the generating capacity of each location.

Hydropower Station Capacity	
Hydropower Station	**Generating Capacity (MW)**
Santa Ana No 1 & 2	6.3
Mill Creek No 1 & 2	3.23
San Gorgonio	2.63
Lytle Creek	0.45
Devil Canyon	276.46
Fontana Sandhill WTP Hydropower Facility	0.31

Are energy needs in your region expected to increase in the future? If so, are there future plans for hydropower generating facilities or conditions for hydropower generation in your region?

- There are currently no future plans for more hydropower generation facilities in the region.

The above checklist demonstrates the areas for which the region is most vulnerable.

Water Audit Report for: San Gorgonio Pass Water Agency (CA3610019)
Reporting Year: 2015 (1/2015 - 12/2015)

Please enter data in the white cells below. Where available, metered values should be used; if metered values are unavailable please estimate a value. Indicate your confidence in the accuracy of the input data by grading each component (n/a or 1-10) using the drop-down list to the left of the input cell. Hover the mouse over the cell to obtain a description of the grades

All volumes to be entered as: ACRE-FEET PER YEAR

To select the correct data grading for each input, determine the highest grade where the utility meets or exceeds all criteria for that grade and all grades below it.

Master Meter and Supply Error Adjustments

WATER SUPPLIED

<---------- Enter grading in column 'E' and 'J' ---------->

	Grading	Value		Pcnt:	Value:
Volume from own sources:	10	0.000 acre-ft/yr			acre-ft/yr
Water imported:	7	3,481.000 acre-ft/yr	7		acre-ft/yr
Water exported:	10	0.000 acre-ft/yr			acre-ft/yr

Enter negative % or value for under-registration
Enter positive % or value for over-registration

WATER SUPPLIED: 3,481.000 acre-ft/yr

AUTHORIZED CONSUMPTION

Click here: ? for help using option buttons below

	Grading	Value	Pcnt:	Value:
Billed metered:	10	3,476.000 acre-ft/yr		
Billed unmetered:	10	0.000 acre-ft/yr		
Unbilled metered:	10	0.000 acre-ft/yr		
Unbilled unmetered:	10	0.000 acre-ft/yr		0.000 acre-ft/yr

Use buttons to select percentage of water supplied **OR** value

AUTHORIZED CONSUMPTION: 3,476.000 acre-ft/yr

WATER LOSSES (Water Supplied - Authorized Consumption)

5.000 acre-ft/yr

Apparent Losses

	Grading	Value	Pcnt:	Value:
Unauthorized consumption:	5	0.000 acre-ft/yr		0.000 acre-ft/yr
Customer metering inaccuracies:	10	3.479 acre-ft/yr	0.10%	acre-ft/yr
Systematic data handling errors:	5	0.000 acre-ft/yr		0.000 acre-ft/yr

Apparent Losses: 3.480 acre-ft/yr

Real Losses (Current Annual Real Losses or CARL)

Real Losses = Water Losses - Apparent Losses: 1.520 acre-ft/yr

WATER LOSSES: 5.000 acre-ft/yr

NON-REVENUE WATER

NON-REVENUE WATER: 5.000 acre-ft/yr

= Water Losses + Unbilled Metered + Unbilled Unmetered

SYSTEM DATA

	Grading	Value	
Length of mains:	10	5.4	miles
Number of active AND inactive service connections:	10	1	
Service connection density:		0	conn./mile main
Are customer meters typically located at the curbstop or property line?		No	
Average length of customer service line:	10	0.0	ft
Average operating pressure:	5	100.0	psi

(length of service line, beyond the property boundary, that is the responsibility of the utility)

COST DATA

	Grading	Value	
Total annual cost of operating water system:	10	$13,380,700	$/Year
Customer retail unit cost (applied to Apparent Losses):	8	$12.30	$/1000 gallons (US)
Variable production cost (applied to Real Losses):	8	$157.00	$/acre-ft

☐ Use Customer Retail Unit Cost to value real losses

WATER AUDIT DATA VALIDITY SCORE:

*** YOUR SCORE IS: 80 out of 100 ***

A weighted scale for the components of consumption and water loss is included in the calculation of the Water Audit Data Validity Score

PRIORITY AREAS FOR ATTENTION:

Based on the information provided, audit accuracy can be improved by addressing the following components:

1: Water imported
2: Unauthorized consumption
3: Systematic data handling errors

Appendix F: Yuba Accord

STATE OF CALIFORNIA
THE RESOURCES AGENCY
DEPARTMENT OF WATER RESOURCES

AGREEMENT FOR THE SUPPLY AND CONVEYANCE OF WATER BY THE DEPARTMENT OF WATER RESOURCES OF THE STATE OF CALIFORNIA TO THE PARTICIPATING STATE WATER PROJECT CONTRACTORS UNDER THE DRY YEAR WATER PURCHASE PROGRAM SWPAO NO. 08-827

THIS AGREEMENT is entered into as of the _____day of _____, 2014, pursuant to the provisions of the California Water Resources Development Bond Act, the State Central Valley Project Act, and other applicable laws of the State of California, between the Department of Water Resources of the State of California, herein referred to as "DWR," and Mojave Water Agency, a public agency in the State of California, herein referred to as the "AGENCY." DWR and the AGENCY are herein referred to separately as the "Party" and collectively as the "Parties."

RECITALS

A. In 2008 and probably for several years to come, because of hydrologic conditions and/or regulatory constraints, the operation of the State Water Project ("SWP") by DWR and the operation of the Central Valley Project ("CVP") by the United States Bureau of Reclamation ("Reclamation") may result in less water being made available to the south-of-Delta CVP water service contractors and the SWP contractors. In anticipation of such potential conditions, DWR is initiating a dry year water purchase program to acquire water from voluntary sellers to augment the water supplies.

B. The Yuba County Water Agency ("Yuba") is engaged in the Yuba River Accord initiative ("Yuba River Accord") to resolve issues associated with operation of the Yuba Project in a way that protects lower Yuba River fisheries and local water-supply reliability, while providing revenues for local flood control projects, water to use for protection and restoration of Delta fisheries, and improvements in state-wide water supply management.

C. The Yuba River Accord includes three major elements, all of which must be in place for the Yuba River Accord to become effective: (1) the Fisheries Agreement (dated November 3, 2007) to provide higher flows for fish in the lower Yuba River under certain conditions, (2) Conjunctive Use Agreements between Yuba and water districts within Yuba County for implementing a conjunctive use and water use efficiency program; and (3) the "Agreement for the Long-Term Purchase of Water from Yuba County Water Agency by the Department of Water Resources" (dated December 4, 2007) ("Yuba Water Purchase Agreement").

D. DWR and Yuba entered into the Yuba Water Purchase Agreement as part of the Yuba River Accord to purchase specified Components of water for the benefit of the EWA, the SWP contractors, and the member agencies of the San Luis & Delta-Mendota Water Authority ("Authority") to resolve potential conflicts concerning the accounting for water that Yuba will release pursuant to the Fisheries Agreement.

E. Reclamation determined to not be a party to the Yuba Water Purchase Agreement. Yuba and DWR will amend the Yuba Water Purchase Agreement at such time as Reclamation is willing to become a party thereto, subject to Reclamation and DWR

entering into a separate agreement for the allocation of, and payment for, water under the Yuba Water Purchase Agreement.

F. Consistent with the Yuba Water Purchase Agreement, when Yuba makes water available to DWR under the Yuba River Accord for benefit of the SWP contractors and the Authority, DWR intends to offer the water under the dry year water purchase program to the Participating SWP Contractors and to the Authority as set forth herein.

G. The SWP contractors and the Authority invested significant resources to assist DWR and Yuba with the development of the Yuba River Accord, the Yuba Water Purchase Agreement, and supporting documentation.

H. The Parties desire to enter into this water supply and conveyance agreement whereby DWR will purchase water under the Yuba River Accord for the dry year water purchase program to make available for purchase by the SWP contractors, including the AGENCY, and the Authority.

AGREEMENT

Now Therefore, in accordance with the Recitals and in consideration of the terms and conditions herein, the Parties agree to the following:

1. DEFINITIONS

When used in this Agreement, the following definitions will apply:

"**Balanced Conditions**" means the hydrologic condition of the Delta as defined in the November 24, 1986 "Agreement between the United States of America and the State of California for Coordinated Operations of the Central Valley Project and the State Water Project."

"**Banks Pumping Plant**" means a SWP facility in the south Delta owned and operated by DWR.

"CALFED" means the joint federal and California program intended to develop and implement a long-term comprehensive plan that will, among other purposes, restore ecological health of the Bay-Delta System and improve water project management.

"Carriage Water" means the water losses due to increased Delta outflow necessary to maintain baseline Delta salinity conditions as determined by DWR, that are associated with Delivered Transfer Water or Stored Released Transfer Water that is exported by CVP or SWP Delta pumping facilities.

"Component 1 Water" means the water supplies available to DWR pursuant to Section 5 of the Yuba Water Purchase Agreement.

"Component 2 Water" means the water supplies available to DWR pursuant to Section 6 of the Yuba Water Purchase Agreement.

“Component 3 Water” means the water supplies available to DWR pursuant to Section 7 of the Yuba Water Purchase Agreement.

“Component 4 Water” means the water supplies available to DWR pursuant to Section 8 of the Yuba Water Purchase Agreement.

“**Conference Year**” means a Water Year for which the North Yuba Index is less than 500,000 acre-feet, calculated according to the procedures and formulas set forth in Exhibits 4 and 5 of the Fisheries Agreement, and using the latest available forecasts for the Water Year.

“Delivered Transfer Water” means Released Transfer Water from Yuba that is accounted as being exported by the SWP and the CVP, or contributing to exports, as described in Section 5 of Exhibit 1 of the Yuba Water Purchase Agreement.

"EWA" means the Environmental Water Account program described in the CALFED Record of Decision and the EWA Operating Principles Agreement (August 28, 2000, as extended in September 2004), as extended by amendment and supplemental approvals, or a long-term environmental water account program.

“**Fisheries Agreement**” means the agreement among Yuba, the California Department of Fish and Game, and other parties, which is part of the Yuba River

Accord, and under which Yuba operates the Yuba Project to provide higher flows in the lower Yuba River under certain conditions to improve fisheries protection.

“Final Classification” means the year-type classification for the Sacramento River region in the May issue of DWR’s Bulletin 120.

"Management Committee" means the committee, consisting of one representative each from Yuba, DWR, Reclamation, the CALFED fishery agencies on behalf of EWA, SWP contractors, and the Authority, established under Section 14 ("Technical Committee and Management Committee") of the Yuba Water Purchase Agreement.

“Participating SWP Contractors” means all SWP contractors that have executed an **“**Agreement for the Supply and Conveyance of Water By the Department of Water Resources of the State of California to the Participating SWP Contractors Under the Dry Year Water Purchase Program” on or before April 1, 2008.

“**Purchased Water**” means the supply of Component 1 Water that is not used by the EWA as provided in Section 3.B.1.a, Component 2 Water, Component 3 Water, and Component 4 Water that has been delivered by Yuba to DWR that is accounted for as Delivered Transfer Water in the manner set forth in Exhibit 1 (“Scheduling and Accounting Principles”) of the Yuba Water Purchase Agreement

and made available for the dry year water purchase program. Purchased Water includes Carriage Water or water used as Delta outflow when the Export/Inflow ratio is controlling in the time period of July 1 to January 31.

“SWP Long-Term Water Supply Contract” means the long-term water supply contract between the Parties, as amended.

"Technical Committee" means the committee, consisting of technical representatives from Yuba, DWR, Reclamation, the CALFED fishery agencies on behalf of EWA, SWP contractors, and the San Luis & Delta-Mendota Water Authority, established under Section 14 ("Technical Committee and Management Committee") of the Yuba Water Purchase Agreement.

"Water Accounting Year" means the twelve-month period commencing January 1 through December 31.

“**Water Year**” means the twelve-month period from October 1 of one year through September 30 of the following year. For this Agreement, each Water Year will be classified: (1) as "Wet," "Above-Normal," "Below-Normal," "Dry" or "Critical," based on the Sacramento Valley Water Year Hydrologic Classification in Figure 1 on page 188 of the State Water Resources Control Board's March 15, 2000, Revised Water-Right Decision 1641; or (2) as a "Conference Year."

"Yuba Project" means the Yuba River Development Project, including New Bullards Bar Dam and Reservoir on the North Yuba River.

"Yuba River Accord" means Yuba's initiative as described in Recitals B and C of this Agreement.

"Yuba Water Purchase Agreement" means the Agreement for the Long-Term Purchase of Water from Yuba County Water Agency by the Department of Water Resources, which is attached hereto as Exhibit A.

2. TERM OF AGREEMENT

A. This Agreement will become effective upon execution by the Parties and will terminate on December 31, 2025, provided, however, the Parties may terminate this Agreement on December 31, 2015, if the Parties fail to amend this Agreement pursuant to Section 3.B.5 below and as necessary to address amendments made to the Yuba Water Purchase Agreement regarding the quantity and pricing of water pursuant to Section 15 thereof; provided further that this Agreement shall remain in effect beyond the termination dates set forth above to the extent required to enable the parties to satisfy all obligations then existing or outstanding.

3. PURCHASED WATER

A. METHODS FOR ESTABLISHING ALLOCATIONS AND SHARING OF WATER

1. DWR will make available to the Participating SWP Contractors, as a group, fifty percent of the following types of water: Component 1 Water that is not used by the EWA as provided in Section 3.B.1.a, Component 2 Water, Component 3 Water, and Component 4 Water.
2. If the AGENCY does not take some or all of the water made available to it pursuant to Section 3.A.1, then DWR will make the water not taken by the AGENCY available first to the other Participating SWP Contractors pursuant to 3.A.4 and then to the Authority pursuant to Section 3.A.5; provided, that the AGENCY will purchase all Delivered Transfer Water DWR is required to purchase from Yuba and that is made available to the AGENCY pursuant to Sections 3.A.1. through 3.A.4 if said water is not purchased by the Participating SWP Contractors or the Authority.
3. DWR will make available to the Participating SWP Contractors and the Participating SWP Contractors may accept and purchase Component 1 Water that is not used by EWA as provided in Section 3.B.1.a, Component 2 Water, Component 3 Water, and Component 4 Water that is made available to the Authority, if the Authority elects to not take said water.
4. All water made available to the Participating SWP Contractors pursuant to Sections 3.A.1 through 3.A.3 shall be allocated among the Participating SWP Contractors as follows:

a) DWR will allocate to the AGENCY its share of Water that is made available to the Participating SWP Contractors under Sections 3.A.1 through 3.A 3 above based on the AGENCY'S maximum Table A amount in its SWP Long-Term Water Supply Contract as a proportion of the total Table A amounts provided under the Long-Term Water Supply Contracts of the Participating SWP Contractors.

b) If any Participating SWP Contractor does not request some or any of its share of the water made available pursuant to Section 3.A.3.a above, the remaining Participating SWP Contractors will have the first right to that water, and DWR will allocate that water among the remaining Participating SWP Contractors, but excluding from the calculation the maximum Table A amount of the Participating SWP Contractor(s) not requesting their full allocation. This process will repeat until all water made available pursuant to this Section 3.A.3 is allocated or no Participating SWP Contractor requests the remaining water made available.

5. DWR will offer to the Authority any Component 1 Water that is not used by the EWA as provided in Section 3.B.1.a, Component 2 Water, Component 3 Water, and Component 4 Water made available pursuant to this Section and remaining unrequested after completing the allocation processes set forth above in Sections 3.A.4.

B. TYPES AND PRICES OF PURCHASED WATER

The AGENCY shall pay for Delivered Transfer Water made available to and accepted by the AGENCY under section 3.A above in accordance with the following sections:

1. COMPONENT 1 WATER

a) While the EWA is in effect, if the EWA does not use all of the Component 1 Water, Component 1 Water unused by the EWA will be allocated and made available by DWR to the AGENCY pursuant to Section 3.A above. The AGENCY will pay for Component 1 Water that is made available to it and accounted for as Purchased Water at the same price per acre-foot as Component 4 Water.

b) If EWA terminates and Yuba remains obligated to provide Component 1 Water, the Parties agree that Component 1 Water remaining to be delivered under the Yuba Water Purchase Agreement will be managed annually, as follows: (1) Component 1 Water in any year will be used to enhance water supply reliability of the Delta export facilities by off-setting new mandatory restrictions imposed on the CVP and SWP, including those being imposed by the federal court order in *NRDC v. Kempthorne*, or through a subsequent biological opinion for the conservation or protection of fish, and (2) if any Component 1 Water remains after off-setting the restrictions set forth in subsection (1) above, then the remaining Component 1 Water will be used as determined by DWR in

close coordination with the California Department of Fish and Game consistent with the water supply reliability project requirements of the funding source from which this water was purchased (Chapter 7(d) of Proposition 50, California Water Code Section 79550(d)).

2. COMPONENT 2 WATER

   a) For Component 2 Water that is accounted for as Purchased Water and made available in a Water Year that has a Final Classification as Dry, the AGENCY will pay $75.00 per acre-foot.

   b) For Component 2 Water that is accounted for as Purchased Water and made available in a Water Year that has a Final Classification as Critical, the AGENCY will pay $93.75 per acre-foot.

3. COMPONENT 3 WATER

   For Component 3 Water that is accounted for as Purchased Water and made available to the AGENCY, the AGENCY will pay:

   a. $25.00 per acre-foot in a Wet Year;

   b. $50.00 per acre-foot in an Above-Normal Year;

   c. $75.00 per acre-foot in a Below-Normal Year;

   d. $100.00 per acre-foot in a Dry Year;

   e. $125.00 per acre-foot in a Critical Year.

4. COMPONENT 4 WATER

   For Component 4 Water that is accounted for as Purchased Water and made available to the AGENCY, the AGENCY will pay:

a. $25.00 per acre-foot in a Wet Year;

b. $50.00 per acre-foot in an Above-Normal Year;

c. $75.00 per acre-foot in a Below-Normal Year;

d. $100.00 per acre-foot in a Dry Year;

e. $125.00 per acre-foot in a Critical Year.

5. POSSIBLE FUTURE ADJUSTMENTS TO QUANTITIES AND PRICES.

If the provisions of Section 15 of the Yuba Water Purchase Agreement require changes to the quantity or pricing of water available therein, the Parties agree that amendment of this agreement for such purposes will be a condition precedent of any amendment of the Yuba Water Purchase Agreement pursuant to Section 15 thereof. The Parties agree to meet and confer and negotiate in good faith potential changes to this Agreement.

6. UNCOMMITTED WATER

a. If Yuba notifies DWR of the availability of uncommitted Delivered Transfer Water prior to accounting for the water in the Holding Account, as set forth in Section 7.4 of Exhibit 1 (“Scheduling and Accounting Principles”) of the Yuba Water Purchase Agreement, DWR will notify the AGENCY, the Participating SWP Contractors, and the Authority of the availability of such water by September 30 of that year. Such water will be offered to the Participating SWP Contractors and to the Authority consistent with Section 3.A.

i. Within 30 days of such notice, the AGENCY will notify DWR of its request for an amount of the uncommitted water that it will purchase, if any.

ii. The amount of this water actually purchased by the AGENCY, the Participating SWP Contractors, and the Authority will be based on requests for this water by the AGENCY, the Participating SWP Contractors, and the Authority, and will not exceed the amount of water made available by Yuba. The Purchased Water that DWR will allocate to the AGENCY will be the lesser of the amount of water requested by the AGENCY or the amount allocated to the AGENCY in the manner set forth in Section 3.A above.

iii. The AGENCY will pay DWR the applicable purchase price for the water determined by the Water Year in which the water is accounted for as Delivered Transfer Water at prices set forth in Section 3.B above.

b. If Yuba has credited uncommitted Delivered Transfer Water to the Holding Account as set forth in Section 7.4 of Exhibit 1 (“Scheduling and Accounting Principles”) of the Yuba Water Purchase Agreement and the water remains in storage until the subsequent Water Accounting Year, then DWR will offer the water in the Holding Account to the Participating SWP Contractors and the Authority consistent with Section 3.A.

i. In the year that the AGENCY elects to take water from the Holding Account, that water will be credited toward the AGENCY's prorata share of the Component 3 Water with any additional deliveries credited as Component 4 Water that is accounted for as Purchased Water for the AGENCY.

ii. The AGENCY will pay DWR the applicable purchase price for the water determined by the Water Year in which the water was accounted for as Delivered Transfer Water as set forth in Exhibit 1 of the Yuba Water Purchase Agreement and at prices set forth in Section 3.B above.

4. REQUESTS, SCHEDULING AND CONVEYANCE

Scheduling and conveyance is subject to DWR's determination of conveyance capacity in SWP facilities. Scheduling and conveyance will be dependent on releases by Yuba, including the flow schedule for the lower Yuba River as provided for in the Fisheries Agreement, the North Yuba Index or the Yuba River Index, capacity of CVP and SWP facilities, and Bay-Delta conditions. In order to meet the goals of Section 6, the Parties may modify in writing the dates established in this Section 4 without amending this Agreement.

A. Requests and Scheduling

1. On or before April 11 of each Water Accounting Year, DWR will inform the AGENCY of the potential quantity of Component 1 Water if not used by the

EWA as provided in Section 3.B.1.a, Component 2 Water, Component 3 Water, and Component 4 Water that is available to the Agency.

2. On or about April 11 of each Water Accounting Year, or as soon thereafter as practicable, the AGENCY will submit an initial request to DWR for delivery of Component 1 Water if not used by the EWA as provided in Section 3.B.1.a, Component 2 Water, Component 3 Water, and Component 4 Water and an initial monthly schedule for delivery of the requested water. That initial monthly schedule will include the quantity of each component of water the AGENCY would like to purchase from DWR.
3. DWR and the AGENCY will, between April 11 and May 19, confer on the allocation of water under Section 3A.
4. Within 5 business days of notice from DWR that there has been a change in the amount of water available, but no later than May 19, the AGENCY will provide DWR with its modified request for each component of water.
5. No later than May 19, DWR will notify the AGENCY of the quantity of Component 1 Water if not used by the EWA as provided in Section 3.B.1.a, Component 2 Water, Component 3 Water, and Component 4 Water that has been allocated to the Agency and that the AGENCY will schedule pursuant to Section 4.A.7 below.
6. The Parties recognize that no later than May 15 DWR must notify Yuba of the quantity of Component 4 Water that DWR will purchase from Yuba.

7. On or about May 20 of each Water Accounting Year, or as soon thereafter as practicable, the AGENCY and DWR will agree upon a final monthly schedule for delivery of Component 1 Water if not used by the EWA as provided in Section 3.B.1.a, Component 2 Water, Component 3 Water, and Component 4 Water that has been allocated to the Agency. The final schedule will be updated to accommodate any changes that affect the delivery of water as provided in Section 9 ("Scheduling of Water") of the Yuba Water Purchase Agreement. The final monthly schedule will include, pursuant to Section 3.A above, the quantity of each component of Purchased Water the AGENCY will purchase and that the AGENCY requests be delivered each month of the Water Accounting Year.
8. The final monthly schedule may be modified by mutual agreement. The AGENCY will submit copies of any proposed modifications to the final monthly schedule to DWR's State Water Project Analysis Office (SWPAO) Chief of Water Supply and Transfers Branch, and Chief of Water Deliveries Section, both at FAX number (916) 653-9628. SWPAO will coordinate with the DWR Operations Control Office in determining whether the proposed modifications to the final monthly schedule can be accommodated by DWR.
9. After DWR approves the final monthly schedule, during any week when DWR is conveying water for the AGENCY, the AGENCY will submit weekly schedules to the DWR Operations Control Office: one to the Chief, Pre-Scheduling Section, FAX (916) 574-2782, and one to the Chief, Operations

Scheduling Section, FAX (916) 574-2785. The weekly schedules will be consistent with the final monthly schedule.

10. The scheduling of Purchased Water, and any adjustments to the schedule, will be in accordance with the Exhibit 1 ("Scheduling and Accounting Principles") of the Yuba Water Purchase Agreement.

11. DWR's approval of the schedule will be subject to Section 4.B, below.

B. Conveyance

The conveyance of water under this Agreement to the AGENCY's delivery structures from the SWP facilities is subject to the terms and conditions of this Agreement, Article 55 of the AGENCY's Water Supply Contract, and applicable laws. Use of Purchased Water under this Agreement shall be restricted to the service area of the SWP. Delivery priorities shall be determined in accordance with Article 12(f) of the AGENCY's SWP Long-Term Water Supply Contract, with Purchased Water being classified as non-project water.

5. INVOICING AND PAYMENTS

DWR will invoice the AGENCY and the AGENCY will submit payment to DWR based on each invoice as provided below.

A. INVOICING AND PAYMENT OF PURCHASED WATER

1. On or after June 10 (or within 9 days of the date that DWR receives an invoice from Yuba), DWR will invoice the AGENCY for fifty percent of the payment for the estimated amount of water that the AGENCY scheduled as

Purchased Water for that calendar year minus fifty percent of any credits due to the AGENCY as provided in Section 5.C below.

2. On January 17 of the next calendar year (or within 9 days of the date that DWR receives an invoice from Yuba), DWR will invoice the AGENCY for the remaining unpaid cost for Purchased Water, including Purchased Water available pursuant to Section 3.B.6, above, purchased by the AGENCY minus the remaining credits due to the AGENCY as provided in Section 6.C below.
3. Invoices will itemize any prior payments and credits, the total due, less any additional credits.

B. INVOICE FOR CONVEYANCE, DELIVERY, ADMINISTRATIVE COSTS

1. DWR will invoice the AGENCY monthly for conveyance charges in accordance with Article 55 of the SWP Long-Term Water Supply contract. Specifically, the AGENCY shall pay the power resources (including on-aqueduct, off-aqueduct, and any other power) incurred in the conveyance of such water from the Delta for the year in which the Purchased Water is conveyed.
2. Upon execution, DWR will invoice the AGENCY a one-time administrative fee of $3,000 for preparation of this Agreement.

C. PAYMENT FOR FIXED ANNUAL COSTS AND CREDIT AGAINST PURCHASED WATER.

1. On or before February 11, or within 10 days of DWR's receipt of Yuba's invoice, each year DWR will invoice the AGENCY its share of Yuba's fixed annual costs as provided in Section 12.B of the Yuba Water Purchase Agreement. The AGENCY's payment of these fixed annual costs will be its share of up to $125,000 prorated among the Participating SWP Contractors calculated in the manner as provided in Section 3.A of this Agreement.
2. As provided in Section 5.A above, for all payments made by the AGENCY under this Subsection, DWR will provide to the AGENCY a credit against future payments due to DWR for Purchased Water, excluding Component 1 Water. If necessary, DWR will record and accrue these credits from year to year until DWR makes Purchased Water, excluding Component 1 Water, available to the AGENCY, at which time such credits will be applied toward payments due.

D. PAYMENTS FOR YUBA DIESEL CONVERSION OF GROUNDWATER PUMPS.

Within 30 days of DWR's receipt of a reviewed and verified invoice from Yuba of its conversion of pumps from diesel as provided under Section 12.A of the Yuba Water Purchase Agreement, DWR will invoice the AGENCY for up to one-half of the amount of the Yuba invoice. The AGENCY's share of Yuba's total costs for diesel conversion will not be more than its share of $500,000 prorated among the Participating SWP Contractors calculated in the manner as provided in Section 3.A of this Agreement.

E. PAYMENTS FOR ADJUSTMENTS TO GROUNDWATER O&M COSTS.

In accordance with the timing of invoices required by Section 5.A above, DWR will invoice the AGENCY for its share of Yuba's costs for any annual increases above actual 2006 Groundwater O&M Costs, as provided in Section 12.C of the Yuba Water Purchase Agreement. The AGENCY's share of Yuba's costs will be based upon the proportion of the total amount of Purchased Water delivered to the AGENCY to the total amount of water delivered to the Participating SWP Contractors and the Authority in the year that the invoice covers. If no Purchased Water is delivered in the year that the invoice covers, the Participating SWP Contractors and the Authority shall share equally the costs invoiced by Yuba to DWR and AGENCY will pay its share, which share shall be calculated in the manner as provided in Section 3.A of this Agreement.

F. PAYMENTS FOR COSTS ATTRIBUTABLE TO YUBA WATER PURCHASE AGREEMENT

The Parties agree that costs that DWR is obligated to pay to Yuba pursuant to the Yuba Water Purchase Agreement as attached hereto and that have not been identified by this Agreement, will be an obligation of the Participating SWP Contractors and the Authority. If necessary, the Parties will amend this Agreement to provide for invoicing and payment of such costs if not provided for herein.

G. TIMING OF PAYMENTS.

1. The AGENCY will pay DWR within 32 days after the AGENCY's receipt of an invoice from DWR.
2. Payment made after 32 days of receipt of invoice will be considered delinquent and interest will accrue at a rate of one percent per month for all delinquencies from the due date until paid.
3. If the AGENCY disputes a cost on an invoice, the AGENCY will make payment based on the invoice received, but will submit a notice to DWR identifying the disputed cost within 60 days of receipt of the invoice. Within 21 days after DWR receives notice of the disputed cost, the Parties will meet and confer, and if appropriate, obtain assistance from the Technical Committee and Management Committee to resolve the error or discrepancy. If the Parties resolve the dispute in a manner that recognizes a payment by the AGENCY that exceeds what is required under this Agreement, the amount of the excessive payment will be reflected by DWR pursuant to Section 6.A as a credit against future payments due from the AGENCY. DWR will reflect the credit on the next subsequent invoice it provides to the AGENCY. If the Parties cannot resolve the dispute, they will follow the dispute resolution process described in Section 10 below.

6. EFFORTS TO MAXIMIZE THE BENEFICIAL USE OF WATER

DWR will use all reasonable efforts to maximize the amount of Purchased Water available to the Participating SWP Contractors, including the AGENCY, and the

Authority. Those efforts will include, but are not limited to fully exercising its rights and obligations under the Yuba Water Purchase Agreement, coordinating with Reclamation on the operations of the SWP and CVP, and storing water in SWP facilities when Delta pumping is constrained, as provided in Section 4.3 of Exhibit 1 to the Yuba Water Purchase Agreement.

7. MEMBERSHIP ON COMMITTEES

DWR agrees that a representative of the Participating SWP Contractors will be a member of the Management Committee and Technical Committee.

8. CONFERENCE YEAR PRINCIPLES

During any Conference Year, the Parties will meet with Yuba and the other parties to the Fisheries Agreement and the Conjunctive Use Agreements to: (1) determine how to address the circumstances, and (2) discuss the operation of the Yuba Project during that Water Accounting Year. During a Conference Year, if Yuba reduces or does not deliver any Component 2, 3, or 4 Water, the AGENCY's and the Participating SWP Contractors' obligation to schedule or purchase any quantity of Purchased Water will be reduced or eliminated accordingly.

9. LIABILITY

A. DWR will not assert that the AGENCY, its directors, officers, agents or employees, are liable for damages of any nature whatsoever arising out of any

actions or omissions by DWR, its Director, officers, agents or employees, related to DWR's performance of this Agreement, where such liability is caused by an act, error or omission of DWR, its Director, officers, agents or employees.

B. The AGENCY will not assert that DWR, its Director, officers, agents or employees, are liable for damages of any nature whatsoever arising out of any actions or omissions by the AGENCY, its directors, officers, agents or employees, related to the AGENCY's performance of this Agreement, where such liability is caused by an act, error or omission of the AGENCY, its director, officers, agents or employees.

C. To the extent permitted by California law, the AGENCY will indemnify, defend and hold DWR, its Director, officers, agents and its employees safe and harmless from any and all, claims, judgments, damages, penalties, costs, liabilities and losses (including without limitation, sums paid in settlement of claims, actual attorney's fees paralegal fees, consultant fees, engineering fees, expert fees, and any other professional fees) that arise from or are related in any way to the AGENCY's activities or performance under this Agreement that are under the exclusive control of the AGENCY, including but not limited to the release, conveyance, use or distribution of water by the AGENCY for purposes of this Agreement.

D. To the extent permitted by California law, DWR will indemnify, defend and hold the AGENCY, its directors, officers, agents and its employees safe and harmless from any and all, claims, judgments, damages, penalties, costs,

liabilities and losses (including without limitation, sums paid in settlement of claims, actual attorney's fees, paralegal fees, consultant fees, engineering fees, expert fees, and any other professional fees) that arise from or are related in any way to DWR's activities or performance under this Agreement that are under the exclusive control of DWR, including but not limited to the release, conveyance, use or distribution of water by DWR for purposes of this Agreement.

10. DISPUTE RESOLUTION

A. Should any material disputes arise concerning any provision of this Agreement, or the rights and obligations of the Parties hereunder, including those involving possible termination or those that might cause the initiation of any administrative or judicial proceeding to enforce or interpret this Agreement, the Party that believes a dispute exists will notify the other Party, and the Parties will promptly meet and confer to attempt to resolve the perceived dispute.

B. If the Process described in the preceding subsection fails to resolve the dispute within thirty days, the Parties will submit the dispute to a mediator who has experience in water-related disputes. The costs of any such mediation will be borne equally by the Parties. Initiation of this mediation process will be through written notice by one Party to the other Party. The Parties reserve all of their other remedies that may be provided by law or equity in the event that such mediation fails to resolve a dispute. The Parties, in consultation with the

mediator, will use their best efforts to resolve the dispute within thirty days. Under no circumstances, however, will mediation under this Section result in a requirement that diminishes, limits or contravenes the discretion, authority or any delegated authority of the Director of DWR or the AGENCY under State law.

C. If mediation fails to resolve the dispute, and prior to commencing any legal action to resolve the dispute, the Party proposing to commence legal action will provide the other Party thirty days' written notice of such action, provided that such notice will not be required where a delay in commencing an action would prejudice the interests of the Party that intends to file suit. During the thirty-day notice period, the Parties will continue to attempt to resolve the dispute.

11. NOT A PRECEDENT

The terms and conditions set forth in this Agreement are not intended to set a precedent for any future contractual arrangements for conveying non-SWP water by DWR to the AGENCY.

12. PAYMENTS, NOTICES OR OTHER COMMUNICATIONS

The time for providing any payments, notices, or other communications specified in this Agreement may be extended within the term of this Agreement with the consent of the Parties, confirmed in writing, without requiring an amendment to this Agreement. All payments, notices, or other communications required under this

Agreement will be in writing, and will be deemed to have been duly given upon the date of service, if: (a) served personally on the Party to whom notice is to be given; (b) sent by electronic mail, and the Party to whom notice is to be given confirms receipt; or (c) on the third day after mailing, if mailed to the Party to whom payment, notice or other communication is directed, by first-class mail, postage prepaid, and properly addressed to the designated representative(s) of the Party set forth below.

DWR: Mr. Carl A. Torgersen
Chief of State Water Project Operations Office
Department of Water Resources
3310 El Camino Avenue
Post Office Box 219000
Sacramento, California 95821-9000,

And

Mr. Robert Cooke
Chief of State Water Project Analysis Office
Department of Water Resources
1416 Ninth Street, Room 1620
Post Office Box 942836
Sacramento, California 94236-0001

AGENCY:
Mr. Kirby Brill, General Manager
Mojave Water Agency
13846 Conference Center Drive
Apple Valley, California 92307-4377
(760) 946-7000

A Party may notify the other Party in writing of a change in its designated representatives, without requiring an amendment to this Agreement. Unless other timing is specified within this Agreement, DWR will provide to the AGENCY copies of any and all payments, notices or other communications it sends or receives

pursuant to the terms of the Yuba Water Purchase Agreement as soon as possible, but no later than 14 days after DWR receives, or sends, such payments, notices or other communications to Yuba and/or the Authority and/or other Participating SWP Contractors.

13. SIGNATORIES' AUTHORITY

The signatories to this Agreement represent that they have authority to execute this Agreement and to bind the Party on whose behalf they execute this Agreement.

14. COUNTERPARTS OF THIS AGREEMENT

This Agreement may be signed in any number of counterparts by the Parties, each of which will be deemed to be an original, and all of which together will be deemed to one and the same instrument. This Agreement, if executed in counterparts, will be valid and binding on a Party as if fully executed all in one copy.

15. BINDING ON SUCCESSORS/ASSIGNMENT

This Agreement will bind and inure to the benefit of the respective successors and assigns of the Party, except that, none of the obligations of the Parties set forth in this Agreement will be assigned without the prior, written approval of the other Party, which approval will not unreasonably be withheld.

16. NO THIRD-PARTY BENEFICIARIES

This Agreement will not be construed to create any third-party beneficiaries, except as set forth in this section. This Agreement is for the sole benefit of the Parties, their respective successors and assigns, and no other person or entity will be entitled to rely on or receive any benefit from this Agreement or any of its terms.

17. AMENDMENTS

A. This Agreement may be amended or modified only by written agreement approved and executed by the Parties.

B. Prior to any amendment of this Agreement, the Parties will meet and confer with the other Participating SWP Contractors and the Authority. The Parties will not agree to any amendment to this Agreement that would adversely affect the rights and obligations of the Participating SWP Contractors under each of their respective **"**Agreement for the Supply and Conveyance of Water by the Department of Water Resources of the State of California to the Participating SWP Contractors under the Dry Year Water Purchase Program" or the Authority under its "Agreement for the Supply and Conveyance of Water by the Department of Water Resources of the State of California to the San Luis & Delta-Mendota Water Authority under the Dry Year Water Purchase Program."

C. Prior to any amendment of any **"**Agreement for the Supply and Conveyance of Water by the Department of Water Resources of the State of California to the Participating SWP Contractors Under the Dry Year Water Purchase Program",

DWR will meet and confer with the AGENCY. DWR will not agree to any amendments to any **"**Agreement for the Supply and Conveyance of Water by the Department of Water Resources of the State of California to the Participating SWP Contractors Under the Dry Year Water Purchase Program" or the "Agreement for the Supply and Conveyance of Water by the Department of Water Resources of the State of California to the San Luis & Delta-Mendota Water Authority under the Dry Year Water Purchase Program" that would adversely affect the rights and obligations under this Agreement.

D. DWR will meet and confer with the AGENCY, the other Participating SWP Contractors and the Authority before agreeing to any proposed changes, amendments, or supplements to the Yuba Water Purchase Agreement. DWR will not agree to any changes, amendments, or supplements to the Yuba Water Purchase Agreement or its Exhibits that would be inconsistent with or adversely affect the Parties' rights and obligations under this Agreement, any other "Agreement for the Supply and Conveyance of Water By the Department of Water Resources of the State of California to the Participating SWP Contractors Under the Dry Year Water Purchase Program" or under the "Agreement for the Supply and Conveyance of Water by the Department of Water Resources of the State of California to the San Luis & Delta-Mendota Water Authority under the Dry Year Water Purchase Program."

18. OPINIONS AND DETERMINATIONS

Where the terms of this Agreement provide for action to be based upon the opinion, determination, approval or review of either Party, such terms are not intended to be, and will not be construed as permitting such actions to be arbitrary, capricious or unreasonable. Any opinion, determination, approval or review required of a Party under this Agreement will be provided in a timely manner.

19. REASONABLE COOPERATION

The Parties will reasonably cooperate with each other, including the execution of all necessary documents and providing assistance in obtaining approvals and permits from regulatory agencies required to perform the obligations under this Agreement and to carry out the purpose and intent of this Agreement.

20. CONSTRUCTION AND INTERPRETATION

This Agreement is entered into freely and voluntarily. This Agreement has been arrived at through negotiation, and each Party has had a full and fair opportunity to revise the terms of this Agreement. Consequently, the normal rule of construction that any ambiguities are to be resolved against the drafting party will not apply in construing or interpreting this Agreement.

21. COMPLETE CONTRACT

This Agreement constitutes the sole, final, complete, exclusive and integrated expression and statement of the terms of this Agreement among the Parties

concerning the subject matter, and supersedes all prior negotiations, representations or agreement, either oral or written, that may be related to the subject matter of this Agreement, except as to those other agreements that are expressly referred to in this Agreement.

22. **DETERMINATION OF UNENFORCEABLE PROVISIONS**

If any term or provision of this Agreement is deemed invalid or unenforceable by any court of final jurisdiction, the Parties will meet and attempt to address this situation pursuant to the provisions of Section 10 of this Agreement.

23. WAIVER

The waiver at any time by a Party of its rights with respect to a default or other matter arising in connection with this Agreement will not be deemed a waiver with respect to any other default or matter.

24. TIME

Time is of the essence in this Agreement. Any date specified in this Agreement may be changed with the written consent of the Parties.

25. APPLICABLE LAW

This Agreement will be construed under and will be deemed to be governed by the laws of the State of California.

26. VENUE

Any appropriate County under California law will be venue for any state court litigation concerning the enforcement or interpretation of this Agreement.

27. REMEDIES NOT EXCLUSIVE

The remedies provided in this Agreement are cumulative and not exclusive, and are in addition to any other remedies that may be provided by law or equity. The exercise by the Party of any remedy under this Agreement will be without prejudice to the enforcement of any other remedy.

28. OFFICIALS NOT TO BENEFIT

No member or delegate to Congress, Resident Commissioner, or Federal or State official will be admitted to any share or part of this Agreement or to any benefit that may arise therefrom.

29. STANDARD CLAUSES

With respect to the mutual obligations of the Parties under this Agreement, the Parties will comply with the Standard Clauses as shown on Exhibit B ("State of California Standard Clauses") to this Agreement for the State of California, Contracts with Public Entities.

30. EXHIBITS INCORPORATED

Each exhibit to which reference is made is deemed incorporated in this Agreement, whether or not actually attached.

IN WITNESS WHEREOF, the Parties hereto, by their authorized representatives, have executed this Agreement on the last date set forth below.

EXHIBIT A

AGREEMENT FOR THE LONG-TERM PURCHASE OF WATER FROM YUBA COUNTY WATER AGENCY BY THE DEPARTMENT OF WATER RESOURCES

EXHIBIT B

DEPARTMENT OF WATER RESOURCES STANDARD CLAUSES
FOR
AGREEMENT FOR THE SUPPLY AND CONVEYANCE OF WATER
BY THE DEPARTMENT OF WATER RESOURCES
OF THE STATE OF CALIFORNIA
TO THE AGENCY
UNDER
THE DRY YEAR WATER PURCHASE PROGRAM

Worker's Compensation Clause. Contractor affirms that it is aware of the provisions of Section 3700 of the California Labor Code which require every employee to be insured against liability for worker's compensation or to undertake self-insurance in accordance with the provisions of that Code, and Contractor affirms that it will comply with such provisions before commencing the performance of work under this Agreement.

Nondiscrimination Clause. During the performance of this Agreement, Contractor and its subcontractors shall not unlawfully discriminate, harass, or allow harassment against any employee or applicant for employment because of sex, race, color, ancestry, religious creed, national origin, physical disability (including HIV and AIDS), mental disability, medical condition (cancer), age (over 40*),* marital status, and denial of family care leave. Contractor and subcontractors shall insure that the evaluation and treatment of their employees and applicants for employment are free from such discrimination and harassment. Contractor and subcontractors shall comply with the provisions of the Fair Employment and Housing Act (Gov. Code §12990 (a-f) et seq.) and the applicable regulations promulgated thereunder (California Code of Regulations, Title 2, Section 7285 et seq.). The applicable regulations of the Fair Employment and Housing Commission implementing Government Code Section 12990 (a-f), set forth in Chapter 5 of Division 4 of Title 2 of the California Code of Regulations, are incorporated into this Agreement by reference and made a part hereof as if set forth in full. Contractor and its subcontractors shall give written notice of their obligations under this clause to labor organizations with which they have a collective bargaining or other Agreement.

Contractor shall include the nondiscrimination and compliance provisions of this clause in all subcontracts to perform work under the Agreement.

Compliance with Laws, Regulations, Permit Requirements. Contractor shall at all times comply with, and require its contractors and subcontractors to comply with, all applicable federal and State laws, rules and regulations, permits and all applicable local ordinances, specifically including but not limited to environmental, procurement and safety laws, rules, regulations, permits and ordinances.

Availability of Funds. Work to be performed under this contract is subject to the availability of funds through the State's normal budget process.

Audit Clause. For contracts in excess of $10,000, the contracting parties shall be subject to the examination and audit of the State Auditor for a period of three years after the final payment under the contract (Government Code Section 8546.7).

Payment Retention Clause. Ten percent of any progress payments that may be provided under this contract shall be withheld per Public Contract Code Sections 10346 and 10379 pending satisfactory completion of all services under the contract.

Reimbursement Clause. If applicable, travel and per diem expenses to be reimbursed under this contract shall be at the same rates the State provides for unrepresented employees in accordance with the provisions of Title 2, Chapter 3, of the California Code of Regulations. Contractor's designated headquarters for the purpose of computing such expenses shall be: The address of the AGENCY as shown in Section 12 of this Agreement.

Drug-Free Workplace Certification. By signing this contract, the Contractor or grantee hereby certifies under penalty of perjury under the laws of the State of California that the Contractor or grantee will comply with the requirements of the Drug-Free Workplace Act of 1990 (Government Code Section 8350 et seq.) and will provide a drug-free workplace by taking the following actions:

1. Publish a statement notifying employees that unlawful manufacture, distribution, dispensation, possession, or use of a controlled substance is prohibited and specifying actions to be taken against employees for violations.

2. Establish a Drug-Free Awareness Program to inform employees about all of the following:

   a) The dangers of drug abuse in the workplace,

b) The person's or organization's policy of maintaining a drug-free workplace,

c) Any available counseling, rehabilitation, and employee assistance programs; and

d) Penalties that may be imposed upon employees for drug abuse violations.

3. Every employee who works on the proposed contract or grant:

a) Will receive a copy of the company's drug-free policy statement, and

b) Will agree to abide by the terms of the company's statement as a condition of employment on the contract or grant.

This contract or grant may be subject to suspension of payments or termination, or both, and the contractor or grantee may be subject to debarment if the Department determines that: 1) the Contractor or grantee has made a false certification, or 2) the Contractor or grantee violates the certification by failing to carry out the requirements noted above.

Americans with Disabilities Act. By signing this contract, Contractor assures the State that it complies with the Americans With Disabilities Act (ADA) of 1990, 942 U.S.C.12101 et seq.), which prohibits discrimination on the basis of disability, as well as all applicable regulations and guidelines issued pursuant to the ADA.

Conflict of Interest. Current State Employees: a) No officer or employee shall engage in any employment activity or enterprise from which the officer or employee receives compensation or has a financial interest and which is sponsored or funded by any State agency, unless the employment, activity or enterprise is required as a condition of regular State employment. b) No State officer or employee shall contract on his or her own behalf as an independent contractor with any State agency to provide goods or services.

Former State Employees: a) For the two year period from the date he or she left State employment, no former State officer or employee may enter into a contract in which he or she engaged in any of the negotiations, transactions, planning, arrangements or any part of the decision-making process relevant to the contract while employed in any capacity by any State agency. b) For the twelve-month period from the date he or she left State employment, no former State officer or employee may enter into a contract with any State agency if he or she was employed by that State agency in a policy-making position in the same general subject area as the proposed contract within the twelve-month period prior to his or her leaving State service.

Child Support Compliance Act. For any agreement in excess of $100,000, the Contractor acknowledges in accordance herewith, that:

1. The Contractor recognizes the importance of child and family support obligations and shall full comply with all applicable State and federal laws relating to child and family support enforcement, including, but not limited to, disclosure of information and compliance with earning assignment orders, as provided in Chapter 8 (commencing with Section 5200) of Part 5 of Division 9 of the Family Code; and

2. The Contractor, to the best of its knowledge, is fully complying with the earnings assignment orders of all employees and is providing the names of all new employees to the New Hire Registry maintained by the Employment Development Department.

Air or Water Pollution Violation. Under the State laws, the Contractor shall not be: 1) in violation of any order or resolution not subject to review promulgated by the State Air Resources Board or an air pollution control district; 2) subject to cease and desist order not subject to review issued pursuant to Section 13301 of the Water Code for violation of waste discharge requirements or discharge prohibitions; or 3) finally determined to be in violation of federal law relating to air or water pollution.

Union Organizing. For all contracts, except fixed price contracts of $50,000 or less, the Contractor acknowledges that: by signing this Agreement the Contractor hereby acknowledges the applicability of Government Code Section 16645 through Section 16649 to this Agreement and agrees to the following:

1. Contractor will not assist, promote or deter union organizing by employees performing work on a State service contract, including a public works contract.

2. No State funds received under this Agreement will be used to assist, promote or deter union organizing.

3. Contractor will not, for any business conducted under this Agreement, use any State property to hold meetings with employees or supervisors, if the purpose of such meetings is to assist, promote or deter union organizing,

unless the State property is equally available to the general public for holding meetings.

4. If Contractor incurs costs or makes expenditures to assist, promote or deter union or organizing, Contractor will maintain records sufficient to show that no reimbursement from State funds has been sought for these costs, and that the Contractor shall provide those records to the Attorney General upon request.

Recycling Certification. Contractor shall certify in writing under penalty of perjury, the maximum, if not exact, percentage of recycled content, both post consumer water and secondary waste as defined in Public Contract Code, Section 12161 and 12200, in materials, goods, or supplies offered or products used in the performance of this Agreement, regardless of whether the product meets the required recycled product percentage as defined in Public Contract Code, Sections 12161 and 12200. Contractor may certify that the product contains zero content. (PCC 10233, 10308.5, 10354)

THE RESOURCES AGENCY
DEPARTMENT OF WATER RESOURCES

AMENDMENT NO. 1 TO THE AGREEMENT FOR THE SUPPLY AND CONVEYANCE OF WATER BY THE DEPARTMENT OF WATER RESOURCES OF THE STATE OF CALIFORNIA TO THE PARTICIPATING STATE WATER PROJECT CONTRACTORS UNDER THE DRY YEAR WATER PURCHASE PROGRAM SWPAO NO. 09-827

THIS AMENDMENT NO. 1 ("Amendment") to the _____, 2014 "Agreement for the Supply and Conveyance of Water by the Department of Water Resources of the State of California to the Participating State Water Project Contractors under the Dry Year Water Purchase Program" ("Agreement") is entered into as of the _____day of _____, 2014, pursuant to the provisions of the California Water Resources Development Bond Act, the State Central Valley Project Act, and other applicable laws of the State of California, between the Department of Water Resources of the State of California, herein referred to as "DWR," and the Mojave Water Agency, a public agency in the State of California, herein referred to as the "AGENCY." DWR and the AGENCY are herein referred to separately as the "Party" and collectively as the "Parties."

The Parties hereby amend the Agreement as follows:

1. Item no. 9 (at page 55) Section 1 ("General Principles") of Exhibit 2 ("Reservoir Refill Accounting Provisions") of Exhibit A ("Long-Term Purchase of water from Yuba County Water Agency by the Department of water Resources") is revised to read as follows:

"If the Transfer Amount Account is not zero on September 30, then the remaining balance of the account will be carried forward to the subsequent water year and the impact accounting will continue until the outstanding balance is eliminated. Exception: If the difference in storage between the Actual Storage and the maximum baseline storage, on September 30th is less than the remaining balance of the previous year plus the Base Transfer (see item 1 above), then the transfer amount account will be reset to the difference between actual storage and the maximum baseline storage amount."

2. All remaining provisions of the Agreement will remain in full force and effect.

The foregoing is hereby agreed to by the Parties.

IN WITNESS WHEREOF, the Parties hereto, by their authorized representatives, have executed this Agreement on the last date set forth below.

Exhibit for Notice to Contractors

Memo Justifying Proposed Change in Exhibit 2 “Reservoir Refill Accounting Provisions”

MEMO

DATE: October 20, 2008

FROM: Technical Committee - Lower Yuba River Accord Water Purchase Agreement

TO: Management Committee - Lower Yuba River Accord Water Purchase Agreement

RE: Proposed Change in Exhibit 2 "Reservoir Refill Accounting Provisions"

The 2008 water transfer is the first year of the long term water transfer between Yuba County Water Agency (YCWA) and the Department of Water Resources (DWR). In 2007 YCWA and DWR completed a transfer to the Environmental Water Account (EWA) under a pilot program. The 2007 transfer resulted in the delivery of 125 TAF of stored water from New Bullards Bar Reservoir to DWR. According to the long term transfer water purchase agreement (Agreement), the storage space in New Bullards Bar Reservoir evacuated as a result of the release of transfer water must be refilled at a time of excess Delta conditions, or an impact is accounted for and the impact volume must be repaid through the release of additional transfer water at a later date. Exhibit 2 of the Agreement contains the accounting steps for determining if a refill impact has occurred. Exhibit 1 of the Agreement contains the procedures for determining the daily transfer flows. According to the refill accounting procedures of Exhibit 2, none of the 125TAF of transfer water from 2007 was refilled in the winter of 2008. As described in more detail below, the accounting of water releases under Exhibit 1 showed that some of the 2007 transfer had actually been refilled. The Technical Committee believes that an additional accounting step is required in Exhibit 2. If Exhibit 2 refill accounting were to remain without the proposed changes of this memo, the accounting in Exhibit 2 would differ from the accounting in Exhibit 1 as of October 1, 2008.

The accounting in Exhibit 1 is accomplished by tracking two sets of daily flows and storage amounts; 1) the actual flows in the Yuba River and storage of New Bullards Bar Reservoir and 2) a determination of the daily flows and resulting storage that would have occurred absent the Agreement and the Lower Yuba River Accord Fisheries Agreement (the Baseline). The primary purpose of Exhibit 1 is to account for the amount of transfer water that is delivered to DWR from the Yuba River. This is accomplished by tracking the actual daily flows and comparing them with computed Baseline daily flows. Since this process must be continuous, it also provides an accounting of the Baseline New Bullards Bar storage and the resulting reduction in flows in the Yuba River due to refilling New Bullards Bar storage in the winter. The determination of transfer flows is tracked through a number of accounting controls to assure DWR that increased releases for transfer are actually occurring. However, in the wintertime, in moderate weather years the ability to determine the exact volume of release that would have occurred under the Baseline is less precise, since this is typically not a transfer time period, and the

ability of DWR to verify these flows is limited, and to a degree affected by YCWA wintertime power production/hydrology risk real-time operations determination. This lack of precision and verification of wintertime operations is the reason Exhibit 2 is in place.

The procedures of Exhibit 2 determine the volume of impact to the Projects due to refill (refill impact) by setting a Target Storage Line that is a "maximum storage operation". If Baseline storage in New Bullards Bar Reservoir, calculated by adding actual storage and unrefilled transfer amount, is above the Target Line, the unrefilled transfer amount is reduced by the volume above the Target Line. And, if the Delta is in balanced conditions, a refill impact of that volume is determined. This system works well as a verifiable method for determining a refill impact for a single year transfer. However, since the reduction of unrefilled transfer volume is only taken when baseline storage is at the Target Line, which is a maximum storage operation, no reduction in the unrefilled transfer volume occurs when New Bullards Bar reservoir is refilling, but baseline storage is below the Target Line. This occurred in the winter of 2008 and is expected to occur in years that are moderately dry. The procedures of Exhibit 2 are to a degree affected by YCWA wintertime power production/hydrology risk real-time operations determination.

As previously stated, Exhibit 1 accounting is computed on a daily basis throughout the year, including a determination of Baseline storage and releases from New Bullards Bar Reservoir. By extension, Exhibit 1 also includes refill of the New Bullards Bar storage, and the effect of that refill on Yuba River flows. The method for refill tracking in Exhibit 2 is different from the method in Exhibit 1, and in dryer year conditions, such as the conditions seen in 2008, results in a difference in the amount of transfer water yet to be refilled between the two accounting methods. The difference results because Exhibit 2 does not have a procedure for adjusting the unfilled amount from a previous year's transfer when the previous year is moderately dry. The Technical Committee has developed a straightforward change to the accounting procedures in Exhibit 2 that would adjust the previous years' remaining refill volume of moderately dry years to be used in the determination of refill impacts.

The Technical Committee has recognized a need to adjust the accounting procedures and had discussed it during several operations-coordination conference calls during the spring and early summer. A meeting at the Joint Operations Center (JOC) was held on June 15th 2008 to review the issue in detail and to come to agreement on a solution. The meeting attendees were John Lehigh and Andy Chu from DWR, Jeff Sandberg from USBR and Steve Grinnell and Jeff Weaver for YCWA. Following a detailed discussion of the issues and possible measures to be added to the accounting, it became clear that the best method was to include a "reset" of the previous years' transfer amount in Exhibit 2. The proposed solution is to modify Exhibit 2 by adding a limit on the amount of previous year transfer volume at the start of the refill period, October 1, to the lesser of; 1) the unrefilled transfer volume from the previous year plus the current year transfer as currently described in Exhibit 2, or 2) the difference in storage between actual storage and baseline storage on September 30.

The proposed change to Exhibit 2 is to change item 9 on page 55 from;

"9) If the Transfer Amount Account is not zero on September 30, then the remaining balance of the account will be carried forward to the subsequent water year and the impact accounting will continue until the outstanding balance is eliminated."

to;

"9) If the Transfer Amount Account is not zero on September 30, then the remaining balance of the account will be carried forward to the subsequent water year and the impact accounting will continue until the outstanding balance is eliminated. *Exception: If the difference in storage between the Actual Storage and the maximum baseline storage, on September 30th is less than the remaining balance of the previous year plus the Base Transfer (see item 1 above), then the transfer amount account will be reset to the difference between actual storage and the maximum baseline storage amount.*

The practical result of this adjustment is that refill accounting under the Agreement will continue to have the static, verifiable refill accounting of Exhibit 2, while recognizing that the accounting of Exhibit 1 is more precise in determining day to day differences in flows and storage between the accounting Baseline and actual flows and storage during moderate conditions for the purpose of accounting the amount of transfer water.

The technical committee, in examining this issue has also recognized that this addition to Exhibit 2 may not cover all circumstances that might arise due to the complexity of YCWA operations and the complexity of the accounting. It was unanimously agreed that although this solution will address the previous year's unrefilled amount in the Exhibit 2 refill accounting, further adjustments might be needed in the future to address unique and rare circumstances.

The Technical Committee requests that the Management Committee review the proposed change and incorporate it into Exhibit 2 of the Water Purchase Agreement.

STATE OF CALIFORNIA

THE RESOURCES AGENCY
DEPARTMENT OF WATER RESOURCES

AMENDMENT 5 TO THE AGREEMENT FOR THE SUPPLY AND CONVEYANCE OF WATER BY THE DEPARTMENT OF WATER RESOURCES OF THE STATE OF CALIFORNIA TO THE PARTICIPATING STATE WATER PROJECT CONTRACTORS UNDER THE DRY YEAR WATER PURCHASE PROGRAM SWPAO NO. 14-827

THIS AMENDMENT 5 (Amendment) to the _____, 2014 "Agreement for the Supply and Conveyance of Water by the Department of Water Resources of the State of California Under the Dry Year Water Purchase Program" (Participation Agreement, or Agreement) is entered into as of the _____ day of _____ , 2014 pursuant to the provisions of the California Water Resources Development Bond Act, the State Central Valley Project Act, and other applicable laws of the State of California, between the Department of Water Resources of the State of California, herein referred to as "DWR," and the Mojave Water Agency, a public agency in the State of California, herein referred to as the "AGENCY." DWR and the AGENCY are herein referred to separately as the "Party" and collectively as the "Parties." Unless otherwise provided in this Amendment, the definitions in the Agreement, the Yuba Water Purchase Agreement, and the exhibits to that agreement shall apply to this Amendment.

RECITALS

A. Under the December 4, 2007 "Agreement for the Long-Term Purchase of Water from Yuba County Water Agency by the Department of Water Resources" (Yuba Water Purchase Agreement), Yuba County Water Agency (Yuba) makes surface water available for delivery and purchase by DWR, some of which is made available through substitution of groundwater for surface flows that would otherwise be used by a number of water districts within Yuba County (Member Units).

B. In 2007 and 2008, 21 State Water Project (SWP) Contractors and the San Luis & Delta-Mendota Water Authority ("AUTHORITY") entered into agreements with DWR for the purchase and delivery of the water made available under the Yuba Water Purchase Agreement (cumulatively referred to as the Participation Agreements). The Participating SWP Contractors and the AUTHORITY are jointly referred to as "Participating Contractors".

C. In 2009, the parties to the Yuba Water Purchase Agreement executed the first amendment to the Yuba Water Purchase Agreement to address a technical reservoir refill accounting provision in Section 1 of Exhibit 2. DWR and the Participating Contractors executed conforming amendments (Amendment Number 1) to each of the Participation Agreements. This amendment is still in effect.

D. In 2009 and 2010, the parties to the Yuba Water Purchase Agreement executed the second and third amendments to the Yuba Water Purchase Agreement to make groundwater substitution water available to DWR for purchase as Component 4 Water at mutually agreed upon pricing. DWR and the Participating Contractors executed conforming amendments to each of the Participation Agreements. Both the second and third amendments have since expired.

E. On January 6, 2012, the parties to the Yuba Water Purchase Agreement executed the fourth amendment to the Yuba Water Purchase Agreement providing for annual pricing negotiations for surface flows made available from groundwater substitution. DWR and the Participating Contractors executed conforming amendments (Amendment Number 4) to each of the Participation Agreements. Amendment 4 expires on December 31, 2015.

F. The term of the Yuba Water Purchase Agreement is through December 31, 2025, or when all obligations thereunder have been satisfied, whichever is later, unless it is terminated earlier.

G. Under Section 15 of the Yuba Water Purchase Agreement, a new amendment is needed to establish prices for water made available after September 30, 2015.

H. In accordance with Section 15 of the Yuba Water Purchase Agreement, DWR and Yuba, in coordination with representatives of the Participating Contractors, have negotiated a new pricing agreement that will be incorporated into the Yuba Water Purchase Agreement by the fifth amendment to that agreement. The fifth amendment reflects changes in market conditions since the initial pricing schedule was proposed in 2004, as well as amending other provisions of that agreement.

I. In light of the new pricing agreement reflected in the fifth amendment to the Yuba Water Purchase Agreement, the parties to the Participation Agreements desire to amend their respective Participation Agreements to conform with changes made by that amendment. This fifth amendment to the Participation Agreement shall be referred to in this Amendment as "Amendment 5".

AMENDMENT 5 to the Participation Agreement

Now Therefore, the Parties hereby amend the Participation Agreement as follows:

1. SECTION 1 , "DEFINITIONS", is amended as follows:

(a) By adding at the end the following new definition:

""**Contributing Participating Contractor**" means any Participating Contractor that elects to contribute money towards the $20,000,000 deposit for purchases of Water from Yuba as described in Section 25 of the Yuba Water Purchase Agreement."

(b) By amending the definition of Participating SWP Contractors to read as follows:

""**Participating SWP Contractors**" means all SWP contractors that have executed a Participation Agreement, Amendment 1 conforming the Participation Agreement to the first amendment to the Yuba Water Purchase Agreement, and Amendment 5 conforming the Participation Agreement to the fifth amendment to the Yuba Water Purchase Agreement. However, a contractor that executes this Amendment 5 will not be considered a Participating SWP Contractor beyond December 31, 2020 if that contractor does not agree to amend its Participation Agreement prior to December 31, 2020."

(c) By amending the definition of Yuba Water Purchase Agreement by adding after "Exhibit A": ", and as amended".

2. EFFECTIVE DATE OF AMENDMENT

Amendment 5 to the Participation Agreement shall take effect when all of the following have occurred: (i) execution by the Parties; (ii) execution of the same or substantively similar amendments by DWR and all other Participating Contractors that elect to participate beyond December 31, 2015; and (iii) execution of the fifth amendment to the Yuba Water Purchase Agreement by DWR and Yuba.

3. SECTION 2, "TERM OF THE AGREEMENT", is amended by adding at the end the following new subparagraphs :

"B. Notwithstanding Subparagraph A, the Parties may terminate the Participation Agreement on December 31, 2020, if they fail to amend the Participation Agreement pursuant to Section 3.B.5 and as necessary to address amendments made to the Yuba Water Purchase Agreement regarding the quantity and pricing of Water to be made available by Yuba after September 30, 2020 pursuant to Section 15 of the Yuba Water Purchase Agreement.

C. Notwithstanding Subparagraphs A and B, the Agreement shall remain in effect beyond the termination dates set forth above to the extent required to enable the Parties to satisfy all payment and water delivery obligations then existing or outstanding at the time of termination."

4. CHANGES TO SECTION 3, "PURCHASED WATER"

a. Section 3.B.1.a, "COMPONENT 1 WATER", is amended to read as follows:

"a. For Component 1 Water that is accounted for as Purchased Water and made available to the AGENCY, the AGENCY will pay:

i. $50 per acre-foot in a Wet Year;
ii. $100 per acre-foot in an Above Normal Year;
iii. $150 per acre-foot in a Below Normal Year;
iv. $200 per acre-foot in a Dry Year, except as provided in subsection vi;
v. $300 per acre-foot in a Critical Year, except as provided in subsection vi;
vi. $350 per acre-foot in two or more consecutive Final Classification Dry Years (or a Dry Year following a Critical Year) or in two or more consecutive Final Classification Critical Years.
vii. Notwithstanding subsections i-vi, in any year in which Yuba's Third-Party Transfer of up to 10,000 acre-feet of Storage Component water under

Section 11 of the Yuba Water Purchase Agreement reduces the quantity of Component 2 Water available to the AGENCY, the price for Component 1 Water will reflect the reductions specified in Section 11.F.2 of such agreement."

b. Section 3.B.2, "COMPONENT 2 WATER", is amended to read as follows:

"For Component 2 Water that is accounted for as Purchased Water and made available to the AGENCY, the AGENCY will pay:

a. $160 per acre-foot in a Dry Year, except as provided in subsection c;
b. $200 per acre-foot in a Critical Year, except as provided in subsection c;
c. $280 per acre-foot in two or more consecutive Final Classification Dry Years (or a Dry Year following a Critical Year) or in two or more consecutive Final Classification Critical Years."

c. Section 3.B.3, "COMPONENT 3 WATER", is amended to read as follows:

"For Component 3 Water that is accounted for as Purchased Water and made available to the AGENCY, the AGENCY will pay:

a. $50 per acre-foot in a Wet Year;
b. $100 per acre-foot in an Above Normal Year;
c. $150 per acre-foot in a Below Normal Year;
d. $200 per acre-foot in a Dry Year, except as provided in subsection f;
e. $300 per acre-foot in a Critical Year, except as provided in subsection f;
f. $350 per acre-foot in two or more consecutive Final Classification Dry Years (or a Dry Year following a Critical Year) or in two or more consecutive Final Classification Critical Years."

d. Section 3.B.4, "COMPONENT 4 WATER", is amended to read as follows:

"a. Notwithstanding any other provision to the contrary of the Yuba Water Purchase Agreement, the following provisions shall apply to Groundwater Substitution Component water and Accrued Groundwater Substitution Component water made available by Yuba, through DWR, to the AGENCY beginning on January 1, 2016 and continuing through the term of this Agreement.

b. Component 4 water shall be comprised solely of Groundwater Substitution Component water. All Groundwater Substitution Component water shall be accounted for as Component 4 Water. Except as otherwise provided herein, Groundwater Substitution Component water and Accrued Groundwater Substitution Component water will be accounted for in accordance with the provisions of the Yuba Water Purchase Agreement.

c. In every year within the term of this Agreement when one or more Participating Contractor(s) desire to purchase Accrued Groundwater Substitution Component water from Yuba through DWR, the Management Committee representatives of DWR, Yuba, and the Participating Contractors will convene by February 15 and conclude by March 31 to negotiate the price per acre-foot of Accrued Groundwater Substitution Component water, any provisions for the Delta export priority for such water, and any other terms applicable to the Accrued Groundwater Substitution Component water.

d. In every Water Accounting Year when: (1) one or more Participating Contractor(s) desire to purchase Accrued Groundwater Substitution Component water; (2) the annual negotiations referenced in Section 3.B.4.c have reached a successful conclusion calling for the purchase of such water that year; (3) the Management Committee representatives for Yuba, the AUTHORITY, and the Participating SWP Contractors have agreed as to the terms of, and each of these representatives has recommended in writing said terms and the approval of, a letter agreement between Yuba and DWR establishing the price per acre-foot and any modified terms that will be applicable to the Accrued Groundwater Substitution Component water for that Water Accounting Year; and (4) DWR and Yuba have executed said letter agreement, DWR will offer in writing to the AGENCY the opportunity to purchase Accrued Groundwater Substitution Component water at the price and terms as provided in the letter agreement between DWR and Yuba."

5. CHANGES TO SECTION 4, "REQUESTS, SCHEDULING AND CONVEYANCE"

a. Section 4.A.1 is amended to read as follows:

"1. On or before April 1 of each year during the term of this Agreement DWR will notify the AGENCY of the quantity of Accrued Groundwater Substitution Component water that Yuba will make available during the Water Accounting Year and the terms of such water, including the price per acre-foot, and any other applicable terms. On or before April 11 of each Water Accounting Year, DWR will inform the AGENCY of the potential quantity of Component 1 Water, Component 2 Water, and Component 3 Water that is available to the AGENCY."

b. Section 4.A.2 is amended by striking "if not used by the EWA, as provided in Section 3.B.1a".

c. Section 4.A.3 is amended to read as follows:

"3. DWR and the AGENCY will, between April 11 and May 14, confer on the allocation of water under Section 3A. By April 13, the AGENCY will notify DWR of the quantity of Accrued Groundwater Substitution Component water it commits to purchase based on the price and terms for Groundwater Substitution Component water for that year. The AGENCY may adjust the quantity of water, up or down, on or before May 14, and on May 14 the AGENCY will commit to the final quantity of Accrued Groundwater Substitution Component water to be purchased during the Water Accounting Year, but such amount will not be less than the actual amount of Accrued Groundwater Substitution Component water made available between April 1 and May 15 for Groundwater Substitution Component water in accordance with the accounting provisions for Groundwater Substitution Component water set forth in Exhibit 1 of the Yuba Water Purchase Agreement. This provision is intended to be consistent with, and not modify, provisions of Section 4.A.5. If necessary, the dates herein may be adjusted if approved in writing by Yuba and DWR with written notice to the AGENCY to allow the Yuba Member Units to maximize the quantities of groundwater substitution pumping program water that could be made available during each year**.**"

d. Section 4.A.4 is amended to read as follows:

"4. No later than May 19, DWR will notify the AGENCY of the quantity of Component 1 Water, Component 2 Water, and Component 3 Water that has been allocated to the AGENCY and that the AGENCY will schedule pursuant to Section 4.A.7."

e. Section 4.A.5 is amended to read as follows:

"5. The AGENCY will provide DWR not less than 24 hours notification for suspension or termination of groundwater pumping due to limitations on the ability of the AGENCY to divert the Groundwater Substitution Component water. In the event of such a suspension or termination of Groundwater Substitution Component water, the AGENCY will pay for its allocated share of the quantity of Accrued Groundwater Substitution Component water, up to and including through a 72-hour period commencing after DWR notifies Yuba to suspend or terminate pumping related to the amount of Groundwater Substitution Component water requested by the AGENCY unless another Participating Contractor purchases that Accrued Groundwater Substitution Component water."

f. Section 4.A.6 is amended to read as follows:

"6. Pursuant to the negotiations described in Section 3.B.4.c in which a letter agreement has been executed as provided in Section 3.B.4.d, the AGENCY will comply with Delta conveyance priority, as determined by the Management Committee representatives as provided in Section 3.B.4.c, for any Groundwater Substitution Component water requested under the Agreement, relative to any other transfer water that DWR conveys at the Harvey O. Banks Pumping Plant for the AGENCY, provided that the Groundwater Substitution Component water will not have a higher priority than Storage Component water provided under the Agreement."

g. Section 4.A.7 is amended by striking "if not used by the EWA, as provided in Section 3.B.1.a".

h. Section 4.A. is further amended by adding at the end the following new paragraph 12:

"12. In the event that Yuba notifies DWR on or before September 1 to not back a specified quantity of Released Transfer Water into Project storage after September 30 of a Water Accounting Year, DWR will notify the AGENCY within five business days and provide an opportunity for the AGENCY to guarantee, no later than September 15, purchase of that portion of such water allocated to the AGENCY in accordance with Section 3.A at the current year pricing regardless of whether it becomes Delivered Transfer Water. Such water, when stored in Project storage, will be released in a subsequent year to the AGENCY provided it was stored in Project storage and not spilled by flood control releases before its scheduled release."

6. CHANGES TO SECTION 5, "INVOICING AND PAYMENTS"

a. Section 5.A.1 is amended to read as follows:

"A. Invoicing and Payment of Purchased Water

1. On or about May 22 (or within 9 days of the date that DWR receives an invoice from Yuba), DWR will invoice the AGENCY for fifty percent of the payment for the estimated amount of Storage Component water that the AGENCY scheduled as Purchased Water for that calendar year minus any credits due to the AGENCY as provided in Sections 5.C and 5.D. DWR will simultaneously invoice the AGENCY for 50 percent of the amount of Accrued Groundwater Substitution Component water that the AGENCY has committed to purchase under Section 4.A.3. Within 32 days of the date that

the AGENCY receives an invoice from DWR, the AGENCY will submit payment to DWR."

b. Section 5.A. is amended further by: redesignating Section 5.A.2 as 5.A.3, Section 5.A.3 as 5.A.4, and adding a new Section 5.A.2 as follows:

"2. a. The AGENCY will pay DWR the per acre foot price for the quantity of Accrued Groundwater Substitution Component water that the AGENCY has committed to purchase pursuant to Section 4.A.3, unless this amount is reduced pursuant to Sections 4.A.5 or 5.A.2.b or is reduced because the Yuba Member Units do not pump the requested quantity of groundwater substitution pumping program water for the Groundwater Substitution Component water.

b. The Parties acknowledge that Section 5.1.8 of the Yuba Accord Fisheries Agreement allows the River Management Team to schedule the release of a portion of Groundwater Substitution Component water at a time when it might not be transferable. The AGENCY will not be required to pay for the portion (if any) of Groundwater Substitution Component water that is scheduled for release in accordance with the provisions of Section 5.1.8 of the Yuba Accord Fisheries Agreement to the extent that this quantity of Groundwater Substitution Component water is not transferable under the accounting provisions set forth in Exhibit 1 of the Yuba Water Purchase Agreement.

c. On or about August 30 in each year that the AGENCY has agreed to purchase Accrued Groundwater Substitution Component water, DWR will submit an invoice to the AGENCY for 90 percent of the amount of Accrued Groundwater Substitution Component water the AGENCY has committed to purchase in Section 4.A.3 or that is otherwise payable under this Agreement during the current Water Accounting Year, less the amount of prior invoices for such Accrued Groundwater Substitution Component water during the current Water Accounting Year. Within 32 days of the date that the AGENCY receives an invoice from DWR, the AGENCY will submit payment to DWR.

d. Approximately 30 days after the end of the release of Accrued Groundwater Substitution Component water from New Bullards Bar Reservoir, after confirmation of the amount of Groundwater Substitution Component water released has been completed, after Yuba and DWR have reached agreement on the final accounting, and Yuba has provided to DWR a final invoice that is undisputed and as required under the Yuba Water Purchase Agreement, DWR will invoice the AGENCY for final payment for Accrued Groundwater Substitution Component water

provided under this Amendment. The AGENCY will submit payment to DWR within 32 days of invoicing by DWR.

e. The final payment for Accrued Groundwater Substitution Component water will reflect any adjustments necessary to account for the total quantity of Accrued Groundwater Substitution Component water payable under this Agreement and any adjustments due pursuant to Sections 4.A.5 or 5.A.2.b.

f. The Agreement provides for a Participating Contractor to pay interest on delinquent payments at the rate of 1 percent per month from the due date until paid in full. DWR will assess such interest on the AGENCY if payments to DWR for invoices pursuant to this Agreement are delinquent. The AGENCY agrees to pay such interest, and DWR will pay such interest collected along with the payments on invoices to Yuba."

c. Section 5.A is further amended by adding at the end the following new subsection 5.A.5:

"5. In the event that the AGENCY has guaranteed the purchase of Water allocated in accordance with Section 3.A that Yuba had notified DWR to not back into Project storage, DWR will invoice the AGENCY for the amount of Water the AGENCY has guaranteed in accordance with Section 4.A.12 to purchase at the current year pricing regardless of whether it becomes Delivered Transfer Water."

d. Section 5.C, PAYMENT OF FIXED ANNUAL COSTS AND CREDIT AGAINST PURCHASED WATER, is amended to read as follows:

"C. PAYMENTS AND CREDITS FOR TIME VALUE OF DEPOSIT FUNDS

1. The AGENCY shall make an annual payment to DWR for the purpose of compensating Contributing Participating Contractors for the time value of the money, computed as a compounded interest rate of 2.25 percent on the outstanding balance, that Contributing Participating Contractors contribute by about December 31, 2014 to comprise the $20,000,000 of deposit funds that serve to guarantee the five-year pricing reflected in the fifth amendment to the Yuba Water Purchase Agreement. On or about May 22 each year, DWR will invoice the AGENCY its share of the annual charge to pay the interest costs on the deposit funds provided by Contributing Participating Contractors providing deposit funds as provided in Section 5.E. The AGENCY's payment of these fixed annual costs will be its share of $175,000 prorated among the Participating SWP Contractors calculated in the manner as provided in Section 3.A. This payment may be offset with any applicable credits due the AGENCY under the Agreement. This annual

payment will be discontinued once the total interest charges have been paid to the Contributing Participating Contractors that fund the deposit after the $20,000,000 deposit has been fully credited to Storage Component water purchases by the Participating Contractors. This annual charge may be reduced in the final year(s) of payment to assure complete payment of the interest without overcharging the Participating Contractors.

2. All charges invoiced to the Participating Contractors for interest as provided in Section 5.C.1 shall be credited by DWR to Water purchases in the same Water Accounting Year by the Contributing Participating Contractors, in proportion to the amount of money each Contributing Participating Contractor contributed to the deposit described in Section 5.E. DWR will compute the actual amount of interest due to the AGENCY, if it is a Contributing Participating Contractor, based on the 2.25 percent interest rate and the deposit balances outstanding during the term of this Agreement. DWR shall credit or pay to AGENCY its proportionate share of the interest amount until the full amount of such interest due has been paid."

e. Section 5.E. PAYMENTS FOR ADJUSTMENTS TO GROUNDWATER O&M COSTS is amended to read as follows:

"E. PROVISION OF DEPOSIT FUNDS TO SECURE PRICING GUARANTEE

1. An AGENCY that has elected to be a Contributing Participating Contractor shall deposit money with DWR towards the $20,000,000 deposit for purchases of Water from Yuba.

   a. The AGENCY shall pay a deposit of $0 to DWR within 10 working days of executing Amendment 5 to the Agreement as its share of the $20,000,000 deposit towards all purchases of Storage Component water by all Participating Contractors beginning after September 30, 2015. DWR will remit these deposit funds to Yuba by December 31, 2014 as part of the $20,000,000 deposit as provided in the Yuba Water Purchase Agreement.

   b. As Yuba credits the deposit funds to Storage Component water purchases by all Participating Contractors, if the AGENCY is a Contributing Participating Contractor, DWR will, in turn, credit these deposit credits to all purchases of Water by the AGENCY beginning October 1, 2015 in proportion to the AGENCY's contribution to the deposit until the entire deposit has been credited and the AGENCY has received full credit for or repayment of its deposit amount during the term of the Agreement as provided herein. In the event that the AGENCY's purchases of Water in any Water Accounting Year are less than the credits available to the AGENCY under the Agreement, DWR

will pay such credit amounts to the AGENCY upon receipt of an invoice.

c. By June 10 each year and by January 17 of the following year, DWR will provide the AGENCY with an accounting of all purchases of Water by Participating Contractors setting forth the amount and cost of Storage Component and Groundwater Substitution Component water purchased by the AGENCY, charges for the AGENCY's proportional share of interest payments, credits for the AGENCY's share of interest on the deposit if any, credits for repayment of deposit funds to the AGENCY from purchases of Storage Component water if any, and any other applicable credits and charges provided in this Agreement. If funds are due from DWR to the AGENCY, the AGENCY shall promptly invoice DWR, and DWR will pay the AGENCY within 30 days. DWR will compute the deposit balance attributable to the AGENCY and compute the interest amounts earned and credited or paid, and provide the AGENCY with detailed accounting of these balances. DWR will adjust the deposit balance attributable to the AGENCY's contribution to the deposit accordingly until the deposit is fully credited.

2. In the event that there are AGENCY deposit funds that have not been fully credited for Storage Component water that has been accounted for as Delivered Transfer Water that is made available through September 30, 2020, then these remaining deposit funds will be: (1) applied to future payments due by the AGENCY to DWR for Storage Component Delivered Transfer Water delivered on or after October 1, 2020 under a subsequent amendment between the Parties at the prices provided in Section 26 of the Yuba Water Purchase Agreement; or (2) if there is no such amendment, refunded by DWR to the AGENCY upon receipt of Prepayment funds from Yuba as provided in Section 25.A of the Yuba Water Purchase Agreement."

7. YUBA WATER SALES TO THIRD PARTIES

The Agreement is amended by adding at the end the following new section:

"**31. SALES TO THIRD PARTIES**

Amendment 5 to the Yuba Water Purchase Agreement provides for the sale of water to third parties under the terms outlined in Section 11.F of that agreement. In accordance with Sections 11.F.3 and 4 of the Yuba Water Purchase Agreement, so long as a transfer is carried out consistent with the transfer water accounting provisions of Exhibit 1 for Released Transfer Water during Balanced Conditions, the AGENCY will not object based on the use of the transfer water accounting provisions of Exhibit 1 to such a transfer as not protective of DWR and the AGENCY as legal users of water during the time the AGENCY remains a Participating Contractor. The

AGENCY also agrees that while a Participating Contractor, it will not purchase water from Yuba other than through the Yuba Water Purchase Agreement."

8. NO OTHER CHANGES

All remaining provisions of the Agreement that are not changed by this Amendment will remain in full force and effect.

9. COUNTERPARTS OF THE AGREEMENT

This Amendment may be signed in any number of counterparts by the Parties, each of which will be deemed to be an original, and all of which together will be deemed to one and the same instrument. This Amendment, if executed in counterparts, will be valid and binding on a Party as if fully executed all in one copy.

IN WITNESS WHEREOF, the Parties hereto, by their authorized representatives, have executed this Amendment on the last date set forth below.

STATE OF CALIFORNIA
THE RESOURCES AGENCY
DEPARTMENT OF WATER RESOURCES
AND
YUBA COUNTY WATER AGENCY

AGREEMENT FOR THE LONG-TERM PURCHASE OF WATER FROM YUBA COUNTY WATER AGENCY BY THE DEPARTMENT OF WATER RESOURCES

This Agreement is entered into as of December 4, 2007 between the Department of Water Resources of the State of California, pursuant to the provisions of the California Water Resources Development Bond Act, the Central Valley Project Act and other applicable laws of the State of California, and Yuba County Water Agency, pursuant to the Yuba Act (California Statutes 1959, Chapter 788, as amended) and other applicable laws of the State of California. Defined terms are set forth in section 1 of this Agreement.

RECITALS

A. DWR operates and maintains the SWP pursuant to the laws of the State of California, involving the development and conveyance of water supplies to water supply agencies throughout the State of California.

B. Reclamation has constructed and is operating the CVP for the diversion, storage, carriage, and distribution of waters of the State of California for irrigation, municipal, domestic, industrial water supplies, for fish and wildlife mitigation, protection and restoration, and for generation and distribution of electric energy, salinity control, navigation, flood control, recreation and other beneficial uses.

C. Yuba is a public agency created and existing pursuant to the provisions of the Yuba Act. Yuba owns and operates the Yuba River Development Project, including the Yuba Project.

D. Yuba is engaged in the Yuba River Accord initiative to resolve issues associated with operation of the Yuba Project in a way that protects lower Yuba River fisheries and local water-supply reliability, while providing revenues for local flood control projects, water to use for protection and restoration of Delta fisheries, and improvements in state-wide water supply management.

E. The Yuba River Accord includes three major elements, all of which must be in place for the Yuba River Accord to become effective: (1) the Fisheries Agreement, under which Yuba would revise the operations of the Yuba Project to provide higher flows in the lower Yuba River under certain conditions to improve fisheries protection and enhancement; (2) the Conjunctive Use Agreements between Yuba and water districts within Yuba County for implementing a conjunctive use and water use efficiency program; and (3) this Agreement between Yuba and DWR, pursuant to which DWR will have rights to beneficially use water flows made available by Yuba through the Fisheries Agreement, the Conjunctive Use Agreements, and additional water releases from the Yuba Project, which Yuba asserts it would not and could not make available from the Yuba Project in the absence of the Yuba River Accord and without the revenues provided to Yuba under this Agreement.

F. DWR supports the Yuba River Accord, and is willing to enter into this Agreement because it will enable the Yuba River Accord to become effective, thereby improving fishery conditions on the Yuba River and improving water supplies to DWR for: (1) the EWA; (2) the SWP contractors pursuant to DWR's dry-year supplemental water supply programs; and (3) the members of the San Luis & Delta-Mendota Water Authority pursuant to DWR's dry-year supplemental water supply programs.

G. The Parties believe that this Agreement is consistent with: (1) Yuba's commitments to utilize water management tools (such as conjunctive use of groundwater), to create operational efficiencies, and manage water shortage risks in new ways that would benefit the fisheries and augment water supplies for downstream users; and (2) the Projects' need for additional water supplies.

H. Yuba is authorized under the Yuba Act to enter into long-term contracts to sell water for use outside of Yuba County, subject to the provision of Section 5.2 of the Yuba Act. Yuba has determined, after compliance with the procedures set forth in Section 5.2 of the Yuba Act, that the water subject to sale or disposition under this Agreement will not be needed during the term of this Agreement by or for the Member Units of Yuba. Yuba has further determined that Yuba is willing, in exchange for the consideration described in this Agreement, to enter into this Agreement.

I. The Parties, in coordination and consultation with Reclamation, the SWP contractors and the San Luis & Delta-Mendota Water Authority, carried out pilot water transfer programs during the 2006 and 2007 Water Accounting Years, and, based on the success of these pilot programs, desire to move forward with this Agreement, as part of the Yuba River Accord.

J. A portion of the Water delivered under this Agreement will be paid for with funds appropriated pursuant to Chapter 7(d) of Proposition 50, California Water Code Section 79550(d).

K. DWR will enter into separate agreements with the SWP contractors and the San Luis & Delta-Mendota Water Authority for the allocation of, and payment for, the Water to the extent determined necessary by DWR to satisfy payment obligations of this Agreement. Reclamation has

determined to not be a party to this Agreement. Yuba and DWR will amend this Agreement at such time as Reclamation is willing to become a party, subject to Reclamation and DWR entering into a separate agreement for the allocation of, and payment for, Water under this Agreement.

L. The Parties have determined that this Agreement does not conflict with Section 25 of the Short-Term Phase 8 Settlement Agreement.

M. In consideration of potential changes that may occur in SWP and CVP Delta operations and implementation of this Agreement related to orders of the United States District Court in *NRDC v. Kempthorne* (Case no. 05-CV-01207, OWW, E.D. Cal.): (1) Yuba revised the environmental analyses in the Yuba River Accord final environmental impact report/environmental impact statement to consider potential effects of the orders from the United States District Court; and (2) the Parties revised the payment provisions for Component 2 Water in Section 6B1 of this Agreement (to $75 per acre foot in a Water Year that has a Final Classification as Dry, instead of $50 per acre foot, and to $93.75 per acre foot in a Water Year that has a Final Classification as Critical, instead of $62.50 per acre foot).

AGREEMENT

The Parties agree as follows:

1. Definitions.

When used herein, the term:

"Buyer" means DWR.

"CALFED" means the joint federal and California program, intended to develop and implement a long-term comprehensive plan that will, among other purposes, restore ecological health of the Bay-Delta System and improve water project management..

"CEQA" means the California Environmental Quality Act.

"Component 1 Water" means the water supplies described in Section 5 of this Agreement.

"Component 2 Water" means the water supplies described in Section 6 of this Agreement.

"Component 3 Water" means the water supplies described in Section 7 of this Agreement.

"Component 4 Water" means the water supplies described in Section 8 of this Agreement.

"Conference Year" means a Water Year for which the North Yuba Index is less than 500,000 acre-feet, calculated according to the procedures and formulas set forth in Exhibits 4 and 5 of the Fisheries Agreement, and using the latest available forecasts for the Water Year.

"Conjunctive Use Agreements" means those agreements (if any) for implementing a conjunctive use and water use efficiency program between Yuba and a sufficient number of Member Units that Yuba determines is satisfactory for Yuba to meet Yuba's obligations under this Agreement, the Fisheries Agreement, and the Yuba Act.

"CVP" means the Central Valley Project, operated by Reclamation.

"Decision 1644" means Revised Water-Right Decision 1644 of the State Board, adopted on July 16, 2003.

"DWR" means the Department of Water Resources of the State of California.

"Effective Date" means the date that this Agreement will take effect, as provided in Section 3 ("Effective Date").

"ESA" means the federal Endangered Species Act of 1973, as amended (16 U.S.C. sections 1531-1544).

"EWA" means the environmental water account program described in the CALFED Record of Decision and the EWA Operating Principles Agreement (August 28, 2000, as extended in September 2004), as extended by amendment and supplemental approvals, or a long-term environmental water account program.

"Feather River Diversion Facility" means an intake structure, pumping facilities, a fish screen that meets State and Federal fish screen criteria, and related facilities that Yuba may consider constructing at some future time at or below the confluence of the Yuba River and the Feather River for the diversion of water under Yuba's existing water rights for use within Yuba County. Yuba has no current plans to develop or construct the Feather River Diversion facility. If this project were developed, the Feather River Diversion Facility would be added as a point of re-diversion under Yuba's existing water rights. On a real-time basis, diversions by Yuba at the Feather River Diversion Facility: (1) would not exceed the quantity of water that would have been available to Yuba for diversion from Yuba River flows upstream of its confluence with the Feather River; (2) when added to the quantity of water diverted by Yuba at Yuba's Daguerre Point of Diversion, would not exceed the quantities of water under Yuba's water rights that Yuba had diverted to beneficial use under applicable provisions of law (including Chapter 1 of Part 1 of Division 2 of the Water Code)

prior to the initiation of water diversions at the Feather River Diversion Facility; and (3) would not cause adverse impacts to, or interfere with, DWR or Reclamation's operations of the SWP and CVP, or cause DWR or Reclamation to have to modify operations of their respective SWP or CVP facilities.

"FERC" means the Federal Energy Regulatory Commission.

"FERC License" means the license, as amended, issued to Yuba by FERC for the operation of the power facilities of the Yuba Project, the term of which expires on April 30, 2016.

"FERC Annual License" means one or more annual licenses issued to Yuba by FERC for the operation of the power facilities of the Yuba Project following the expiration of the term of the FERC License.

"FERC Long-Term License" means the long-term license issued to Yuba by FERC for the operation of the power facilities of the Yuba Project following the expiration of the term of the FERC License and the last FERC Annual License.

"Final Classification" means the year-type classification for the Sacramento River region in the May issue of DWR's Bulletin 120.

"Fisheries Agreement" means the agreement among Yuba, the California Department of Fish and Game, and other parties, under which Yuba operates the Yuba Project to provide higher flows in the lower Yuba River under certain conditions to improve fisheries protection.

"*Force Majeure* Event" means any: (1) flood; (2) earthquake; (3) failure of the California Aqueduct, the Delta-Mendota Canal, levees, other conveyance facilities, or other major components of the SWP, CVP or the Yuba Project; (4) act of God (other than drought); or (5) any other event (other than a Regulatory Action) beyond the reasonable control of DWR, Reclamation, or Yuba that significantly affects the ability to divert or use Water delivered by Yuba under this Agreement, or that significantly affects Yuba's ability to deliver Water under this Agreement while also meeting its obligations to its Member Units or its obligations under the Fisheries Agreement.

"Groundwater O&M Costs" means the costs related to pumping groundwater as described in Section 12 ("Other Payments to Yuba by Buyers") of this Agreement.

"Groundwater Substitution Transfer Monitoring and Operations Program" means the program, set forth in Exhibit 3 to this Agreement, pursuant to which Yuba will monitor and report groundwater pumping to implement this Agreement.

"Management Committee" means the committee, consisting of one representative each from Yuba, DWR, Reclamation, the CALFED fishery agencies on behalf of EWA, SWP contractors, and the San Luis & Delta-Mendota Water Authority, established under Section 14 ("Technical Committee and Management Committee") of this Agreement.

"Member Units" means a "Member Unit" as defined in Section 2(g) of the Yuba Act.

"NEPA" means the National Environmental Policy Act.

"Parties" means DWR and Yuba.

"PG&E" means Pacific Gas and Electric Company.

"PG&E Power Contract" means the power purchase contract between Yuba and PG&E related to the operation of the Yuba Project for the generation of hydroelectric power, dated May 13, 1966.

"Projects" means the SWP and the CVP.

"Reclamation" means the United States Department of the Interior, Bureau of Reclamation.

"Regulatory Action" means a court order, regulatory action or change in applicable law that significantly affects the Parties' or Reclamation's ability to divert or use Water, or that significantly affects Yuba's ability to deliver Water while also meeting its obligations to its Member Units or its obligations under the Fisheries Agreement.

"Short-Term Phase 8 Settlement Agreement" means the "Short-Term Agreement to Guide Implementation of Short-Term Water Management Actions to Meet Local Water Supply Needs and to Make Water Available to the SWP and CVP to Assist in Meeting the Requirements of the 1995 Water Quality Control Plan and to Resolve Phase 8 Issues" (effective date March 24, 2003).

"State Board" means the California State Water Resources Control Board.

"SWP" means the State Water Project operated by DWR. The SWP is also known as the State Water Facilities, as defined in California Water Code section 12934(d).

"Technical Committee" means the committee, consisting of technical representatives from Yuba, DWR, Reclamation, the CALFED fishery agencies on behalf of EWA,

SWP contractors and the San Luis & Delta-Mendota Water Authority, established under Section 14 ("Technical Committee and Management Committee") of this Agreement.

"Water" means Component 1 Water through Component 4 Water delivered by Yuba in a manner consistent with the provisions of Section 11 ("General Provisions Applicable to Water") of this Agreement.

"Water Accounting Year" means the twelve-month period from January 1 to December 31. The Water Accounting Year will be used to account for Water.

"Water Year" means the twelve-month period from October 1 of one year through September 30 of the following year. For this Agreement, each Water Year will be classified: (1) as "Wet," "Above-Normal," "Below-Normal," "Dry" or "Critical," based on the Sacramento Valley Water Year Hydrologic Classification in Figure 1 on page 188 of the State Board's March 15, 2000, Revised Water-Right Decision 1641; or (2) as a "Conference Year," based on the procedures and formulas set forth in Exhibits 4 and 5 of the Fisheries Agreement, using the latest available forecast for the Water Year.

"Yuba" means the Yuba County Water Agency.

"Yuba Act" means the Yuba County Water Agency Act, California Statutes 1959, Chapter 788, as amended.

"Yuba Project" means the Yuba River Development Project, including New Bullards Bar Dam and Reservoir on the North Yuba River.

"Yuba River Accord" means Yuba's initiative as described in Recitals D and E of this Agreement.

2. Term of Agreement.

This Agreement will terminate on December 31, 2025, or when all obligations under this Agreement have been satisfied, whichever is later, unless this Agreement is terminated earlier as provided herein.

3. Effective Date.

This Agreement will become effective when all of the following have occurred: (1) full execution of this Agreement; (2) full execution of the Fisheries Agreement; (3) full execution of the Conjunctive Use Agreements (if any, unless Yuba provides DWR written notification of Yuba's waiver of this condition); (4) full execution of an agreement between Yuba and PG&E to amend provisions of the PG&E Power Contract, and approval of the California Public Utilities Commission

of such an amendment, if determined necessary by Yuba (unless Yuba provides DWR written notification of Yuba's waiver of this condition); (5) receipt of all State Board approvals that may be necessary to enable the Fisheries Agreement and this Agreement to be fully implemented; and (6) full execution of the agreements between DWR and one or more SWP contractors, and an agreement between DWR and the San Luis & Delta-Mendota Water Authority, referred to in Recital K of this Agreement. The Parties will support the actions described in this section.

4. Actions Taken by Yuba to Make Water Available.

A. In accordance with Section 5.2 of the Yuba Act, all sales of Water are subject to the prior right to the use of such water or Yuba facilities by or for the Member Units. Yuba has taken the following measures to assure that the quantities of Water will be available to DWR during all Water Year types, as provided in this Agreement, for the term of this Agreement:

1. Yuba has entered into the Conjunctive Use Agreements (if any) under which the contracting Member Units have agreed to provide groundwater supplies in substitution for surface water supplies to assist Yuba in implementing this Agreement, to the extent (if any) determined by Yuba to be satisfactory for Yuba to meet Yuba's obligations under this Agreement, the Fisheries Agreement, and the Yuba Act; and

2. Yuba is implementing a groundwater monitoring program within its service area to ensure that the groundwater supply developed pursuant to the Conjunctive Use Agreements (if any) is within the long-term safe yield of the affected aquifer; and

3. The Board of Directors of Yuba has adopted a resolution making findings concerning Yuba's compliance with Section 5.2 of the Yuba Act, and determining that the Water exceeds the needs of its Member Units and that Yuba can and will perform its obligations under this Agreement.

B. In addition, Yuba may consider the installation and operation of the Feather River Diversion Facility at some future time in the event that Yuba determines that operation of the Feather River Diversion Facility would assist Yuba in making water supplies available within Yuba County. Subject to Yuba agreeing to operate this facility in the manner described in the definition of Feather River Diversion Facility, DWR will not oppose the installation and operation of the Feather River Diversion Facility for this purpose, and will not object to Yuba obtaining regulatory permits and approvals for the Feather River Diversion Facility.

5. Component 1 Water

A. Component 1 Water Quantity.

1. In each of the first eight Water Accounting Years of this Agreement (January 1, 2008 through December 31, 2015), Yuba will deliver to the Buyer, for use by the EWA, and the Buyer will pay for, 60,000 acre-feet of Component 1 Water, subject to Section 11 ("General Provisions Applicable to Water") of this Agreement. The total quantity of Component 1 Water that Yuba will deliver to the Buyer during the first eight Water Accounting Years of this Agreement will be 480,000 acre-feet, subject to extending the delivery period beyond the eight years if needed pursuant to subsection 2 below and Section 11G. Unless conditions under Section 23D ("As to Termination of the EWA Program") apply, Component 1 Water will be used to support continued implementation of EWA.

2. In certain years, and pursuant to the accounting principles set forth in Exhibit 1, operational limitations of the Yuba Project, the CVP, and/or the SWP may cause the quantity of Component 1 Water that Yuba can deliver to the Buyer to be reduced below 60,000 acre-feet during a Water Accounting Year. Under those circumstances, unless the Parties agree otherwise, Yuba will deliver the undelivered Component 1 Water so that the remaining quantity of the 480,000 acre-feet will be delivered during subsequent years under the following conditions: (a) during the next Water Accounting Year that is not a Dry or Critical Water Year; (b) when such make-up water can be delivered from Yuba's available surface-water supply; and (c) on a schedule that is acceptable to the Buyer and Yuba that would not impair the ability of Yuba to make Components 2 through Components 4 Water available, as provided in this Agreement.

3. The Buyer and Yuba will schedule Component 1 Water pursuant to Section 9 ("Scheduling of Water") of this Agreement.

4. In all Water Accounting Years that include all or part of the term of any FERC Annual License, Yuba will deliver to the Buyer, and the Buyer will pay for, 60,000 acre-feet of Component 1 Water, subject to Sections 15A(2) and 15B of this Agreement.

5. The quantities of Component 1 Water delivered by Yuba to the Buyer during all Water Accounting Years that include the term of the FERC Long-Term License, and do not include any part of the term of any FERC Annual License, will be subject to Sections 15A(3) and 15C of this Agreement.

B. Component 1 Water Pricing.

1. As full compensation to Yuba for making Component 1 Water in Section 5A available during each of the first eight Water Accounting Years of this Agreement, or in subsequent years under Section 5A2 and 11G, the Buyer will pay Yuba $30,900,000. This payment will be made as described in Section 5C and Section 10 ("Invoicing") of this Agreement.

2. The pricing provisions applicable to additional Component 1 Water delivered by Yuba to the Buyer during all Water Accounting Years after the first eight Water

Accounting Years will be those set forth in Section 15 ("Quantities of and Pricing Provisions for Water During a FERC Annual License and During the FERC Long-Term License") of this Agreement.

C. Component 1 Water Payment Provisions.

In accordance with Section 10 ("Invoicing") of this Agreement, Yuba will, within thirty days of the Effective Date, submit an invoice to DWR for the payment of $30,900,000 for the 480,000 acre-feet Component 1 Water. DWR will make payment to Yuba within sixty days of the date the invoice has been received by both the DWR Contract Manager and the Accounting Office.

6. Component 2 Water.

A. Component 2 Water Quantity.

1. In addition to Component 1, 3, or 4 Water, Yuba will deliver to the Buyer, subject to Section 11 ("General Provisions Applicable to Water") of this Agreement, and the Buyer will pay for:

a. In any Water Year that has a Final Classification as Dry, 15,000 acre-feet of Component 2 Water; and

b. In any Water Year that has a Final Classification as Critical, 30,000 acre-feet of Component 2 Water.

2. The Buyer and Yuba will schedule Component 2 Water pursuant to Section 9 ("Scheduling of Water") of this Agreement.

3. In all Water Accounting Years that include all or part of the term of any FERC Annual License, Yuba will deliver to the Buyer Component 2 Water, subject to Sections 15A(2) and 15B of this Agreement.

4. The quantities of Component 2 Water delivered by Yuba to the Buyer during all Water Accounting Years that include the term of the FERC Long-Term License, and do not include any part of the term of any FERC Annual License, will be subject to Sections 15A(3) and 15C of this Agreement.

B. Component 2 Water Pricing.

1. The Buyer will pay Yuba for Component 2 Water as follows:

a. In any Water Year that has a Final Classification as Dry, $75.00 per acre-foot;

b. In any Water Year that has a Final Classification as Critical, $93.75 per acre-foot; and

c. The payment adjustments (if any) provided for in Section 12C of this Agreement.

2. The Buyer will pay Yuba for Component 2 Water pursuant to Section 6C and Section 10 ("Invoicing") of this Agreement.

3. The pricing provisions applicable to Component 2 Water delivered by Yuba to Buyer during all Water Accounting Years that include all or part of the term of any FERC Annual License or the term of the FERC Long-Term License are set forth in Section 15 ("Quantities of and Pricing Provisions for Water During a FERC Annual License and During the FERC Long-Term License") of this Agreement.

C. Component 2 Payment Provisions.

1. For each Water Year that Component 2 Water is being delivered to the Buyer, Yuba will submit an invoice to the Buyer on or after June 1 for fifty percent of the amount due for Component 2 Water scheduled to be delivered to the Buyer pursuant to this Agreement, adjusted by an amount equal to fifty percent of any credits due from Yuba to the Buyer. By January 7 of the subsequent year, Yuba will submit an invoice to the Buyer for the remaining fifty percent of the amount due for Component 2 Water scheduled to be delivered to the Buyer pursuant to this Agreement, less the remaining amount of any credits due the Buyer. The invoices will contain all of the information and be transmitted to Buyer as set forth in Section 10 ("Invoicing") of this Agreement.

2. DWR will pay Yuba within sixty days of the date that both the DWR Contract Manager and the Accounting Office receive invoices containing all of the information required by Section 10(B) of this Agreement. With respect to the first invoice from Yuba, the Buyer will pay Yuba an amount equal to fifty percent of the price for the Component 2 Water that has been scheduled for delivery during the current Water Accounting Year in accordance with Section 9 ("Scheduling of Water") of this Agreement, minus fifty percent of any credit due from Yuba to the Buyer pursuant to Section 12 ("Payments for Fixed Annual Costs") of this Agreement. With respect to the second invoice from Yuba, the Buyer will pay the remaining amount due to Yuba for Component 2 Water, based on an accounting of actual Water deliveries in the previous Water Accounting Year, less the remaining amount of any credit due the Buyer pursuant to Section 12 ("Payments for Fixed Annual Costs") of this Agreement. With respect to both invoices from Yuba, DWR will pay Yuba within sixty days of the date both the DWR Contract Manager and the

Accounting Office have received the appropriate invoices containing all of the information required by Section 10(B) of this Agreement.

7. Component 3 Water.

A. Component 3 Water Quantity.

1. In addition to Component 1, 2, or 4 Water, and subject to Section 11 ("General Provisions Applicable to Water") of this Agreement:

a. When the allocations as of April 21:

(i) For CVP South of Delta agricultural contractors are at or below thirty-five percent of their CVP contractual entitlements, and for SWP contractors are at or below forty percent of their SWP water supply contract Table A Amounts, Yuba will deliver to the Buyer, and the Buyer will pay for, 40,000 acre-feet of Component 3 Water; or

(ii) For CVP South of Delta agricultural contractors are at or below forty-five percent and above thirty-five percent of their CVP contractual entitlements, or for SWP contractors are at or below sixty percent and above forty percent of their SWP water supply contract Table A Amounts the Buyer, on or before April 21, the Buyer may request that Yuba deliver up to 40,000 acre-feet of Component 3 Water, and Yuba will deliver to Buyer the quantity of Component 3 Water requested.

2. The Buyer and Yuba will schedule Component 3 Water pursuant to Section 9 ("Scheduling of Water") of this Agreement. In addition:

a. If after April 21, but prior to May 21, allocations to CVP South of Delta agricultural contractors or SWP contractors decrease, then:

(i) if section 7A(1)(a)(ii) of this Agreement remains applicable notwithstanding the decreased allocation(s), the Buyer will have the right to call for Component 3 Water or additional Component 3 Water up to the maximum amount authorized by section 7A(1)(a)(ii); provided, however, that the quantity or increased quantity of Component 3 Water Yuba is required to deliver will be reduced to reflect any reduction in the amount of groundwater pumping availability between April 21 and May 21.

(ii) if section 7A(1)(a)(i) of this Agreement becomes applicable due to the decreased allocations, and the Buyer had opted to have less than 40,000 acre feet of Component 3 Water delivered, Yuba will deliver to the Buyer, and the Buyer will pay for 40,000 acre feet of Component 3 Water reduced by an amount that reflects any reduction in the amount of groundwater pumping availability between April 21 and May 21.

b. If after April 21, but prior to May 21, allocations to CVP South of Delta agricultural contractors or SWP contractors increase, then the Buyer may, on or before May 21, reduce their request for Component 3 Water to the greater of zero or the quantity of water already delivered by Yuba plus the quantity of water already stored by Yuba through the substitution of groundwater for surface water in anticipation of Component 3 Water deliveries originally requested by the Buyer. This section will not apply to circumstances where, notwithstanding an increase in the Buyer' May water supply allocations, Section 7(A)(1)(a)(i) of this Agreement remains applicable.

3. In all Water Accounting Years that include all or part of the term of any FERC Annual License, Yuba will deliver to the Buyer, and the Buyer will pay for, Component 3 Water, subject to Section 15B of this Agreement.

4. The quantities of Component 3 Water delivered by Yuba to the Buyer during Water Accounting Years that include the term of the FERC Long-Term License, and do not include any part of the term of any FERC Annual License, will be subject to Section 15C of this Agreement.

B. Component 3 Water Pricing.

1. The Buyer will pay Yuba for Component 3 Water as follows:

a. In any Water Year that has a Final Classification as Wet, $25.00 per acre-foot;

b. In any Water Year that has a Final Classification as Above-Normal, $50.00 per acre-foot;

c. In any Water Year that has a Final Classification as Below-Normal, $75.00 per acre-foot;

d. In any Water Year that has a Final Classification as Dry, $100.00 per acre-foot;

e. In any Water Year that has a Final Classification as Critical, $125.00 per acre-foot; and

f. The payment adjustments (if any) provided for in Section 12C ("Payments for Adjustments in Groundwater O&M Costs) of this Agreement.

2. The Buyer will pay Yuba for Component 3 Water pursuant to Section 7C and Section 10 ("Invoicing") of this Agreement.

3. The pricing provisions applicable to Component 3 Water delivered by Yuba to Buyer during all Water Accounting Years that include all or part of the term of any FERC Annual License or the term of the FERC Long-Term License are set forth in Sections 15B and C of this Agreement.

C. Component 3 Payment Provisions

1. In accordance with Section 10 ("Invoicing") of this Agreement, Yuba will submit an invoice to the Buyer on or after June 1 each Water Accounting Year for fifty percent of the amount due for Component 3 Water scheduled to be delivered to the Buyer pursuant to this Agreement, adjusted by an amount equal to fifty percent of any credits due from Yuba to the Buyer. By January 7 of the subsequent year, Yuba will submit an invoice to the Buyer for the remaining fifty percent of the amount due for Component 3 Water scheduled to be delivered to the Buyer pursuant to this Agreement, less the remaining amount of any credits due the Buyer.

2. In accordance with Section 10 ("Invoicing") of this Agreement, DWR will pay Yuba within sixty days of the date that both the DWR Contract Manager and the Accounting Office receive the appropriate invoices and verification that the amount of Component 3 Water specified therein has been scheduled in accordance with Section 9 ("Scheduling of Water") of this Agreement. The Buyer will pay Yuba an amount equal to fifty percent of the price for the Component 3 Water that has been scheduled for delivery during the current Water Accounting Year in accordance with Section 9 ("Scheduling of Water") of this Agreement, minus fifty percent of any credit due from Yuba to the Buyer pursuant to Section 12 ("Payments for Fixed Annual Costs") of this Agreement. On or before March 7 of the subsequent year, the Buyer will pay the remaining amount due to Yuba for Component 3 Water, based on an accounting of actual Water deliveries in the previous Water Accounting Year, less the remaining amount of any credit due the Buyer pursuant to Section 12 ("Payments for Fixed Annual Costs") of this Agreement.

8. Component 4 Water.

A. Component 4 Water Quantity.

1. In addition to Component 1, 2, or 3 Water, Yuba will provide to the Buyer, subject to Section 11 ("General Provisions Applicable to Water") of this Agreement, Component 4 Water as follows:

a. On or before April 10 of each year, Yuba will inform the Buyer of the quantity of Component 4 Water that Yuba could make available from Yuba's available surface and groundwater that Water Accounting Year.

b. By May 15 the Buyer will notify Yuba if it will take delivery of any or all of the Component 4 Water that Yuba informed the Buyer that Yuba will make available.

2. The Buyer and Yuba will schedule Component 4 Water pursuant to Section 9 ("Scheduling of Water") of this Agreement.

3. In all Water Accounting Years that include all or a part of the term of any FERC Annual License, Yuba will deliver to the Buyer, and the Buyer will pay for, Component 4 Water pursuant to Section 15B of this Agreement.

4. The quantities of Component 4 Water delivered by Yuba to the Buyer during all Water Accounting Years that include the term of the FERC Long-Term License, and do not include any part of the term of any FERC Annual License, will be subject to Section 15C of this Agreement.

B. Component 4 Water Pricing.

1. The Buyer will pay Yuba for Component 4 Water as follows:

a. In any Water Year that has a Final Classification as Wet, $25.00 per acre-foot;

b. In any Water Year that has a Final Classification as Above-Normal, $50.00 per acre-foot;

c. In any Water Year that has a Final Classification as Below-Normal, $75.00 per acre-foot;

d. In any Water Year that has a Final Classification as Dry, $100.00 per acre-foot;

e. In any Water Year that has a Final Classification as Critical, $125.00 per acre-foot

f. The payment adjustments (if any) provided for in Section 12C ("Payments for Adjustments in Groundwater O&M Costs") of this Agreement.

2. The Buyer will pay Yuba for Component 4 Water pursuant to the payment and invoicing provisions of this Section.

3. The pricing provisions applicable to Component 4 Water delivered by Yuba to Buyer during all Water Accounting Years that include all or part of the term of any FERC

Annual License or the term of the FERC Long-Term License are set forth in Sections 15B and C of this Agreement.

C. Component 4 Payment Provisions.

1. In accordance with Section 10 ("Invoicing") of this Agreement, Yuba will submit an invoice to the Buyer on or after June 1 each Water Accounting Year for fifty percent of the amount due for Component 4 Water scheduled to be delivered to the Buyer pursuant to this Agreement, adjusted by an amount equal to fifty percent of any credits due from Yuba to the Buyer. By January 7 of the subsequent year, Yuba will submit an invoice to the Buyer for the remaining fifty percent of the amount due for Component 4 Water scheduled to be delivered to the Buyer pursuant to this Agreement, less the remaining amount of any credits due the Buyer.

2. In accordance with Section 10 ("Invoicing") of this Agreement, DWR will pay Yuba within sixty days of the date that both the DWR Contract Manager and the Accounting Office receive the appropriate invoices and verification that the amount of Component 4 Water specified therein has been scheduled in accordance with Section 9 ("Scheduling of Water") of this Agreement. The Buyer will pay Yuba an amount equal to fifty percent of the price for the Component 4 Water that has been scheduled for delivery during the current Water Accounting Year in accordance with Section 9 ("Scheduling of Water") of this Agreement, minus fifty percent of any credit due from Yuba to the Buyer pursuant to Section 12 ("Payments for Fixed Annual Costs") of this Agreement. On or before March 7 of the subsequent year, the Buyer will pay the remaining amount due to Yuba for Component 4 Water, based on an accounting of actual Water deliveries in the previous Water Accounting Year, less the remaining amount of any credit due the Buyer pursuant to Section 12 ("Payments for Fixed Annual Costs") of this Agreement.

9. Scheduling of Water.

On or about April 10 of each Water Accounting Year, or as soon thereafter as practicable, the Parties will agree on a proposed delivery schedule for Component 1, 2, 3 and 4 Water. The proposed schedule may be revised periodically thereafter, and the Parties will agree on a final schedule no later than May 21. The final schedule will be updated to accommodate any changes in the North Yuba Index or the Yuba River Index and may be adjusted to account for changes in Bay-Delta conditions, including hydrologic or regulatory conditions, that affect the delivery of Water, and for changes in the flow schedule for the lower Yuba River as provided for in the Fisheries Agreement. The proposed and final schedules will also show the scheduling of water delivered by Yuba under the Short-Term Phase 8 Settlement Agreement. The scheduling of Water, and any adjustments to the schedule, will be in accordance with the water scheduling and accounting provisions set forth in Exhibit 1 ("Scheduling and Accounting Principles") of this Agreement.

10. Invoicing.

A. Reserved.

B. Yuba's invoices to DWR will contain the following information:

i) Federal and State Agreement numbers;
ii) Yuba's Taxpayer Identification Number;
iii) remittance address;
iv) point of contact;
v) for estimated payments, verification that the Water has been scheduled in accordance with Section 9 ("Scheduling of Water") of this Agreement; and
vi) for year-end payments, certification that the Water has been delivered.

C. Yuba will submit, at the same time, two copies of each invoice to DWR State Water Project Analysis Office and one copy to DWR Accounting office at the following addresses:

Department of Water Resources
Chief, State Water Project Analysis Office
1416 Ninth Street
Post Office Box 942836
Sacramento, California 94236-0001

Department of Water Resources
Accounting Office, Contracts Payable Unit
Post Office Box 942836
Sacramento, California 94236-0001

11. General Provisions Applicable to Water.

A. Accounting for Water.

Water delivered by Yuba to the Buyer will be accounted for in the manner set forth in Exhibit 1 ("Scheduling and Accounting Principles") of this Agreement. To the extent a conflict exists between the provisions of this Agreement and Exhibit 1, the provisions of this Agreement will control. Notwithstanding any other provision of this Agreement, the Buyer will only pay for water delivered by Yuba to the Buyer that is accounted for as Delivered Transfer Water pursuant to Exhibit 1.

B. Reservoir Refill Impact Accounting.

Yuba will provide assurance to the Buyer and Reclamation that the refilling of reservoir storage in the Yuba Project resulting from the delivery of Water under this Agreement will not adversely impact the Projects. Yuba will avoid adverse impacts to the Projects by complying with the

provisions of Exhibit 2 ("Reservoir Refill Accounting Provisions") of this Agreement. The provisions of Exhibit 2 will not apply to Water made available as a result of Yuba delivering groundwater instead of surface water to its Member Units to implement this Agreement.

C. Yuba's Conjunctive Use Program.

To the extent that Yuba delivers groundwater instead of surface water to its Member Units in order to deliver Water to the Buyer pursuant to this Agreement, Yuba will comply with the provisions of Exhibit 3 ("Groundwater Substitution Transfer Monitoring and Operations Program") of this Agreement.

D. Conference Year Principles.

During any Conference Year, the Parties will meet (along with the parties to the Fisheries Agreement and the Conjunctive Use Agreements) to determine how to address the circumstances, and to discuss the operation of the Yuba Project during that Water Accounting Year. During a Conference Year: (1) Yuba will have no obligation to deliver any quantity of Components 1 through 4 Water; (2) Yuba will not have to refund any part of the payment received for Component 1 Water; and (3) Yuba will deliver in a subsequent Water Accounting Year on a schedule that is acceptable to the Buyer and Yuba the quantity of Component 1 Water that was not delivered during the Conference Year.

E. Efforts to Maximize the Beneficial Use of Water.

Yuba will optimize to the extent feasible the operation of the Yuba Project to meet Yuba's obligations to supply Water under this Agreement. DWR will coordinate with Reclamation in the operation of the Projects to maximize the beneficial use of Water released by Yuba under this Agreement, including without limitation using all reasonable efforts to store water in Project facilities when Delta pumping is constrained and to avoid spills of water stored as result of the release of Water.

F. Sale to Third Parties.

To the extent the Water is otherwise transferable under California law, in those years when Yuba offers Components 3 or 4 Water, but the Buyer decline to take all of the Water offered, Yuba may sell the Water not taken by Buyer to a third party, provided that such sale to the third party will not impair Yuba's ability to meet its obligations to deliver Components 1 through 4 Water in the current or any future Water Accounting Year. In addition, to the extent the water is otherwise transferable under California law, Yuba may sell to a third party any quantity of Components 1, 3 or 4 Water released by Yuba that would have been accounted for as Water except for the inability of the Buyer to take delivery (e.g., during times when the Bay-Delta was out of balance). Yuba will provide the Buyer ten days' advance notice of a sale to a third party under this section.

G. Periodic Accounting of Water Delivered by Yuba.

After the first eight years of operations under this Agreement, and as appropriate thereafter, the Parties, with the assistance of the Technical Committee and the Management Committee, will develop a comprehensive accounting of all Water delivered under this Agreement. If it is determined that less than the quantities of Water required to be delivered during the first eight years have been delivered, and the Buyer has paid for quantities of Water that have not been delivered, then Yuba will deliver supplies of Water to the Buyer to make up for such deficiencies, on a schedule that is acceptable to the Buyer and Yuba that would not impair the ability of Yuba to make other deliveries of Water under this Agreement.

12. Other Payments to Yuba by the Buyer.

A. Diesel Conversions.

In furtherance of the mitigation of potential impacts to air quality from implementation of the Accord, Yuba has implemented a program to convert certain pumps used to pump groundwater from diesel to electric, or to other forms of energy that reduce air quality impacts. Conversion of pumps to electricity or other forms of energy that reduce air quality impacts has been and will be performed by Yuba for purposes of this Agreement. Prior to submitting invoices under this section to the Buyer under Section 10 ("Invoicing") of this Agreement, Yuba will: (1) submit to the Technical Committee for review documentation of the diesel conversion work performed and costs incurred from and after September 1, 2004 for purposes of this Agreement and the Accord; and (2) confirm to the Management Committee that the work performed and costs incurred were in furtherance of mitigation of potential impacts on air quality from implementation of the Accord. Subject to receipt of such information and concurrence by the Management Committee, the Buyer will pay Yuba the amount of such invoices, but not more than a total of $1,000,000.00.

B. Payments for Fixed Annual Costs and for Environmental Compliance.
